The CHAIRMAN having then proposed "The Health of Her Majesty the Queen," the only toast given, moved the following resolution: "That this meeting protests against the present unjust exemption of income derived from personal property from contributing towards the various objects for which funds are now raised by local rates, and is strongly of opinion that this grievance affects owners and occupiers of house property in towns quite as much as the landed interest, and, therefore, that both descriptions of property are equally interested in the removal of this anomaly." Referring to the Act of Elizabeth, which ordained that everyone should pay towards the maintenance of the poor of the country according to his means, that Act, no doubt, excepted from such taxation woods, forests, and mines. He would say, let them be included, and also let personal property be included, for "what was sauce for the goose was sauce for the gander." What they complained of was that they, the owners and occupiers of land, paid not only their fair share of imperial taxation, but they were also called upon to pay the exceptionally and ever-increasing income tax, beyond the imperial burden. They were called upon to pay income tax in disguise to the extent of about 13 per cent. over and above the owners of other description of property. They had also to pay new impositions entirely unconnected with Poor-law management, and now they were called upon to pay an education rate. That was stated to be 3d. in the £, but he believed it would more often be 6d. He contended that all these rates should be general in their incidence, and that all descriptions of property, in-

cluding personal incomes, mines, woods, &c., should pay a fair proportion of taxation.

Mr. R. H. MANSFEN (Staffordshire) seconded the resolution, maintaining that manufacturers paid only a very small proportion of taxation for labour compared with the payments which the agriculturist—the owner and occupier of land—was called upon to pay.

Mr. NIELD (Manchester) supported the resolution in a lengthy speech, in the course of which he was frequently interrupted.

Mr. RUSSEN (Worcestershire) also supported the resolution, which was carried.

Mr. A. PELL, M.P., moved: "That the proposal to divide the payment of rate between owners and occupier does not afford any relief or remedy for the grievance complained of in the incidence of local taxation, and that no settlement of the question could be accepted as final or satisfactory which is not preceded by a thorough inquiry to determine whether the objects now locally provided for are of local or national obligation."

Mr. SEWELL READ, M.P., seconded the motion. He had come to Oxford direct from the House of Commons that day, where he had been advocating the extinction of all ground game, and he hoped he should be excused if he should wander a little from the subject in hand. He was himself a tenant-farmer, and might be said to represent the occupiers of land in South Norfolk, and if he said anything in favour of the owners of land, they must not suppose that his sympathies were altogether in favour of those owners. He protested emphatically against the doxma that because it was possible to say that the owners of property might incur more benefit from the remission of local taxation than the tenant, therefore it was a question which ought not to occupy the attention of the Chamber of Agriculture. He protested against any such narrow-minded considerations. What did the Government propose to do for them in the circumstances in which they were placed? They proposed to set landlord and tenant by the ears—to divide the rate between the owners and the occupiers. In fact, by putting the lots into two baskets, on the back of one donkey, they wanted to make them believe that the same beast did not carry the whole burden.

Col. LEWIS (Wales) supported the resolution, which was carried.

Mr. HOLLY (Devonshire) moved the last resolution: "That, until the question of local taxation reform has been satisfactorily dealt with, this meeting pledges itself to oppose most strenuously the imposition of any fresh rates on the present unjust basis, for such purposes as national elementary education, expenses of elections, turnpike roads, emigration, &c."

Mr. G. WHITTAKER (Worcestershire) seconded the resolution, which was carried, and the meeting broke up.

[According to the "organ" of the Central Chamber, the "general company consisted mainly of farmers attending the Royal Agricultural Show;" whereas *The North of England Farmer* "regrets to say the meeting was worse than a failure. Instead of 150 being present, as the authorities of the Central Chamber represented there would be, there were only between fifty and sixty, twenty of whom were reporters with free tickets and two-thirds of the others were induced to attend by a Worcester man. This is not our idea, we wish to say, but the view of a secretary of a provincial chamber, who was present."]

LOCAL TAXATION.

At the quarterly meeting of the Nottinghamshire Chamber of Agriculture held at East Retford, the attendance was not so large as had been expected. In consequence of the Education Bill having passed the House of Commons, the subject was not discussed; and Local Taxation was thus the only one left.

The Rev. C. NEVILLE moved the first resolution: "That real property as opposed to personal property is subjected to much greater burdens in respect of the maintenance of the poor, and other taxes, than it is entitled justly to bear; this meeting is, therefore, of opinion that the area of rating should be extended so that the whole income of the country, however derived, should bear its fair share of taxation." There was, no doubt, a difficulty in the country in getting farmers to unite,

and in this respect they were not so successful as the inhabitants of towns; but still if they could arrange to meet and combine together it would be a great advantage to the agricultural interest, as they could then, by united action, press their questions on the Government of the day. It was sometimes said that this question of rating was not interesting to tenants—the landlords had more to do with the question. Now, he had had a good deal of experience in the letting of land, and he was sure that Lord Galway and Mr. Foljambe would confirm what he had said when he asserted that the increase of rating fell very heavily on the tenant. It was the reverse of a landlord's question; but he said this, that if landlords did their utmost to save tenants every shilling they could, tenants in return should do what they could to support the advocacy of such great public questions.

Mr. JOHN WALKER (Mattersea) seconded the resolution.

Mr. GEO. SPORER supported the resolution. He thought the real question at issue lay in a nut-shell. The great question they had to consider was that of rating; and he thought that all farmers there, as well as those who had rateable property of any kind, must see that the rates were increasing to an alarming extent. In addition to those already imposed, they had the prospect of an education-rate, and, looming in the distance, perhaps an emigration-rate. When they saw the position in which the agricultural interest was at present, and the fluctuations which were inseparable from this occupation, he thought the time had arrived when the agricultural interest should take the lead in examining into this question, and ask why it was that they were charged with such an amount of rates, and whether other classes should not share the burdens of those rates with them. Their great grievance was, that as holders and occupiers of land they had to pay taxes on land and houses, to the exclusion of personal property or property consisting of shares, money in the funds, &c. The fact was that about two-thirds of the whole income of the country, as matters at present stood escaped taxation.

Mr. F. J. S. FOLJAMBE, M.P., moved the second resolution, "That this Chamber regrets that the Government has made no attempt during the present session to place the burdens of taxation on a more extended and equal basis; and therefore pledges itself to use every constitutional means to produce a speedy adjustment of the question." He quite concurred with the assertion that the Government had made no attempt to settle the great question which they were then discussing, but it must be kept in mind that the progress of the Ministry was one which demanded the strength of a Hercules to carry it out, and that more than one member of the Government had broken down under the labour of the session. He hoped that before the Government framed a measure on such a great question as this, great care would be taken in reference to its provisions, and ample time given for its consideration. So far as the resolution he had read went, he was sure that all who had agreed with the first resolution would have no difficulty in supporting the one he had just read. The duty of all to use every constitutional means for the adjustment of the question was obvious; and this must be done by bringing it before Parliament by petition, supported by the efforts of their representatives in the House of Commons. There was no doubt some reason why the landed proprietor of the country should be called on to pay the taxes; because the original tenure of land was that the defensive forces of the country in time of war should be supplied by the holders. That tenure had now completely altered, but when the Act was passed for rating land exclusively there was very little property of any other kind, and it was not till after the persecution in the low countries and in France that the authors of our now extensive manufactures came to this country and laid the foundation of England's wealth. Our present connections as a nation were now entirely altered, and the necessity of a change in the mode of rating was obvious. It would, however, require great care in the framing of such a measure, for they could not always give a specific value to money. But it was quite incontrovertible that a great part of the income of this country, which had not yet borne its proportion in the payment of taxes, and when land was now so heavily taxed there was great danger that the new rates which were in prospect might be like the last straw, which would break the camel's back.

Mr. H. BEEVOR (Blyth), seconded the motion.

Mr. GODBER (Baldertou), supported the resolution. The House of Parliament seemed to have no time at all to attend to

the landed interest. They seemed to have lost sight of England. They were killing the fatted calf for Ireland, but they turned a deaf ear to the complaints of the farmer. Mr. Lowe, in his grand budget, forgot all about the Malt Tax, and it really seemed that they had no time to attend to the farmers of England, but they must look out for themselves.

The resolutions were carried.

WEIGHTS AND MEASURES.

The following report of a joint committee of the International Decimal Association, and of the Central Chamber of Agriculture, has been issued, under the signature of Lord Fortescue, as chairman: From evidence brought before your committee, it appears that the extreme difference of practice in the weights and measures used in different markets of the United Kingdom, for the sale of grain and other agricultural products and manures, is the cause of considerable inconvenience and loss. The Banbury, Devonshire, Essex, Howden-shire, Kincardineshire, Leicestershire, Malton, Monmouthshire, Norfolk, North of England, North Riding of Yorkshire, Scottish, Warwickshire, and Worcestershire Chambers of Agriculture are unanimous in their opinion that steps should be taken for obtaining a uniform system as speedily as possible; and, from long experience, your committee are convinced that no voluntary or permissive legislation, and that no local arrangement or understanding will enable us to realize the object in view. In the language used by more than one of such Chambers, "Whatever standard be decided upon, the same should be made compulsory throughout the country." Besides, however, a general testimony in favour of uniformity of weights and measures in the United Kingdom, your committee find that a movement has been gaining ground for extending such uniformity among all countries. And your Committee are strongly impressed with the conviction that, dependent as we are upon foreign countries for the supply of grain, other agricultural products and manures, great advantage would be derived if, in making the necessary change, we could contribute to the realization of this larger object. It would save time, it would prevent errors, it would greatly facilitate commercial transactions, if grain were quoted in the same manner in every market of the world, and if our merchants and corn-growers could understand the ordinary quotations from Stettin or Odessa as readily as those from their own home markets. Nor is the object far from practical attainment. Your Committee have learned that considerable progress has already been made in the great work; that a large number of countries, having an aggregate population of more than 200,000,000 (two hundred millions), both on the Baltic and Mediterranean seas, and on the Atlantic and Pacific oceans, have agreed in adopting and are already using the metric system; that this system has just been established throughout our Indian Empire, and that in this kingdom and in the United States of America the use of the same weights and measures has been made legal and permissive. Under such circumstances, and believing that if a change is to be made, it is best to endeavour to secure a system as perfect as possible, one not likely to be again altered, and one equally suitable to the general wants of all classes of the community, your Committee have come to the conclusion that the best mode of obtaining a real and permanent uniformity in weights and measures applicable to the sale of grain and other agricultural products and manures is by adapting our present practice to the metric system. With a view to this object, your Committee beg to make the following recommendations: (1.) That, in the opinion of this Committee, it is desirable that the Government should be requested to act upon the recommendations of the Standards Commissioners in their second and third reports, by legislating, with the least practicable delay, in reference to the introduction of the metric weights and measures in this country, and facilitating their use by making proper arrangements for the legal verification and stamping of such weights and measures. (2.) That the Chambers of Agriculture and the Chambers of Commerce be recommended to petition the Legislature to pass, with the least practicable delay, such enactments as will establish the kilogramme with its decimal multiples and divisions as the standard unit of weight in lieu of the present pound avoird-

dupois and other imperial and customary weights. (3.) That, in the opinion of your Committee, the use of such standard weights should be made compulsory within a definite time; and thenceforth contracts made by any other weights should be invalid. (4.) That, although the Central Chamber of Agriculture has recommended that grain should be sold by the "cental" of 100 lb. (one hundred pounds), which is in use at Liverpool, yet as your Committee find the general average weight of a sack of the different kinds of grain to be about 22½ lb. (two hundred and twenty-four pounds), or the tenth

part of a ton, they are of opinion that it would be desirable to substitute for the "cental" a weight of 100 (one hundred) kilogrammes (or, in other words, "a quintal"), which only differs by a fraction from 220 lb. (two hundred and twenty pounds). (5.) That this report be printed and copies transmitted to all the chambers of agriculture and chambers of commerce, to agricultural societies, farmer's clubs, and municipal councils, with the request that they will circulate the same, and consider the recommendations of this Committee at their earliest convenience.

CALENDAR OF AGRICULTURE.

The harvest over the largest part of the kingdom will be done during this month, an early portion of the crops being cut and carried during the latter end of last month, and the latest harvest extends over the North of Scotland, and in late seasons is often prolonged into October. In these unsteady climates the grains are all cut by hand-sickles, toothed or scythed, tied into sheaves, and placed in stooks of twelve sheaves, often with two placed astride on the top, with the butt-ends meeting, and the grain ends split to cover the ends of the stook. This position defends the stook from rains, and in a dry condition; but, when thoroughly wetted by heavy rains, the drying of the stook is prevented by the covering sheaves, which have often to be removed for the purpose of exposing the stook to the drying winds. Still, it is reckoned a useful precaution. Thatch must be always ready to cover the ricks, in hand-drawn straws from the last year's crop; and in wheat-growing crops it suits well to thrash the new crop for seed, and to draw the straws for thatch from the operation of machinery. But, as before observed, the thatching of ricks of grain will be wholly superseded by the permanent roofs of thin irons which cover the position of the ricks, in a row, with a railway intervening, for the convenience of the grains being conveyed to the thrashing machinery. The arrangement will wholly remove the risk of damage to the ricks before being thatched, which is often both a loss and a perplexing accident. Except in some cases of dry lands, early climates, and very short crops of straws, all grains should be tied into sheaves for the purpose of convenient handling, and for the better sentching by machinery. Barley and oats, which are the crops that are treated in broadcast, may lie in swathe for some days, turned over, and then tied into sheaves. Few crops are so short in straws as not to admit this manufacture. The extreme shortness of straw prevails only on the chalks and sands of the southern counties, in which the thrashing by flail rather than by machinery is suited for the separation of straws and grains, that are forked together as a hay-rick, making a slovenly work, partly necessary, but mostly continued from custom.

Peas are ripped, torn, or cut from the ground by hand-sickle, laid into small heaps, that are frequently turned over to procure a uniform dryness, and then carried into ricks or barns. The thatching of the ricks must be done quickly, as leguminous bodies imbibe and retain much moisture. A platform of wooden beams and bars, placed some feet from the ground, is a very suitable position for peas and beans. An open space underneath is advantageous to any ricks of dried herbage.

Machinery cuts beans with a comparative advantage of the stems standing upright, and of strength to withstand the cutting power of the machine, and to fall regularly from its stroke, and, as when cut by hand-sickle, the haulm is tied into sheaves with straw ropes or with tarred twine, which last, being preserved, will last for several years. The ricks being all thatched and secured by ropes, the yard must be raked clean, and all rubbish

carried to a dung-yard, so that a general neatness may prevail on every point of management.

Lay well-prepared earthy composts on grass-lands eaten bare and on lucerne. Being previously scarified deeply, spread the compost evenly over the surface, bush-barrow, and then roll the ground heavily in dry weather. This treatment promotes an early spring vegetation.

Finish the dunging of clay fallows for wheats. Cart stones and tiles to drains. Scour ditches. Repair, straighten, and widen brooks and rivulets, and mix the excavated materials with lime for earthy composts.

In the end of the month scarify the pea and bean grattans, when the quality of the land will produce wheat, as is required from beans, and in some cases from peas; if not, it is referred for oats and barley in the spring. Burn into ashes the rubbish collected by the scarifyings, which will form a dress for the land; and it may answer a good purpose to apply a sprinkling of farm-yard dung to assist the crop of autumn wheat.

But this arrangement wholly depends if the crop of legumes has been thick on the ground and has covered the land with a leafy canopy so close as to exclude light and drought, kill all weeds, retain moisture, engender minute life, and promote its destruction for the purpose of fertilizing the soil. Unless these circumstances are in existence the land must be cropped in the spring, with the advantages of the surface being scarified and the rubbish burnt into ashes.

Plough grass leys for wheat in the end of the month, when the ground may be moistened by rains, and the land may be exposed for a time before sowing. The practice is not much to be commended; for on turnip soils, be the cause what it may, the fact is certain, that the turnip succeeds best after oats; and as in the case of bare fallow lands, wheat on ley just before the following, and being sown upon it, the two crops of the same vegetable are too nearly placed. Plough the green crop lands of next year, and perform the operations of fallowing into the second or third earth with the rolling and clearing away of weeds and stones. The advantage is gained of a forward condition in the spring. Objections have been found to land lying during winter in a fine comminution of particles, which admit the most intimate mixture with water, becoming "sleeched" in the manner of mul, and with its weakness, having the adhesion destroyed, that is so very necessary for the activity of vegetation being promoted. Autumn fallowing can be done only with early harvests and under benign climates, and it may not advance beyond some stray performances.

In the end of the month plough clay fallows for wheat, and sow winter vetches on good lands for the early spring food. Mix the seed with beans or winter barley and rye, which last may be sown as a seed crop, and also for an early green meat for ewes and lambs.

Pick hops. The flowers are cut by scissors from the haulm, and placed in bins; paid by measure at a fixed rate; then carried to the oast, and dried with coke and

sulphur to give a yellow tinge; a slight colouring is sometimes used. The hops are pressed into bags of a certain size and weight, and are ready for the market. The haulm of the hop is used for litter in cattle yards, being slow of decomposition, it must be cut into short pieces. Place the poles on a dry ground in a conical form, with an extreme top covering.

The latest crop of spring-sown vetches along with the second crop of clovers, will form the green meat of the farm, and must be amply supplied to the work horses, to the milch cows at the evening meal, to the young pigs in the store-yard, and to a yard of young cattle, and the earliest calves of the year. A portion of the herbage of the vetches will be provided with an early seeding, and being made into hay, or so far dried as to prevent mould, will form a most valuable food for work horses, and for

keeping stock. The yards must be littered often and thinly with straws cut into short lengths by the thrashing machinery, as that condition will afford much convenience in the straws being mixed with the solid and urinary feces, and for being covered in the land. The summer straws being thus prepared for litter, the yards erected in the basin-shape to hold moisture, and the animals amply supplied with green meat in an unbroken succession. The making of dung may go on during the summer months, and will produce a most valuable addition in the quantity, and of a quality fully equal to the winter production. It will wholly depend on the provision that is made of green food, which must be unbroken, and ample in the quantity. The preparation and acquisition of manure is fully equal in importance to the cultivation of the land to which it is applied.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

Sow salads, as mustard and cress, twice, with ten or fourteen days intervals; radish in frames, and transplant lettuce to stand on ridges all winter. The seeds may be sown early for winter, and so soon as fit for transplantation ought to be pricked out into a roomy frame, where the plants will prosper and stand the winter: some of the hardiest brown sorts may perhaps endure the frost, but in general the other sorts prevail.

Plant the main stock of cabbages in an open situation, the soil rich with manure, unless it be new loam. All the "Brassicas" prosper amazingly in fresh earth, and indeed far better than in old garden soil.

The plants of spinach raised from seed should be thinned out to regular distances of two or three inches: the plants will then become stocky, and may be thinned again, and the plants so removed may be used for the table.

Thin out and hoe the spaces between the rows of turnips, which should always be sown in drills.

Sow salad again if required.

Mushroom beds are prepared during the month, and is the proper season for those produced naturally, especially if the month be showery. The plants show no reason for being cultivated in the dark, as they are seen to prosper in full day-light.

Continual attention to weeding is now required, for now the garden is liable to be quickly filled with groundsel, chickweed, and other rubbish.

Trench, ridge, and dig spare grounds. Manure and prepare plots for artichokes, asparagus, sea-kale, and rhubarb. Carry off and clean the garden of haulm, and take all to the rotting compost heaps. Dig potatoes; carefully pick out the worthless, the very small tubers, and the least appearance of disease, for though it is said that partial symptoms do not convey the infection yet it may be the safest way to avoid the contact as much as possible.

Exterminate all weeds which will appear in the roots only, as it cannot be supposed that stems have been allowed to bear seeds in any cultivated grounds. Digging and hand-picking of the roots will remove the pests of the garden, which create a constant labour. Each plot of ground is brought into a state of clean order, a neat digging that renders a sober quiet picture during winter, more beautiful perhaps than that of the rampant luxuriance of summer.

The earliest collected manure in the liquid pit will be ready to be used on the beds prepared for stroug roots,

as artichokes, rhubarb, sea-kale, and cabbage plants, which require a strong encouragement both in the soil and in the manure. Much moisture is required in the dung, which should be deeply saturated with liquids, soaked and so far dried as not to lose any moisture by dropping. The collection of materials for manure in the dry compost heap and in the liquid tank must be unremittingly continued during every season of the year.

FRUIT DEPARTMENT.

The first operation may be the final planting of strawberry beds and rows, well-rooted young plants will rarely fail, but the best method is to be provided with young stock raised in pots and now transplanted with entire balls. Pot strawberries for forcing.

Prune, bark to within three or four eyes of the projecting shoots, of apple, pear, plum, and cherry trees so far to aid the swelling of fruitful buds. At the end of the month plant young fruit trees in a well wrought loam that is fresh and rich with dung, or in a turf of soil of a grassy vegetation which retains trees in much health and vigour. Pits in which trees are planted are prepared for one or two years by frequent diggings and mixings with short and rich liquids, so that the tree is richly fed, but the roots meet a strong obstacle in the passage from the loose soil into the firm bank of unmoved ground. It may be better to place the roots among the loamy preparation in a moderate depth to spread horizontally along the upper stratum of the vegetable surface in which the fibrous roots of trees seek their aliment. Mulch the ground freely over the position of the roots. The orchard will be fenced: single trees must be defended by three or four posts in the ground bearing cross-bows at the top, which spread wider to admit the branches having a range of protection. The posts to open outwards at the top for that purpose. The stem of the young tree in two feet above the ground must be defended from the gnawings of hares and rabbits by a fence of a few wires joined together. The tree may be five to seven feet high, clean and smooth in the bark, gently tapering in the stem, with a strong leading shoot and branches regularly spread, of uniform length, root of healthy fibres attached to a strong tap, which must be all shortened when planted and laid in proper horizontal direction. No bundle of roots can be inserted. Gather the crops of pears and apples, and lay in store on a dry floor in a dry place; cover with dry straw, when laid for some time, and remove every appearance of decay from the store.

Place nets in front of any wall fruit trees to catch the falling fruit. Protect grapes and other fruits by muslin or gauze covers, and if wasps abound suspend bottles half filled with treacle-water among the branches, which will destroy a large number.

FLOWER GARDEN.

Finish the clipping of hedges, hawthorn, box-edgings, which may be planted and renewed, and plant slips of herbaceous flowering plants; remove and re-pot any

choice green-house plants and place them in their winter quarters, and transplant pinks raised from pipings.

Weed and roll gravel walks and lawns, when in a damp state; rough dig or fork all the vacant parts of borders; give every portion of ground a neat hoeing and raking to destroy weeds and to bring the surface to that neat appearance which is so reposing during winter. Weeds and rubbish left now will prove a great nuisance, as it will soon be too late to work the ground.

AUTUMN CULTURE.

BY A PRACTICAL FARMER.

The unusual suitability of this forward season for the operations of autumn culture must be our excuse for again touching on the subject. The benefits to be derived from autumn culture are immense, and the virtues and fertility imparted to the soil by the various operations are invaluable. By autumn culture we mean the breaking up the soil immediately after harvest, and subjecting it to the customary processes of cultivation as for a summer fallow. For this purpose of breaking up, the power of steam is of wonderful advantage. It would be of incalculable benefit to the country if all the arable land not under crop, which has been properly drained, could at once be broken up by the steam plough or cultivator within the next month. The destruction of weeds and the seedlings of weeds would be most effective. The absorption of atmospheric influences at this season when the air is greatly charged with the effluvia emitted from decayed and decaying vegetation is of surprising benefit, being deposited by dews and rains. The destroying of insects, grubs, wireworms, slugs, and all such pests by these processes is of itself salvation to many a crop. The dews and rains alone supply the soil under this management with all the constituents necessary for the production of a wheat crop, and the preparation of other soils for early corn seeding or spring root crops is of great, if not essential importance. It also greatly facilitates fallow operations for the ensuing spring and summer. Would that steam cultivation was just now universal! What wondrous benefits it would confer upon all cultivators at this season! and to clay lands and retentive adhesive soils it would be like a new creation. The amelioration of such soils by this deep, powerful, and effective pulverization gives it new powers, which could not otherwise be obtained. The cost of steam engines and the cultivating machinery and apparatus necessary for these works would be amply recouped by the value of their work at this particular season, to say nothing of their value and usefulness at other periods of the year. The steam engine itself would almost be in daily use. We sincerely hope these implements will speedily be accessible to every farmer, to facilitate which little companies should be formed in every district for the purchase and management of these expensive appliances to farm culture, each member having the use of them according to arrangement. Wealthy farmers will do well to supply themselves. In this way steam cultivation may be greatly extended, and the higher branches of culture would thus be generally adopted. To promote this order of culture should now be the object of every intelligent farmer. It is good for the land, it is good for the farmer, it is good for the country. We most decidedly approve of steam cultivation for autumn culture; but as it is not yet in general practice, we should suggest the adoption of that order of culture which most nearly approaches it. For this purpose ploughs should be used with the digging breasts only, as supplied by all our

leading plough-makers, or the strong skeleton ploughs well armed with prongs might suffice. The object being to break up the soil as roughly as possible, in order that the greatest amount of surface, be it clods or otherwise, should be presented or laid open to the sun and air, for the absorption of atmospheric influences, as also to facilitate its further culture by scarifiers, and harrows. Lands that have borne a pea or a bean crop are generally infested with slugs. These operations are certain destruction to them, and if the season is suitable for the wheat seeding, a splendid plant is the result. The autumn preparation for an early spring crop is exceedingly good practice. Beans and peas can be got in very advantageously, but it is still better for the potato or mangold crop. On mild soils very little more is required in the spring but a good harrowing, followed by the plough, either in ridging, or upon the flat, so that the crops may be put in according to the will of the farmer. In the district from whence we write, it is customary to prepare thus for these crops, and few parts of the country can equal them. For clays and stiffer soils it is requisite to lay them up in small lauds or broad ridges, ready to be broken down in the spring, prior to seeding. We will give our suggestions as to the proper course to be pursued in autumn culture. The crops should all be cut as close to the ground as possible. As the fields are cleared, the breeding ewes and ordinary grazing sheep should be put in to pick up the seedling weeds and grassy headland. In a few days a surface harrowing should take place, whereby the seeds of weeds may be encouraged to vegetate, so as to secure their destruction under the cultivating operations. After these preliminaries, and the completion of the harvest (for be it always remembered that the ingathering of the harvest should at all times be of the first importance, all other things giving way to it), all the teams in the absence of steam power, should at once be set to work to break up the soil as deeply and roughly as possible, the rougher the better. When all is thoroughly broken up, let it lie awhile, till other farm operations which may have remained in abeyance are got on with, so that no department of farm work is injuriously neglected. In a week or two from the breaking up, the various operations of culture should be proceeded to, with heavy scarifiers or harrows to move all the broken-up soil, and expose fresh surfaces to atmospheric influences, and all fields not required for seeding may be thus left for an indefinite time, or till they are required for spring service, providing the winter and weather is propitious; but occasionally they get so drenched and consolidated by rains as to require a fresh breaking up, or ploughing in the spring, this the farmer's judgment will decide. All fields required for the wheat seeding, or winter beans, should be left in the rough state till seed time, and then to be reduced to a proper pulverization for the seed bed, by such harrowings and rollings as may be required. If they are reduced too soon the pro-

bilities are that the soil would run too close together to make a good seed bed. We repeat that autumn culture is invaluable, and ought to be universally practised. We say that all objections and hindrances to this order of culture must give way before an advancing agriculture. We most sincerely urge the universal adoption of steam cultivation at this particular season for the first operation of

breaking up the soil. All subsequent workings may be advantageously done by the teams. It is highly desirable thus to promote cleanliness upon the farm, but it is of higher importance to obtain those fertilizing properties which are imbibed by the soil under this system of cultivation.

THE DRY SEASON.

BY THE NORTHERN FARMER.

A succession of dry summers, such as has been experienced, more or less, during the two past and present years, but most severely in 1868 and 1870, has a very marked effect on the business of the agriculturist, seriously affecting his pecuniary interests, and when there is a large number of live stock to be provided for during the winter months there is considerable danger of the loss occasioned being almost irreparable. During the past summer, and even up to the present date, but few districts in these kingdoms have altogether escaped injury, either to hay, pastures, corn, or green crops. The spectacle of cattle and sheep feeding on growing corn during the months of June and July for the purpose of trying to keep the animals alive is one but seldom presented to the people of this country, and yet in some of the southern English counties it was this season unfortunately too common. Such a proceeding showed, not only the straights to which stockowners were reduced to procure food for their animals, but also emphatically proclaimed the miserable condition and prospects of the corn crop. Clearly the fields so occupied were not supposed capable of paying for purchased food for the stock if held on till harvest and gathered in the usual course. The loss of a field of corn is a very trying thing to a tenant-farmer, and affects him more ways than one, as the money he looked forward to receive by the sale of the grain is not only gone, but the straw, so necessary for winter use, and laying the foundation of future fertility in the shape of valuable manure, is also hopelessly gone, the double loss amounting to something considerable. Even now the state of the pastures nearly everywhere is most distressing to look at, the grass, when there is any, being utterly devoid of succulence, and where the fields were bared down in the early part of the season, and the sun had consequently full play on the roots, there is not a vestige of anything in the shape of food, the entire moisture of the soil being apparently exhausted. It will be a good many weeks ere the soaking autumnal rains will be able to bring back a shade of verdure to such fields, powerfully aided as they will by the high rate of temperature imparted to the earth's surface by the lengthened continuance of intense heat. Grasses and clovers spring-sown have done better amongst the corn than when sown without a crop; in the one case benefiting by the shade, and in the other the tender rootlets were unable to cope with the full glare of the sun, and although perhaps not completely killed out, yet being only able to maintain a feeble and struggling existence, there is now but a few dried blades, where, in more congenial seasons, there would be by this time a dense mass of luxuriant vegetation, capable of fattening a sheep of any size, and from six to eight to the statute acre. An instance of this sort has occurred in our own experience this season, and is a very fair illustration that a mode of farming, however good in principle and successful in some years, may yet occasionally be beaten by the very method which it is supposed to supersede. While the fields on which the small seeds were sown simultaneously with the

corn crop show a beautiful covering of verdure, the clover in some instances being half way in the sheaves of corn, about twenty acres laid down without a crop, consisting of grasses, clovers, and rape, cannot admit of the sheep being put on them, being literally burned down; the rape leaves, which should by this time be broad and luxuriant, possessing not the slightest succulence. This is on land after a highly manured green crop the previous season, capable of bearing wheat or any other cereal, so that both corn and straw is lost in this instance, without much prospect of the herbage being so much strengthened as to afford a fair amount of feeding during the current year. Swedes, where they escaped the fly in the earlier stages of their growth, now begin to succumb to the intensity of the drought, large squares withering off, and the leaves where not actually withered yet drooping so much as to make it very dubious whether in the event of dry weather continuing much longer they may ever be able to recover themselves. This crop when so terribly checked by dry weather, is extremely apt to mildew late in autumn, the bulbs, even if they attain a moderate size, keeping badly, being affected by dry rot, and having black or discoloured flesh, a sure indication that the feeding properties of the plant are materially impaired. Mangolds on light land suffer also from such a lengthened drought, though in a less degree than the swede, the bulbs being in general sound, although much smaller in size than they ought to be. The crown seems to be affected first and the leaves proceeding immediately from it—withering off, growth is stopped—and a full crop cannot be calculated on when this casualty becomes at all general on the field. But for the immense labour consequent on watering large breadths of green crop with a horse and water-cart, it should surely be more generally attempted than it is, as the results even from such a primitive method of laying on the water are so successful that they should command both the respect and attention of farmers to a much greater extent than is given by them to the subject at the present day. We happen to know a small farmer who is a highly successful grower of turnips, and for much of his success he is indebted to his energetic use of the water-cart during those seasons which are so dry as to threaten partial or total loss of the crop. Singularly enough his neighbours, probably deterred by the herculean labour, do not imitate him in an example so meritorious, preferring to risk the crop rather than attempt it. Turnips raised solely with artificial manures have a trying ordeal to endure during such a season as the present, not having the advantage or the chance of the slightest particle of moisture from dung or anything present in the soil capable of containing moisture, and on which they might be able to maintain an existence, however struggling. In this case the water-cart would be particularly beneficial, probably saving the crop, or at least greatly increasing its bulk, by a few applications at the most critical time of its growth. The necessity of having recourse to artificial watering during such seasons as that of 1870, not only for one crop but for all—hay, pastures, roots, and corn—

has attracted the attention of thinking men, and already a movement is on foot to devise the best and most economical means of irrigating with pure water, whether the supply is obtained from a river or by storing that which falls from the clouds. This is a highly important matter, and well worthy of serious attention, particularly when such results are obtained from the application of sewage, and the modes of storing and putting the latter on the land being so easily copied or modified, so as to suit peculiar circumstances and situations. It is certainly highly suggestive to find such large sums capable of being made by an acre of grass which has been dressed with sewage. Surely in situations where river water can be easily led to particular fields and laid on to the crop by gravitation, it would be well worth giving it a trial. The fertilizing property being absent, the same results could not of course be expected; but they might easily be supposed to be so great as to pay for all expenses, and leave a respectable profit besides. Ordinary irrigated meadows are a familiar example of what can be accomplished by pure water; the same fields, year after year, giving heavy crops without the aid of any other fertilizer. One could suppose the refreshing influence which would be exercised on a pasture field by the letting on of a stream of water for a few hours, and how gratefully the parched soil would absorb the welcome moisture. A field so treated would be an oasis in any district, its greenness being in pleasing and extraordinary contrast to the brown and withered appearance of the surrounding country. For a regularly-organized system of irrigation, where the water has to be raised to a certain height before it can be used, steam-power, as the most regular, most completely under control, and at all times available, would probably prove most suitable. Where large reservoirs were constructed for storing the water until required for use, windmills, the motive power for which costs nothing, would be both serviceable and economical. The subject is an important one, and we are greatly deceived if this season's experience will not have the effect of bringing it prominently forward; the best means for procuring a cheap supply of water for field crops being agitated and discussed by men of standing and influence in both the agricultural and engineering professions.

Happy is the farmer this year who, having a heavy stock, however short of grass he may be, has still abundance of water on his own land or within easy distance, as more than half his difficulties are overcome when this is the case. Cattle do astonishingly well with plenty of water, even when the grass appears almost incapable of supporting them; and on the other hand if both are short, disease is certain to get in amongst them, and deaths from indigestion and similar causes are almost sure to take place. Dairy stock have dried up prematurely, even where the range was large, the grasses having lost all succulence, and green house-food, even where preparations had been

made for a supply, being very hard to obtain in large quantity. Butter has, in consequence of the small make, risen to an extravagant price, and has every appearance of reaching what may prove a heavy tax on the consumer, without however recouping the producer for the loss sustained by the indifferent yield.

Of all the stock on the farm sheep thrive best in a dry season, particularly if they have the shade of a large fence to retire to, or an occasional clump of trees. This has been a trying season for them, the fly having been extremely troublesome, great assiduity being required to preserve them from injury sustained by its attacks. When fly-struck we find nothing better for healing the excoriated skin after the maggots have been picked off, than a little dust of powdered white lead; it not only dries up the moisture on the wound, and allays the pain, but it also is a thorough preventive of a subsequent lodgment being effected. Those breeds which have not a protecting lock of wool on the forehead, get dreadfully scalded from the constant attacks of these troublesome insects. Applications of tar are not only unsightly, but require constant renewal, a linen cap should therefore be placed on every sheep which has been badly abraded, and all further trouble is at once obviated, and the poor animals relieved from a very large amount of annoyance and even pain. Valuable sheep should on no account be neglected in this particular. Sore breasts have been and still are frequent this dry and hot season, caused by the sheep lying flat and spending much of their time in that position. The parts coming into contact with the ground get stripped of the skin, and a very bad sore is the inevitable consequence. We find it useful to scrape off the mortified matter, and anoint with a mixture composed of equal parts of "oil of tar," "spirits of turpentine" and "butyr of antimony." For all sores on sheep this mixture is very healing, and should be constantly at hand.

To all appearance the approaching winter will be a trying one on many owners of stock, the hay and turnip crops being so indifferent, and recourse must be had, and that extensively, to artificials. Corn is not likely to be dear, and, if not, should form a leading feature in the assisted food of both sheep and cattle. By its use adulteration is escaped, the consumer knowing exactly what he is paying for, which is a very important point, and one not always easily ascertained when manufactured foods are purchased. The extreme dryness of the soil has rendered it almost useless to put in any kind of turnips after corn or other crops, there being not the slightest chance of their doing any good; but grasses sown on scarified stables will come exceedingly handy in the spring for sheep; and pure Italian rye-grass, sown on rich well-cleaned stables, or on potato land, will give a supply of spring food which not only come in early but prove exceedingly valuable.

IRISH BUTTER MARKET.

TO THE EDITOR.

SIR,—As a general rule there has been a difficulty in ascertaining the real value of butter by quotations of prices, arising from the fact that the qualities are so variable; but the difficulty is to a great extent overcome by the system adopted in the Cork Butter Market, of dividing the butter into six qualities or classes, and allowing each quality to bring its own value in price—the very large supply to the market causing the prices of each quality to be strictly ruled by supply and demand. In such a market as Cork—the largest butter market in the world—where such a great quantity of butter has to be sold every day, no other influence but supply and demand can

long rule, and it may be fairly assumed that the prices of Cork butter over a period of years are a safe standard of the values of the respective qualities, the price of first Corks being the legitimate value of the best Irish butter, and that the prices of the other classes represent also the value of butters corresponding to them in quality.

I send you Tables, showing, 1st, The average prices of each quality per month for the past three years; 2nd, The highest and lowest prices of first quality per month for the same period; 3rd, The highest and lowest prices each year for the other qualities,

I have selected a three years' average, as it deals with the present values of goods; while an average running back over a longer period would be likely to mislead, as it would include prices to which there is no probability of our ever returning, and a totally different state of affairs as regards the effect of foreign supply and demand. A careful study of those tables will give a good idea of the general course of prices, but in purchasing Irish butter, to be able to operate to advantage, the buyer should have an intimate knowledge and experience of, and should constantly and carefully study all the influences that may affect it in price and quality. Those influences are numerous, extremely varied, and subject to constant change.

The price is affected by many causes, among which are home supply, foreign supply, home and foreign consumption, by the demand, by the prices of butter in different markets, by the relative prices of other provisions, by the weather, by stocks in hands of both consumers and speculators in various places, and by many local and temporary causes, such as haymaking, harvesting, holidays, rent-days, &c., which have the effect of either sending in or keeping back butter from market.

The quality, either as regards its keeping properties or otherwise, is affected by the weather, by the condition of the milk, the description of cattle, by the pasture, by the size, airiness, and convenience of the dairies, and very much by the sort of fuel used in the district: where peat or turf is burned the butter generally taking a flavour from it.

Butter intended for keeping should be thoroughly freed from the milk in making, the cream being in good condition, and not injured by heat, and the butter should be made close in grain, firm, and not too rich. Such butter does not require the great quantity of salt that is necessary in butter not possessing those keeping properties. Sound judgment on this point is rare, and can only be acquired by experience. When buying butter for keeping, care should be taken that it has not been already held for a long time, particularly during the hot summer months.

I am yours truly,

T. J. CLANCY,

Watercourse, Cork.

Butter Merchant.

SHEEP SALES AND LETTINGS.

SALE OF OXFORDSHIRE SHEARLING RAMS.—At the annual sale of rams, bred by Mr. John Treadwell, of the Model Farm, Upper Winchendon, the auctioneer was Mr. J. A. Mumford, of Chilton, Thame. The following are the purchasers and prices realized: Mr. Foster, 12½ gs.; Mr. Palmer (Slenkey), 11 gs.; Mr. Parrott (Shisburn), 6 gs.; Mr. Salmon, 7½ gs.; Mr. Foster, 11½ gs.; Mr. Phillips, 5½ gs.; Mr. Bulford, 9½ gs.; Mr. Bliss, 10 gs.; Mr. Greaves, 11 gs.; Mr. W. Stevens, 5½ gs.; Mr. Syral, 9½ gs.; Mr. Dover, 9 gs.; Mr. Bliss, 7½ gs.; Mr. W. Stevens, 8 gs.; Mr. Linnell, 10½ gs.; Mr. Saunders, 11½ gs.; Mr. Higgins, 11 gs.; Mr. Bliss, 8 gs.; Mr. Cooling, 8½ gs.; Mr. Parrott, 9 gs.; Mr. Ginger, 9 gs.; Mr. Watson, 6 gs.; Mr. E. Freeman, 10 gs.; Mr. Bulford, 6½ gs.; Mr. Dover, 7 gs.; Mr. Rowland, 10 gs.; Mr. Bryant, 13 gs.; Mr. Rand, 6 gs.; Mr. Bulford, 6½ gs.; Mr. Ginger, 6½ gs.; Mr. Rose, 7 gs.; Mr. Bliss, 6 gs.; Mr. Gregory, 8½ gs.; Mr. Williams, 8½ gs.; Mr. Parrott, 5½ gs.; Mr. Rund, 5½ gs.; Mr. King, 10 gs.; Mr. Bliss, 6½ gs.; Mr. Jones, 9 gs.; Mr. J. Cox, 6 gs.; Mr. Rowland, 11 gs.; Mr. G. Clarke, 8 gs.; Mr. Ginger, 7 gs.; Mr. Guy, 6½ gs.; Mr. Brett, 8½ gs.; Mr. E. Clarke, 6 gs.; Mr. Boddington, 6 gs.; Mr. Timbertuke, 8 gs.; Mr. Syrett, 7 gs.; Mr. Holt, 7 gs.; Mr. May, 8 gs.; Mr. Higgins, 7½ gs.; Mr. Tompkins, 3 gs.; Mr. King, 5½ gs.; Mr. J. Osborne, 6½ gs.; Mr. J. Perkins, 8 gs. The sale realized £470. The average was considerably below that of last year. During the day Mr

Treadwell stated that he intended to challenge the decision of the Judges at the Royal Show at Oxford with respect to the disqualification of his sheep, as he had two witnesses to prove that his sheep were shorn in the first and second weeks in April.

THE SCORBOROUGH RAMS.—The annual letting of Mr. James Hall's Leicester rams took place at Scarborough, near Beverley. The sheep were in good condition, and there was a large bidding and a successful letting. Of 105 sheep only 13 did not find customers by public sale. One shearing reached £25 to Mr. J. S. Jordan, fifty-five shearlings brought an average of £9 1s., and thirty-seven old sheep averaged £6 9s. The general average was £8 7s. 6d.

THE WEST DEREHAM (MR. HUGH AYLMEYER'S) SHEEP LETTING.—The animals brought to the hammer consisted of 100 ram lambs, 80 shearling, and ten two-shear rams, and the prices realised were for ram lambs from £1 5s. to £8 15s., the average being £5 4s. 4d.; the shearlings from £6 5s. to £17 10s., the average £8 5s. 9d.; the two-shears from £6 5s. to £11, the average £7 10.

THE MARHAM HALL RAM LETTING.—The annual letting of Cotswold rams and ram lambs took place on Mr. T. Brown's farm at Marham Norfolk. The animals submitted to competition comprised 80 ram lambs, 80 shear-ling and 10 two-shear Cotswold rams, all of which had been bred by Mr. Brown. The 80 ram lambs averaged £6 0s. 10d. Of the shearing rams, the first 10 averaged £10 16s. 3d.; the first 20, £11 9s. 3d.; the first 30, £10 11s. 6d.; the first 40, £10 15s. 4d.; first 50, £10 6s. 3d.; first 60, £10 4s. 6d.; first 70, £9 19s. 6d.; the 80, £9 13s. The 10 two-shear rams averaged £5 19s. 5d.; one of the sheep shown at Harleston lot for £31 10s., and other good sheep for the same amount, Mr. Brown reserving his Oxford prize sheep for his own use.

THE COTSWOLD ANNUAL RAM SALES.—These annual sales commenced by Messrs. Lync and Acock submitting at Broadfield Farm, for Mr. Lane, five prime Cotswold sheep for letting, and selling 47 other shearlings. There was a vigorous competition for No. 1, and the hammer ultimately fell to Mr. Swanwick, of Cirencester College, when 80 guineas had been reached, the highest price realised in the sale. Several others made high figures, and the result showed an average of £14 11s. 8d. The same auctioneers offered four sheep for letting, and sold 47, drafted from the flock of Mr. R. Garne, of Aldsworth. Nos. 7 and 9 excited spirited biddings, and they were ultimately knocked down at 50 gs. each. The 51 sheep averaged £16 4s. They also sold for Mr. Walker, of Northleach, 38 prime shearing Cotswold rams. Mr. Barton, of Cln St. Denis, purchased the highest-priced animal for 36 guineas. The average was good, being £12 8s.

SALES AT CIRENCESTER FAIR.—Mr. Clarke, of Frampton Mansell, showed 10 shearlings, which were sold at an average of 6½ gs. each. Mr. Charles Barton showed 12 shearlings, eight of which were disposed of at 8 gs. each, the highest price obtained being 15 gs.

MR. COXON'S ANNUAL SALE.—The fourteenth annual sale of Shropshire rams and ewes took place at Freeford. The sale was entrusted, as usual, to Mr. W. G. Preece. The shearing ram Cap-tivator, the winner of the first prize at the late national show at Oxford, after a spirited bidding, was secured by Mr. W. German for the season for 35 gs. Commander was purchased by Mr. F. Byrd for 35 gs., the Breeder's Friend by Mr. Harding for 19 gs., and Chancitor by Mr. German for 42 gs. The ram which seemed to be the prime of the lot, and which realised the longest figure was Coereion, secured by Mr. Clare for 52 gs. The first department of the sale, viz., 29 rams, realised £195 15s., an average of about £17 1s. each. The next lots were six noted rams, the principal, Preserver, being bought by Mr. Masfen for 24 gs., and Baron Pendeford by Mr. Webb for 18 gs. This lot realised £85 4s., an average of £14 14s. each. There were ten pens of five ewes each, which realised £135 7s. 6d., an average of £3 1s. 4d. each.

MR. E. WATERS' SALE OF RAMS, RAM LAMBS, AND EWES was held by Mr. Waters, of Salisbury, and 100 ram lambs, 13 shearing rams, and 216 ewes were sold. The two former classes went off very well, but the ewes sold badly. Among the highest prices given we may mention the following: Mr. Mayo, 15 gs.; Mr. Rawlence, 44 gs.; Mr. Kent, 14½ gs.; Mr. Lyne, 25 gs.; Mr. Compton, 25 gs.; Mr. Russell 15½ gs.; Mr. Hoddinolt, 14½ gs.; Mr. Symes, 13½ gs.; Mr. C. Long, 15½ gs.; Mr. Noteley, 16 gs.; Mr.

Kellow, for Mr. A. Morrison, 39 gs. After this prices gradually lowered to 4 gs., and the average over 100 lambs disposed of was £9 18s. 6d. For shearlings prices ranged from 4 gs. up to 21 gs.; Mr. Hoddinolt gave 20 gs., and Mr. Moore gave 30 gs. The average for the older sheep was £15 3s. 8d.

The sale of the second portion of the late Mr. E. Waters' improved Hampshire Downs at Stratford-sub-Castle, on Wednesday last, drew a large attendance of the principal sheep breeders and agriculturists of the surrounding and more distant counties. The auctioneer was Mr. John Waters, of Salisbury. For a pen of ten six-tooth ewes, the extraordinary price of £7 per head was obtained, Mr. Brine (Dorset) being the purchaser. The average for this age was £3 6s. per head. For an equally fine pen of four-tooth ewes, Mr. Parker, of Lasham, Hants, paid £5 10s. per head—the average of the four-teeth being £2 17s. 9d. The same gentleman (Mr. Parker) gave £5 10s. per head for the best pen of two-teeth ewes, and this age averaged £2 13s. 8d. For chilver lambs, 50s., was the price paid for the best pens, the average being £1 16s. 2d. The ram lambs, which were younger than those sold on the first occasion, ranged from £3 to £9 9s., averaging £4 14s. per head.

THE OXFORD SALE OF SIORTHORNS.—Lady Knightly 2nd goes not to Australia, but to Messrs. Wolcott and Campbell, New York Mills, Oneida Co., United States, who also purchased Patricia, through the same agent, Mr. R. Gibson.

MR. COTHER'S RAM SALE.—Mr. Cother's thirty-ninth ram sale took place at Middle Aston, and there was a fair attendance of farmers, breeders, and others. There were 46 lots sold, and the highest price realised was 15 gs., the second 14 gs., and the third £12 1s. 6d.; the average was £7 12s. 3d., and the total amount of the sale £359 3s. 6d. Mr. Savage, of Sarsden, bought five of the best sheep for Canada.

THE MARKSHALL FLOCK.—The annual letting of Mr. T. Allen's long-wooled rams took place on his farm at Markshall. The following was the result: The 21 ram lambs averaged £3 16s., and the 34 shearing rams £6 17s. 6d.

MR. NICHOLSON'S HAMPSHIRE DOWNS AND MR. SEXTON'S COTSWOLDS.—At Ipswich, Mr. Sparling sold for Mr. Nicholson, who had been a very successful breeder and exhibitor of this class of sheep. The first two Hampshire ram lambs fetched £2 15s. each, three others £4, £3, and £3 respectively. The first half-bred ram lamb realised £2 10s., another £1 12s. 6d., and a third £2 12s. 6d. A Hampshire shearing ram was sold at £3, a Lincoln shearing ram £9 5s., and a half-bred £3 5s. After the sale of Mr. Nicholson's sheep, about 20 Cotswold shearing tups, the property of Mr. G. M. Sexton, Wherstead Hall, were offered for sale. Five of the tups fetched £4 each, three £4 5s. each, one £4 10s., another £5, and a third £7. The others averaged about £3 15s.

At Bingley Hall, nearly 200 Shropshire rams and 300 ewes were pitched; but the attendance was much smaller than usual. Mr. E. Lythall's lot made from 5½ to 10 guineas; about half being passed. Mr. Yates's from 5½ to 12 gs.; half sold. Mr. Noek's 6 to 20 gs.; all sold, and averaging about 11 gs. Lord Willoughby de Broke's, Lord Sudeley's, Mr. R. Wyatt's, and other lots were withdrawn. One only of Mr. Sheldon's was sold, at 30 gs., to Mr. D. R. Davies. Three of Mr. May's went at from 5½ to 10 guineas, one being let; and one of Mr. Pitgrim's at 15 guineas. The interest of the day, however, centred in Mrs. Beach's lot, which included three Royal winners. The third prize two shear was first offered, and let for the season to Messrs. Webb and Sons, Seed Farms, Kinvor Hill, at 63 guineas. Then followed the second prize, which made 35 gs. for the season, to Captain Oliver. Mr. May secured the third prize-shearing at £3 guineas; the others bringing the average down to £28 13s. The prices and the public voice both confirmed the opinion that the respective positions of the two aged prize sheep at Oxford should have been reversed; as, in fact, the third prize has previously let higher than the second. The ewes sold far better than was anticipated. Mr. Yates's made 42s. to 44s.; Mr. Pilgrim's 40s. to 110s., the highest price of the day, given by Mr. Firmstone; Mr. Noek's 53s. to 58s.; Mr. Lot's 40s. to 50s.; Mr. E. Lythall's 45s. to 53s.; Mr. Owen's 45s. to 50s.; Mr. Shuttleworth's 46s. to 47s.; Mrs. Beach's 53s. to 59s.; Mr. Tongue's 45s. to 49s.; Mr. Tollfree's 42s. to 50s.; Mr. Chilwell's 36s. to 40s.; and Mr. Hughes's 45s.

Mr. Willoughby Wood's sale was held at Holly Bank, when 35 rams were offered, and all sold at prices ranging from 5½ to 25 guineas—the average being £8 2s. 6d. The ewes made from 40s. to 55s.—average, 48s. Messrs. Lythall, and Clarke, of Birmingham, conducted the last two sales.

Mr. James Rawlence's ram sale under Messrs. Ewer and Winstanley took place at Bulbridge. For a ram lamb there was a spirited competition, and it was knocked down to Mr. Kellow, for Mr. Morrison, of Fonthill, at 60 guineas for the season. For a ram lamb of similar class, there was also great competition, Mr. Kellow being again the higer at 40 guineas. Lot 33 to Mr. R. K. Melsome, 23 guineas; lot 45, Mr. Rose, 21 guineas; lot 23, Mr. Buckman, 15 guineas; lot 51, Mr. C. Notley, Codford, £18 2s. 6d. The others sold at prices from 13 to 8 guineas. The pairs realised sums varying from 19 to 7 guineas. The two-teeth rams let at from 10 to 6 guineas; and sold from 11 to 8 guineas. Mr. Arnold hired a four-teeth ram at £13 2s. 6d., and the remainder in that class sold and let at from 10 to 5 guineas. A six-teeth ram was let to Mr. Bennett for £12 1s. 6d., and a six-teeth ram was sold to Mr. R. Brine for 13 guineas. The average for ram lambs let and sold was £11 3s. 6d. each, and the average throughout the sale was £10 12s. per head.

OXFORD RAM FAIR.—At this fair, Messrs. Franklin and Gale offered 70 very capital ram lambs, from the flock of H. Gale of Cuddesdon, many of which failed to find purchasers. Those sold, however, realised satisfactory prices, varying from £16 5s. 6d. to £3 13s. 6d., making the very fair average of £6 10s. The same auctioneers then proceeded to dispose of 60 ram lambs and a few older sheep, bred by W. Chillingworth, of Cuddesdon. The whole were sold at an average of £6 12s., the highest price being £14 3s. 6d., the lowest £3 13s. 6d. This average was not so high as last year's (£10 5s.). They afterwards submitted for sale by auction 15 ram lambs, the property of J. N. Gale, of Chilworth, which were all sold except one, at an average of £3 10s.

ZEALS RAM SALE.—The annual sale of rams and ram lambs, bred by Mr. C. Rose, took place in a field adjoining his farm buildings. The prices realised were from 15½ gs. downward, many being sold at 11, 10, and 9 gs., &c., down to 5 gs.

BABINGLEY RAM SALE.—The annual sale of long-woolled shearing rams, the property of Mr. Charles Bradfield, was held on Wednesday last. Mr. Long, the auctioneer, disposed of the animals with the following results: First ten rams £52 5s., second £72, third £61 5s., fourth £54, fifth £50, sixth £47, seventh £48 15s., and eighth £44 15s., the average being £5 7s. 6d.

MR. DIBBEN'S RAM AND RAM LAMB SALE.—On Tuesday last the annual sale and letting of ram lambs and rams belonging to Mr. Dibben, of Bishopstone, was held at Fisherton, the auctioneers being Messrs. Ewer and Winstanley. There were four ram lambs to be let, and eighty-three to be sold. Those to be let realised 6½ gs., 13½, 6½, and 8 gs. respectively. Amongst the purchasers were Mr. E. Pinckney, 9½ gs., Mr. Cheney 9 gs., Mr. James Rawlence 9 gs., Mr. Carpenter 13½ gs., and 15 gs. for a two-teeth, Mr. Symes 12½ gs., Mr. Andrews 10½ gs., Mr. Jenner 10 gs., Mr. Whitmarsh 10 gs. The whole lot realised an average of £8 5s. 6d.

THE RAM SALES AT HEREFORD FARM.—Messrs. Russell and Son offered twenty-five rams from Mr. Downing's, Hohn Laey, and for these the lowest figure was 5 gs., and the highest £8 5s. Thirty store sheep belonging to Mr. Downing were also put up by the same auctioneers, and sold at an average of £2. The following lots were also put up: 10 rams from Mr. Taylor's, Showle Court, prices from £6 to £8 10s.; 15 Oxfordshire down rams, belonging to Mr. Bryan, Southleigh, prices from 5 gs. to 6½ gs.; 4 rams from Stretton Court (Mr. Yeomans), price 5½ gs. They also sold a quantity of Oxfordshire Down rams, belonging to Mr. Gillett, the prices being 6 gs., 6½ gs., and 7 gs.

SALE OF RAMS AT RUDSTON HOUSE.—On Wednesday a large number of the principal breeders of sheep in the district assembled, when upwards of seventy pure-bred Leicester rams were submitted to competition by Messrs. Allison and Wentworth. The highest shearing was taken by Mr. J. H. Medforth, of Gransmoor, for £30; the next in price was £20, taken by Mr. J. Staveley, of Dotterill Park; another, by Mr. J. H. Medforth, £16 10s.; next, by Mr. Simpson Staveley, of Tibthorpe, at £16 5s. The average of one-shearings was £10 5s. Out of 32 shearings offered, 22 were

taken. Of the two-year shearings eight were at an average of 8 gs.; and of the three-shear four were let at an average of £8 10s.; of four-shear three were let, averaging £8 17s., the highest of which Mr. Jordan, of Emswell, took at £14. Thirty-three were let for £34 14s., being a shade under £10 9s. each, in the lot.

SHEEP SALES AT MELTON FAIR.—Messrs. Spurling's sale: Mr. Lewin's first seven score of black-faced wether lambs averaged about 45s. 3d. each, and the ewe lambs 18s. and 15s. Mr. Waller's wether lambs about 20s. 6d.; the cronies about 22s. 3d.; two shearing tups fetched 42s. each, one 45s., one 44s., and another 52s. Mr. H. Orford's fat sheep fetched 36s. 6d., and the cronies 27s. 6d.; his tups averaged about 45s. Mr. Smith's wether lambs 15s. 6d., and the ewes 20s. Mr. Bond had 1,760 lambs and sheep for sale. The principal consignors of lambs were the executors of Mr. Thomas Crisp, of Gedgrave Hall, and Mr. A. Crisp, of Chillesford; their wether lambs averaged about 14s. 6d. the best, and inferior about 12s.; some half-bred lambs of better quality averaged 17s. 3d., as did the down cronies; the black-faced shearing ewes averaged 45s.; one lot sold for 42s. Mr. W. Toller's (Gedgrave) lambs averaged 20s. 6d. Lord Rendlesham's black-faced ewe lambs 23s., and the ram lambs 21s. each; 14 ewes sold for 34s. Mr. Crisp's (Chillesford) fat sheep averaged about 39s. Mr. Ling's (Otley) half-bred lambs, one score sold for 15s., others for less.

SHROPSHIRE SHEEP AT PATSHULL.—This annual sale of Shropshire sheep, the property of the Right Hon. the Earl of Dartmouth, took place on Monday last, and was attended by a greater number of gentlemen than on any previous occasion. Thirty-four rams were offered, of which 30 were disposed of at prices varying 5½ to 13 guineas. Store ewes realised 51s., and yearlings 45s. Messrs. Nock, Son, and Wilson, of Bridgnorth, were the auctioneers.

SALE OF LORD CHESHAM'S SHROPSHIRE RAMS.—The second annual sale of pure-bred Shropshire shearing rams belonging to the now noted Latimer flock took place on the 17th inst. The sheep offered were, if anything, superior to those sold last year, and presented all the best characteristics of the breed—size, quality, and wool. Two rams were let for the season—one, the highly commended at the Royal show, being secured by Mr. Bradshaw at 21 guineas; the other was taken by Mr. E. Smith at 11 guineas. Twenty-one shearings were sold, the prices given ranging from 5 to 15 guineas. The average was £7 3s. Afterwards 125 stock ewes, which were in fair condition, considering the season, were sold at an average of nearly £3 per head, which was considered a very satisfactory price.

SALE OF HAMPSHIRE DOWN SHEEP.—On Thursday a sale of sheep was held at Bradwell, near Stony Stratford, Buckinghamshire, the residence of Mr. W. G. Duncan. This was the first sale of the kind in the neighbourhood, and was also the result of an experiment by Mr. Duncan to introduce the Hampshire breed in the district. He is an admirer of this breed, and his land has proved suitable to the breed, as shown by the splendid animals offered for sale. The land on this part of Bucks is naturally of a cold description, and Hampshire sheep seem more adapted for it than long-woolled sheep, which are principally used. The sale was quite a success, and Mr. Duncan's first appearance as a sheep breeder will certainly not be his only sale. Mr. J. F. Goodwin, of Newport Pagnal, was the auctioneer. A quantity of theaves made from £2 12s. to £2 16s. per head, and ewes fetched from 44s. to 50s. Wether lambs made from 30s. 6d. to 34s. The ram lambs sold at prices varying £2 12s. 6d. to £13 5s. A two-shear ram, bought at the late Mr. Humfrey's sale, of Oak Ash, made £13 15s.

THE GREAT GIVENDALE RAM LETTINGS.—The best shearing was let to Mr. Jordan, of Emswell, for £20. The two-shear sheep commanded a still better competition, and double figures were the rule. The second best shearing of last year (£35 10s.), after a strong contest with Mr. Fojambe's agent, was secured by Mr. Mede, an Irish breeder of Ballynarth, Ballinassig, county of Cork, for £33 10s. Among some of the leading breeders who were takers were Mr. Wright, of Oglethorpe-hall; Mr. Staveley, of Hayton; Mr. Phillips, of Beadlam-grange; Mr. Brown, Holme on Spalding Moor; Mr. Stamper, Highfield-house, Nunington, and several others.

SALE OF ALDERNEYS.—Mr. Richardson submitted to public competition, a valuable herd of Alderney and Guernsey

cows and heifers, the property of Mr. P. H. Fowler, of the Clarendon Repository, Watford, Hertfordshire, importer for the Royal dairies at Windsor and Osborne. The highest price realised was 26 guineas, while the general average was about 21 guineas.

Messrs. Mann and Raven disposed of a number of Lincoln shearing rams, bred by Mr. T. Gannell, of Milton. The sale took place on the bowling-green of the Lion Hotel, Cambridge. The prices realised were very good, ranging from £40 downwards. The prices obtained averaged more than £11.

A sale of ewes and lambs took place at Shrewsbury by Mr. W. G. Preece. It opened shortly after ten, when some shearings belonging to Mr. John Jones, of Agden, Whitechurch, were put up. The first, by Duke of Cambridge, was sold for 9 guineas, and two others at 7 and 6 guineas. Mr. Edwards, of Oxon, had eight rams entered, one of which sold for 10 guineas, another at 9s, and others at lower prices. Mr. Tanner, Frodesley, Salop, had fifteen. A two-shear ram sold for 11 guineas, and another at 9. Mr. Bowen Jones, Emsdon House, obtained 8 guineas for a three-shear ram. Messrs. Crane, Shrawardine and Forton, offered twenty-eight for sale and four for letting. Caractacus, a ram by Chieftain, was let for 53 guineas, and another ram let for 21 guineas. The rams for sale realised 20, 17, 15, 14 guineas, and lower prices. A ram, the property of the Rev. C. P. Peters, Pitchford Rectory, realised 32 guineas. Mr. John Evans, of Ullington, had only one or two under fifty entered. The first put up, a three-shear ram, Standard Bearer, was let to the Earl of Strathmore for 60 guineas, which was the highest price realised. Premium let for 16 guineas, Favourite for 24, Scottish Hero 48, Downton Pippin 14, another for 21. The average of the rams sold was 12 guineas, and the average of the ewes £3 10s. Mr. Thornton, Pitchford, offered a dozen rams. One ram let for 10 guineas. The highest selling price was 30 guineas, which was obtained for a two-shear ram. Mr. Thomas Horton, Harnage Grange, let two, one at 9 guineas, and sold several, the highest price being 13 guineas. Mr. Mansell, Ercall Park, sold ten rams at an average price of nearly 9 guineas. The Hon. E. Kenyon, Maesfen, let three rams, one at 12, one at 10, and one at 9 guineas. The best selling price was 11 guineas. Messrs. Fenn and Harding let Macgregor for 15 guineas. The highest selling price was 13 guineas. Mr. G. Allen, Eccleshall, let a ram for 40 guineas, one at 35 guineas, and others at lower figures. One fine ram, with remarkably good wool, was bought by James Iland, of Ludlow, for 41 guineas. On Wednesday an unusually large quantity of ewes were offered, all of them being of the purest breed, and there being a capital attendance of buyers, prices were much better than on the day previous. The Messrs. Crane had twelve lots, all of which were disposed of. A pen of five was sold for £5 10s. each, others at 8s., 6s., 6s., 6s., 6s., and lower prices, the smallest price realised being 49s. per head. Mr. Evans, Ullington, had thirteen lots of five each, and they sold at 90s., 80s., 75s. 7s., down to 48s. each. Messrs. Bowen and Jones, Emsdon, had fifty ewes, and all were bought up. One lot sold at 6s. per head, another 60s., and at other lower prices, down to 46s. Mr. Evan Bowen, Bicton House, had fifteen pens of five each. The best price obtained was 61s., and the average about 50s. Three pens belonging to the Earl of Powis were sold at an average price per head of 46s. The Rev. G. P. Peters had only one pen, but it contained some well-bred animals, which were readily disposed of at 72s. each. For one pen the Messrs. Fowler, Acton Reynald, obtained 61s. per head, for another 56s., while others were disposed of at figures somewhat lower. Mr. J. Minton, Forton, obtained an average price of 56s.; Messrs. Fenn and Harding, of 54s.; and Mr. Barber, Harlescott, 72s., one lot being sold at 56s. Mr. Horton had eight pens, and some of them obtained the best prices of the day. Four superb shearing prize ewes sold at £10 10s. each, another four at £9 15s., and a third lot at the same price. All were bought for transportation to San Francisco. For one lot of five Mr. Tanner, Frodesley, got 76s. Mr. Meredith, Frodesley, had eight pens of five. The prices varied between 38s. and 42s. Mr. Perry, Acton Pigott, disposed of thirty ewes at an average price of 46s. Mr. Bach had fifty ewes, which realised an average price of 43s. Mr. Lewis, Baschurch, had forty ewes, which sold for an average of nearly 43s. each.

Mr. Rigen's annual sale of Southdown ewes and letting and sale of rams, took place at Hove, Brighton, on Friday.

At the lunch the Chairman (Mr. Turner) gave "The health of Mr. Rigen, and success to the sale." The sheep brought before them to-day might be in lower condition than usual, but that was easily accounted for by the shortness of keep they had been suffering from in this part of the country. They had felt the effects of both a cold spring and a very dry summer, and in fact the weather had been against them ever since the beginning of last March. Mr. Rigen, like most flock-masters, had not been able to withstand the effects of the severity, and consequently the sheep were not in so high condition as they would otherwise have been. But it must be remembered there was the blood all the same. Mr. Rigen said it was perfectly true, as Mr. Turner had said, that they had incredible difficulties to contend against during the past six months, and as an instance he might mention that he had sown more than a hundred acres with rape and turnips, and not a single acre had yet made any show. No one would hardly believe that sheep could have lived on what he had had to give them during the last two or three months; he had, however, been fortunate in having water, and that was the only thing that had saved him. The sheep to-day would all be submitted with a low reserve, and he must do the best he could under the circumstances. Mr. Drawbridge, the Sussex auctioneer, then submitted the lots to competition. Ewes: Five full-mouthed ewes, £4, The Prince of Wales: five, £4 10s., The Duke of Richmond; five, £3, Mr. Woods, Leatherhead: five, £3 5s., Mr. Woods; five, £3 5s., E. Stenning, Godstone; five, £3, Carew Gibson; five, £2 15s., E. Cane, Berwick; five, £2 10s., J. S. Turner, Chynton; five, £2 10s., E. Stenning; five, £2 10s., Mr. Gillespie, Bolney; five, £2 10s., C. Gibson; five, £2 5s., C. Gibson; five, £2 7s. 6d., J. Hodson, Blatchington; five shearing ewes, £2 15s., Mr. Case, Street Place; five, £2 10s., Mr. Case; five, £2 15s., The Prince of Wales; five, £2 15s., Mr. Northall Lowne. Rams for letting: Four years old, by Young Elegance, 15 guineas, Colonel Tomline, M.P., Ipswich; two years old, by Grandson of Archbishop, 27 guineas, Colonel Tomline; one year old, by No. 40, highly commended at Taunton and Oxford, 15 guineas, Mr. Heasman, Angering; one year old, by No. 40, commended at Taunton, 15 guineas, Mr. Wadehouse, Hertford; one year old, by No. 40, commended at Taunton, 15 guineas, C. Gibson; one year old, by No. 40, 15 guineas, Lord Norbury; one year old, by Son of Plenipo, 10 guineas, Mr. Drummond, Southampton; one year old, by Son of Plenipo, 12 guineas, Lord Norbury; one year old, by Son of Plenipo, 20 guineas, Mr. Gillespie, Bolney. Rams for sale: Three years old, by a son of Reserve, 10 guineas, Mr. Stevens, North Devon; two years old, by a son of Plenipo, 10 gs., Mr. Gibson; one year old, by a ram of Mr. Boys, 10 guineas, Mr. Hodson, Plymouth, one year old, by Young Plenipo, dam a Beddingham ewe, 11 guineas, Mr. Milward, Notts; one year old, by No. 40, dam a Goodwood ewe; 12½ guineas, Mr. Hodson, Blatchington; one year old, by No. 40, 12 guineas, Northall Laurie; one year old, 13½ guineas, Lady Shelley; one year old, dam a Webb ewe, 10 guineas, S. Beard, Rottingdean. Archbishop won the first prize at Canterbury, and was sold by Mr. Webb for 250 guineas; Young Elegance was sold at Mr. Webb's last sale for 140 guineas; No. 40 is the son of Reserve, highly commended at Leicester.

The sale of the Attleborough sheep took place on Thursday, when was offered the entire flock consisting of 42 shearing rams, 75 tup lambs, 75 ewe lambs, 25 shearing ewes, and 150 flock ewes. The average results of the sale are as follows:

	Average.	Total.
41 shearing rams	£6 16 0	£279 0
65 ram lambs.....	4 0 0	258 10
177 ewes	2 16 9	502 18
75 ewe lambs.....	1 18 0	142 0

Total.....£1,182 8

At the luncheon, Mr. C. S. READ, M.P., who presided, said, I remarked just now that we were very blessed in living in an island. There is one thing about the island, however, that we seem to have forgotten, and that is that for many centuries it kept away from us not only the arms of the invader, but also the plagues and pestilences among stock which have for centuries devastated the continent of Europe. We seem now to have forgotten this fact, and, having these diseases located

amongst us, we have Acts of Parliament and Orders in Council for the purpose of stamping them out, but I am sorry to say that we still take no sufficient precaution against their introduction. Why, we passed a measure no less than thirteen months ago for the erection of a separate market in the metropolis for the sale and slaughter of foreign stock, and you will hardly believe that although the Corporation of London thirteen months ago knew that this bill was passed, yet they have not at present fixed upon a site or done anything at all towards the erection of this market. Now, what is the consequence? All our cattle which go into the London market are obliged to be slaughtered there, because of their coming in contact with foreign stock; and I would ask any of you who have had the misery of having a lot of cattle there on a bad market day, whether it does not seriously affect your interest? We cannot expect to get that market open until such time as there is a separate market for foreign stock. We have passed an Act of Parliament that has been put in force with a certain amount of unanimity in this county, endeavouring to get rid of these diseases, but I am sorry to say they still linger among us, and are on the increase. I don't doubt that in the course of this autumn, when we have our usual importation of stock from distant parts of the kingdom, we shall have serious outbreaks of the foot-and-mouth disease, and I would beg you to be very careful as to

the quality of the stock you buy, and the state of health they are in. I believe this will be the last of the pleasant gatherings we have had now for some years past at Attleboro' Hall. It must be a feeling of regret that we, who come here principally to meet our friends, should be deprived of so pleasant a holiday; but it must also be a feeling of regret that those excellent sheep which Messrs. Salter have so long offered for our notice are now to be dispersed, for I fear from the fact that they have to be dispersed, they have not altogether answered the purpose of the producers, Messrs. Salter. No one knows, who has not tried it, the expenses that are incurred by keeping up a good flock for the purpose of furnishing these annual ram sales. I know that they are increasing expenses, and I don't wonder that my friend Mr. Salter has found out that he cannot bestow that time and attention upon them any longer; and that, therefore, he gives them up. This year, when our crop of turnips is so slender, and our new layers are so faint, it is more than ever necessary that we should supply ourselves with the very best stock, and I think for quantity and quality of mutton, and length of wool, you cannot find any sheep superior to Messrs. Salter's; and as I know that in this district the old black-faced ewe is still a favourite with flockmasters, I say it is impossible to find a better cross for them than coming to these Attleboro' rams.

AGRICULTURAL REPORTS.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

There has been no distinguishing feature in the cattle trade of the past month. Notwithstanding the war we have continued to receive supplies from the Continent, and large numbers of beasts have come to hand from Tonning. It is expected, however, that the shipments from this port will be immediately stopped. We have also received some good animals from Spain. From our own grazing districts the arrivals have been on a full average scale; but there has been a scarcity of really prime stock, although certainly many good useful animals have been exhibited. As regards trade a fair amount of firmness has been apparent, notwithstanding the absence of activity in the demand. The best breeds being scarce at one time realized 5s. 8d. per 8lbs., but the quotation at the present moment is 5s. 6d. per 8lbs. Other breeds have been purchased quietly, and the currencies have been somewhat irregular.

The supply of sheep has been about an average, both as regards number and condition. For most descriptions the trade has been firm, and enhanced quotations have been paid, the best Downs and half-breeds selling at 5s. 6d. to 5s. 8d. per 8lbs.

In the lamb trade there has been a want of animation, but prices have been without change, ranging from 5s. 10d. to 6s. 6d. per 8lbs.

Calves have been in moderate supply, and fair request, at about late rates. Pigs have sold slowly.

The total imports of foreign stock into London during the past month have been as under:

Beasts	7,278	Head.
Sheep and Lambs	32,558	
Calves	2,301	
Pigs	2,388	

COMPARISON OF IMPORTS.

Aug.	Beasts.	Sheep and Lambs.	Calves.	Pigs.
1869	8,840	30,116	3,245	2,803
1868	10,179	26,112	1,883	3,288
1867	8,741	23,943	1,037	5,726
1866	14,927	44,566	2,960	4,087
1865	16,536	61,060	3,287	8,251
1864	11,475	41,830	2,786	4,326
1863	9,502	39,062	4,327	4,108
1862	5,630	35,056	2,060	3,297
1861	6,581	35,386	1,874	3,718
1860	6,647	40,105	2,520	4,075
1859	6,502	32,483	3,254	1,805

The arrivals of bullocks from our own grazing districts, as

well as from Scotland and Ireland, thus compare with the three previous years:

From—	Aug. 1870.	Aug. 1869.	Aug. 1868.	Aug. 1867.
Lincolnshire, Leicestershire, and Northamptonshire	6,550	8,950	9,600	7,200
Other parts of England	2,830	1,720	1,590	2,500
Scotland	109	13	306	70
Ireland	130	290	295	310

The annexed figures show the total supplies of stock exhibited and disposed of during the month:

Beasts	23,330	Head.
Sheep and Lambs	164,690	
Calves	3,538	
Pigs	1,140	

COMPARISON OF SUPPLIES.

Aug.	Beasts.	Sheep and Lambs.	Calves.	Pigs.
1869	22,179	155,660	3,769	543
1868	22,230	176,050	3,253	1,175
1867	20,030	124,120	2,690	2,205
1866	26,840	153,720	2,690	2,560
1865	29,600	147,520	3,828	2,480
1864	29,420	154,800	3,426	3,046
1863	26,264	149,430	3,070	2,622
1862	24,072	154,920	2,354	3,012
1861	23,420	159,740	2,952	3,220
1860	22,290	151,500	3,348	2,070

The dead meat markets have been moderately supplied. The trade, on the whole, has been quiet, at about late rates. Beef from 3s. 6d. to 3s. 10d., mutton 3s. 10d. to 5s. 2d., lambs 5s. 4d. to 5s. 8d., veal 4s. 8d. to 5s., and pork 4s. to 5s. 4d. per 5lbs. by the carcase.

NORTHUMBERLAND.

Harvest, which in early spring months promised to be late, has been hastened forward by the unprecedented dry, hot, and often withering days of June and July. Reaping was partially begun on early gravelly soils adjacent to Wooler and Beaumont Water the first week in the present month, and by the 7th harvest became general over the entire district. Oats, being dried up at the roots, were a very short crop. Barley was our best crop. Wheat, which on all our loamy soils was in former seasons first ready for the sickle, has this season on many farms been left for the "kirk," or finish; and by the end of the month, with such roasting atmosphere, a very large portion will be in stack. We may safely assert that over ninety per cent. of the entire cereal crop, and a large breadth of beans and peas, has been cut by machinery. So far as our information goes, no test as to yield of grain is certified; yet the sheaf-bulk, when packed together in the stack, will fall woefully short of average years—a poor prospect for winter-keep, in face of the small hay-crop and the totally dried-up pastures. Our only hope is that the winter may be a mild one.—Aug. 26.

NORTH RIDING OF YORKSHIRE.

With the brilliant harvest weather the work is proceeding vigorously. Nearly all the grain in this district is cut, and a considerable quantity secured. The wheat crop is turning out as, according to our last report, we anticipated, viz., a fair average crop. The bulk of straw not excessive, but quality fine and likely to yield well. The barley crop is very good—thick on the ground, all standing, and the heads of a good length, and, so far, much has been secured without a stain. Oats are deficient in bulk and the yield likely to be bad. In many fields a large proportion of smutted heads are seen, and on all but the deep, loamy soils the grain is thin-bodied and light. On the 18th instant we had about half an inch of rain and some trifling showers since, which includes the whole of the rain-fall in this part of the country since the beginning of July. Our pastures are fairly burnt up, and afterwards have never had the least chance of growing. To maintain outdoor stock hay and artificial foods have to be given; but with all the aid that is given they make but little progress, and prime beef is very scarce. The root crops have made little growth. The white turnips are very backward and are suffering from the ravages of the grub. Swedes are, and have been, at a standstill, and the whole crop is very patchy. Our prospect for winter keep is very bad indeed.—Aug. 26.

AGRICULTURAL INTELLIGENCE, FAIRS, &c.

ALFORD FAIR.—There was no difficulty to find a buyer for each lot, upwards of 400 sheep being penned, which sold at about 35s. to 50s. for drapes and ewes, fat mutton 7d. to 7½d. per lb., lambs 18s. to 30s. each, 13 fat and store beasts, which averaged 9s. per stone.

APPLEBY FAIR was a dull hanging one, and owners, who held firm, were obliged, in order to effect sales, to submit to current prices, owing to the scarcity of food. Grey-faced wether hogs brought from 15s. to 16s., half-bred do. 14s. to 18s., three-parts bred 18s. to 22s., black-faced wethers from off the fell 18s. to 22s., black-faced ewes 20s. to 25s., and half-bred ewes 40s. to 45s. Fat sheep and lambs were good to sell, and brought high prices, but other stocks were quite a drag, and many remained in the evening in the pens unsold.

BODMIN FAIR.—Fat cattle and sheep sold freely, but in consequence of the scarcity of grass the demand for store cattle was very limited. Good horses were much asked for, but the prices wanted for a few superior animals present were so large that little business was done until late in the day. The following prices were made: Fat cattle from 70s. to 72s. per cwt., store cattle 40s. to 42s., cows and calves 60s.; fat sheep 7d. to 7½d. per lb.; ewes 35s. to 40s. each, lambs 25s.

BOSTON FAT SHEEP MARKET.—Very few penned, and prices ranged from 8d. to 8½d. per lb.

CARLISLE FAIR.—In the lamb market a great falling off in the number shown as compared with last year, only 13,000 being placed. Last year upwards of 34,000 lambs were exhibited. In the earlier part of the day business was slow, buyers being unwilling to accede to the terms of the holders. In the afternoon, however, the market became more animated, and lambs sold pretty freely at the following prices: Half-breds 19s. to 34s., Cheviots 16s. to 19s., crosses 16s. to 24s. These prices bear favourable comparison with those of recent markets, and are considerably in advance of those obtained at this fair last year. The number of cattle was very small, and consisted mainly of Irish and cross-breds, for which £1 to £12 each were the average prices.

DUNDEE FAIR.—Among the fat cattle shown were several good lots, the top lot selling at £22 per head. Subjoined are a few of the sales: A lot of ten two-year-olds at £21 10s., a lot of four at £18, three queys at £14, a pair for £12, a single beast at £15, a lot of ten Highland cattle at £7, and several small lots of yearlings at from £7 10s. to £10. The show of milch cows, chiefly Ayrshires, was good, but far in excess of the demand. Mr. Liddle, Denny, showed thirty, and sold a few only at prices ranging from £13 10s. to £20. Mr. Thomas Nicol, Forlar, showed twenty-two, and sold some at from £12 to £21. Four harness horses sold at prices ranging from £15 to £48.

DUNSE HOOK FAIR.—There was a very good show of lambs, and the demand was fair, prices ruled much the same as at Lanmas, though in some cases from 2s. to 3s. a head were obtained in advance of Lanmas. A lot of bred lambs sold at 30s.; a lot at 28s.; a lot of three-parts-bred at 28s.; a lot at 22s.; a lot at 22s. 6d.; a lot at 26s.; the Greenlaw Dean lot at 22s.; a lot at 20s.; a lot of three-parts-bred at 20s.; a lot of grey-faced at 12s.; a lot of sheep at 38s. a-head. Leicester tups, a lot of twenty, brought an average of £6 14s. 10d., the highest priced one £13 10s. Mr. Wilson of Cumledge's lot of seventeen brought an average of £7 13s. 4d. the highest one in this lot being purchased at £15.

IPSWICH LAMB FAIR.—Owing to the scarcity of feed and poor prospects as to turnips, trade was dull. Lambs made from 20s. to 30s. Messrs. Spurling and Sons had some 2,700 sheep and lambs, the disposition of which was at the fall of the auctioneer's hammer. Mr. Keeble's (Tattingstone) lambs sold at 26s. to 28s., Mr. J. Lay's (Bentley) 24s. to 27s., Mr. J. C. Cobbold's 22s. 6d. to 27s., Mr. T. Wainwright's (Ixworth) black-faced ewe lambs 26s. to 28s., shearing ewes 38s. 6d. to 43s., two-shear ewes 40s. to 43s., black-faced tups 40s. to 50s.; Mr. Cooper's (Holton) ewes 40s. to 45s.; Mr. Emerson's (Sadron Walden) shearing tups 40s. to 50s., lambs 30s. to 40s.; Mr. Woodward's (Old Newton) 45s. to 46s.; Col. Tomline's, M.P., shearing ewes 38s. to 40s., crones 24s.; Mr. W. Gurdon's (Brantham Court) shearing ewes 45s. to 46s., crones 36s. to 39s. Messrs. Cruso and Hawkins had a number of tups for sale. Twenty shearing Norfolk Cotswold rams belonging to Mr. Thornton, averaged £7, the highest price being £9 15s.; and 20 pure Lincolnshires, the property of Captain Catling, Needham Hall, Wisbeach, averaged £7 15s., the top price being £10 15s. Of Mr. C. Boby's Southdowns 7 only were let, at £6 6s. each.

KNARESBRO' FORTNIGHTLY MARKET.—There was a moderate attendance of buyers, and a thin supply of fat stock at 8s. to 9s. per stone. Fat sheep 7d. to 8d., lambs 8d. to 9d., fat calves 7d. to 7½d.

LANARK SECOND LAMB MARKET.—The stock consists of black-faced ewe and wether lambs, Cheviots, and crosses. Generally ewe lambs take the lead in regard to numbers; but on the present occasion wether lambs were by far the largest class, and certainly greater than has ever been seen at the second fair at Lanark. The total number of all kinds was estimated at about 25,000, or nearly a third more than last year, which may be accounted for by the large turn out of wether lambs. The attendance of purchasers, both from England, the north of Scotland, and the Lothians was moderately good, and a considerable stroke of business was done in black-faced ewe lambs by English buyers, and also in black-faced wether lambs by those from the north. Wether lambs had a very bad sale, and in sympathy with the slowness of trade prices were back 2s. apiece from the lamb fair held at Lanark a fortnight ago. The best demand was for black-faced ewe lambs, the

whole of which were understood to be sold at prices above those obtained last year, the increase ranging from 1s. 6d. to 2s., according to the character of the stock and the fortune of the seller. Cross lambs were also in request, and they may be quoted at 3s. apiece above the value which they made in 1869. Cheviot stock was thinly represented. With the exception of a few tops, nearly all the lots of lambs on sale were seconds.

LINCOLN FAT STOCK MARKET.—A large number of beasts, but very few in first-rate condition, they made 9s. per stone, and mutton 8d. per lb.

MARLBOROUGH FAIR.—A larger number of sheep than has been known for many years, and prices receded 3s. to 4s. per head, several lots remaining unsold. The highest price for ewes was 53s., realised by Mrs. Price, of Wolfhall, who also made 45s. for lambs. Mr. George Brown made 50s. for the prize ewes, bought by Mr. T. Owen, of Clapton.

MELTON MOWBRAY FAIR.—The show of horned cattle was quite as large as might have been expected from the long continued drought, and prices (though unremunerative to the grazier) were very fair for useful mated and half-mated beasts. Norfolk jobbers were present, but acted with caution. The pitch of sheep was quite up to the average; lambs from 20s. to 24s. per head.

ROMNEY FAIR.—About 12,000 sheep and lambs were penned—nearly all Romney-marsh bred and fed, but, as might be supposed, considering the extreme drought which has prevailed almost without intermission since the lambing-season, most of the latter on offer were in poor condition. Togs and ewes also bore evidence of the shortness of keep, but, notwith-

standing, business was brisk. Lambs realised from 10s. to 20s., togs 27s. to 33s., and ewes from 22s. to 30s. per head.

ROMSEY SHEEP FAIR.—The number penned was above an average. Trade was heavy, and the prices realised were from 3s. to 4s. per head less than last year. Lambs fetched from 18s. to 25s.; ewes from 25s. to 34s. There was a ready sale of sheep fit for the butcher, at good prices.

RUTHERGLEN FAIR.—Milch stock has gone to a very high value; there was no fall in the value of cattle, however, and prices were much in accordance with those obtained at the market last month. The largest lot of milch cows in the fair sold at from £13 to £18. Mr. John Dunlop sold at from £12 to £19. Draught horses ranged from £25 to £45, and in a few instances from the latter figure to £60 was obtained. Harness horses sold at from £30 to £50, and ponies from £10 to £26.

SALISBURY FORTNIGHTLY MARKET.—There was a preponderance of middling and inferior qualities. The best made good prices, one lot of prime Devons realizing as much as 14s. per score. Trade however ruled slow, especially for inferior animals, which were purchaseable at lower figures than at last market, and were not cleared off. In the sheep department some 2,500 were penned of various qualities. Secondary sorts made rather less money than before, but good pens maintained late rates, and the whole found purchasers. Best oxen realized from 12s. 6d. to 13s. 6d. per score, and heifers from 11s. to 12s. Wether mutton made as a general rule from 8d. to 8½d. per lb., and ewe ditto from 7½d. to 8d.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

While the past month has been the time for the gathering of providential blessing, and much of the corn which lately covered the fields has been safely housed, the savage and unreasonable lusts of men have gathered hostile armies for deadly combat, and the earth from which we all spring has been saturated with human blood. We can only hope that the terrific sacrifices of human life will soon come to an end, and that the victories of Prussia will be so complete that peace once more will be in the ascendant. England has no small reason to be thankful that she has done her best to prevent this effusion of blood, and has kept aloof herself from the tremendous strife. But these political movements have made most unsteady markets; first an unusual rise, then an equal depression, as warlike or pacific views were entertained, and in expectation of the latter new wheat has already fallen from its first made prices 6s. to 7s. per qr., and old, both foreign and English, have given way 3s. to 4s. per qr.; but at this point there seems something like a settlement, and with red wheat at about 50s. and white at 54s. in London, we seem to have arrived at an approach to safety for farmers under most unusual circumstances. With only an average crop as the highest estimate, we see no hurry to realise such prices, especially as the Baltic is shut up both by a Prussian prohibition and a French fleet, and the ordinary return of winter will most probably shorten the receipts from Prussia, &c. The export of wheat to France has ceased since she has gathered her own crop, but immense quantities of oats have been taken for that country, where the yield has been very deficient; and beyond this there has been a free export of flour, the exigencies of the war requiring the manufactured article for the population of Paris. The quality of the new wheat has been answerable to the fine dry weather, but the temperature has varied exceedingly, the third week having brought frosty nights and mornings, and still heavy rains are much needed to revive the meadows, which have yielded so scanty a crop of hay. Unless they fall soon lean stock must be forced for a time

upon the meat market, and eventually add much to its price; and what mischief this war will do is yet to be seen in the way of waste and destruction. The following were the range of prices recently paid at the several places named: White wheat at Paris, 52s., red, 50s.; old white at Bordeaux, 56s., new, 52s.; red in Belgium from 54s. to 58s.; at Hambro', 52s. to 53s. 6d.; at Rostock, 52s.; in different parts of Spain, 48s. to 50s.; at Pesth, 41s.; in Italy, 50s. to 53s.; at Rostoff, 34s. to 36s.; at Alexandria, 40s.; at Algiers, hard 43s., soft 49s.; New York, No. 2 red, 43s. c. f. i.; San Francisco, 53s. 6d. c. f. i.; best wheat at Adelaide 5s. 4d. per bush.

The first Monday in August commenced on a moderate English supply of wheat, with heavy arrivals from abroad, nearly 40,000 quarters being from the Baltic alone, and 12,000 from America. The show of samples from the near counties was scanty this morning, and with them appeared some new Talavera of moderate quality, which sold at 60s. The trade on the whole was quiet, but 1s. over Monday's rates was generally realised. In foreign samples the choice was for Russian qualities, which also brought about the same improvement. This advance noted in the metropolis was quickly responded to in the country, scarcely any market being without an equal advance, while a rise of 2s. was reported at Bury St. Edmund's, Birmingham, Hull, Rochester, Stockton, &c., Market Harborough and Melton Mowbray being 2s. to 3s. per qr. dearer. At Glasgow and Edinburgh the advance was about 1s. Dublin could only report more firmness both for native and foreign produce.

On the second Monday the English returns were small, but the foreign again considerable, though little beyond half the preceding week. A small exhibition of samples was made on the Essex and Kentish stands, nearly half was new, the best red (weighing 64lbs. per bush.) brought 58s., and the best white (weighing 63lbs. per bush.) 61s. High prices were at first demanded for old, but millers would not exceed previous rates. The foreign trade was firm, and some descriptions occasionally brought an

advance of 1s. per qr. Sales of floating cargoes could only be made by some concessions. The country trade this week was extremely dull; though many places held on for the previous rates, others accepted a decline of 1s., and some were 2s. easier, as Birmingham, Bristol, Gloucester, Newcastle, and Stockton. Liverpool was 3d. per cental down on Tuesday, with an equal decline on Friday. Though Glasgow did not make the reduction over 1s. per qr., Edinburgh wrote a reduction of 2s. to 3s. In Ireland the corn trade was dull, Dublin and Cork giving advices of the same tenor.

On the third Monday the home supply was moderate, but that from abroad was greatly increased, Danzig and Rostock sending 30,000 qrs., and America 17,000 qrs. A severe reduction was noted in new samples from the starting prices, the highest for red being 52s. and white 54s., while old fell in value 3s. to 4s. per qr., though little was offering. The business done in foreign consisted principally of American sorts, which also were quoted 3s. lower, and to sell other qualities the same decline was required. Floating cargoes were reduced also in value 3s. per qr. The great fall noted in London threw the country markets into apparent confusion, and most irregular rates were the consequence, inasmuch that we can only take the average decline on new at 5s. to 6s. per qr., and old about 3s. to 4s. Liverpool was down 6d. for the week per cental on Tuesday, and very dull on the succeeding Friday; and Glasgow was down 1s. per boll, or 2s. per qr. Edinburgh declined 2s. to 3s. per qr. Dublin noted a reduction of 1s. per barrel, on old foreign, sales of new red being made at 31s. per barrel.

On the fourth Monday there was a slight increase in the English supply, and a great reduction in the foreign, though still good. There was a fair show this morning on the Kentish and Essex stands, mostly new, of good quality. A few samples early in the day went off from the Essex stands at about the previous currency; but as the day advanced Kentish factors found they had to make a reduction of fully 1s. per qr. before they could do business. This being done, the show was pretty well cleared off. Old was, however, no lower, there being but little offered. The foreign trade was moderate, consisting principally of a demand for Russian and American sorts, which in some cases were sold on rather easier terms, though those of fine Galatz were held as on the previous Monday. Floating cargoes were quiet. The country trade this week was but little changed; but there was an occasional decline of 1s. and sometimes of 2s. per qr. on new samples.

The imports into London for the four weeks were 20,419 qrs. English, 193,316 qrs. foreign, against 15,005 qrs. English, 183,998 qrs. foreign, for the same period in 1869. The London exports in the same time were 2,260 qrs., with 31,375 cwts. flour. The imports into the kingdom for the four weeks ending 13th August were 3,197,879 cwts. wheat, 310,667 cwts. flour, against 3,282,531 cwts. wheat, 466,276 cwts. flour, for the same time last year. The general averages commenced at 49s. 9d., and closed at 54s. 10d.; and the London averages began at 59s. 2d., and closed at 55s. 10d. per qr.

The flour trade during the four weeks has not materially varied. There was a decline in country sorts of 2s. per sack on the third Monday, notwithstanding a demand for France; and though that demand was partly kept up on the fourth, there was so little home inquiry that it only served to prevent a fall. Barrels fell at the same time fully 1s., and they have since remained without change. Town millers have not lowered the top price, which has remained 54s. The imports into London for the four weeks were 62,343 sacks English,

14,097 sacks 29,932 barrels foreign, against 62,234 sacks English, 33,874 sacks 7,238 barrels foreign, in 1869.

Maize has been declining all through the month, making the reduction in four weeks 4s. to 5s. per qr., good useful yellow being procurable at 31s., which was recently selling at 35s. and more. The imports for the four weeks were 71,934 qrs., against 19,851 qrs. in 1869.

The crop of English barley being exhausted, and but very few samples of new yet appearing, the few shown have brought good prices, say 40s. to 44s.; but values cannot be said to have yet settled. The great reduction in Indian Corn could not fail to influence grinding sorts, which for the last four weeks have given way fully 1s. per qr. every week, for fair quality may now be had at 26s. to 27s. The London imports for the four weeks were 767 qrs. English, 38,338 qrs. foreign, against 1,352 qrs. English, 8,060 qrs. foreign, in 1869. We think it probable there may be some recovery from this decline, as stocks of foreign are low, and the new English will be much above these rates.

The malt trade has been dull, and tending downwards.

With some of the new crop of oats arriving, there has been a gradual increase in the English supply, partly owing to the better prices lately made through the extraordinary demand for France, which country has taken the large amount of 139,470 qrs. in four weeks; but there have been equally extraordinary imports, leaving the balance against prices of about 2s. per qr. Russian 38lbs. per bushels, lately worth about 25s. or more closed at 23s., there being some symptoms of an upward movement at the last market to the extent of 6d. per qr. What France may yet require there is no foreseeing; but we know that German ports are closed against us, and this may materially reduce our receipts. Our own crop is decidedly short, and at the best times never comes up to our necessities. The imports into London for the four weeks were 6,144 qrs. English, 62 qrs. Scotch, 1,300 qrs. Irish, 493,133 qrs. foreign, against 4,310 qrs. English, 180 qrs. Scotch, 1,000 qrs. Irish, 127,715 qrs. foreign, for the same period in 1869.

The occasional appearance of new samples of beans of good quality, together with moderate foreign supplies, and a general reduction in feeding stuffs, have caused this grain, which lately commanded high rates, to gradually give way, say from 2s. to 3s. per qr. in the four weeks. For some hard new winter 42s. was bid on the fourth Monday. The imports for four weeks into London were 1,232 qrs. English, 2,569 qrs. foreign, against 1,038 qrs. English, 2,640 qrs. foreign for the same period in 1869.

New peas have also increased the English arrivals to a moderate extent, but very large imports of inferior mixed white from the Baltic have caused a general decline in this pulse to about the same extent as beans, with, however, much more difficulty to place them. Some low sorts might be had at 32s. to 33s., the better at 35s., and the best white at 38s. to 40s., duns 37s. to 38s. The imports into London for four weeks were 2,258 qrs. English, 35,026 qrs. foreign, against 1,176 qrs. English, 6,674 qrs. foreign in 1869.

The supply of linseed having only been moderate and the want of grass making feed scarce, both seed and cake have found a fair inquiry at full prices. The imports were 23,343 qrs., against 42,752 qrs. in 1869. Very little has lately been passing in cloverseed, but prices have ruled firm. New trefoil has been placed at moderate prices. New white mustard seed and winter tares have been inquired for, but as rain is much wanted, and the prices asked have been high, buyers have preferred holding off.

HARDING'S FLEXIBLE ROOFING.

REDUCED TO ONE PENNY PER SQUARE FOOT.

The BEST and CHEAPEST COVERING for HOUSES, SHEDS, FARM and other BUILDINGS, &c.

Suitable for all Climates, and adopted by the English and Foreign Governments, Railway Companies, Metropolitan Board of Works, &c. Awarded the Silver Medal, Amsterdam Exhibition, 1869, for its Cheapness and Superiority to Felt, although the price was then 50 per cent. higher than at present, and is proved to be a much more Durable, Efficient, and Weather-tight Roofing than Corrugated Iron, at One-third the cost, and can be most easily fixed by any unpractised person. Please send for samples of present make.

PRICE ONE PENNY per Square Foot, or 23s. per Roll of 25 yards by 4 1/2 inches wide.
DRESSING, 2s. 6d. per gal.; ZINC NAILS, 5d. per lb.
SAMPLES AND TRADE TERMS FREE.

HARDING'S COMPOUND GLYCERINE DIP. CONTAINS NO POISON, AND IS DESTRUCTIVE TO INSECT LIFE ONLY.

It is a certain cure for Scab in Sheep, who thrive and increase in weight after the use of this Dip. It also preserves the bath of all animals belonging to the household.

It increases the growth of the wool, and cleanses it of all offensive accumulations which always cause functional derangement, it being a well known fact that acid and corrupt humours allowed to remain on the surface are the cause of a great many diseases which afflict animal life.

This preparation is most easily applied, perfectly harmless in use, and most deadly to Ticks, Lice, Maggots, and a sure cure for Foot Rot. It also prevents the Fly striking; avoiding the Animal being troubled with Maggots, and heals all Sores, &c.

Sold in Tins of 5lbs. and 10lbs., at 6d. per lb.; and in Drums of 25lbs., 50lbs. and upwards, at 5d. per lb.; by all Chemists, seedsmen, Ironmongers, and others throughout the Kingdom.

A 5lb. TIN IS SUFFICIENT FOR TWENTY-FIVE SHEEP.

No Dipping Apparatus necessary, common Tubs being all required. (See the simple Directions for Use on each Tin.)

THE LONDON AND COUNTY BANK opens—

DRAWING ACCOUNTS with Commercial Houses and Private Individuals, either upon the plan usually adopted by other Bankers, or by charging a small Commission to those persons to whom it may not be convenient to sustain an agreed Permanent Balance.

DEPOSIT ACCOUNTS.—Deposit Receipts are issued for sums of Money placed upon these Accounts, and Interest is allowed for such periods and at such rates as may be agreed upon, reference being had to the state of the Money Market.

CIRCULAR NOTES AND LETTERS OF CREDIT are issued, payable in the principal Cities and Towns of the Continent, in Australia, Canada, India, and China, the United States, and elsewhere.

The Agency of Foreign and Country Banks is undertaken.

The PURCHASE and SALE of Government and other Stocks, of English or Foreign Shares effected, and DIVIDENDS, ANNUITIES, &c., received for Customers of the Bank.

Great facilities are also afforded to the Customers of the Bank for the receipt of Money from the Towns where the Company has Branches.

The Officers of the Bank are bound not to disclose the transactions of any of its Customers.

By Order of the Directors, WM. MCKEWAN, General Manager.

HALF A MILLION

HAS BEEN PAID BY THE

RAILWAY PASSENGERS' ASSURANCE COMPANY

AS

COMPENSATION FOR ACCIDENTS OF ALL KINDS

(RIDING, DRIVING, WALKING, HUNTING, &c.)

An Annual Payment of £3 to £6 5s. insures £1,000 at death, and an allowance at the rate of £6 per week for injury.

A BONUS TO ALL POLICY HOLDERS

OF FIVE YEARS' STANDING HAS BEEN DECLARED,

PAYABLE IN AND AFTER 1871.

For particulars, apply to the Clerks at the Railway Stations, to the Local Agents, or at the Offices,

64, CORNHILL, and 10, REGENT STREET, LONDON.

WILLIAM J. VIAN, SECRETARY.

THIRD SERIES.

THE
FARMER'S MAGAZINE,
AND
MONTHLY JOURNAL
OF
THE AGRICULTURAL INTEREST.

Dedicated

TO THE

FARMERS OF THE UNITED KINGDOM.

LONDON :

PUBLISHED BY ROGERSON AND TUXFORD, 265, STRAND.

PRICE TWO SHILLINGS.

ASK YOUR GROCERS OR CHEMISTS FOR

GEYELIN'S TAPIOCA BEEF BOUILLON,

A most delicious and nutritious Soup for 2d. a Pint, or for Thickening Broths from any Meat,

SOLD IN CANISTERS, containing 5 portions, 1s.; 12 ditto, 2s. 3d.; 25 ditto, 4s. 6d.; 50 ditto, 8s. 6d.; 100 ditto, 16s. Each portion will make a pint of Soup.

Sole Manufacturers--GEYELIN & CO.,

Produce Merchants, Manufacturers of Granulated Tapioca, International Mustard, and Rizina,

Belgrave House, Argyle Square, King's Cross, London, W.C.

TWENTY-FOURTH EDITION.

WARREN'S FARMERS' ACCOUNT BOOK.

Price—Folio, for large farms, 8s.; Quarto, for small farms and for schools where youths are trained for Agricultural Pursuits, 5s. Also, Folio, with pages for a weekly instead of a daily account of labour, 7s.

Royston: John Warren. London: Simpkin, Marshall, and Co.; Whittaker and Co.; Longman and Co.; Ridgway.

CHEAP SUNDAY AND WEEK-DAY READING FOR THE PEOPLE.

Now Publishing,

The Church of England Magazine,

A VERY CHEAP RELIGIOUS PERIODICAL.

Containing original contributions by several of the Bishops and many other distinguished Divines; Narratives; Sketches of Natural History; Biography, Missionary Proceedings, Juvenile Reading, Poetry, &c., with a Register of Ecclesiastical Intelligence; the whole combining amusement with instruction, in a style suited for all classes of readers.

A series of Parish Churches, with Illustrations of a superior kind is in course of publication. This series, which will be of a very extended character, will be found of particular interest.

Intending subscribers are requested to send their orders without delay, as the back volumes and parts are now becoming VERY SCARCE.

As the Magazine enjoys a circulation far exceeding that of any other church periodical, and is read by all classes of society, it will be found a very eligible medium for Advertisements, which are conspicuously printed, and inserted at the most reasonable rate.

Vol. LXVI., Imperial 8vo., Embossed Cloth, 480 pages, with highly-finished Illustrations of Parish Churches, price 5s. 6d. London: Published in weekly numbers, price 1½d., and in monthly parts, price 9d., by S. EWINS & SON, 9, Ave Maria Lane; ROGERSON & TUXFORD, 265, Strand, W.C.; and sold by all Booksellers.

Now Ready, Cloth, in two Volumes, 782 pp., with four steel Portraits, Price 10s., uniform with "SCOTT AND SEBRIGHT," "SILK AND SCARLET," &c.,

FIELD AND FERN, OR SCOTTISH FLOCKS AND HERDS,

BY H. H. DIXON.

With Steel Engravings of Mr. Hugh Watson, Professor Dick, Mr. Nightingale, and the late Duke of Richmond, &c.

The Volumes, "North" and "South" (of the Frith of Forth) may be had separately—Price FIVE SHILLINGS each.

Copies will be sent by Post on application to the Author.

PUBLISHED BY ROGERSON AND TUXFORD, 265, STRAND.

Handwritten text, possibly a signature or name, located to the right of the illustration.

W. Woodcut. 1844.

PLATE I.

LADY ANNE; A PRIZE SHORTHORN COW.

THE PROPERTY OF MR. JAMES HOW, OF BROUGHTON, HUNTINGDON.

Lady Anne, a red-and-white cow, bred by Mr. Logan at Maidue, near Newport, in Monmouthshire, and calved August 14th, 1866, is by Prince of the Empire (20578), out of Lady Elinor by Sir Roger (16991), her dam, Lady Sarah, by Baron Warlabey (7813)—Lady Mary by Leonardo (7137)—Lady Anne by Emperor (1014)—Studley by Studley (628)—by Stirling (2705).

Prince of the Empire (20578), a red-and-white bull, bred by Mr. Carr, of Stackhouse, and calved September 12th, 1861, is by Elin King (17796), out of Wide Awake by Royal Buck (10750), her dam, Bonnet, by Buckingham (3239)—Bliss by Leonard (4210)—Young Broughton by Young Matchem (2282)—by Jerry (4097)—by Young Pilot (4702)—by Pilot (496)—by Son of Apollo (36). Prince of the Empire was sold to Mr. Logan, at three months old, for 300 gs.

Lady Elinor, a red-and-white cow, bred by Lady Pigot, and calved January 17th, 1861, is also the dam, amongst others, of La Belle Hélène, another well-known heifer in the show-ring.

At Mr. Logan's sale, in the spring of 1867, Mr. How bought Lady Anne, then seven months old, for 30 gs.; but he did not exhibit her until the following year, since when she has been very busy, as the subjoined list of prizes she has taken will tell:

- 1868.—1st prize, Norfolk Society, at Downham, on June 18.
1st prize, Bedfordshire, at Luton, June 26; and the special for the best animal in the yard.
1st prize, Cambridgeshire and Isle of Ely, at Newmarket, July 1.
1st prize, Northamptonshire, at Oundle, July 2 and 3.
1st prize, Leicester, Royal Agricultural Society of England, July 16 to 21.
1st prize, South Lincolnshire, at Grantham, July 24.
3rd prize, Yorkshire, at Wetherby, Aug. 5, 6, and 7.
1st prize, Oxfordshire, at Banbury, Sept. 9 and 10; and the Champion prize for the best animal in the yard; also a champion prize for the best animal exhibited by a tenant-farmer.
1st prize, Huntingdonshire, at Ramsey, Sept. 23; and a silver cup for the best Shorthorn in any of the classes.
- 1869.—1st prize, Bath and West of England, at Southampton, May 31.

- 1st prize, Norfolk, at Attleborough, June 24 and 25; and cup for the best cow (she was entered as cow when only a heifer, for the cup).
1st prize, Oxfordshire, at Oxford, June 30; and the two champion prizes, as at Banbury, for the best animal in the yard.
1st prize, Northamptonshire, at Northampton, July 1 and 2.
3rd prize, Manchester, Royal Agricultural Society of England, July 19 to 24.
2nd prize, Durham, at Bishop's Auckland, July 29.
1st prize, Lincolnshire, at Lincoln, July 29 to 31.
2nd prize, Yorkshire, at Beverley, Aug. 4 and 5.
1st prize, Huntingdonshire, at Huntingdon, Sept. 15.
1st prize, Cambridgeshire and Isle of Ely, at March, Sept. 22 and 23.
1st prize, Bedfordshire, at Bedford, Oct. 1.
- 1870.—2nd prize, Norfolk, at Harleston, June 23 and 24.
3rd prize, Oxford, Royal Agricultural Society of England, July 18 to 22.
1st prize, Lincolnshire, at Sleaford, July 27 to 29.
2nd prize, Yorkshire, at Wakefield, Aug. 3 to 5.
1st prize, Northamptonshire, at Wellingborough, Sept. 15 and 16; 1st prize, Huntingdonshire, at St. Neot's, Sept. 21.

Lady Anne has had three calves at single births. Her last calf, born on her birthday, August 14th, 1870, is Lady Fragrance, a red-and-white heifer, by Lord Blithe (22126), an own brother to Mr. Booth's famous sisters Lady Fragrant and Lady Grateful, and a bull by which Mr. How has also calved this season out of Bright Hope, British Rose, Windsor's Butterfly, and Pauline 5th.

The Shorthorns Judges of the Royal Leicester Meeting in their report speak of Lady Anne as "a very perfect animal," as she should be, considering she beat here Mr. Booth's Patricia, put second to her and Mr. Booth's Lady Gaiety, the reserve number of the class. At Manchester the Judges wrote thus of her: "Lady Anne is a very good heifer, her fore-flank particularly a good point; although very fat, she carried her flesh very evenly."

Queen Anne's winnings in the show-ring amount in all to about £280, including seven silver cups; and she will not be shown again, but kept for breeding purposes.

PLATE II.

GAMOS; A THOROUGH-BRED FILLY.

THE PROPERTY OF MR. W. GRAHAM.

Gamos, bred by Lord Falmouth in 1867, is by Saunterer, out of Bess Lyon, by Longbow, her dam Daughter of Toscar, by Bay Middleton—Malvina, by Oscar—Spotless, by Walton.

Saunterer, bred by Mr. Jaques, in 1854, is by Irish Bird-catcher, out of Ennui, by Bay Middleton. He was sold when a foal for 50 guineas at one of the Easby sales, being booked to John Osborne for Mr. Jackson. During the four seasons he was in training he started fifty-five times, won twenty-seven, and ran second twelve times. He changed hands again previous to coming out as a four-year-old, when Mr. Merry gave at the hammer 2,100 guineas for the black, whose performances on going to the stud were thus neatly summed up: His pedigree shows a combination of blood celebrated for speed and stoutness, both of which qualities he possessed in a high degree—as proved by his running at two years old; his extraordinary performance in the Cambridgeshire at three years old; his winning as a four-year-old the Goodwood Cup and Emperor's Cup at Chantilly in a canter, beating the best English and French horses; and his running second at five years old when half fit to Fisherman for the Ascot Cup, beating off North Lincoln and Defender. He retired in possession of the Whip which he had held for two years. It was thus that we ourselves wrote of him immediately on the conclusion of his first season at the stud, when we met with him once again at the Great Middleborough Horse and Hound Show: "How nicely timed the change does come after so much of the big, beefy Windhounds and De Clares, to that neat, handsome, sweet bit of a racehorse Saunterer—'the black 'un,' as they call him—the truest-made horse of them all, with his well-knit back, his fine shoulders, his wicked little head, and thin, bloodlike neck. And then those legs, not big ones, your lordships, for he is not a big one anywhere, but as clean as paint and as hard as iron. Turn back to your *Calendars*, erudite Mr. Weatherby, and trace all he has done. Go back to memory, Mr. Dawson, or ask your next door neighbour all he could do; and you, Squire Jaques—'the melancholy Jaques' for once, as you stand by him in the box—and reflect how readily you 'got out' of him." Saunterer stood at Croft in 1860 and 1861, and at the end of his second season in York-

shire was sold to go to Hanover, whence he was reclaimed by Mr. Blenkiron for the Middle Park Establishment, where he has continued since the spring of 1866. His stock came out in 1863, and he is the sire amongst other winners in this country of the following: Coastguard, Crisis, Dandle, Olmar, Sir Roger, Zambezi, Attaché, Gertrude, Master Walter, Perambulator, Westley, and Gamos; the winner of the Oaks being amongst the first lot of three-year-olds out by Saunterer since his return to England.

Bess Lyon, bred by Mr. J. B. Shepherd in 1855, ran in a few races as a two-year-old, but without any success. In 1859, she threw her first foal, Blacklock (cut), to Ellington, and then passed into Lord Falmouth's stud, where her account stood thus: In 1860, Edgworth Bess, by Vandermeulin; 1861, Goldylocks, by Teddington; 1862, Brown Willy, by Wild Dayrell; 1863, Rallywood, by Wild Dayrell; 1864, Sunnylocks, by Newminster; 1865, Pearlfeather, by Newminster; 1866, missed to King Tom; and in 1867, Gamos, by Saunterer. Bess Lyon was sold with the Oaks filly at her foot to Mr. Blenkiron for £600, and her produce at Middle Park runs on thus: In 1868, Loadstar, by Saunterer; in 1869, a colt by Marsyas, that was sold the other day for 570 guineas; and 1870, a colt by Saunterer, to which horse the mare had been put again.

Gamos is a light chestnut filly, standing a full sixteen hands, although she looks higher. She has a plain head, not particularly well set on to a lean, ungainly neck. Her forehead, however, is otherwise set off by the most magnificent shoulders, long and beautifully laid. She has also good depth of ribs, but is otherwise a tall, staring filly, standing very straight on her legs, with curby hocks, and altogether middling and infirm-looking joints. Indeed, she was in her appearance as little like running over Epsom and winning the Oaks as anything in the paddock; and we certainly fancied the filly far more than a two-year-old. It is almost needless to say that she does not bear the least resemblance to her sire. At Mr. Blenkiron's sale in 1868 Gamos was knocked down for 220 guineas to Mr. Graham.

It will be noticed that the winners of the Derby and Oaks this year were both bred by Lord Falmouth.

THE CLAYS OF CORNWALL.

BY CUTHBERT W. JOHNSON, F.R.S.

The china-clays of Cornwall are of world-wide reputation. In travelling through that fine county the agriculturist will notice in various districts the very white character of some of the streams. This turbidness is owing to the preparation of the china-clays, which are washed out of the granitic soils, and also from certain mining operations. It will be useful to many a reader of this magazine if we examine the composition of these and other clays; and this will be the more interesting, since much greater attention is now profitably bestowed on our heavy soils than was a few years since deemed useful, better modes of cultivation are adopted, and their chemical composition much better understood.

This muddiness of some of the Cornish streams, caused by the preparers of the china-clay and the miners, is very injurious to some of the beautiful Cornish and Devon salmon rivers, and is the more to be regretted since it is capable of being prevented without injury to the valuable clay and mining operations. How these injure the fisheries, and the easy means of prevention, was not long since described by Mr. Frank Buckland, when addressing, at Exeter, the members of the British association. As he well remarked,

"The question of pollutions on the Devonshire rivers is a very serious one, and here we at once are met face to face by the danger of interfering with the commerce of

the country. According to mine-owners, rivers are the natural sewers to take away the washings of the mine: they therefore put all their pollutions into the river, and these act injuriously—1st, inasmuch as they prevent the fish ascending the rivers. 2nd, they kill them by some soluble or insoluble compound from the refuse of the mine: thus lately, on the Tavy, a mine was pumped out, and no less than seven or eight hundredweight of salmon and trout, small and great, were all destroyed. 3rd, the débris from the mines covers over the gravel, so that the fish cannot find spawning-places, or, having made their nests and laid their eggs, the eggs or young fish become suffocated by the mud. 4th, the pollutions from the mines destroy vegetation: the insects, therefore, are not hatched out, and the young fish consequently suffer from want of food. The 5th clause of the Fishery Act of 1861 gives a penalty for polluting water in which salmon are found; but practically this is found inoperative. There can, however, be no doubt that a system of catch-pits may very much lessen the injury. As an instance of this, I may mention that there were copper-mines near Snowdon which drained into the Glaslyn, passing first through three small lakes or tarns. The one nearest the mine afforded the necessary opportunity for the poisonous refuse to subside; and the fish in it have been completely destroyed, while in the second or third they were not injured in the least. The value of land in the neighbourhood of mines is generally very small, and catch-pits can be made at a slight expense by merely digging trenches in the ground. It very often happens that the washings from pollutions may be conducted along the brow of a hill: small channels should be cut into the main channel, so as to allow the pollution to spread itself out gradually over land which is really of no practical value."

The Cornish china-clays (to which I have alluded) are prepared from the soils resting upon the granite formation, by a process which is well described in Murray's "Cornwall and Devon," to which I am indebted for the following abridged account of the works in the neighbourhood of St. Austel:

In some places the granite is known as "soft growan," and is characterised by the partial decomposition of its felspar. In some localities the growan is tolerably firm, and is quarried under the name of "china-stone," which is extensively employed in the potteries. This china-stone is ready for sale when cut into conveniently-sized blocks. The softer china-clay, which is dug out of pits, and is known as "china-clay" or "kaolin," requires a much greater preparation for the purpose of separating the quartz and mica from the decomposed felspar. This clay is dug up, and placed upon an inclined platform under a small fall of water, and here it is repeatedly stirred with a "piggle" and spade; by which means the whole is gradually carried down by the water in a state of mechanical suspension. The heavy and useless portion of the clays collect in a trench below the platform, while the china-clay is carried on through a series of tanks, in which the heavier particles are deposited, until it arrives at larger tanks or ponds, from which, after resting for a time and depositing its clay, the clear water is from time to time withdrawn. When these ponds are filled with clay, they are drained, and the porcelain earth is removed to "pans," in which it remains until sufficiently consolidated to be cut into oblong pieces. It is then dried, and ready for being shipped. This clay was about a century since first noticed, and I believe prepared, by W. Cookworthy, a Plymouth Quaker.

From small beginnings, the amount of china-clay annually sent from Cornwall is at least 100,000 tons. It is shipped not only for the use of our Staffordshire and other potteries, but to France, Belgium, and other foreign

states. Its use is not confined to porcelain; it is also employed by the calico, linen, and paper makers.

Cornwall is not the only district from whence our manufacturers obtain their clay; there is a large quantity prepared in Dorsetshire, and other places, of varying qualities. That which is shipped from the neighbourhood of St. Austel is sold, according to its quality, at from about 15s. to 35s. a ton. I have no knowledge of the extent of the earthenware and porcelain annually required by our own country, but the exportation to foreign lands is enormous, and is annually increasing. The declared value of the earthenware and porcelain exported in the year 1855 was £1,000,738; this had increased to £1,642,550 in 1869, and in 1870 to £1,778,530.

The origin of this fine clay is interesting. To begin with the granite, by the decomposition of which by the action of the atmosphere its soils are produced; let us first remember its chemical composition. It is chiefly formed in varying proportions of felspar, mica, and quartz. These are composed in 100 parts of the following substances:

	Felspar.	Mica.	Quartz.
Silica	62.83	48.65	97.05
Alumina (clay).....	17.17	29.25	0.50
Lime	3.00	—	—
Oxide of iron.....	1.00	5.05	1.00
Potash	13.00	14.05	—
Oxide of manganese —	—	1.75	0.75
Loss in analysis.....	3.00	1.25	0.70
	100.00	100.00	100.00

The granite, notwithstanding its hard, tenacious nature, is slowly decomposed by the action of the atmosphere, and, when reduced to powder, its constituents are separated with considerable facility; thus the granite pavement of the London streets, which is gradually worn to powder, in that state readily part with its potash, and to such an extent that after rain the street water contains a considerable amount of potash. The formation of the soils of the granite formation was some time since thus traced by Mr. T. F. Jamieson, of Ellon (*Jour. Roy. Ag. Soc.*, vol. xvii., p. 461):

The felspar of the granite in the course of the changes brought about gradually loses its transparency and lustre, the surface becomes dull and earthy, and at length it falls down into a powder. This powder forms the kaolin or porcelain clay; its composition is somewhat variable, but approximates to—

Silica	47.2
Alumina	39.1
Water	13.7
	100.0

A little iron and lime generally remains, and frequently some potash or soda, according to what was the original constitution of the mineral, and the degree of completeness with which the alkalis have been washed out. The following table contains analyses of some varieties of porcelain clay:

	Cornwall. Boase.	Devon. Fownes.	Miessen. Forchhammer.
Silica... ..	39.55	47.20	46.46
Alumina	38.05	38.80	36.37
Peroxide of iron
Lime	0.24	1.47
Potash	1.76	...
Magnesia... ..	1.45
Water	12.50	12.00	13.61
Insoluble matter and tale	8.70

A comparison of these with the analyses given of felspar will at once show what has taken place. When the removal of the alkalis has been complete, or nearly so, a poor ste-

rile clay will be the consequence, but it is rarely that the alkaline silicate is altogether dissolved out. Forchammer considers that the yellow clay of Denmark consists of granite, the felspar of which has been altered, whilst its mica remains unchanged, its quartz forming the sand of the clay; while the blue clay results from syenite and greenstone, which have no mica. The clay derived from the potash felspar is wanting in lime, and not so favourable to vegetation as that from minerals which contain both lime and potash or soda. The red colour of the clay is owing to the presence of peroxide of iron. In the blue clays the colour would appear to be occasionally owing to carbonaceous matter acting on this peroxide and converting it back into the dark protoxide. Thus, below beds of peat, even in districts where the clay is otherwise red, a blue-coloured clay is usually found; and beneath vegetation red marls and sandstones are sometimes seen converted into a green or bluish-green colour, the carbonaceous matter abstracting part of the oxygen.

Sir Henry de la Beche some time since remarked the varying quality of the Cornish granite, and of the soils which rest upon them. He observed how much the fertility of these soils depend upon their elevation above the sea and the amount of rain they received (*Jour. Roy. Ag. Soc.*, vol. iii. p. 31). As he remarked, the relative fertility of the granite soil of Cornwall would appear greatly to depend upon the abundance and easily-decomposable character of the felspar in the subjacent rock; he also remarked that the relative proportion of mica would appear to have an appreciable effect upon such soils, tending to render them poor, due allowance being made for atmospherical influences. These, however, seem to influence very considerably the agricultural value of the granitic or growan soils (Cornish name for gravelly soils). Thus we have been unable to detect any appreciable difference between much of the granite on the high land of Dartmoor and that in the Scilly Islands, in places where both were well decomposed. In the Scilly Islands there is much growan land which is fairly fertile, producing good crops of potatoes, wheat, barley, and grass; while Dartmoor is merely covered by heath and coarse grass, and peat is abundant. In the one case we have islands in the Atlantic of small relative height, upon which snow is rarely seen; while in the other there is an extensive area in the interior of Devon varying from 1,400 to 2,000 feet above the sea, on which fogs are frequent, and snow often falls and rests before it is even seen on the lower grounds. The country around Moreton Hampstead, several hundred feet lower than the mass of Dartmoor, of which it is the geological continuation, forms a striking contrast as to fertility with the high granitic soils on the west of that town. The grass land is generally good, tolerable crops of barley are obtained, the potatoes grown are highly-esteemed in the Exeter market; yet the general character of the granite around Moreton Hampstead, and of that upon much of the adjoining high land of Dartmoor, are mineralogically the same.

Judging from Cornwall and Devon, there are few soils which are more influenced by relative elevation above the sea than the "growan" or granitic soils. No doubt there may be some variation in the mineralogical character of the subjacent granites, and consequently in their relative productiveness; but there is no doubt but that the fertility of the granitic groups of Cornwall gradually increases as they diminish in elevation. The growan soil frequently requires rain, of which, however, there is generally no want in the district. This season (1870) has been in Cornwall the driest ever remembered, little or no rain having fallen from February to September, yet the harvest has been excellent. On these soils potatoes are successfully cultivated. Of the cereals, barley and oats

are the most generally grown: wheat is more so than formerly. Trees, from the abundance of the sea breezes in Cornwall, require shelter. The oak, the sycamore, and the ash then grow well on the growan soils.

The amount of alumina in the clay soils of Cornwall is as various as in other places. In some districts they very beneficially practise the burning of the clay obtained from the substratum. The success of this operation of course depends upon the chemical composition of the clays thus treated, since, as a matter of course, the clay-ashes differ as widely in composition as the clays from which they are produced. We may still, however, form a pretty accurate estimate of the nature of the substances usually contained in clay-ashes from the chemical examinations which have been made. These ashes, the young farmer must remember, not only contain the earthy and saline matters of the clay and of its organic matters, but of the similar substances contained in the wood or other fuel employed in their preparation, with a considerable portion also of their carbon or charcoal; and this last substance, when the amount of ashes employed upon the land is very considerable, is much greater as regards the extent of the application of the charcoal than many farmers are willing to believe; and this evidently leads to another conclusion—that these ashes, from the absorbent powers which they hence possess, are well adapted to have liquid manures or other too-rapidly-decomposing matters mixed with them, either when they are used as a covering to farmyards or compost heaps, for the floors of buildings in which stock are kept, or in the preparation of drill manures. Davy examined the ashes obtained from a variety of soils, principally those by the now-nearly-exploded paring and burning system. He obtained from 100 parts of the ashes produced by paring and burning a stiff clay soil, at Mount's Bay, in Cornwall:

	Parts.
Charcoal	8
Common and other sorts.....	2
Oxide of iron	7
Chalk	2
Clay and sand	81

Supposing, therefore, that 50 tons per acre of these ashes are applied (a quantity often much exceeded), we from this analysis perceive that the farmer must often dress his land (in the ashes) with about four tons of charcoal per acre. And hence we may safely conclude that the good effects of such a dressing must be evident for several years, even if we allow but little benefit to be derived from the mechanical effects thus produced on the adhesive soils to which it is applied.

The cultivators of clay soils may indeed derive considerable benefit, in most instances, from a careful examination of the result of the labours of the chemist. It should for instance, be more generally known that the composition of a clay soil often varies materially at different depths, a fact of very considerable importance not only to the drainer, but to those who are endeavouring to permanently increase the fertility of their soils by deeper ploughings or by the mixture of different strata. To give only one example, an apparently uniform clay being analyzed by Professor Phillips (*Jour. Roy. Ag. Soc.*, vol. vii., p. 258) was found to contain:

	At 22 in.	At 54 in.
Silica	59.0	72.9
Alumina	23.5	13.4
Per oxide of iron.....	8.1	6.6
Carbonate of lime	1.0	0.8
Water, sulphate of lime, &c. ...	4.8	5.5
Carbonate of magnesia	0.0	9.8

And again, some valuable experimental researches upon the clays adapted for tiles were made by Professor Johnston. He found various infusible or fire clays to be com-

posed—1, from Cool Island; 2, from Stourbridge; 3, from Stannington; 4, from Howth, as follows:

	1.	2.	3.	4.
Alumina	30.8	38.8	40.9	23.2
Silica	46.2	46.1	43.0	67.96

Our tiles and bricks clays, says Professor Johnston, are usually red naturally, or become so when burned. This shows the presence of oxide of iron, one of the ingredients which tend to make them fusible. Many also contain lime, some in very considerable proportion. Magnesia is by no means uncommon, while potash and soda are always present in quantities more or less appreciable. It is the presence of these ingredients which gives to our bricks and tiles the burned, glassy, swollen, and porous appearance they occasionally present, and which at times, in the hands of a careless or unskilful fireman, causes them to run together into one melted mass. The following is the analysis of four varieties of good clay: 1, being from Cattle Hill, near Dunferline; 2, from Sherburn Hill, near Durham; 3, from Tullarone, county of Sligo; 4, from Portobello, near Edinburgh:

The very important practical conclusion to which the Professor arrived will be readily responded to by every agriculturist: "The cheapening of tiles is at present an object of the highest national importance. Our machines for making tiles, and for screening or washing clays, will not come into general use till the persuasion is every where spread that there is no clay so apparently bad, which, by a skilful preparation, may not be made fit for the manufacture of tiles." The absorption of water by various specimens of tiles and other building materials is often a question little regarded, especially in those cases where it is important for the sake of collecting rain-water for cattle, to employ for roofing a material which will not absorb the rain. The following table shows the result of our own trials to ascertain the amount of water absorbed by 1, a red brick; 2, a red pantile; 3, a square roof tile; 4, a slate, which the farmer will note does not absorb any water. This table shows the weight of the

material, after being dried for three hours in an oven, and then after being immersed in water for a quarter of an hour:

	WEIGHT.					
	Dried,		Soaked,		Increase.	
	Lbs.	Oz.	Lbs.	Oz.	Lbs.	Oz.
Red brick	6	6	7	8	1	2
Red pantile ...	4	11	4	13	0	2
Square roof tile	2	14	3	2	0	4
A slate	5	11	5	11	0	0

It was in the September of this year, when on a pilgrimage to the beautiful little Cornish port of Fowey, these facts engaged my attention. To this place, by means of the Lostwithiel railway, about 100 tons per day of the china-clay are brought and shipped. I have on former occasions alluded to the many other very interesting objects which Cornwall possesses; the noble cliffs of Grauwacke—serpentine and granite—with which it is environed; the brilliantly bright sea water, which rolls its waves against them; its minerals; its calcareous sea-shore sands and sea weeds, so extensively employed as manures. Its fisheries too are of abounding interest to the pilgrim from the more level portions of our island: and such a traveller, if an agriculturist, will not fail to notice the skilful way in which the cultivators of this noble county adapt their operations to the mildness and moisture of the climate and the hilly nature in general of their farms.

The live stock, cattle, sheep, and pigs of Cornwall especially attract the visitor's attention, and as he arrives in the neighbourhood of Penzance, the extensive districts devoted to the growth of brocoli and early potatoes will be examined with considerable interest. These occupy very many acres around Mount's Bay, and are extensively manured, besides the ordinary farm manures, with sea weeds. The quantity of these vegetables sent to the metropolis by railway is very large. The average annual despatch of early potatoes from the Penzance railway station for the past four seasons is 2,337 tons, and of brocoli 2,627. The largest total of potatoes was in 1863, when 3,146 tons were sent off, and of brocoli in 1868, when the quantity was 3,571 tons. This year 2,591 tons of potatoes and 2,574 tons of brocoli have been despatched.

The wanderer from other lands will also not fail to note the intelligence and courtesy of the Cornish men, their air of general comfort, and the absence there of anything like a beggar. Such a visitor, to, will recall to mind, when he remarks their very numerous fishermen and their sailors, that these are the men from amongst whom came many a noble British admiral who have well helped to preserve our empire of the sea, from the days of the Crusaders and the Armada, to the time of our own glorious Queen Victoria.

FORBIDDEN FRUIT AT THE AUTUMN SHOWS.

During the last fortnight or so the local agricultural shows have been at their full tide. Occasionally there have, no doubt, been too many meetings of the same kind in the same district to invest any one of these with any particular importance; nor, moreover, has the actual success of such exhibitions been altogether up to an average. Shortness of keep, the spread of the Foot-and-Mouth disease, with some other concomitant causes have thinned out the entries; while it looked at one time as if the consideration of any farmer's business would be crowded out at the after-dinner sittings by the one

absorbing topic of the day. In our ECHOES, a very good opening having been made at Leamington; at least as so it seemed, by the introduction of such matters as the desirability of extending the Lincolnshire Tenant-Right, of removing much of the hedge-row timber, and of keeping down the ground game. But all this, as it turned out, was all wrong; and, indeed, as the President subsequently hinted, if he had done his duty he should have called any speaker to order who "wandered into points likely to create differences of opinion and discussions hardly fitting for a meeting like the present. You must remember there

is a Chamber of Agriculture to which these matters more especially belong." Very good; or at any rate, let us say in passing that farmers have no right to talk about agreements, or timber, or hares and rabbits, as members of a county Agricultural Society, but to refer all such grievances to their county Chamber of Agriculture. Now it does so happen that one of these Chambers has been started in Warwickshire, and that only during last spring the Game Laws were very vigorously handled by that body, the proceedings terminating with the following straightforward resolution: "That rabbits and hares should be the absolute property of the occupier of the land, and that any agreement to the contrary between landlord and tenant should be null and void." Whereupon Lord Aylesford, in a letter of three lines, ordered his name to be taken "from the list of subscribers to the Warwickshire Chamber of Agriculture;" and Lord Warwick, in a more lengthy communication wrote to "explain the reason of my absence from their later debates. I do not go so far as to assert that the working of the Game Law is not a legitimate subject for discussion by a Chamber of Agriculture, but I will say that, considering how liable it must be to produce antagonism of classes, it should only be entered on in a moderate and kindly spirit"—and so on. In fact, so far as we can understand its tone and purport, Lord Warwick's letter reads vastly like a censure on the Chamber for ever taking up the game evil.

And now what is to be done? At Leamington Lord Warwick, as President of the Agricultural Society, says the game question is hardly a fitting point for the meeting to consider, and to this Lord Leigh says *hear! hear!* Turn it the rather over to the Chamber of Agriculture; and when the Chamber did take up the point Lord Warwick did not go quite "so far as to assert it was not a legitimate subject," but he intimated pretty well as much, and Lord Aylesford stopped his subscription. What is to be done? we ask. No one, we imagine, will be bold enough to maintain that the over-preservation of game will ever be corrected without protesting against the abuse! But then where are the farmers to do as much? Not at the agricultural dinners, or the noble chairmen will call them to order. Not at the Chambers of Agriculture, or the noble presidents and vice-presidents will keep away and stop their subscriptions. "I was not aware," wrote Lord Warwick in his famous letter, "that hares and rabbits had gone so far as to take the streets of Birmingham by storm;" but if the farmers are denied their opportunity elsewhere, the streets of Birmingham will take the hares and rabbits by storm, as there will be nothing else left for it but "urban indignation," the Farmers' Clubs, and the House of Commons.

Lord Warwick, as President of the Warwickshire Agricultural Society, thought they had wandered too much on to points hardly fitting for the meeting; such "points," as we take it, being *faria* agreements and heavy game-preserving. These topics were here introduced by Mr. Horley, a tenant-farmer; while at Walsall, Lord Hatherton, as President of the Staffordshire Agricultural Society, dwelt on precisely the same subjects: "All that was required was a simple, short, and fair agreement between landlord and tenant, with liberal covenants, and a covenant as to unexhausted improvements in case of outgoing tenancy. There could not be any difficulty about unexhausted improvements, because he thought that building and draining were the work of the landlord; and when he could not do it the tenant ought to be able to go to the landlord or his agent, and come to an understanding as to how he was to reconp himself for those improvements in case he became an outgoing tenant. There should be a liberal covenant with regard to unexhausted value of

maure in the soil. He held that with regard to that the tenant had a Tenant-Right." Again, he "depreciated in the strongest terms that modern system of cramming an estate with game to the great detriment of the land." Now it is evident enough that Lord Warwick would call Lord Hatherton to order, as if anything Lord Hatherton spoke only still more forcibly than Mr. Horley on "points hardly fitting for such a meeting." Then, at Tarporley, Sir Philip Egerton, the chairman, ran riot on exactly the same line. He talked chiefly, if after rather an odd fashion, of agreements and game: "No written document was equal to a good understanding between landlord and tenant—a mutual feeling of dependence one upon the other—a feeling of honour between man and man, and Christian man and Christian man." Surely, if a landlord in the chair thinks fit to express himself in this way, the tenant may be allowed a word or two, if only to say that the clearer the understanding the better, and the greater the feeling of dependence the worse in the long run for everybody.

However, as Lord Warwick cautions us, these matters are apt to get "somewhat personal"—"to require a reply"—"their discussion may lead to certain disagreements," and so on. In short, according to Mr. Caldecott, "Mr. Horley had lifted up two landlords, as if there were no others like them in the county," and Mr. Caldecott emphatically "would not have it." Thrice happy Warwickshire! Where, of course, every landlord gives his tenants the privilege to kill the ground game, sanctions the system of compensation for unexhausted improvements, and returns them the whole of their rent on the wheat land. In truth, it became such very bad taste to single out one or two when all were doing so well, that Lord Leigh at last protested that he

Did good by stealth, and blushed to find it fame.

"My private feelings led me to see that it would be better for me to give up ground game to my tenants, and I did so for that reason. But I never expected it would pass beyond my own tenantry. It got into the newspapers, and it has been to me a source of annoyance, as it appeared as if I wished to dictate to my neighbours." This naturally will only increase the dilemma. If we are not to talk about it, if we are not to cite a good example when we can, how are we to work upon those "private feelings," which leads landlords to do precisely the contrary? For our part we are inclined to think there is no better argument than an example, good or bad, and we would make the most of it.

At the Judges' dinner at Walsall the other day, we heard Mr. Masfen declare that, "as to the game question, there was no man who had a greater horror than himself of being game-eaten; while, at the same time no man had a greater horror of the question being taken up and used as political capital, as it had been by certain persons during the last twelve or eighteen months. It would be in his power to single out certain gentlemen, and he need not go many counties distant to find them, who had spoken very liberally upon this question for political purposes, but whose actions would not bear reflecting upon, their tenants suffering more from game than the tenants of any other landlords in the county." Now, good as this is, would it not have come all the stronger if the county not so far off had been named, or even the gentlemen who speak so liberally and act so differently? Still there is a wholesome tone in all this; and the moral of it is, that people who attend agricultural dinners with the idea only of paying vapid empty compliments to each other had by far better stay away, whether they be noble lords or tenant-farmers. It is a nice question, indeed, whether men who have nothing more to say should not at once be called to *order*.

THE NEW FOREIGN CATTLE ORDERS.

Mars, the God of War, has been depicted as attended by fire, famine, and pestilence, with an innumerable brood of minor evils, the offspring of the same malevolent trinity, in his train. The sudden outbreak of the rinderpest in Germany and France, therefore, is but the natural offspring of things, and another power of evil let loose to do mischief to mankind. Pestilence amongst cattle will now produce scarcity in the districts already eat up by mighty armies, and scarcity will probably produce famine, and famine pestilence, amongst the populations also debilitated by privations of almost every other kind. And thus the ministers of evil assist each other. Impressed with this tone of feeling, the public received the announcement that the cattle plague had appeared in Germany, with some apprehension; but the information still more recently published, that the rinderpest has already run through Germany, the whole of northern France, and invaded Belgium and Holland, startled the agriculturists of England as much as any news published during this year of stirring events. Now we would not endorse any alarmist sentiment, nor deal with a real danger and matter of fact in the sensational manner that is now so common, thanks to the special correspondents of the present day, like George Colman's friend, "two single gentlemen rolled into one," combining the author and artist, and *drawing*, therefore, doubly on imagination, in their confidential poupouring to the listening world. Still, it is possible to light the danger beacon without setting the old country on fire; and, therefore, while the facts are in themselves real and serious enough, there is no justification for giving currency to the opinion that the authorities are asleep or inert, and are not adopting every necessary precaution within their reach.

The plague, it appears, has been brought from Podolia and Hungary, where it seems to be permanently naturalized in the numerous herds of cattle that have been sent to Berlin for the use of the German armies. From Berlin the speed at which it has travelled is unprecedented. On the 8th of September, Mr. E. Eardley Wilmot, of the Privy Council Veterinary Department, writes that "information has been received of the existence of cattle-plague in Kaiserlauten;" and in a few days afterwards we learn that, after reaching Kaiserlauten, it immediately appeared at Saarbrück, in the French department of the Moselle, and at Bar-le-duc, only 70 miles from Paris; after which it spread with marvellous rapidity through Belgium to the Dutch district of Leyden, near Rotterdam. In fact, originating with the cattle convoys moving westward for the armies, it has out-distanced them, and, over-running the armies themselves, has spread over Northern France, Belgium, and Holland. To meet these facts, so far as they bear on our own circumstances, we have to record that the Privy Council has acted promptly and energetically. It has also officially announced that Holland and Belgium have both been in the list of scheduled countries "since the passing of the Act of 1869," and that, therefore, they have not been specified in the recent Order in Council dated the 9th of September, by which, immediately after the 14th of September, France takes its place on the list of scheduled countries; and all the regulations in the 4th schedule of the Act of 1869 apply to cattle brought from any port of France. This determination was arrived at by the Privy Council only "from the probability that her cattle may become infected by those which are sent from

Prussia for the use of the German armies." How quickly the probability has become a certainty is well known; and the decision of the Privy Council was certainly not a moment too soon, and we have a strong hope that it was not a day too late.

So recently as the 20th instant, the Council issued another important Order, by which all the regulations in the fourth schedule of the Act of 1869 "shall apply to sheep and goats brought to Great Britain from any port of the States of the North German Confederation or France, and landed in Great Britain; and all such sheep and goats shall be slaughtered within ten days of the landing thereof." It also orders that "with respect to cattle, sheep, and goats brought from any port of the North German Confederation or France, and landed within the Port of London, no such cattle, sheep, or goats shall be landed, except at places approved of by her Majesty's Commissioners of Customs, and set apart for such purpose, and, notwithstanding any order to the contrary, no animal shall be moved alive out of any place so approved and set apart." Moreover, "the Government here has issued instructions to Customs' officers at all the ports to exercise the strictest scrutiny and vigilance in the examination of foreign cattle;" and upon this and the ample means of information which Mr. Forster says the Government possess, we have to rely.

The recent Order in Council has been properly and promptly issued. What, however, is really wanted is the long promised new market for foreign cattle, on the banks of the Thames, and why have we not this? Is the Act permissive, or is it passed in one Session, with liberty to defer its being put into force to an indefinite time? If so, if it be not put off till the Greek Kalends, it will certainly be a dead letter until too late to prevent infection. If, however, it be the fault of the Corporation, we hope the Privy Council will look to it. Nero fiddled when Rome was in flames, and we have no doubt the civic authorities would still feed on turtle, and punish costermongers, while our herds were perishing. It was said by Sydney Smith that we should have no safety on railways until a bishop was smashed in a tunnel; and we believe that if the Privy Council had had Star Chamber powers, and had put the aldermen of the city upon vegetable diet immediately the Foreign Market Act had been passed, until its provisions were carried out, we should at the present moment have had such a market on the banks of the Thames, and London would now have been placed in the same position for preventing the spread of disease from foreign cattle as our provincial ports are. Still there is hope; on only Tuesday last *The Times* announced that "to-day Government will be asked by the civic authorities to sanction the purchase of a site for the proposed Foreign Cattle Market. This site is Deptford Dockyard, the sale of which by the Admiralty gave rise to certain questions at the close of the late Session. It is understood that the City Markets Committee has entered into an agreement to re-purchase 22 acres, for the sum of £91,000." This would look like land at last; whereas *The City Press* of Saturday declares emphatically that "whatever amount of truth there may be about this statement, one thing is quite clear—it is premature. The matter has not yet been decided upon by the Court of Common Council."

THE AUTUMN STOCK SALES.

"Well," drawled out a quaint country auctioneer, as he dropped down from his perch after a terribly dull sale on the Southdowns, "Well, I only wish we could have had that French gen'lman here again to-day!" And many will echo the aspiration; for, as our report of the Biddenham gathering runs, "it was remarked that the usual visitors from the Continent were absent, and it is probable there was also a deficiency of those foreign commissions which give so useful a stimulus to sales of this kind." Precisely so. We care not what breed it be—Southdown or Leicester, Oxford or Shropshire, Cotswold or Lincoln—but everywhere has there been the same deadness of trade, as we do not believe there has been a letting during the season but where the result has been considerably under an average. In many cases business has been so bad, that the auctioneer has discreetly declined to go through the catalogue, but preferred that anyone in the company should "call" any sheep he might fancy. At Hove, Mr. Turner, the chairman at the luncheon, said "the animals brought out might be in a lower condition than usual; but that was easily accounted for by the shortness of keep they had been suffering from. They had felt the effects of both a cold spring and a very dry summer; and, in fact, the weather had been against them ever since the beginning of March." This may be something, but not much, as we question whether a home customer, more especially, would care about hiring a ram for use in the same high flattering condition in which he might have been sent to take honours at Oxford. Indeed, at a Lincolnshire letting Mr. Dring, of Claxby, declared that "on these occasions he should be glad if the breeder could vouch that there were no sheep amongst them fed on anything but green food for the last six months. If kept on green food they would be leaner, few sheep would fall lame when they got them at work, and there would be more work in them." With the general shortness of keep, farmers may not care so much about extending or even maintaining the strength of their flocks; but the real secret of that slackness, which it would be only idle to ignore, is the absence of the "French gen'lman" and "the deficiency of those foreign commissions."

But there are lulls in most trades; and, although the ram-breeder may find more sheep on his hands than he quite likes to see, he can so far have no great reason to despair. The scientific cultivation of the sheep was never carried to so great a height as it is just at present. At Oxford and Manchester these sections supplied the chief features of the show. The Shorthorn may have driven out the Longhorn, and the Devon may be gradually dropping back to his home in the West; but the more varieties of sheep there are "invented," the more people would there seem to be ready to use them. The Leicester and the Southdown in their purity were never more appreciated, although wide ranges of country be covered with Shropshires and Oxfords and Lincolns. "No ram breeder," as it was said in a kind of commentary on the career of Bakewell, "ever died a rich man," and yet no one should be capable of doing more good in his degree. More modern practice, however, would go to dispute the truth of such an axiom. During the early autumn it is impossible to look into a local Journal without reading of the profuse hospitality, the genial welcome, and the jovial after-sitting associated with the annual letting of the famous Grange longwools or Hill-side shortwools, as the case may be.

The war, no doubt, has much to answer for, but even a Continental war cannot in these times be of very long duration, and Hope may still be found at the bottom of the box. It must be remembered that during the civil strife in America, "the Shorthorn fever," as it was termed, seemed to have quite died out. The rage, like the mania for tulips or Cochín Chinás, had quite spent itself—we should never see such prices again—a more wholesome tone would rule henceforth, and so on. And really for a season it did look as if this were going to be the case. But as we all know well enough highly-bred stock is again as highly or more highly prized than ever. A heifer now is worth more by some hundreds than the best bull would realize some few years since. And the secret here again is, if not precisely the presence of "the French gen'lman," at any rate the influence of "the foreign commission." Nothing does so much to make a sale, either public or private, as the fact that the foreigner is a buyer. Let the ram-breeder then bear this in mind. Just for a season his market is shut up by the war, as it might have been by the cattle trade; but his turn will come again, and probably with a better average than ever, so that we would counsel him not to lose heart, not to miss his opportunity on the show-ground, nor relax his energies in the sheep fold.

In sober truth, putting our Canadian and Australian customers out of court, the business done with good-pedigree cattle is hardly in a more encouraging condition than the demand for carefully-bred sheep. Week by week almost some of our contemporaries, with more nerve than we quite own to in this way, will not only announce but anticipate the highly successful dispersion of some renowned herd, which is about to be brought to the hammer. These notes of admiration will dwell on the excellence of the tribes, the curious felicity of the crosses, and the imposing appearance of the animals themselves. And yet the results have often been hardly worth reporting, if, indeed, they have not been here and there systematically suppressed. During the Royal meeting in July people were not particular for a thousand or two as to what they gave; and since then many a *Herd Book* entry, good to trace and good to look on, might have been picked up for twenty or thirty sovereigns, so strong are the vicissitudes of the trade, or so whimsical the vagaries of fashion. This is demonstrated in many different ways. We have, in turn, imported at long prices, Shorthorn stock from America, and we are now busy buying up horses from France. The stud of the Count Lagrange in which the Emperor of the French was always supposed to have an interest, came to the hammer at Tattersall's, when the highest price we believe ever given for a stallion was obtained for Gladiateur, a French bred horse but a brilliant performer in this country; and there is something pertinent to the theme we are touching on in this purchase. Some two or three years back it was declared that the thorough-bred yearling sales had seen their best day; that, with the decline of two or three young noblemen would follow a decline in the value of young stock; and, in the face of this, Mr. Blenkiron, who has just bought Gladiateur for 5,800 guineas, has seldom known a better average for his yearlings than in 1870, if ever, indeed, he had sold so many so well. But the trade stops here; as with Mr. Booth or Major Gunter, nothing goes down with your racing man but Middle Park or Hampton Court; and elsewhere thorough-bred stock has been fairly given

away. Nay, often enough during the past summer, lot after lot, like a Shropshire or an Oxford later on, has been sent back without a bidding. But then, like Major Gunter, Mr. Blenkirton has laid the foundation of his stud with a lavish hand. In truth, if no one obtains higher, no one gives higher prices; and he is continually buying. A dearer bargain, so far, than Gladiateur was perhaps ever known. As utterly untried at the stud he could not, in reason, be appraised at half the money; for it by no means follows that the best race-horses turn out the best stallions; while he is faded in his appearance, having scarcely laid on any flesh since he was put out of

work—a not altogether wholesome sign. But the bystanders cheered the bidding; and whatever may come of it, a fact such as this will bring over many a customer hereafter, or so soon as peace shall be again restored to the Continent. An old saying maintains that the best articles are the cheapest, no matter what they cost; and Turner, the painter, always bought up his own pictures at an auction if they were going low, as he found in the end it paid him to do so. Let the moral of this commend it to any one who is looking out for a ram, a bull, or a horse. The money is sure to come back again some day or other.

SALE OF MR. C. R. SAUNDERS' HERD OF SHORTHORNS,

AT NUNWICK HALL, PENRITH, SEPT. 23, 1870.

BY MR. JOHN THORNTON.

It seems scarcely fifteen years ago since we sojourned in the north, saw Windsor win at the Royal at Carlisle, and then looked over Mr. R. W. Saunders' herd (father of the present man) previous to its sale on the Tuesday of the last week in July. Pedigrees were then not accounted of so much fashion as now, although a roan six-year-old Gwynne cow did make 70 gs., and went to Holker Hall; while the top price of the day, 150 gs., was given for the white Filigree, grand-daughter of Richard Booth's Fame, strangely enough by Mr. Alexander for Kentucky. Abraham Parker (9856) had reigned supreme in the herd after his victory in the Northern show grounds—the Edgar of the present day—and left behind him a number of whites and light roans. Pearls, too, were thought more of than now, and we remember a white cow making 60 gs. from Mr. Cartwright, of Northamptonshire—the Oliver of the period—and her white calf 50 gs. by a local man. Then, as now, there were a lot of aged bulls going at a trifle over butcher's price, Sir Harry Gwynne (12080) to Scotland for 30 gs., and Sir Charles (12075) secured for the district at 45 gs.

We found the ring pitched on the same little knoll, opposite the triangular roof of the bull houses, and encircled with the trees, which had thickened in foliage with their years, but with this addition, that the ground was surrounded three parts round with a strong amphitheatre of seats four deep, giving the scene more the appearance of a Spanish bull fight than a peaceful bull sale. The day, bright, warm, and cheerful, spent among green fields of rich pastures and picturesque scenery, was a happy contrast to the previous one, when at the Penrith show we lounged through the cattle and watched the excitement of the multitude in their delight at the hurdle jumping. Many faces at the show were present in the pastures, where the cows and heifers were more conveniently seen than in the byre, certainly with its calf stalls the most compact we have found in the north. The road was very full all the morning, and a waggonette and pair, with the Duke of Devonshire and Col. Towneley, Lord Skelmersdale's representatives, Messrs. Atherton, Baxter, and others broke down with its load. The cows showed to much advantage, and might really be termed a fine lot, especially old Waterloo 18th and her daughter the massive but doubtful Waterloo Duchess. Calves, milk, and a bad time had pulled the three-year-olds down; but we fancied Wallace had much to account for as well, as none of his produce would bear critical examination. The two-year-olds and yearlings were as pretty as paint, and in that happy condition of flesh, fat enough to please, and lean enough to breed; good treatment, in the shape of meal and crushed cake seemed to agree

with them, as well as careful treatment by the burly George, whose figure was as round as the Edgar he has so frequently led out. Still they might have been fresher, especially the bulls. A covered rick barn made a capital place for the luncheon, at which Lord Kenlis, supported by Earl of Dummore, Lord Skelmersdale, Col. Kingseote, Sir Harry Vane, Captain Gandy, and Mr. J. P. Foster presided. The usual Royal toasts preceded Mr. Saunders, whose brief reply led to brevity in the remaining speeches, for no sooner had the first 180 lunched than a rush was made outside to refill, and altogether we heard 587 hungry mouths were filled. The massive Edgar, and his equal rotund and handsome son, Lord of Nunwick, were paraded in the amphitheatre after the first company had lunched, and Mr. Thornton at half-past one was at his post in the centre of the arena; but it was remarkable how slowly each lot was put up. "Twenty guineas" was some time coming, whilst the old twelve year Waterloo 18th, from Shethiu, a true-made Shorthorn, walked slowly round. Bid after bid came out chiefly from the local men, and a young exhibitor and neighbour, got her at 34 guineas. Jenny Deans, with her bad crops and fine rich quality, made but half the price she fetched from Mr. Spearman at Bushey in '62, but she left her grand hair and quality to all her descendants. This however, with a line of sound blood going back to Chas. Colling's Daisy, did not take the public fancy, as none of her tribe sold high. The dam of Edgar, young Emma, was a beautiful cow, with much elegance and the same grand quality, but her teeth were bad, and she lost her cud, so she was not offered. Lot 6 was the highest-priced cow at Brayton, in '67, when Mr. Chas. Saunders gave 125 gs. for her; she had deepened, but was not massive, although very elegant, while she soon ran up to 81 gs., and went to a friend who sat beside Mr. Fawcett. Lady Elvira from Countess Emma, granddam of Edgar, was really a beautiful cow, full of quality and substance, but with short, lumpy quarters; she went to Lord Dummore, who, like Mr. Foster of yore, seems to go in now more for heavy flesh and good animals than pedigree. The first Gwynne was not handsome, still her blood sold her, for two Cumberland men wrestled well from 30 to 71 gs. One of the grandest and most stylish lots was Waterloo Duchess; she has slipped once and never bred, and seemed altogether so doubtful that she made but a speculative price. Duchess Emma had a plain head, and was common coloured, notwithstanding Ninth Grand Duke, her sire; but Wild Eyes Duchess was for many the cow of the day. Different to what we generally find a Wild Eyes, she was immensely wide and round, with a long neck, pretty good shoulders,

and very good quarters, and full of Bates' style; as probably one of the best of the sort out. Lord Skelmersdale, Mr. Baxter, Atherton, and many were in, but finally Mr. Jacob Wilson and Lord Dunmore opposed, and, for a wonder, Scotch blood was beaten, and she was bought for Mr. Cochrane, of Canada, whose purse seems bottomless. Fleda's Farewell, also by Ninth Grand Duke and out of the 155 gs. Knightly Fleda, was a very handsome animal, and his lordship secured her at nearly half the price of the more fashionable Wild Eyes. The produce of Wallace seemed hairless and light fleshed, and in the next dozen lots, a couple of Waterloo cows with unfashionable crosses sold well, a white "Bates upon Knightley" better, as soon after the roan and almost pure Waterloo 36th entered. The biddings were very rapid, from 100 up to 300 in no time, and then Mr. Jacob Wilson and Mr. Oliver were in up to 450, after which Lord Kenlis bid and finally beat the Captain at 475 gs. The excitement of the company could be restrained no longer, cheers again and again burst out, especially as it was known the lot was to remain in the North. The next animal was the great lot of the sale, as her pure pedigree by Mr. Foster's Royal Cambridge—old Moss Rose's son—out of Mr. Bolden's Waterloo 31st, made her about the third best Waterloo in the kingdom; although not particularly a handsome red, and somewhat disfigured by a hip down. After the excitement of the last, the biddings were not so easily caught; but it seemed that Mr. Wilson and Mr. Oliver were again at it, with Lord Kenlis to the rescue, for at 470 Mr. Oliver gave 500, and the glass ran finally. Once more the company cheered, and the place presented a wonderful sight. Not only was the raised platform crowded, but the people climbed upon the roof of the bull-houses, even to the pinnacle, and even the branches of the trees all around were filled. It was considered that fully 1,500 to 2,000 were then present. The two succeeding lots went cheap enough; but when the yellow red, own sister to Waterloo 36th, entered, the audience was as quiet as a church congregation, every bid rang out, from a hundred upwards, and Lord Skelmersdale opposed: though Mr. Wilson got in at 300, and she joins the Wild Eyes cow for Canada. An exceedingly pretty roan heifer by the same sire, and out of lot 1, was secured by his Lordship at half the price. False Fanny, a very pretty roan hairy daughter of Edgar's out of Ellen, a Knightley cow, drew forth many bids, and finally Mr. Foster and Mr. Hay settled down until the latter was beaten. Elfin Deans had rich hair, colour, and a fine quality of flesh, and she went cheap enough to Mr. Dalzell; Mr. Hay securing the next lot of the same tribe, only a lighter roan, for New Zealand. Then came another daughter of Edgar's out of the pure Waterloo 31st. Mr. Graham began the contest early, and at last he and Lord Kenlis were the only bidders, when the Commoner won at the high sum of 360 gs. There was great substance and plenty of hair in this one-year-old, and Mr. Graham got two substantial ones as the nucleus of a new herd at Tamscroft, over Darwin. The calves galloped round the ring to the delight of the company. Fille d'Edgar, own sister to False Fanny, was equally as pretty, and Mr. Foster secured her also. The most attractively-bred calf was from the Wild Eyes cow; although a nice one and of a good colour, she seemed rather flat in the ribs, but Lord Dunmore at last purchased her in lieu of her dam, and Mr. Fawcett's friend took the pretty Princess Alexandra's calf at 53 gs., though her sister, Princess Beatrice by Kildonan, was no taking lot, what with her black nose. The other calves sold well.

Edgar walked gaily round the ring; and it would be difficult to find a fresher looking bull, or more active at his age, rising eight years, even fleshed with grand hind

quarters and splendid hocks and hind legs. But the public were slow to bid at him, until a butcher ventured 50 gs.; then Mr. Brockbank bid, and Mr. Thomson took it up, until a hundred was called; a nod from Mr. Brockbank was as good as five, "ten" said Mr. Thompson, and the glass runs, "going at 110 and—gone!" Lord of Nunwich, his son and from a pure Waterloo dam, was next brought in, and was very much like his sire, with perhaps a trifle more elegance. Mr. Messenger, who was bidding for Australia, went well along up to 200 gs., and then stopped, so Mr. Wilson got him for his own and his uncle's use at Shotley Hall. Earl of Eglinton, by the Duke of Devonshire's Tenth Grand Duke, although a good sire, was bad girthed and short-quartered, with his tail close in his back, so that Mr. Brockbank soon secured him, and Mr. Lambert, who had hired Wild Boy, a level fine bull, bought him outright at 50gs., notwithstanding his lameness. General Williams was impotent, and Waterloo Boy, who had served most of the heifers, although narrow-backed, sold well at 89 gs. A Company of tenant farmers had formed to buy one of the best bulls, so they went in for Edgar's brother, but dropped off at 5 gs. over 30 gs. each man, and he goes to Australia cheap enough at 130 gs. This was by far the best bull of the sale. The competition was very slow and heavy for the calves, still they averaged well, and biddings were good when once started, though the long time that elapsed in putting them up sadly hindered the sale. A more pleasant one we rarely remember, bright and cheerful; while, compared with the last, the result is astonishing. No large herd since 1867 has made so good an average, and it is nearly £10 above the great return for a smaller herd sold in the spring at Edebridge, Kent, and hitherto the highest this year. Subjoined are the prices.

COWS AND HEIFERS.

- Waterloo 18th, roan, calved April 23, 1858, by Bosquet (14183), dam Waterloo 15th by The Hero (10934).—J. Lamb, Cumberland, 34 gs.
- Ellen, roan, calved May 3, 1858, by Prince of Glo'ster (13517), dam Fleda by Grey Friar (9172).—A. Metcalfe, Westmoreland, 52 gs.
- Jenny Deans, roan, calved March 9, 1859, by Great Mogul (14651), dam Young Daisy by Zedig (8796).—J. Lamb, 42 gs.
- Young Emma, roan, calved January 5, 1860, by MacTurk (14872), dam Countess Emma by Heir-at-Law (13005).—Unit to offer.
- Lady Emma Oxford, red and white, calved April 7, 1862, by Eighth Duke of Oxford (15939), dam Countess Emma by Heir-at-Law (13005).—W. Parker, Penrith, 45 gs.
- Princess Alexandra, roan, calved March 10, 1863, by Eighth Duke of Oxford (15939), dam Catchit by Earl of Dublin (10178).—Malcolm, Carlisle, 81 gs.
- Lady Elvira, roan, calved June 6, 1863, by Lord Oxford (20214), dam Countess Emma by Heir-at-Law (13005).—Earl of Dunmore, 84 gs.
- Flower, roan, calved March 16, 1864, by British Prince (19354), dam Fleda by Grey Friar (9172).—J. and J. Gaitskill, Whitehaven, 54 gs. And white cow calf by Earl of Eglinton.—T. Dalzell, Whitehaven, 19 gs.
- Clara Gwynne, white, calved April 17, 1864, by Prince Patrick (18633), dam Nelly Gwynne by Old Rowley (15020).—J. Thorn, Cumberland, 71 gs.
- Waterloo Duchess, roan, calved June 7, 1864, by Ninth Grand Duke (19879), dam Waterloo 18th by Bosquet (14183).—Rev. P. Graham, Lancashire, 55 gs.
- Duchess Emma, roan, calved December 3, 1864, by Ninth Grand Duke (19879), dam Countess Emma by Heir-at-Law (13005).—W. Sayer, Penrith, 51 gs.
- Wild Eyes Duchess, red, calved February 3, 1865, by Ninth Grand Duke (19879), dam Wild Eyes 19th by Lablache (16353).—M. H. Cochrane, Canada, 275 gs.
- Fleda's Farewell, roan, calved March 20, 1865, by Ninth Grand Duke (19879), dam Fleda by Grey Friar (9172).—Earl of Dunmore, 140 gs.

Effy Deans, white, calved January 18, 1866, by Edgar (19680), dam Jenny Deans by Great Mogul (14651).—T. H. Parker, Carlisle, 50 gs.

Lady Fanny Oxford, red and white, calved February 23, 1866, by Valiant Duke (23111), dam Lady Emma Oxford by 8th Duke of Oxford (15939).—W. Thompson, Tebay Westmoreland, 50 gs.

Pearl Brooch, roan, calved February 27, 1867, by Wallace (23166), dam Pearl Powder by Ninth Grand Duke (19579).—Dixon, Northumberland, 50 gs.

Fair Fanny, roan, calved March 7, 1867, by Wallace (23166), dam Ellen by Prince of Gloucester (13517).—J. Morton, Kendal, 55 gs.

Waterloo 22nd, roan, calved April 2, 1867, by Kildonan (20051), dam Waterloo 20th by Cherry Duke 2nd (14265).—Dixon, Northumberland, 71 gs.

Annie Gwynne, roan, calved March 30, 1867, by Wallace (23166), dam Clara Gwynne by Prince Patrick (18633).—G. H. Head, Carlisle, 67 gs.

Waterloo 34th, red roan, calved May 10, 1867, by Wallace (23166), dam Waterloo 18th by Bosquet (14183).—B. Baxter, Yorkshire, 82 gs.

Indian Squaw, red and a little white, calved October 7, 1867, by Wallace (23166), dam Imagine by Hayman (16245).—Col. Rigg, Penrith, 36 gs.; and her red and white bull calf by Waterloo Boy.—J. Nicholson, Penrith, 16 gs.

Farewell's White Rose, white, calved March 8, 1868, by Earl of Eglinton (23832), dam Fleda's Farewell lot 13 by 9th Grand Duke (19579).—Lord Skelmersdale, 100 gs.

Princess Beatrice, white, calved March 24, 1868, by Kildonan (20051), dam Princess Alexandra by 8th Duke of Oxford (15939).—R. Hetherington, Cumberland, 34 gs.

Fickle Fanny, red, calved March 24, 1868, by Edgar (19680), dam Ellen by Prince of Gloucester (13517).—R. Jefferson, Cumberland, 51 gs.

Lady Eglinton, red and white, calved April 4, 1868, by Earl of Eglinton (23832), dam Lady Emma Oxford by 8th Duke of Oxford (15939).—G. M. Tracy, Kent, 70 gs.

Waterloo 39th, red and a little white, calved April 16, 1868, by Waterloo Chief (23184), dam Waterloo 20th by Cherry Duke 2nd (14265).—Sir W. Lawson, Cumberland, 81 gs.

Waterloo 35th, roan, calved April 30, 1868, by Earl of Eglinton (23832), dam Waterloo 32nd by Ninth Grand Duke (19579).—Lord Kenlis, Westmoreland, 475 gs.

Waterloo 37th, red, calved September 14, 1868, by Royal Cambridge (25009), dam Waterloo 31st by Third Grand Duke (16182).—R. E. Oliver, Sholebroke, 500 gs.

Pearl Necklace, roan, calved March 6, 1869, by Wild Boy (25447), dam Pearl Powder by Ninth Grand Duke (19579).—Col. Sanderson, Penrith, 47 gs.

Lady Eleonora, red, calved March 15, 1869, by Wild Boy (25447), dam Lady Elvira by Lord Oxford (20214).—J. White, Australia, 66 gs.

Waterloo 38th, red, calved March 12, 1869, by Earl of Eglinton (23832), dam Waterloo 32nd by Ninth Grand Duke (19579).—M. H. Cochrane, Canada, 300 gs.

Waterloo 39th, roan, calved March 18, 1869, by Earl of Eglinton (23832), dam Waterloo 18th by Bosquet (14183).—Lord Skelmersdale, 150 gs.

Amy Gwynne, white, calved March 26, 1869, by Earl of Eglinton (23832), dam Clara Gwynne by Prince Patrick (18633).—J. Malcolm, 56 gs.

False Fanny, roan, calved March 27, 1869, by Edgar (19680), dam Ellen by Prince of Gloucester (13517).—J. P. Foster, Killhow, 40 gs.

Elfin Deans, roan, calved April 24, 1869, by Earl of Eglinton (23832), dam Effy Deans by Edgar (19680).—T. Dalzell, Cumberland, 65 gs.

Eddie Deans, roan, calved October 31, 1869, by Earl of Eglinton (23832), dam Jenny Deans by Great Mogul (14651).—T. O. Hay, New Zealand, 61 gs.

Waterloo 40th, white, calved September 17, 1869, by Edgar (19680), dam Waterloo 31st by Third Grand Duke (16182).—Rev. P. Graham, Lancashire, 360 gs.

Mary Gwynne, red and white, calved February 28, 1870, by Wild Boy (25447), dam Clara Gwynne by Prince Patrick (18633).—T. O. Hay, New Zealand, 56 gs.

Lady Emma, red, calved March 16, 1870, by Wild Boy (25447), dam Lady Elvira by Lord Oxford (20214).—Earl of Dunmore, 45 gs.

Fille d'Edgar, roan, calved March 8, 1870, by Edgar (19680), dam Ellen by Prince of Gloucester (13517).—J. P. Foster, 86 gs.

Wild Eyes Duchess 2nd, red and white, calved March 16, 1870, by Earl of Eglinton (23832), dam Wild Eyes Duchess by 9th Grand Duke (19579).—Earl of Dunmore, 120 gs.

Emma's First, red and white, calved March 17, 1870, by Game Boy (26215), dam Young Emma by Mac Turk (14872).—R. Hetherington, 53 gs.

Lady of Nunwick, red, calved March 18, 1870, by Earl of Eglinton (23832), dam Lady Emma Oxford by 8th Duke of Oxford (15939).—W. Thompson, Tebay, 45 gs.

Princess Victoria, roan, calved March 29, 1870, by Earl of Eglinton (23832), dam Princess Alexandra lot 6 by 8th Duke of Oxford (15939).—J. Malcolm, Carlisle, 53 gs.

Tufty Deans, white, calved April 3, 1870, by Earl of Eglinton (23832), dam Effy Deans lot 14 by Edgar (19680).—C. W. Wilson, Kendal, 30 gs.

Duchess Emma 2nd, roan, calved April 3, 1870, by Gameboy (26215), dam Duchess Emma lot 11 by 9th Grand Duke (19579).—W. Thompson, Penrith, 41 gs.

BULLS.

Edgar (19680), roan, calved December 22, 1862, by Prince Patrick (18633), dam Young Emma lot 4 by Mac Turk (14872).—H. Thompson, Penrith, 110 gs.

Earl of Eglinton (23832), roan, calved April 10, 1866, by Tenth Grand Duke (21848), dam Lady Elvira lot 7, by Lord Oxford (20214).—R. B. Bruckbank, Carlisle, 61 gs.

Wild Boy (25447), red and white, calved April 20, 1866, by Edgar (19680), dam Wild Eyes 19th by Lahlache (16353).—M. Lambert, Northumberland, 50 gs.

Lord of Nunwick (26702), roan, calved September 16, 1867, by Edgar (19680), dam Waterloo 31st by 3rd Grand Duke (16182).—Jacob Wilson, Northumberland, 295 gs.

General Williams (24028), roan, calved September 3, 1866, by Wallace (23166), dam Dora Gwynne by Prince Patrick (18633).—J. Collins, Penrith, 35 gs.

Waterloo B y (27762), red, calved December 9, 1868, by Earl of Eglinton (23832), dam Waterloo 21st by Cherry Duke 2nd (14265).—Sir H. Vane, Bart., 89 gs.

Great Salkeld, red and white, calved March 17, 1869, by Wild Boy (25447), dam Lady Emma Oxford lot 5, by 8th Duke of Oxford (15939).—Rev. O. James, Penrith, 32 gs.

Farewell's Eglinton, roan, calved March 18, 1869, by Earl of Eglinton (23832), dam Fleda's Farewell by 9th Grand Duke (19579).—Captain Thompson, Carlisle, 55 gs.

Prince James, roan, calved March 24, 1869, by Earl of Eglinton (23832), dam Princess Alexandra by 8th Duke of Oxford (15939).—J. Nicholson, Penrith, 40 gs.

Salkeld Dykes, red and little white, calved March 28, 1869, by Wild Boy (25447), dam Young Emma by Mac Turk (14872).—J. White, Australia, 130 gs.

Falstaff, red and white, calved October 20, 1869, by Wild Boy (25447), dam Flower by British Prince (19354).—Parker, Bootle, 39 gs.

Eden Lacey, red, calved March 13, 1870, by Lord of Nunwick (26702), dam Fair Fanny by Wallace (23166).—J. Lancaster, Penrith, 21 gs.

Game Laws, roan, calved April 8, 1870, by Lord of Nunwick (26702), dam Annie Gwynne by Wallace (23166).—T. Bowstead, Eden Hall, 34 gs.

Fitz-Edgar, roan, calved March 5, 1870, by Edgar (19680), dam Fleda's Farewell by 9th Grand Duke (19579).—G. H. Head, 51 gs.

Pearl Seeker, red and white, calved March 7, 1870, got by Game Boy (26215), dam Pearl Brooch by Wallace (23166).—Scott, 25 gs.

Waterloo Commander, roan, calved March 16, 1870, by Game Boy (26215), dam Waterloo 22nd by Kildonan (20051).—A. Graham, 35 gs.

SUMMARY.

45 cows	£106 10s. 4d.	£4,793 5s.
16 bulls	£66 8s. 3d.	£1,062 12s.

61 averaged £96. £5,855 17s.

In 1855, 38 cows averaged £44 18s., 18 bulls £33 15s. 6d., and the general average for 56 head was £41 6s. 6d., amounting to £2,314 4s.

THE NEWBOURN HALL SUFFOLK SALE.

On Wednesday, Sept. 21, Mr. Wolton's Suffolk horses were sold by auction by Messrs. Biddell and Blencowe, and Mr. Bond (a joint firm on this occasion), and the sale of Suffolk cows followed on the next day. Of late years, no one has done more to keep up the celebrity which Messrs. Crisp, Catlin, and Barthropp gave the Suffolk horse than Mr. Samuel Wolton, of Newbourn Hall. Indeed, we may safely say, with animals of their own breeding not one of these noted exhibitors has been more successful than Mr. Wolton, for of all the prizes which have been placed to his credit scarcely one has been won by an animal not bred at Newbourn Hall—a fact reflecting no little credit to the judgment displayed, and adding a pleasant flavour of satisfaction not always attending success.

In our chronicles of noted Sales, it more often falls to our task to append an obituary sketch of the late proprietor. On the present occasion we omit the notice—for the excellent reason that the good old man is still in the flesh, hale and hearty, and if one may judge by a pleasant word, a quiet mind and a look of contentment, we may add, happy also. But Mr. Wolton is a very old man—*ninety* next March; and in the zenith of his fame as a breeder, with sons in the prime of manhood to carry on what he has established, he wisely retires from business. The history of the Newbourn Hall horse-stock dates a long way back—according to the opening address of the officiating auctioneer, Mr. William Biddell, something like a hundred years. Points of history, dates, and figures culled from introductory speeches at agricultural sales are at best put forth as subject to correction. In the present case we believe the fact to be rather under, than over stated, for in our sketch of the rise and progress of the Newbourn horses we may go back almost to the middle of the last century. In those days there lived at the Hall a certain Mr. Higham, who bred and patronised, as every farmer in the district did at that time, pure Suffolk horses. In course of time there fell into the hands of a young man in the neighbourhood, a Mr. Wolton, one of Mr. Higham's daughters, and a few years later all the old man's horses also—the lady by marriage, the animals by valuation. These were the parental ancestors of the present occupier of Newbourn Hall. In 1781 Mr. Higham died, the son-in-law took the farm, and that same year was borne that honourable specimen of an Englishman known by the present generation of Suffolk farmers as “old Sam Wolton of Newbourn Hall.” The auctioneer told his audience that Mr. Wolton's father was “great in horses,” and if you ask Mr. Wolton what old Higham's were said to be like, he will tell you “*As good as mine*”—a character those who were present on Wednesday may regard as rather a high one, in as much as we learn that in the said valuation the first four were put down at £100 the team; but price is not always a correct measure of merit, and if their shoulders were a bit short and straight, their crests low, and their feet flat, they were, no doubt, good in their day. The auctioneer's remark rests on a more tangible proof. That John Wolton was “great in horses” may be gathered from the fact that when the old man died, and the present Mr. Wolton took the farm, he bid 80 gs. each for the first four led into the ring, was beaten off for all, and had to start his stud with other animals from the same sale, at £50 to £60 a-piece. This was in 1812, a time when farmers were flush of funds and coffers that overflowed with guineas; the produce of £7 a quarter

wheat and half-a-crown a pound wool being kept in bounds by late hours, port wine, and much company. That money was plentiful, or Suffolk horses in great repute, one other or both, may be gathered from the prices recorded at this and other sales, at one of which—Sir Robert Harland's, at Bourne Hall, Wherstead—the four best mares made 440 gs., and the foals 40 each. From this time Mr. Wolton has scrupulously kept to the pure stock. “If you have a breed, *have a breed*,” is one of his standing maxims, and no one has kept to this more persistently. It was not, however, till about twenty years back that Mr. Wolton began to show in public. His first essay was for the sum of £3, for which a certain grand old gelding, Proctor by name, walked some twelve miles to Wick market, met two on the same errand, and brought home the coveted Red Rosette, a nest egg for the stable, not much in itself, but the fore-runner to a host of good things, which in the aggregate must have amounted to a handsome sum. This was not all. Side by side with Proctor stood one of old Mr. Catlin's entries, beaten hollow; and in proportion as the joy of Butley over a victory, so was the depression of defeat; for at the dinner which followed, Newbourn vexed Butley in no measured terms in chaff and toast to the last glass in the bottle. In 1850 the county show was at Ipswich, held then in September, and here we find Mr. Wolton first with a foal as big as a yearling, and good looking to boot, as withal pronounced by the judges as the best of fifteen shown. A son of Catlin's Duke out of Smiler, he was for years afterwards travelled in West Suffolk, to the incalculable benefit of the breed in that district. In 1851, at Woodbridge, Proctor turns up again, placing another “three pounds” to Newbourn. Doughty by Catlin's old Boxer adds £3 more to the same account, and her foal gets first prize, and better still, is there and then sold to the Duke of Grafton for 40 gs. In 1852, Proctor walks another 30 miles or so for the £3 at Framlingham, and gets it too, while another of the Newbourn mares takes second prize in a class of ten. At this time Mr. Wolton's name as a breeder was becoming pretty widely known. His stable was filled with good mares, and his pastures were dotted over with as promising a lot of young things as one would wish to see; but a sorry year was 1853 for the Newbourn Hall horses. To raise a stable of good animals of one's own breeding is a work of patience, of many years, often of a lifetime. One mare won't breed, another slips her foal, a third never breeds a filly, and the filly foal of a fourth dies at a week old. Then, again, what trouble and disappointment come at a later stage! Unsoundness, accident, and a hundred unforeseen difficulties come between the breeder and a team of good animals of his own rearing, and in many a case what seems a promising start ends in utter failure. From 1812 to 1853—more than forty years—Mr. Wolton had patiently stuck to his breed of Suffolk horses, and at that time sure enough he had a stable any man might be proud to own. A man's flock is liable to lameness, to the rot, to fearful losses in the lambing season; a herd of the best Shorthorns may be destroyed in a few weeks by pleuro-pneumonia, rinderpest, or what not, and the best breed of pigs may all go wrong in a few months; but in a general way a stable of horses is subject to no such ravages. Still there are exceptions to every rule, and of all the visitations to which flock, herd, or stud was ever subject, nothing came with such destructive devastation as an unknown,

ineurable, mysterious malady brought upon Mr. Wolton's horses in the year 1853. In that year in a few months he flayed, young and old, *fourteen!* In *one week* he lost six such mares as it takes a life time to breed. The best veterinary advice was called in, the most scientific in the profession came and gave advice; but the most assiduous attention on the living, the strictest examination of the dead failed to arrest this frightful disease. Such a calamity would have damped the spirit and reduced to despair many a man who could bear a good deal, too. But Mr. Wolton is not one given to despair; he doesn't look as if he were. Out of the remnant of that splendid collection he set to and raised something better than ever; and although for some years after this occurrence his name was scantily seen in the catalogues of the day, he soon made a mark in the prize-list that he has never ceased to maintain. Using the best blood of the day and occasionally infusing a fresh strain through a mare from another stable, he made amends by his perseverance for the injury Fortune, in one of her sternest modes, inflicted. The "Brightwell Hall mare," a purchase at a long figure many years ago, was a prolific source of good animals. This was a wide, short-legged, active mare, of no very great size, but of true Suffolk stamp, though with a great deal of white about her legs, a point which at all times was but a venial sin in the Hall stable; for when Old Warrior was bought from Mr. Crisp, to infuse a fresh strain of blood about twelve years ago, he startled the Newbourn horsemen not a little by making his appearance in one if not two white stockings. With this animal he was particularly fortunate, the white leg made but little mark on the well-bred whole-colours he was put to, and his wide-fronted, thick-backed progeny gave great satisfaction both at Newbourn and Kesgrave, where he was also extensively used by Mr. Wolton's son. The white stockings did, however, occasionally make their appearance, and the thick-short neck and faulty hind legs were there as well. Catlin's old Duke left the grand old prize winner, Moggy, as his best representative, and the cross with Barthropp's Hero on to the Brightwell Hall blood resulted in a succession of winners. Abbey, a two years old mare, bought at Mr. Catlin's sale for 125 gs., paid her way as the foreigners took one of her colts at a long figure, and another of her progeny, a three years old Warrior filly, made 76 guineas at the sale on Wednesday. The stallion Monarch, used lately in the place of his sire Warrior, was out of the old Moggy mare, and has been in the best place at several competitions in the county and neighbouring shows. His stock are now two years old, and what is ever a great point in a sire they are all of a stamp, and that not a very bad one. He is sire of Mr. Wilson's two years old, which took all the honours at Walden and Harleston this year. As a general rule they have a little bit too much daylight below—a fault Monarch himself is not quite free of; but both sire and progeny show plenty of quality, size, and good colour. Neither Emperor (Chester nor Harwich) nor Canterbury Pilgrim seemed to have been used, though the old Moggy was sent to Mr. Biddell's Abbot, a son of the Pilgrim, and a right good colt was the result, albeit he inherits the colour of the old mare—her worst fault, and perhaps his own too.

The stable as submitted to the public on Wednesday consisted of 48 head, including 8 stallions, 3 mares with foals at foot, 16 mares in foal, 4 geldings, and 5 fillies, the whole of which were open to the purchaser who was inclined to give most money. There was one exception—the old Moggy mare was to be bought in at any price, and presented to the son who takes the farm. The whole of the animals offered were in beautiful condition, but not over-fat; and, on looking round,

we came to the conclusion that they were a particularly sound collection of farm-horses. Several were bought by the sons; but they were buying as others were buying, and as the auctioneer announced the size of Mr. Wolton's family precluded his favouring any branch of it by allowing them to pick the animals over, the public seemed well satisfied to enter into competition with them. To enumerate the company by name we should have to give the entire list of all those who have come before the public in the county of Suffolk as breeders, buyers, or exhibitors of horses—few, indeed, connected with the trade were absent; but of foreign commissioners there was a sad want. Indeed the competition was confined to one or two agents of landlords, one or two large proprietors who were there in person, and tenant-farmers who bought as something more than fancy investments, though the prices they gave approached to fancy prices. The highest prices for the mares ran thus: 105, 105, 100, 90, 76 guineas, or just £100 each for the five best mares; the best ten averaging a little under 80 each, and the whole stud, including stallions, foals, &c., making an average of rather over £51 each.

Colonel Wilson, a West Suffolk landed proprietor, who is forming a stud with great judgment, bought three: Lot 112, by Warrior, out of the Abbey mare, a thick-set, short necked three-year-old—a very good mare, 76 gs.; Lot 130, an eleven years old mare by Barthropp's Hero, from the Brightwell Hall stock, a winner of several prizes, 50 gs.; and Lot 143, a two-year-old filly by Warrior, out of Leicester Violet by Canterbury Pilgrim, 90 gs. Lot 111, a six-years-old mare in foal to Monarch, an animal whose action round the ring was a little feeling, was knocked down to Mr. Cordy for 100 gs. A Mr. Collins secured two very splendid mares, No. 113, a winner at Oxford in July, at 105 gs., three years old, by Warrior and in foal to Magnum-Bonum; and 114, a six-years-old mare, by Warrior, out of the Abbey mare, a frequent winner, at the same price. Lot 115 made 57gs., the buyer being Mr. Capon—perhaps the best bargain of day. Mr. Horace Wolton secured the next lot at 60 gs., another Warrior, and winner of two first and one second prizes. Mr. Samuel Wolton, jun., bought the foal from the old Moggy mare commended at the Sudbury show, a well-grown promising colt, for 35 gs. He also took Monarch, the six-years-old stallion, for 90 gs., as well as Heir-Apparent, one of his sons, a year old, at 94 gs., a very good colt which we shall no doubt hear of again. Peer of the Realm, a son of Biddell's Abbot and the old Moggy mare, a large dark-coloured two-years-old colt, shown several times this year, was sold to Mr. Emson for 66 gs., perhaps the cheapest stallion of the day. Altogether the sale might be considered satisfactory, but the absence of the foreign buyers reduced the average considerably; and so far Mr. Wolton was very unfortunate. The French and Germans have always been large purchasers of Suffolk horses, but this year they are otherwise engaged, or only want animals for guns or starving garrisons—and Wednesday's prices were too high for either. We must here remark that neither vendors nor auctioneers bestowed any trouble on pedigree tables, as few of the mares had anything given beyond sire and dam, and not always as much. Surely, after such years of trouble, the buyers should have been furnished with the lines of blood the purchases embraced!

The sale of blood red cattle was on Thursday. Mr. Wolton's herd is justly-celebrated, and really the display they made was quite creditable. The prices ranged up to 35 gs., the best being bought by Mr. Taylor, of Harleston, in Norfolk. Mr. Wolton's sons, Mr. Clarke and Mr. Stubbs—all gentlemen in the eastern district. Mr. King, from Ashley Hall, Cambridge, Mr. Nockwood, Braintree, Mr. Collins, and Mr. Loft also secured several

lots. The ten highest prices averaged about £33 each; but, as with the horses, so with the herd—pedigree seemed to be a matter either totally disregarded or not deemed worth the trouble of printing.

Mr. Wolton is succeeded at Newbourne by his younger son Horace, on whom of late years the management of the stud, both at home and in the show-field, has entirely devolved, and the herd was almost of his own selection. He has secured enough both of horses and red cattle to start well on his own account, and all wish him

God speed in his endeavours to follow in the footsteps of his father. Mr. Samuel Wolton, the elder son, gives up the Kesgrave farm to take the large occupation of Butley Abbey, from whence the late Mr. Crisp and Mr. Catlin before him sent forth their renowned Suffolks to victory. He takes with him from Kesgrave a fine stud of mares, and with his selections from his father's stable should, and we doubt not will, do great things in the showyard, and keep up the character Butley Abbey has acquired through his predecessors.

IXWORTH FARMERS' CLUB.

At the first meeting for the season, Mr. W. Maufield in the chair.

Mr. W. MATTHEW, Kuettishall, read a paper on "The growth of beet-root and sainfoin in connection with the four-course system of farming," as follows: I thought I could not do better than choose the subject I have done, and among the many reasons for doing so is that experience should teach us knowledge, and now that we have had the experience of three dry summers, with a great deal of sun, I feel it would be a good thing for us to put together our thoughts upon the matter, and decide what is the best thing to be done to meet such wants as we have felt in such seasons as these, and try to hit upon some plan that will leave us less dependent in future upon our artificial grasses, clovers, &c., and tend to secure a good plant of beet-root, for upon these two crops for spring and summer keep, I think we who farm light and mixed soils are now very dependent. Another reason I might give is, I think, we as farmers require a system that will render our farms more self-supporting, or in other words, lessen some of those heavy items of expenditure for cake, artificial manure, labour, &c., more particularly as the sources from which we draw these supplies are beginning to fail; for instance, guano £5 per ton more than it was at one time, cake from £2 to £3 per ton more than we used to get it at, and the quality of neither any the better for the extra price. Another reason I could give is, that we should do well to ask ourselves. Is there no plan by which we can increase the quantity of our stock upon our farms without materially diminishing the quantity of corn? I will thus divide my subject into three heads: 1st—These dry summers, what are our wants? how best supplied? 2nd—The different sources of manure or its equivalent that we have at hand upon our farms. 3rd—Increasing our supply of green food. Any suggestion to be of practical value to the farmers of Suffolk must be made to fit in with the four-course system, for nearly all of us are compelled by our agreement to farm according to its rule, and this, I must say, I think one of the evils of farming—for when a man hires a farm, his landlord in a great measure farms it for him—this must necessarily check that spirit of enterprise, without which no business can succeed, nor can anything new be tried and brought out; but but I do not wish it to be thought I am condemning the four-course system, it has stood the test of ages, and when other system have failed it has been found to succeed; but I think the failures of those who have tried to depart from it have arisen, not so much because it would not answer ever to do so, but because they left a system and took to farming without any system at all. 1st.—Then, these dry summers, what are our wants? How best supplied? Taking a retrospective view, the first difficulty we had to encounter in the spring of 1863 was the difficulty of obtaining a plant of beet-root. The months of April, May, and June being so hot and dry, that none of us could get a plant but those who were fortunate to have their land cultivated in the Autumn, and the seed drilled by the middle of April. The next difficulty of that year was, what were we to give our stock, and how to fill our stackyard. From want of rain the crop of clover was very short, also the mixed grasses. The only fields that did well were those planted with sainfoin. Then the season ended by our discovering immediately after harvest that all our young layers were dead, and we must either have gone without sheep the next season or been at the expense of drilling them over

again. I will now describe what I tried myself, and the results. Upon one field of 40 acres I drilled 2 pecks per acre of common rye-grass, 2 pecks per acre of Italian rye-grass, $\frac{1}{2}$ peck of trefoil, $\frac{1}{4}$ peck of white clover, $\frac{1}{4}$ peck of rib grass. The result of this was, it came up well just after the first shower, but the drought and sun again set in, and the trefoil and suckling all died off, but the rye-grass and rib-grass kept alive, and although it produced but little food in the early part of the following spring, it made good feed in the summer, and my sheep and lambs settled upon it better than any other field. I also tried a mixture of Italian grass, rib grass, and tares: 1 bushel of winter tares per acre, 3 pecks of Italian grass per acre, $\frac{1}{2}$ peck rib grass per acre. This mixture did well, and produced a capital piece of early feed with the tares and grass, and the rib grass and rye grass made some after-feed, and produced a good flag for the succeeding crop of wheat. I cannot say I prefer rye grass as a preparation for wheat, but upon our light lands it is better than nothing at all, for upon this field I had not sufficient rye grass to finish the field by three acres. I therefore drilled it with the tares without the rye grass, and the wheat crop was this year at least one coomb per acre more where the rye grass was than where there was nothing at all. On another field I sowed one peck per acre of trifolium; this I mowed for hay, had a far crop, and my horses were very fond of the stover, but the wheat this year was very light after it. The best crop again on my farm was the sainfoin; indeed the only crop that did not suffer from the drought. Looking back to the year 1869, the plant of clover and young seeds after harvest were so good that we all thought this summer there would be no lack of feed, but what has been the case? The drought and sun have again been too severe for our layers of one year's growth, and keep for stock has not been so abundant as it was last year, with only the half plant of layers that were left us. Tares, also, were a partial crop, and we have again had the same difficulty in obtaining a plant of beet root, and only in those fields that had the autumn tillage is there a plant. But the sainfoins of two and three years old have again done well, therefore proving that plant able to stand the severest drought, and now we have again lost our young layers, all but the sainfoin. I have again drilled over 60 acres as follows: Half bushel per acre of Schroederii brome grass, half bushel of Italian peas per acre, quarter peck rib grass per acre, 3 pecks of red suckling. I have not used any trefoil or white clover, my previous experience being that it was useless. I also intend drilling this week one field with tares. 1 bushel per acre, and $\frac{3}{4}$ bushel Italian grass. And as I have now 70 acres of sainfoin, of very good plant, I feel less dependent upon the success of this late feeding than I should otherwise have done; and I will now ask you to follow me as I describe my system of growing beetroot and sainfoin upon my farm; and I hope you will give me your opinion of its merits, and offer such remarks as may strike you as to its general adaptation to this neighbourhood. I will suppose them, in the first place, I have 500 acres of arable land in my occupation, and I think it right to grow 20 acres of beetroot in each year, the plan I pursue is, I take beetroot after barley—*i.e.*, not laying down 20 acres of the barley shift with small seeds. As soon as wheat sowing is completed, I plough in the barley stubble a good deep earth—say 9 inches; then as soon as the land has been acted upon by the weather, I harrow and ridge up, about the new year, or earlier if I can; then in March or April, as the

weather permits, I manure with—say 14 loads per acre of farmyard muck, $\frac{1}{4}$ of a ton per acre of rape cake, and 2 cwt. of salt, drilling the seed not later than the middle of April. This beetroot will be followed by wheat. In the succeeding spring I drill in the wheat sainfoin, rather over one coomb per acre; this sainfoin I intend to lay three years, to be succeeded by wheat, in course with the remainder of that shift, thus making the beetroot and sainfoin fit in with the four-course system. Perhaps some will say I am losing sight of one of the heads of my subject, in making use of such a heavy dressing of manure for beetroot; but I would go further, if rape cake could be bought at £5 per ton, I would use half a ton per acre, and taking into consideration that this field is to have no more manure for four years, I think you will say the dressing is not excessive. The course will be: 1st, Beetroot after barley, instead of layer; 2nd, Wheat after beetroot, in course; 3rd, Sainfoin, after wheat instead of turnips; 4th, Sainfoin, instead of barley; 5th, Sainfoin, instead of clover, &c.; 6th, Wheat after sainfoin, in course. I should, thereupon, have 20 acres in each year to lay down with sainfoin, and 20 acres of three-year-old sainfoin to come up for wheat in each year; and, if I succeeded in getting a plant of sainfoin, I should always have 60 acres of sainfoin, of three different ages, growing on my farm. Again, taking beetroot after barley, you save the autumn tillage of the land. The land after barley is in a very different state, and does not require so much labour to bring it into a good tilth as after wheat; the preparation for wheat being to get the land together as much as you can, the preparation for beetroot being to leave the land as light as you can. Again, taking beetroot after barley enables you to clean the land well before laying it down with sainfoin, which is to lay three years, and upon this will your success mainly depend; and, as practice is better than theory, I have succeeded in obtaining a full plant of beetroot during the last three years grown in this way. I have heard some say, "A penny earned is as good as a penny saved," but I am inclined to think that the penny saved is the best, inasmuch as the saving a penny incurs no risk, when the earning a penny must. And when the labour and seed question is tested in connection with this plan of growing beetroot and sainfoin with the ordinary four-course, you will find a great saving will be effected. What will then be the value of these crops upon this 120 acres of land so treated against 110 acres under the four-course? The next thing I should like to introduce for our consideration is the different sources of manure we have at hand upon our farms, or its equivalent: 1st, Comes the manure from stock; 2nd, Rest is equivalent to manure; 3rd, Shade is ditto, ditto; 4th, Tillage to heavy land is ditto; 5th, Succession of crops is ditto. We all of us know that stock can be kept upon our farms without limit, if we put our hands in our pockets for purchased food—but will it pay? Yes, half way. One-half from the pocket, one-half from the green crops of the farm; therefore if we want to increase our manure supply from this source, we must increase our green crops to make it profitable. Rest to land is equivalent to manure. When land is laid down to herbage, the future vegetation which it produces tends, by its decomposition, to renovate the productive power of the soil. Land in this state is said to be in rest, therefore will not the three years' sainfoin be a source of manure? Shade is also equivalent to manure. We are all of us aware that a crop of clover mown for hay is a better preparation for wheat, than if the land is fed bare by sheep during the summer months, more particularly upon light land; also upon heavy land a stout crop of beans is considered a better preparation for wheat than a poor thin crop of beans; also a good thick plant of mustard is better than a light one, as a preparatory crop; also upon our lands when we feed our clovers with sheep we find it better, as a rule, to apply the dressing of farmyard manure that we intend for the wheat crop before harvest. Does not this prove that the land shaded from the sun is better than if exposed to its influence? Therefore, may we not safely infer that shade is equivalent to manure? Tillage to heavy land is equivalent to manure. We all know that a well-cultivated field of heavy land, without manure, would produce a better crop than a field of ill-cultivated land with manure. Succession of crops a source of manure. All plants grown and carried off the ground must necessarily tend to exhaust the soil; but plants which are grown and suffered to decay, or consumed by animals upon the land, do not exhaust the

soil. Some crops prepare the land for crops of a different kind, taking out of them certain propensities and leaving certain deposits behind, thereby rendering the field more kind for a succeeding crop of some other species. For instance, we all of us know in practice that a crop of clover without manure is a better preparation for wheat than a pea stubble with any fair amount of manure. The purchase of artificial manure to restore the fertility of our soil is a very easy way of getting over the difficulty; but is it not very desirable that we should ask ourselves if we have not some undeveloped sources of manure at home that it would be worth our while to look up and bring out? and would it not well repay us to give this question of succession of crops our best attention? The 3rd head of my subject—The keeping more stock: To keep in view profit, as I before mentioned, we must find one-half of the keep from the green crops of the farm. Will not the having 60 acres of sainfoin increase my food for stock, whether it is cut for hay, cut for soiling during the summer, in the yards, or whether it is fed upon the land for sheep? I have found sainfoin for horses and cattle in the yards during the summer months surpass any other green food, and for chaff during the winter for horses, cattle and sheep, there is nothing equal to it—it is both food and physic. Will not having the sainfoin from 60 acres of land, all taken off this 60 acres and consumed upon the rest of the farm, enable me to keep more stock, and adding the other half of cake or corn, make the rest of the land grow more corn? Will not the 60 acres of land requiring no manure for the time it is in sainfoin, enable you to manure more heavily the other arable lands of the farm? Will not these 20-acre pieces of land that have been treated in this way, when it comes to be laid down with clover, be more kind for a plant, cut more hay, or carry more stock, and therefore grow more wheat? Will not growing beet-root in the way I have mentioned enable us better to cultivate the fallow shift? I have mostly found this portion of the fallow the worst cultivated of any part of the arable land. Will it not also enable us to sow more swedes upon our light lands, increasing the quantity of food for grazing stock? Will not the putting these things fairly together compensate for the loss of twenty acres of barley? And will not the having these sixty acres in sainfoin of three different ages be the best means of providing against such dry summers as we have been having, and also prove no loss in a season when we have plenty of rain? To arrive at a proper conclusion, I will name what I have had a field of 16 acres of sainfoin produce these last three consecutive years: 1868—first crop of hay, 33 waggon loads; second crop fed by lambs. 1869—first crop of hay, 35 waggon loads; second crop, 80 sacks of seed. 1870—first crop of hay, 33 waggon loads; second crop seed, estimated 56 coombs. And here I may add I have now the option of taking it up for wheat or letting it lie another year, which I intend to do, in consequence of my young seeds having failed. I shall be following out one of the rules (if not all of them) of a great and successful merchant, who had three rules by which he exercised his judgment and conducted his business, viz.: "Take an option whenever you can. Cut short your losses. Let your profits run on." I have not attempted to show how to make farming a paying occupation or a profitable investment for money; that will depend entirely upon the business-like habits and judgment of the man; but I trust I have introduced such a subject for this evening's discussion as will bring out your practical suggestions, and such will, I fear not, prove a mutual benefit to us all.

Mr. FISON asked how the system of growing sainfoin would act on heavy land. Would it not depend upon the cleanness of the land?

Mr. PETO said it must depend upon the character of the land.

Mr. MATTHEW said if he had heavy land he should try it, although he should not be so confident of success.

Mr. FISON said he had tried it, and it had succeeded, but it was a favourable piece of land.

Mr. PETO said with regard to sainfoin on heavy land he could perhaps give some information. On a visit to Sussex two years since, he called on a friend farming heavy land, and to his astonishment, on a chalk subsoil he saw as good a plant of sainfoin as he had on his own farm. But it was useless to grow it on a stiff land unless it had a chalky subsoil. Sainfoin was suitable to the kind of land Mr. Matthew was farming.

By sowing a certain quantity of tares and rye-grass they got feed for the cattle where they would not otherwise get it. But it then became a question as to a wheat crop. He had found a difficulty in producing a crop of wheat after two such crops together. He (Mr. Peto) saved a piece of sainfoin for two years and had a nice piece of wheat after it. He regretted ploughing up the sainfoin this year, but there was great difficulty in getting sufficient hay and feed.

The CHAIRMAN said a friend of his planted some sainfoin on a heavy land with clay subsoil, and last year he had a good crop and this year a better one. If the soil was dry sainfoin would grow, but he questioned whether it would grow if there was no chalk. As to the four-course system if it allowed one crop to be grown in succession for two or three years it was a very great improvement upon the old four-course system.

Mr. MATTHEW said if he could grow three green crops, and show that it did not injure the land, no one could get damages from him. If a tenant grew three crops of sainfoin he would not be strictly following the lease, but he would defy anyone to make him pay damages.

Mr. TAYLOR asked the depth roots of sainfoin would run in three years.

Mr. MATTHEW said he could not tell. Wheat went down some distance, and no doubt sainfoin went down quite as far.

Mr. FISON said he once traced the roots of some wheat in full vigour nearly 20 feet into the ground. It is a gravelly soil.

Mr. PETO said that was contrary to what was generally believed, as it was said wheat stopped when it came to gravel.

Mr. FISON said he thought, after what had been said, that they might venture to grow sainfoin on heavy land.

Mr. MATTHEW said the stronger the clay the more likely would they be to get a plant, but it was his impression they would not get quantity.

Mr. HARRISON said it was his opinion that sainfoin would not do on heavy land.

Mr. MATTHEW said at Riddlesworth, where he managed a farm for Mr. Thornhill, he had a different system of growing sainfoin. The land was farmed on the five-course system, three shifts of green crop and two of corn, but he deviated in this way—he kept one shift always down in sainfoin, which he let lay for five years.

Mr. HARRISON said Mr. Matthew had treated the subject so ably that there was little left to say. He (Mr. Harrison) should demur from the system at Riddlesworth, as in the second round, which was now begun, he believed the plant would fail. He did not think it was safe to let the land rest less than 12 years.

Mr. MATTHEW said the land at Riddlesworth had 20 years rest from clover.

The CHAIRMAN said they must not overlook the other part of the question—that of growing beet in connection with the four-course system.

Mr. STURGEON said he found the best way of growing beet on his heavy land was to cultivate it by steam. He had a good plant on the land that was steam-cultivated, and on some other land that was not so cultivated he had not a plant. He also put on ten loads of farm-yard manure and quarter of a ton per acre of artificial manure. He had some land that would not grow beet or sainfoin any season.

Mr. MATTHEW asked what the steam cultivation cost per acre?

Mr. STURGEON said he cultivated the land twice, and it cost 25s. per acre, including coal.

Mr. FISON said he had ten acres prepared for beet, manured with ten loads of farm-yard manure, two cwt. salt, and a ton of guano. It was after rye, and he had a splendid crop.

Mr. DRISCOLL said he had found the artificial manure better than the farm-yard manure for beet.

Mr. GATES said Mr. Matthew's system of growing sainfoin seemed to be a means of losing money less than by growing wheat at 22s. a comb. He had been trying sainfoin on the flat, and he did not think it would answer. He got eight small loads off ten acres.

Mr. PETO said he agreed with Mr. Sturgeon as to the steam cultivation. If a man had that kind of land and the capital, he could not employ his capital better than in ploughing up the land 12 inches deep. He did not agree that it was right

to put any kind of manure on light or mixed soil land before Christmas. Where he had folded lands he put his ewes and sheep on to the turnips and such crops, and put them on to layers to fold. On a good mixed soil and clay land they could apply the manure any time they pleased.

Mr. FISON, speaking theoretically, thought a man would be more sure of a crop if what could be spared of farmyard manure were put on the land early in the autumn.

Mr. PETO said he spoke from experience. He had ploughed his land up nine inches deep for beet, and in February he should plough it back, and then in March he should bout it up and put the manure on about a fortnight before he put the seed in.

Mr. GOLDSMITH said he had grown sainfoin 40 years, and at first he found it successful. He asked to be allowed to farm 100 acres of his land on the five-course system, but he was glad to get it back again. He heard a gentleman say that sainfoin should lay one year, and he tried it for eight years, but he found it grew less every year. He grew better wheat after sainfoin than any other layer. He believed if he had taken sainfoin with beet, he should have done better. He believed sainfoin would grow on chalk that was thoroughly dry, and he knew instances of chalk land that was cold not growing sainfoin. With regard to beet he thought the early cultivation was the best. When he ploughed his manure in the autumn, he always had the best beet. If a man had heavy land, and wanted a crop of beet, he must put his hand into his pocket.

Mr. WITT was of opinion that they should grow as much sainfoin as the land would reasonably grow. As to mangold he could grow better from artificial than from farm-yard manure, and he had tried both; and his barley was quite as good after the one as the other.

Mr. MATTHEW said he should like to know the effect of rape-cake for beet-root. The French, who grow sugar-beet, used it largely, and that had increased the price.

Mr. GOLDSMITH said he had got more per acre off the land on which he had put rape-cake than he had off other land.

The CHAIRMAN, in summing up the discussion, said that beet and sainfoin were too expensive crops, and especially the former. The fewer acres of beet they grow the better, and their aim should be to grow the greatest quantity of roots on the smallest quantity of land. With regard to sainfoin he could say very little. He had tried it, although with partial success, but intended to grow it again, and should go between the system advocated by Mr. Matthew and that advocated by Mr. Goldsmith. He (Mr. Manfield) should first grow a root crop, to be followed by barley, to be followed by sainfoin, to stand again, and this he should follow by wheat. After wheat he should put barley, and thus miss a second wheat crop. Sainfoin produced more stover and more money per acre than any other green crop of the clover tribe they could grow. Mr. Matthew had spoken of ryegrass, but that would be the last thing that he (the Chairman) would grow if he could help it.

Mr. MATTHEW, in replying, said he quite agreed with letting the sainfoin lay only two years if a man could not keep his land clean; but if he was going to take two fallow crops as they came round, he should let it lay three or four years. To secure a crop of sainfoin to lay three years the land should be in the best condition.

A vote of thanks to Mr. Matthew for his paper was agreed to.

THE NEW MARKETS AT DONCASTER.—The foundation stone of the new Corn Exchange and the south east wing of the market-house was laid by the Mayor, Mr. A. J. Smith, in the presence of a large concourse of people, on Thursday afternoon. The market improvements of Doncaster are amongst the most important works which the Corporation have undertaken. These extensions will not only supply a great want as a corn exchange, but will add another architectural ornament to the town. Besides this, the inhabitants will also have a spacious hall, which may be used for public meetings, assemblies, concerts, and their like, and will afford accommodation to a greater number of persons than any place at present existing.

THE DISTRIBUTION OF STOCK AND CROP ON A FARM.

BY THE NORTHERN FARMER.

It will be conceded by most men interested in or connected with agriculture that the man who makes fewest changes has, in the long run, the greatest chance of success, and is most likely to attain a competency for his declining years. By this we do not mean or allude to in any way the man of stubborn spirit, or possibly dull intellect, who sees no necessity for change, but is perfectly satisfied with old modes of farming, breeds of cattle, and implements of old style merely because they are old and did very well for those who came before him. Such men, unless highly favoured by fertility of soil or other fortuitous circumstance which gives them an advantage over others in the same business, must go down, and every succeeding year finds their numbers lessened and their places taken by men who by having been better educated and possessing more tact, see the necessity of availing themselves of all the advantages and labour-saving appliances which a progressive age has placed within their reach.

The class we particularly refer to are those who are constantly changing their mode of farming to meet, as they suppose, the exigencies of the times, selling off their dairy stock to get into sheep, or breaking up permanent pasture, and doing away in a great measure with live stock for the purpose of growing an increased quantity of corn because the price of that commodity is temporarily good. Some men at almost regularly recurring intervals have an auction at their farms, the public notice of which invariably states that in consequence of a change in their system of farming, a portion or the whole of the present stock and many of the implements are no longer required, and will be disposed of by public sale. Such a line of conduct pursued by a farmer, we look upon as highly dangerous to his present interests and future well-doing, and he must have more than an ordinary share of luck if he benefits in the long run by the repeated changes which his stock and style has undergone.

Suppose, for instance, the case of a man breaking up a portion of permanent pasture for the purpose of growing more corn than he has been in the habit of doing, merely because that article for the time being bears a relatively higher value than it had done for some years past, and displacing a portion of his live stock to enable him to do so. The probability is that by the time he has the corn ready for sale, a reaction has taken place, shippers having had their attention attracted to the very thing that induced him to break up his land, grain-ships crowd into every port, and the markets everywhere are speedily lowered and equalized. So quickly is this now done, and such a short period is permitted to elapse after the markets have risen so much in these islands as to afford a margin of profit, that it has become nearly an impossibility to catch a paying price with a specially grown crop. In like manner loss is frequently experienced with live stock, when, after a year or two of good prices for certain descriptions, a farmer is induced to alter his mode of management so as to have all, or nearly all, his animals of one sort, and ready for sale at the period of the year his recent experience led him to expect prices would be high. This mistake seems to be easier and most frequently made with fat cattle and in sheep breeding, and from the fact of numbers simultaneously following the same course and adopting the same line of argument in

making their arrangements, the markets are almost sure to be glutted at the very season they were previously scarce, and as sales must in general be forced, the profits are scarcely perceptible, even should actual loss be avoided. A mode of farming which combines regularity in the quantity of both white and green crops grown each year, sustaining an easily-ascertained and regular number of stock both summer and winter, must obviously be a much safer system for a farmer to follow than that which attempts a change in one or more of its departments every other year. When a system is followed with unvarying regularity for a succession of years, the man who carries it out has an opportunity of learning his business thoroughly. He finds out the best market for his produce, or may even succeed in making a local market for some portion of it; he can calculate almost the exact amount of food, and balance his animals accordingly. The quantity of manure made is as nearly as possible proportioned to the breadth of land required to be gone over; and his having something of everything does away in a great measure with the danger of heavy loss. A rotation of crops, based on sound principles, and embracing as far as possible all the elements of good husbandry, is assuredly the best safeguard for both the owner and cultivator of the soil, the interests of both being protected, and their prosperity ensured just in proportion to the stringency with which its conditions are enforced. We seldom hear a farmer speak of extending by a year the rotation which he is bound to follow, the extension consisting in taking a second corn-crop in succession, without much doubting the propriety of the course which he proposes carrying out, as unless the land is very good indeed, the hay-crop, which succeeds as well as the subsequent grazing, is impoverished in an exact ratio to the weight of the crop so taken. The pasture will be noticeably deficient in succulence; slow to make a start in spring; growth easily checked by dry weather in summer; and, as an unfailing consequence, the field will be unable to keep the number of stock, which under more favourable circumstances it might easily have sustained. Even when again broken up, the scourging crop will show by a feebler vegetation, neither corn nor straw being up to the mark; and the soil will not recover its full vigour and strength until it has got a liberal dressing of farm-yard manure. We altogether disbelieve in the renewing influence which stock exert on pasture-land which has been laid down in poor condition, although it is an idea by which many men are beguiled, and induced to crop severely in the expectation that when in grass the stock, particularly sheep, will make it all right. Careful consideration ought to make it apparent to all interested in the matter that before the animals can improve the herbage, they must be fed themselves; and if the field has nothing under the surface from which the roots of the grasses can derive nourishment, it is vain to expect a vigorous or abundant growth. Hence, but a small number can be kept on such land, and those probably barely able to keep themselves in store condition; the cash return for the season is almost nil; and the pasture has not visibly altered for the better. In the course of another year the improved grasses begin to die out for want of nourishment; moss spreads itself like a carpet; the herbage becomes coarse and sour, indicated by its

being rejected by the cattle, and left in large tufts all over the field; and the improvement which was calculated on so hopefully ends in disappointment and loss. The extended introduction of portable manures has often tempted men to take advantage of their land, with the view, it may be, of getting over a temporary difficulty by so doing; and corn has been taken after turnips grown with guano and phosphates, and the land laid down in ordinary course, without getting a particle of dung, and the roots drawn from the field on which they were grown, and consumed elsewhere; or probably sold off the farm altogether. Lessening the live-stock on a farm, with the view of growing both green and white crops nearly altogether, with the assistance of artificials, is about the most suicidal policy a farmer could contrive to follow. At first it is rather attractive, and offers some advantages; one of the most apparent being the saving of labour in the collection, carting, and application of manure. A couple of horses may be dispensed with, and probably a few hands, less or more, according to the size of the occupation, and for a time the expenditure is sensibly diminished. On a farm in good heart this course may be followed for a year or two to tide over a difficulty; and if done judiciously, may possibly reinstate the farmer in his former position of independence, and enable him to keep a full stock of cattle for the manufacture of the indispensable article, dung. To persist in using concentrated manures solely, can only have one ending, and that is ruin. Objecting so strongly to that mode of farming, which distinguishes it from a fixed system of husbandry may be styled erratic or occasional, we necessarily admire the forethought and wisdom displayed in those leases which, under liberal covenants to the tenant, yet bind him down to follow a certain fixed rotation, which observation and experience has fully demonstrated to be most suitable to the peculiarities and character of the soil which he has undertaken to cultivate. To have permission to alter the arrangements of the lease; particularly with regard to introducing another corn-crop, we look upon as being but a very doubtful privilege; more likely to injure than benefit the lessee; the immediate monetary return being eventually swallowed up in restoring the land to its original condition. It takes a very clear-headed and talented man to manage a farm on which the business is conducted irregularly, the deterioration of the soil, the changing character of the seasons, and the fickleness of the produce markets, all combining to render it an impossibility to calculate with any kind of precision what product will succeed best; and, moreover, bring the largest amount of money for the coming season. There can scarcely be an error committed in growing too great an extent of green-crop; yet, a large breadth is too frequently avoided, probably on account of the cultivation being elaborate and expensive, and the return not quite so quick as is the case with corn, unless sold direct off the farm—a mode of disposing of them which is counted such very bad farming as to deter any one from attempting it, unless under circumstances peculiarly exceptional. Now a well-mannered green-crop, forced into rapid and succulent growth by a well prepared soil, is in the end the cheapest and best paying crop a man can grow, as its characteristics are essentially restorative. During the earlier stages of its growth the land is cleaned and stirred, and thus receives all the beneficial effects of atmospheric influence which it could have had if under a plain fallow. The more these crops are forced, and the greater the success achieved in their cultivation, the less do they take from the soil by the absorption of its manurial constituents. It requires no scientific knowledge on the part of the practical farmer, who has been at all observant of the processes going on year after year under his immediate

observation, to show him that all plants having large leaves act beneficially on the soil. Experience shows him that when the surface of the ground is covered with this kind of vegetation it is warmed, and weeds are destroyed by the shade. Moreover, by means of the largely expanded surface spread out to the atmosphere in the shape of leaves, the crop is enabled to absorb much of the nourishment which it requires from the air itself, becoming less and less exhaustive of the soil as the leaves are developed. Again, the roots of the turnip and mangold being taken up before they have made any attempt to perfect their seeds, a fruitful source of exhaustion is at once avoided, and the soil retains the manure but little altered in its character for the support of succeeding crops.

We know of no rotation capable of being so universally adopted on light and medium land as the four-course, modified or extended as local circumstance or climatic influence may render suitable or obligatory. It embraces all the elements of good husbandry; its very foundation being the thorough cleansing of the land from weeds, and the restorative and exhausting crops being so equally balanced, there is no danger of deterioration, if the rules of good husbandry are carefully attended to. To keep up the large supply of manure which is yearly required, a heavy stock must be constantly kept, so that every thing in the shape of green crop, clover, and cultivated grasses can be consumed on the farm, and converted into this invaluable fertilizer. By carrying out this system, the idea with which we started, and which forms the heading of this paper, viz., the equal "distribution of stock and crop on a farm," becomes realized. The breadth of roots grown each season even on a small occupation being considerable, a correspondingly large number of animals can be carried through the winter, and thus a continuous system of reproduction becomes inaugurated and sustained. In exact proportion to the success attained in one season will be the power to prepare and collect abundant material for the sustenance of the succeeding crop, and lay a solid foundation on which to rear a well-earned and substantial prosperity.

It is singular that the four-course system can scarcely be profitably carried out in its integrity outside the county in which it originated. This more especially applies to growing wheat after clover, and, although repeatedly tried in the sister countries, invariably proves so unsuccessful that it has to be given up. We saw it ourselves persevered in for several years by an clever, patient, and enthusiastic a man as one could well wish to meet; and he had reluctantly to give the matter up. He could not conceive that what did so well for him in Norfolk should not do elsewhere; but, although he succeeded splendidly with clover, the produce of a statute acre of wheat could not be forced over eighteen bushels, and that amount was reached only in a very favourable season. Where wheat will not succeed as the opening crop, oats must be substituted, barley being still continued as the laying-down crop, although on good land wheat is frequently taken instead. The temptation at this stage of the course is very great to take the second corn crop, and the arguments in favour of doing so which present themselves to a man's mind are peculiarly seductive. If heavy expense has been gone to in preparing for the root crop, and the land consequently in good condition, it appears but a trifling matter to take wheat first and then barley, the latter being of superior quality, and a better crop than it would have been, if taken immediately after the roots, and besides being so much safer to lay down with than wheat. The second corn crop may possibly not be so injurious when followed by one year's clover, but when sown down for one year's hay and one or more year's pasture, it tells surprisingly; and, again, on the opening crop its effects

are extremely noticeable. By sowing mixed grasses and clovers, and pasturing for a season, the four-course becomes extended to a five or six-course, as the case may be, and in this way becomes extremely convenient on the thinner soils, rendering the work less laborious and recruiting the land by a short period of rest. This proves of immense advantage to the green crops, all the varieties being extremely shy growers on land long worked and loose of texture, but delighting in fresh land newly broken up, even although so coarse and lumpy as to appear almost unfitted for the reception of their small seeds.

By extending the rotation, a better opportunity is afforded for holding over a stock of breeding ewes and a larger stock of cattle for the summer than could otherwise be managed. When a dairy stock is kept and the calves reared, the young cattle can be held over more conveniently, coming in handy to tie up for stall-feeding, and the farmer becomes in a great measure independent of the markets, useful stores running so high in the autumn fairs when in such general demand, that the obtaining of anything like a fair profit on their keep for the winter is becoming every season more problematical. By so arranging the crop and stock of an arable farm as to have both summer and winter food in abundant supply for all the animals reared, selling nothing until so well finished as to be incapable of improvement, all the profit that can be extracted from them is secured to the breeder.

Another very important advantage which accrues to the farmer when in a position to dispense with the purchase of extra stock is the immunity from contagious disease which he enjoys. He may not always escape, the approach of distemper of any kind being so insidious as to frequently baffle all arrangements for its exclusion however carefully made, but his chances of doing so are infinitely greater than when animals that have travelled long distances are periodically introduced to his pastures or stalls. Many men have been crippled in their resources for years; nay, brought to ruin's verge by the introduction of one diseased animal, no notice being taken of the danger until numbers had been contaminated and the mischief irreparable. Carefully bred cattle, well-fed from their birth, are more uniform in their character and general outline than those usually picked up at markets and fairs, and being inured to both climate and soil, escape those checks, frequently severe in their nature, which bought cattle too often experience, and which are altogether unavoidable if they have been reared in a more sheltered district than that to which they have been brought, or on better land.

The same argument applies equally well to sheep, as if a breeding stock is kept its owner has an opportunity of studying and improving on every point where he imagines there is a deficiency—wool, mutton, and milking property all coming under his intelligent supervision, and gradually worked up to a useful standard, becoming distinguished in a few years by uniformity of type, possessing a fair share of every quality that constitutes a good sheep. Above all things he can improve his own position and the character of his flock by judicious crossing with a view to enlarging the milking capacity of the ewes, as, however well bred, if they are poor nurses maturity is delayed, and under the most favourable conditions the number of puny lambs is out of all proportion to those marketable, or really worth holding over as likely to turn out paying store stock. Bought sheep very frequently prove troublesome, if from a district or farm where it was not usual to feed with roots in winter, as they will starve almost before they can be induced to touch a turnip. The sheep bred on an arable farm being used to roots during their first autumn and winter, will subsist wholly on them at any future period, if by severe weather they are excluded from being able to pick up a

living on the pastures. Cutaneous disease may never be known by a man from youth to age who breeds his own stock; whereas if he makes frequent purchases he can scarcely avoid its occasional introduction by any amount of care, forethought, or experience. The loss from this cause alone is dreadfully severe, and the annoyance beyond expression, when it becomes established in a large flock—years sometimes elapsing before it is thoroughly eradicated.

The ever-present difficulty with the arable farmer is the keeping up of a regular supply of fertilizing matter with which to nourish the crops and recoup the soil for the continual drain upon its permanent resources. It is the husbandman's interest to take as much out of it as possible; yet, while he does so, he cannot afford to transgress the rules of good husbandry, or at best but negligently attend to them, as, if he does so, the earth will in a very short time refuse to yield a profitable increase.

Manure can only be made on the farm by keeping a large number of well-fed animals, and even with the very utmost that can be done in that way the quantity will be short, unless purchased food, either bulky or concentrated, is brought to the farm and consumed there. When favourably situated for procuring bulky manures at moderate cost, the farmer may grow whatever crops he may think likely to pay him best; but when from remoteness of situation such a supply is denied him, he must of necessity give a preference to those which, by being consumed at home, leave a considerable residuum for the nourishment of the soil.

Potatoes, when they escape disease, pay remarkably well, and most men like to have a few acres of the earliest varieties for sale, the amount of money made by them being large, and the return immediate. Now this crop, although classed as ameliorating or restorative, is only partially so, inasmuch as although it requires to be well manured, and gives an opportunity for cleaning and stirring the soil, and thus forms an excellent preparation for a paying crop, it yet robs the land thus far, that being sold off the farm, it returns nothing in the shape of manurial constituents for the sustenance of future crops. No one knowing the importance of the potato to the rent-paying farmer would think for a moment of recommending a reduction in the breadth grown for the reason above stated; but keeping that line of argument in view, he may with great propriety recommend the purchase of all the manure required for the potato crop, so that the roots may have the advantage of the home-made dung, and a full breadth grown without having to resort too extensively to portable fertilizers. Potatoes do well on the manure from large towns, and this should be trusted to in every case where it can be procured at all economically, whether by road, water, or rail. Five, ten, or twenty acres managed this way every year according to size of occupation, is of immense benefit to the man who carries it out, as he can by the use of this extraneous manure grow a crop which pays all expenses, heavy though they may be, and leaves a good profit, besides benefiting the land through every crop in the rotation.

In this paper much stress has been laid on the necessity of keeping a heavy stock constantly on the farm; yet some care must be exercised to provide a proportionate amount of food, and to have it for every season, otherwise, instead of profit, the year's transactions will end in loss. The farmer, who is over-stocked, is always in trouble; in spring he must stock the pastures too early for the want of house-food, and in autumn he must permit the cattle to remain in the fields until, through exposure to bad weather and insufficiency of food, they become greatly reduced in condition. If to avoid this he begins early on his store of roots and hay, he is run out probably in March, the very season when the lengthening day and the

chilly cutting winds cause increased consumption, and a struggle of some kind must be made to hold them over on purchased food until something can be picked up on the pastures. The full supply of food tells on every animal, but of course most noticeably on those whose produce is being daily turned into cash. The widely-distended bag of a well-fed cow as she comes from the pastures to be milked, and the sense of relief which she unmistakably shows when the process is completed, is both a source of gratification and profit, and is in wide contrast to the limp half-empty appearance of the udder, when the cows are on bare pastures, and have to roam about continually in quest of food. No amount of care or good management on the part of mistress or maid can make up for this oversight on the part of the master; and when, on making up the year's receipts, he finds the amount to be little over half what it reasonably might have been, he can only blame himself for his short-sightedness in keeping more cattle than the food he had provided was able to sustain. Breeding ewes tell also very forcibly by the return which they give, whether they have been liberally fed or not, any deficiency in food telling at once on the milk, and the lamb in consequence ceases to grow, and becomes stunted and profitless. A flock of sheep do

gradually when on a good range, and give no trouble, the lambs thriving so rapidly as to be almost seen growing; and the ewe herself grows a good sound marketable fleece, besides being nearly always in prime condition, a very short period elapsing after the lambs have been withdrawn, when she herself is fit for the butcher.

A fixed course which recognizes the true principles of successful husbandry, the restorative and exhaustive crops being equally distributed, and the wants of the live-stock well provided for, will, if patiently persevered in, seldom fail in placing the man who carries it out in a position of independence and comfort. When a farm possesses a moderately good soil, and is not over-rented, the tenant is encouraged to improve, and a very few years' care, attention, and judicious outlay effects a vast difference on its appearance and capabilities; fences are improved, perennial weeds eradicated, and the increasing bulk of the crops indicate with considerable exactness the degree of progress which has been made. The grass assumes a more healthful and brilliant hue; the sward becomes thicker, and feeds more cattle than it could previously, and to better purpose; and as the "face" and stamina of the farm improves, so in direct proportion does the farmer's present condition and future prospects.

THE GREAT EXHIBITIONS OF IMPLEMENTS.

At the closing Council Meeting for the season on the first Wednesday in August it was resolved that "The Implement Committee of the Royal Agricultural Society of England be requested to consider and report in November whether any or what restrictions should in future be imposed on the exhibition of duplicate implements, especially by agents, and on the exhibition of miscellaneous articles." Again, in the Special Appendix or Report on the Taunton Meeting of the Bath and West of England Society, as just issued, the pamphlet opens after this fashion: "In order to keep the show within reasonable dimensions, duplicates of every description should be forbidden, that is when the maker is present. Agents should be absent. In many cases we found the same implements on different stands. The miscellaneous department, by which we refer to the immense collection of articles not in the remotest degree agricultural in their bearings, requires compression and centralization. They appeared here, there, and everywhere. We would go further than this, and suggest that exhibitors of similar kinds of machinery should, as far as practicable, be collected together. It has been done with reference to the seedsmen with the best effect. Why not in other departments? The coach-builders made a great display. What a comfort to an intending purchaser if he could have compared the merits of inventions at adjoining stands instead of having to consult the catalogue and run from one end of the show to the other! How interesting and convenient if all makers of reaping and mowing machinery could be put nigh one another!" The agricultural authority of *The Times*, we believe, claims credit for having advanced something similar on the overwhelming extent of the implement section of our leading meetings; but, considering the terrible muddle he made of the stock show at Oxford, he should surely have gone a little further, and have recommended that there should be no "duplicates" of cattle or sheep, as more especially not of Devons, nor of Herefords.

Plainly put, of course the resolution of the Royal Society and the first suggestion of the West of England Society go directly to destroy the agency business. The Royal Society aims at exhibition restrictions

"especially by agents;" and the West of England Society says, "When the maker is present agents should be absent." If carried out, this step will not only materially change the character of the show but still more clearly revolutionise the trade. Many of these agents have stands of their own at the great and smaller gatherings of the year, and many of the makers prefer that orders should be executed through the local agents. How often have we heard the head of a firm refer a customer to Mr. This or That, "in your own neighbourhood," as the man to supply him with a prize plough or a reaping machine! But henceforth the agent is to be "absent." We do not suppose that it is proposed to go quite so far as to banish him bodily from the show ground, but he is to be denied the great benefit of this greatest of all advertisements, and to confine his operations henceforth to the market-place and the farmers' ordinary. There is, perhaps, no other business which depends so much on, or which has developed itself so signally through the means of efficient agency as the manufacture of agricultural machinery; and the proposed reform raises a question that would certainly look to be rather a delicate if not a dangerous one to deal with. As regards "the miscellaneous articles" the course is clearer. Every body is coming to see "the opportunity," insured by the attendance at a Royal Society's show; and, unless some very resolute restriction be adopted here, we shall, no doubt, very soon have grand pianos, patent tooth-picks and soda-water manufactories distracting one's attention from the more orthodox display of chaff-cutters, steam-engines, or haymakers.

We do not know how far the Implement Paper in the West of England Appendix has the authority of the Council; as without this it can naturally have little or no weight. But taking for granted that the opinions here propounded have at least been "passed" by the Journal Committee, we may give a little more attention to the contemplated alterations in the exhibition of implements. The writer certainly goes "further," when he advises that similar kinds of machinery should as far as practicable be "collected together;" but, although apparently offered as such, this is by no means a new idea.

We have seen it adopted at meetings of the Highland Society, and with the most thorough failure and general dissatisfaction. An exhibitor, whose expenses are heavy enough already, will have to multiply his staff, while the arrangement of his stand will be destroyed, and the complete really "Royal" look of the ground lost to us for ever. Nothing, as we well remember, presented a more poverty-struck appearance than that row of ploughs at Edinburgh, where "the intending purchaser could compare the merit of inventions," with the show-men jostling each other like cheap-jacks at a country fair. Palpably there is only one legitimate way of "collecting similar kinds of machinery," and of "comparing their merits," and that is of course by public and properly organized trials. But then the West of England Society in its wisdom has discarded any proper system of trials; anybody goes to work or not, as pretty much when and where he pleases, and as a natural consequence nobody seems to care much about what little is done in this way. The writer of the report says that at Taunton "steam cultivating machinery was conspicuous by its absence. Surely it might be regarded as an evidence of the firm root it has taken, that makers can afford to be absent." Was ever there such an absurdity proffered in the shape of an argument or reasonable deduction! He might as well say that the steam-engine or the drill has taken such firm root that makers can afford to be absent! The true cause, no doubt, is that it does *not* pay to exhibit the steam-plough at the West of England shows. The field trials command but little interest, and these have often been so far away that few people ever thought of visiting them. When, however, the Royal Society next year offers its thousand pounds premium will "steam cultivating machinery be conspicuous by its absence?" or can "the makers afford to be absent?" In our report of the meeting we said that "the trials" were never so tame as at Taunton; while we suggested, as we suggest still, that the Council should offer, say a hundred pounds in premiums for novelties on the stands or in the fields,

when a new spirit would be infused into these proceedings; for, as their own reporter now puts it, "the decision arrived at *does* guide the mass, otherwise we should not find exhibitors so intensely eager for success." Who of late years ever saw an implement exhibitor intensely eager at a West of England Show?

Colonel Luttrell writes like a master of his subject on the horses; Mr. Hole concludes his notice of the Devons by "regretting the absence from the list of exhibitors such as Messrs. Quartley, Turner, Mordridge, Passmore, and others, as no question the show Devons from this or some other cause are much below their average excellence, despite that wondrous tale of the *Times*, which declared them at Oxford to "have never been better!" Mr. Savidge, the Shorthorn judge, says Royal Buttery 20th "quite surpassed" Mandarin, and "won point for point," a decision we protested against at the time, as at the Stroud show the other day Mandarin "quite surpassed" Buttery, and "won point for point," whatever that may happen to mean. Then Mr. Henry Fookes, as the sheep steward, "has every confidence in asserting that the judges went through their arduous duties in a manner which could not fail to give satisfaction to all possessing a practical knowledge of the breeding and management of sheep." As regards the Southdowns, on which Mr. Fookes is especially well qualified to speak, we reported precisely the reverse of this. The judging did *not* give satisfaction; and as one of the judges at Oxford, Mr. Fookes did everything he could to upset or correct the Southdown judges at Taunton! Would Mr. Fookes, in the face of all this, be good enough to tell us to whether of the two we are to look for "practical knowledge," "breeding and management," and so forth? There never was a more direct contradiction than these two sets of awards convey, and one or the other must be wrong. Either Mr. Fookes judges better than he writes, or *vice versa*; and it would really be interesting to know in which province we are to regard him as the better authority? So far, precisely as he writes up the Taunton judges does he write down himself.

THE ADMINISTRATION OF THE POOR LAWS.

A conference of the counties of Hants and Berks was recently held at Basingstoke, Mr. W. W. B. Beach, M.P., in the chair.

Four subjects were set down for discussion at this meeting, viz.: 1. "The training of pauper children;" 2. "Vagrancy;" 3. "Out-door relief;" 4. "Internal management of work-houses."

The CHAIRMAN, in opening the conference, said they were all much indebted to Mr. W. Portal for the great trouble he had taken in this matter, but he knew full well the great difficulties which arose in administering the Poor Laws, and he had therefore been justified in calling those more particularly interested in their removal together to consider what measures might be taken for producing some amelioration of the present Poor Law system. No doubt the difficulties which existed resulted very much from a difference in the several modes of administering relief by the various Boards of Guardians, and those gentlemen were perfectly justified in judging in each case brought before them; but they, perhaps, had not always the same opportunity of judging as the members of another board might have. Different cases were brought before different boards, and the different members of a board must hold their particular opinions as to the mode of dealing with cases. But it was desirable, if possible, that some homogeneous arrangement should be effected by which boards of guardians throughout the country might act in harmony with one another. The present Poor Law system

had now been worked for a considerable time, and it was a great improvement on the system which had previously existed. Pauperism in extent had been greatly reduced, and an improvement had been effected in the mode of carrying out relief; yet, from various causes operating at the present day, we were, to a certain extent, relapsing into that system which existed prior to the passing of the present Poor Laws. There was no doubt that the great evils which were prevalent in former times in administering those laws resulted from relief being given in aid of wages. This encouraged men to rely on eleemosynary relief; but it should be their object to give assistance in such a manner as to encourage a man to rely upon himself. He should never apply for aid unless absolutely in need; but he (the Chairman) feared there was now a great disposition on the part of a labouring man to think that upon every petty occasion he was justified in applying for assistance. He did not possess that spirit of independence which years ago would have led him to shrink from doing so. A great proof of this was to be found in the great, the alarming extent, to which out-door relief existed at the present time. The proportion of such relief in England and Ireland, although the analogy did not quite hold good, differed materially. In Ireland out-door relief was scarcely in excess of in-door, whilst in England it was immensely in excess of it. Of course out-door relief should be given in certain cases—where, for example, a man was incapacitated temporarily from labour in consequence of accident; but it should always be awarded with great discretion, and only where a man was totally unable to support himself and his family. To medical

relief he should be entitled at such times, and more should not be given unless he was totally unable to gain support for himself and those dependent upon him. Various opinions were entertained as to the modes in which the many evils which had arisen should be dealt with and checked, and by which a better system might be brought about; but these suggestions involved such a large number of subjects that he should not be justified in trespassing upon their attention by bringing them forward at the commencement of that important discussion. There were a great many professional tramps wandering about the country, and it should be as much as possible the object of those engaged in administering relief to the poor, whilst affording temporary aid in workhouses to those passing by, to check the system of professional tramping.

VOICE: Professional vagrancy does not exist to anything like the extent generally believed.

Mr. W. PORTAL, before reading his paper, made a few preliminary remarks on the course of the proceedings arranged for the day, intimating that papers would first be read by gentlemen on four subjects, which would afterwards be discussed. The reasons which had induced others and himself to invite those present to that conference were that in other parts of England meetings of the kind had been held, and had been attended with beneficial results. They had present amongst them Mr. T. B. Baker, a gentleman who had taken great interest in the subject, and who had the management of a conference of this character. He (Mr. Portal) had the pleasure of attending one of these at Malvern, not long ago, and he thought it would be desirable to introduce them into this neighbourhood. It appeared to him it would be well that the people of this county should have an opportunity to discuss the different modes of administering the poor laws, for it was astonishing to find the difference that prevailed in Union A, Union B, and Union C, and none of them, he thought, were so well versed in poor-law matters, however great their experience might have been, that they could learn nothing from each other during these discussions. They had that day some fifty or sixty gentlemen representing 38 unions—26 in Hampshire and 12 in Berkshire, and it would be a question for decision presently whether it would be advisable hereafter to hold these meetings periodically—alternately at Basingstoke and Reading. He had ventured to take the lead on the present occasion, and (if they would permit him) he would now read the paper he had prepared: Training of Pauper Children.—Upon the training of the children of paupers *no* depends in a very great measure the amount of pauperism for the future. "Once pauper, aye for ever pauper!" may apply with but few exceptions to the adult, but inasmuch as the vast majority of pauper children are so from no fault of their own, but from circumstances over which they have no control, and for which they at least are not responsible, we shall all, I think, agree that we are bound, as individuals, and as a nation also, to spare no pains or means to rescue them while young from their unenviable position, to foster in them a spirit of self-reliance and thrift, and to fit them for taking their places in the world as industrious, honest, respectable, and respected men and women. Let me remind you at the outset, however, that "pauper" children are not a very hopeful material to work upon, or are they altogether capable of being compared with the ordinary run of children of national or other schools. Many are weak and diseased, born of diseased parents, weak in body, still weaker in mind; yet all are equally children of the state, and all must be efficiently tended and cared for. They are, in truth, destitute. No one else will have them, no one else will take care of them. Some are born in the workhouse, and remain there until able to earn their own living, while others are in for much shorter periods, and liable to be removed at any time by their parents. Such are the materials we have to deal with, and they at once suggest difficulties. There are several ways allowed by the legislature to boards of guardians for the training of children, and for facility of discussion by this conference, I divide them into four general heads: 1, *Children out to School*; 2, *Children taught in the Workhouses*; 3, *Children sent to District Schools*; 4, *Children Boarded out*. 1.—There is the very small workhouse, where the children being so few in number that it is not deemed desirable to have a separate school, and these in the workhouse go, as if they lived in their parents' cottages, every morning to the national school in the village or town adjoining, taking their mid-day

meal with them, with their slate and their books, and leading very nearly the same kind of life as their poor but freer neighbours. I believe that children thus taught, and mixing early in life with their equals and their betters, joining in their games, exposed to the same weather, and liable to the same temptations, are found to be capable at the accustomed age to fill with credit the places allotted to them, and, presuming always that there is a good master and matron in the workhouse to look after them while in the house, instances of permanent or hereditary pauperism are under such treatment seldom to be met with. The objection commonly raised to this system is that the children are away out of sight of the master and matron during so many hours of the day. They cannot, therefore, be wholly responsible for the conduct and behaviour of the children, and that such going out of and coming into the workhouse gives facilities for bringing into the house much that is objectionable and to be avoided. It has also been said that, by the village or other school children these poor friendless ones from the workhouse are regarded as "speckled" birds, looked down upon by them as inferiors, not admitted into their little coteries, not permitted to share their games and pleasure, and that this has a depressing effect on them. How far this is so many gentlemen here can doubtless inform us. 2.—We come now to mention the school in the workhouse. The usual type, however, of a workhouse school, conducted either as in the smaller workhouses by one teacher only for boys and girls, or, as in the larger workhouses, by a master for the boys and a mistress for the girls, is the system most commonly in use in country unions, and under which system the majority of pauper children are brought up. I will not describe the routine pursued at schools of this type, because they are well known to all here, and I must be very brief. Whatever may be the shortcomings of these schools, I do not think they can be said to have failed. Although 20, 15, or even 10 years ago, much fault may have been found with these schools, I have yet to learn that pauper children trained in them become paupers when adults, whether female or male, or that the present inmates of the workhouses of this country contain any appreciable proportion of those who as children received the full benefit of training in them; on the contrary, I believe that if a return were called for by the Poor Law Board, showing the number of children who have received full benefit from workhouse training a very large proportion of them will be found to be dispauperised, and no difficulty whatever is found in procuring situations, especially for the girls. Some of these schools, however, are, we must all allow, unsatisfactory. And yet the discipline is found to be good, perhaps too good. The children often look drilled and disciplined to an extent that verges on the ridiculous or the painful. The punctuality and regularity is not to be excelled in a regiment or in a man of war. They watch every twinkle of their master's eye, and every frown on his brow, and they smile only when he smiles, and that is seldom or never—in their presence, at least. They are walked out once or twice a week during very fine weather; they mustn't get their clothes wet, much less their feet; but as for games, they scarcely know any, and if they did, there seems an absence of spirit and boyish energy and pluck about them which we all delight to witness in other playgrounds and cricket fields. In school hours they for the most part are taught to read, write, and sum well; the schools are periodically inspected, are generally pronounced to be in a creditable condition and the masters and mistresses "efficient," or at all events "competent"; and very many children are made fair scholars, and are good, trustworthy, well-meaning boys and girls, but many of them are not able to battle with the world into which they must soon enter, and are unable, in short, to get their own living. Though many of these schools have also an industrial teacher, and the boys are frequently taught both tailoring and shoemaking, I believe that the instances are extremely rare of this kind of training being turned to any really good purpose in after life, and but very few are competent shoemakers or tailors from this instruction. The outdoor work, too, in the garden or in the field (as the case may be) to which these boys are taken generally (in fine weather, at any rate) in the afternoons, seems somehow or other to lack reality about it: they dig unlike other boys, they walk, they talk, they run unlike other boys. If you watch the whole proceeding you cannot help bearing away with you the impression that these boys are not working for their own living. There is an artificial appear-

auce about the whole work. It does not look like business, there is too much routine about it, and when farmers and others come to the house and ask for a boy to enter his employ on the farm, or in his house as a servant, you hear very shortly that the poor boy is more trouble than he's worth, that he's as green as grass, and that it requires the temper of a Job to put up with him. And the same may probably be said of the same workhouse as regards the bringing up of girls, in that, though they have been taught needlework, washing, cooking, cleaning, &c., they are unfit for service when they come to be free, and they are glad to go to such an "Industrial Home" as that established by the kind Miss Twining and others, to fit them for service, domestic or otherwise. When all this is true of a workhouse school, to what cause are we to attribute it? So far from believing it to be due to any niggardly or parsimonious feeling on the part of the guardians (a body of men who receive a large share of abuse, and of whom many hard things are most unjustly spoken, but said, I am inclined to believe, in ignorance), it is due, I believe, to the very opposite cause. The life of children in a workhouse is too *artificial*, too unlike the real, hard, stern, struggling life which they *must* engage in when they leave it. Instead of too little being done for them, too little is done by them; they have not to "rough" it as the poor labourer's child has to rough it. Everything is not found for the labourer's child as is found for these children. They are not thrown enough upon their own resources—everything is done for them. They are waked in the morning: they are bathed so many times a week in most workhouses, hot and cold water laid on. If they should be poorly the doctor calls every day, or mostly so. Their food is regularly supplied; three hot meat dinners every week and one cold meat one, and three hot soup dinners. Some are taught knitting, others netting, some shoemaking, others tailoring. A cow or two is often kept, so that they may have good wholesome milk, instead of contract sky-blue. Their clothes are far superior to those of the ordinary labourer's child, and so, indeed, is their diet, and so is their bed and their bedding. Large pieces of land are bought or rented as much for the purpose of training the children in husbandry as for the purposes of profit. If the training of these children is in some of these workhouses not sufficient to enable them to rely upon their own energies in after life, the remedy must be found, I think, mainly in more judgment, more discretion, more interest, more common sense, first in the master and matron, and next in the teachers and instructors. The constant bickerings and squabbings between the officers in most large workhouses is well known to all connected with the administration of the poor law, and this militates very sadly against the welfare of the youth. If either officer is seen to digress in the least from the strict letter of the consolidated order of the Poor-law Board (though from the very best motives and with the best intentions) he runs the risk of being reported on the following board day. Each one is too often jealous of the other, and the children may suffer in consequence, and that many children do suffer in consequence is to be gathered from the fact that, while all these workhouses are governed by the same general laws, and under the control of the same Poor-law Board and of poor-law inspectors, you will find in workhouse A the training of the children does not lead to their being dispauperized, while in workhouse B scarcely a single instance is to be met with of failure, but active, honest, and thrifty young men and women are the result of the training they have therein received. The secret of success is this. Obtain a master and matron who have their heart in the work—good kind Christian people, but who do not come to the situation altogether for the sake of the salary that goes with it, but who will look after the orphan, the friendless, and the (otherwise) destitute child as if it were their own; who pride themselves on the number of children that they have been in great measure the means of sending out into the world ready and strong enough to grapple with the world's trials and difficulties, with good common sense and a supply of what we call "nousé;" who teach the children to look to them not as their master but as their friend; who invite them to write to them occasionally when they leave the workhouse, and to tell them of their success or failure, as the case may be; who invite them, when on leave or holiday, to come and spend a day or two with them, even though it is at a workhouse (in the so-called "vicious" and "contaminating" atmosphere, of which, I think, there has been much exaggeration); who will advise them as to their

clubs or their savings' banks; who will entwine themselves into their confidence, and who will (like the Great Master) never leave or forsake them. I have known several such masters, several such matrons, thank God; and not only so, but I know several such now in the active fulfilment of their duties. With such a master as this over the workhouse, and over large workhouses, I should like to see many gentlemen, lady or clergy, presiding, and there would be no such need surely of endeavouring to persuade Boards of Guardians to incur still further expenditure for the formation of the (3rd) district schools into which all the available children of several neighbouring workhouses would be consolidated. Into a description of these I need not go. I know well that many of our workhouse school inspectors as well as poor-law inspectors advocate the establishment of district schools, such as Farnham and Hartley Wintney District School, and Reading and Wokingham District School; or as Central London District School with 1,100, or the South Metropolitan District School with 1,000 children. For the children of London or of other large cities these schools are a necessity. The requirements for earth, air, and water, for space, all demand it. Their health generally make it an absolute necessity to remove them from the city. The results, too, of the training in these schools, as shown in the last report of Mr. C. Tufnell to the Poor-law Board, are of a very encouraging character. Some years ago I was a strong advocate for district schools, but time and experience have led me to feel the necessity of closing the "capital account" for more buildings and consequent increase of "establishment charges," and of developing the means that we already have within our reach. I think also that the advantage to the children of having them *near* to those who are most likely to have "sympathy" for them and to find places for them, *near* to those who, perhaps, knew their fathers or their mothers, and thus keep up rather than sever parochial ties and ties of friendship between them and their more prosperous neighbours, is great. There is much good in these district schools, nor can I doubt such high authorities as my friend Mr. Carleton Tufnell and others concerning them, but, to my mind, large masses of children are productive of much evil, and when I know that in reformatory schools and in industrial schools it has been generally held, not only by the managers, but also by the Government inspectors, that no more than fifty should be collected under one or the same roof, in order that as much of the house and the family influence between the boys and the teachers as is practicable should be kept up, I cannot recommend the guardians of the poor (but who are also guardians of the public local-rates) to incur an expense which is by no means a necessity. It must also be borne in mind that you can only send your orphans and friendless and deserted children to these schools. You must always *still* have a certain number of children in the workhouse, namely, the "ins and outs" as they have been called—those who come in for a very short period of time, and who are liable to be taken out at any minute by their parents; and others who cannot go to a district school. There remains (4th and last) the boarding-out system as practised in Scotland for many years past, in Bath under the able supervision of Col. Grant; at Warwick, in the Thornbury Union; at Chorlton, Caistor, Horncastle, and a few other unions. The nearest examples to us are to be found at Christchurch and Ringwood on one side of us, and Eton on the other. In England, however, this system of farming out, or "boarding out," as it is now called (orphan and other children with foster-parents), has not yet had sufficient trial to enable us to form a decided opinion upon it. There seems much to recommend in it, but unless thoroughly well looked after, and closely and continuously watched, with a searching system of frequent inspection—no second-hand contracts, no under-letting—it is open to frightful abuses. The reports of Mr. Bowyer, of the eastern and midland district, and of Mr. Wodehouse, of the northern district, and Mr. Browne, of the western district, in the last annual report of the Poor Law Board, all touch upon this new method, and there is a very full report of the Poor Law inspector, Mr. Henley, entering minutely into the boarding out as carried out in Scotland, as well as in certain unions in England. With regard to the system as carried out at Eton, Mr. Henley states that the training, both moral and physical, is successful, and the children thus reared are likely to be absorbed into the population, and *not* to become paupers. The cost at Eton seems

to be about 3s. to 4s. a week, exclusive of 20s. to 30s. for outfit. At Christchurch it has only been tried a few months, but at Ringwood for a much longer period. This much is certain about it, and the same may be said of all the four methods of training pauper children—that in each of the four systems to which I have called your attention there is much good to be found when efficiently, honestly, and sensibly worked. It is advantageous to have more than one plan as our universal type. Let me now offer one or two practical suggestions. We, as guardians, want rather more freedom and discretion afforded us in the matter of educating our pauper children than the Poor Law Board at present allows us. Our children, trained in workhouses, though with better clothing and better food than can be obtained by those of the ordinary agricultural labourer, generally appear to suffer from want of that liberty and space which are so essential to their healthy development of body and mind. It would be well to break down these barriers, and give us permission to put out, either on loan or hire, as day-workers either on a farm or elsewhere, those who are preparing for their first situations in life, allowing them to come home to the workhouse as their natural, and, indeed, only refuge. Again, as children, in the small workhouses go out to the neighbouring village or national school, so let the ordinary labourer send his child (if he should live near, and wish to do so) to the school in the workhouse, on payment of the ordinary fee. Again, let the weak-minded and idiotic children, *not* the strong and healthy, be removed into an asylum for juvenile idiots, the building of which should be at the national, and not at local cost. Also, let the schoolmaster's salary depend more on the *results* of his training than on the number per head committed to his care, which militates unfairly against small houses. Again, let us have reliable returns, as far as they can be ascertained, of the success that has in after years attended the training of the children under each of these systems. I hold one that has been fairly kept for the last 20 years in a small union, and the result shows that a small workhouse *can* be a good training school. Of the training of *out-door* pauper children I have only to wish that the order of the Poor Law Board were made more stringent upon us than it is, that no out-relief be given to the children of out-door paupers unless they attend some school, if practicable, and that school fees be made *always* part of the relief. After all, the gentlemen Boards of Guardians may do much, and the officers both in and out of the house may do much, but the co-operation of others, the ladies and gentlemen who *have* the *time* and the *will*, and the *sympathy* to assist in the great work of befriending and benefiting and assisting our poorest children is most urgently needed. I believe that the present Poor Law has sadly dried up many springs of charity amongst the rich, and loosened the bonds of parental and filial affection amongst the poor; but let us hope that such meetings as this will call public attention to some of the wants of our poor orphan and destitute children; and whether by committees of visitors in the workhouses, or district visitors for our villages as well as towns, kind Christian friends will be forthcoming, who will co-operate with the Poor Law Guardians and others in improving the condition and brightening the future of our pauper children.

The Rev. Mr. POLE remarked that in their union (Kingsclere) the proportion was two-thirds State children, or children deserted by their parents. In the matter of training, the results in that union, which was a small one, were not unsatisfactory, and the proportion of those who came back to the house after leaving was very small—not, on an average once a year. Many of them did very well in after-life, and the girls were especially fortunate in that respect. Frequent applications came from Reading for girls for domestic service. He thought the training had better be left in the hands of the guardians than to district schools; and they would do much better in keeping their union school children as much as possible to themselves. He did not think the boarding-out system adapted to their purposes.

Mr. TAYLOR observed that, prior to discussing so important a question, it would have been better if the paper just read could have been printed, so that each might have made himself perfectly acquainted with its contents. Mr. Portal did not appear friendly to district schools; but he (Mr. Taylor), as a Guardian of Reading Union, and having known the work of a district school for sixteen or seventeen years, and having

seen that children educated in it had received a sound education at an economical rate, and had afterwards been well placed out in life, rarely appearing again as paupers—he wished to state his views, and to show that, though there were difficulties connected with district schools, the cost of maintaining and educating these children had not been excessive. Mr. Portal spoke of the cost of Eton children being about 3s. or 4s. a week, exclusive of the 20s. or 30s. for outfit. At the school he (Mr. Taylor) referred to it had only been 2s. 4d., and 7d. a week for clothing. The boys left at an early age for agricultural service, and the girls for domestic employments. Some of them got on in life afterwards as well as those children who had never been in a union.

Mr. TUFNELL said there was such an opposition to district schools in the country that he despaired of ever seeing them generally adopted; but, so far as his experience went, the results obtained in district schools could never be equalled in workhouse schools. Their object was to prevent hereditary pauperism as it once existed, and he believed the district schools about London had stopped it entirely. The great difficulty in all schools was to know in what industry boys should be employed. In these district schools they had tried every possible one, and experience had shown it to be that which none of them would ever have imagined without such experience. It had been found that the employment best adapted for pauper children was music. These children were sent into the army, and he never knew of a single instance in which a boy sent out as a musician ever returned. He was acquainted, too, with several clergymen who were pauper boys in some of these schools, and there were others in the army doing well as non-commissioned officers, and one was now expecting to get his commission. These observations applied more particularly to orphan children, and this showed that the best way of dealing with young paupers was to send them from their own parishes, and so remove them probably from the influence of degraded parents. If he could have his own way he would send every boy from his own parish. There was a great difficulty with respect to the training of girls, who sometimes failed in industry, sometimes in morality. This demoralization was caused by mixing together, and he showed more particularly how it was brought about. He recommended the plan of a half industrial, half intellectual training. He thought there was no reason for limiting the number of non-criminal children assembling together for school purposes, but others should be restricted in number. A parent could at all times remove a child from the guardian's care. He should like to make them responsible *in loco parentis*.

Mr. MARX observed that children were sent out from the Alresford Union as agricultural labourers at the age of twelve years. Would Mr. Tufnell inform the meeting at what age the generality of boys left the district schools referred to?

Mr. TUFNELL admitted that the boys left the London district schools somewhat late, but a London boy of fourteen was not larger in growth than a country boy at twelve. They were weaker, and were half-starved before they entered. One country pauper child was equal in strength to two or three Londoners.

Mr. SCLATER was strongly of opinion that district schools were much more adapted for towns than for country unions. The Chairman, Vice-Chairman, and others present, could not control the strong opinions and prejudices of Boards of Guardians, and therefore he thought it was almost useless to discuss the question. He agreed almost entirely with the paper read by Mr. Portal, but he thought one point had been pressed rather too far. He appeared to think that pauper children, when out in place in the world, were rather looked down upon. That feeling no doubt prevailed many years ago, and it had been strongly painted by Mr. Charles Dickens; but, in his opinion, the feeling was now a thing of the past.

Mr. BRONCKER asked Mr. Tufnell if a band could be organised in a small union.

Mr. TUFNELL replied that it could not, and that was another advantage of district schools.

Sir NELSON RYECROFT enumerated several instances of boys who had left the Sevenoaks Union, in Kent, for various employments, and who had been tolerably successful in after life. Tailors and shoemakers did not appear to have enjoyed an equal amount of success.

Mr. PORTAL produced written documents, one from Mr.

Hoare, of the Bradford Union, and one from Mr. Best. On the subject of music, the first named gentleman spoke approvingly; but Mr. Best feared that it was likely to induce boys to lead a vagrant life. He recommended agricultural labour for boys, and that girls should be employed in laundry and domestic work.

Mr. PALMER, referring to Mr. Portal's remarks with respect to those children who were often weak in body and mind, and who were not the best sample of children to operate upon, alluded to the school at Wargrave, and said he did not believe that any private school in England could produce such a report as to health as could be furnished with respect to that school. With one slight exception, there had been only one epidemic in 20 years. One advantage of district schools consisted in the removal of children from the evil influences in which they might have been brought up. In those schools, too, the children were surrounded by social influences which it would be impossible to obtain in a workhouse. At Wargrave, people in the neighbourhood frequently invited them out, and they mixed with the residents of the village. When they left school they departed much with the same feelings as those entertained by children leaving a boarding school, and if they wished to surround children with social influences, and to destroy that workhouse feeling, the best institution possible at present was the district school. The farming-out was another plan, but it was questionable whether or not it was a good one; for (as Mr. Portal had remarked) it would require a great deal of supervision to keep things from going wrong.

Mr. PORTAL said he had been careful to show that under each system by which they took the charge of children they would find something good, but none was perfect. Yet, considering the conditions under which we live, the high rates, &c., he thought this was not the time to encumber themselves with large expenses for educational purposes when probably they had ample means for educating the children. He had been somewhat misunderstood with respect to district schools. He would hesitate to provide them in those districts which did not possess them—not that he positively objected to them: With regard to orphans, the theory was that these children were the children of the State, and they could not do too much for them. Mr. Portal concluded by moving the following resolution—"That, though great difficulties exist in establishing district schools in agricultural districts, yet, where practicable they deserve encouragement; and that idiotic and weak-minded children should be removed from all schools to central asylums."

The resolution having been seconded,

Mr. DAVIS said he should like to have had a statistical account of the percentage of results; for it was only by such statistics that they could arrive at any substantial conclusion. Mr. Portal had remarked on the condition of workhouse boys, but this was to be attributed to their circumstances early in life. They were often born in sin, of diseased parents, the outcasts of society, and, he believed, if they took all things into consideration, that the present system was by no means a bad one.

Mr. SCLATER asked Mr. Portal whether, when he suggested that idiots and weak-minded children should be sent to an asylum, he meant to include all children of that kind? Some of these were in the workhouse for a short time only, and he thought the latter portion of the resolution should be confined to those children never likely to be removed from the workhouse.

Mr. PORTAL, replying to Mr. Davis, said he had rather a weakness for statistics, but he had not provided them on this occasion, because persons were not able to retain them in their memory. In all well worked schools he believed it would be found that at last 75 per cent. turned out well, and were dispensed in after life. With regard to the last portion of the resolution, he apprehended that there could scarcely be a doubt that these idiots and weak-minded children were a great drag on the masters. They were miserable and unhappy, but at Earlswood they were cheerful and contented. He was willing to withdraw that portion of the resolution.

SEVERAL VOICES: "No, no."

The Chairman put the resolution to the meeting, and it was carried intact, no further dissent being shown, and the meeting then proceeded with the reading and discussion of other papers set down in the list.

VAGRANCY.—ITS CAUSES AND PREVENTION.

Mr. T. B. L. BAKER (Hardwicke Court) then read the following paper: I am much honoured by being asked to write, for your consideration, a ten minutes' paper on "Vagrancy: its causes and prevention." But to do so I must be very brief. If, therefore, I give my opinion *quantum valeat*, briefly and decidedly, I trust that my doing so may be imputed not, to want of courtesy, but to want of time. The causes and the character of vagrancy are so differently stated by writers of great experience in different parts of England that I can only come rather unwillingly to the conclusion that we have, not one set of vagrants travelling throughout the whole country, but several distinct species, each keeping to their own district. In Gloucestershire and the neighbouring counties we find nothing of the highly amusing and poetical vagrants described by Mr. Doyle, in Cheshire, nor of the burglars or organised robbers described by Mr. Dunne, in Cumberland. But, in truth, all our accounts of the class appear sadly liable either to error or misconstruction. Even our statistical returns have been sadly misunderstood. Many readers of the judicial statistics took alarm at the returns there given, and believed that the ratepayers had to maintain an average of 32,000 vagrants, and could not understand the Poor Law Board describing them as only 6,000. The return, indeed, of 32,000, which was intended to include tramps with vagrants, has been found on examination so unsatisfactory that it will be omitted for the future. This want of information as to the numbers and character of the class we have to deal with is greatly to be regretted, and I fear we shall not get a satisfactory solution of how to prevent them till we get a more accurate knowledge of their numbers and habits. This, I think, may be acquired by one of the modes of prevention which I propose, if it be ever fairly carried out. The causes of vagrancy in my part of the country, I think, are easily stated. A man falls out of work either from slackness of trade, which causes not only the most idle or the most drunken, but also the oldest and weakest of the gang to be discharged, or even at times of full work an idle, or careless, or stupid man will be occasionally turned off. These usually try, in the first place, to get employment in the same town, but if they fail, and find their money and credit exhausted, they set out to seek it elsewhere. For a time they may seek for it honestly and diligently, but those who fail in getting employment quickly—sleeping in filthy vagrant wards as, alas! most of them are—insufficiently fed—wet through by day and with small means of drying by night—become contaminated in body and mind, and, finding from their companions the advantages of begging, gradually join the ranks of the older mendicants with whom they are obliged to associate. It has been asserted by some that most of the vagrants are the sons of vagrants born and bred to the trade, but I think this is sufficiently disproved by the fact that in July, 1858, there were only 2,069 vagrants in England and Wales, as shown by the Poor Law return, while in 1867 there were 5,248. And it is clearly impossible that the odd 3,179 could have been born and bred in the time. If I am right in these causes they ought to be some guide to us in finding a system of prevention. It has been commonly said, that if we could prevent the public from indiscriminate alms-giving beggars would cease, but few even pretend to tell us how the public are to be so prevented; yet unless we can at least greatly diminish the alms-giving we shall do no good. I believe, however, that this is quite feasible if we carefully consult the public feeling. We must, in the first place, take the utmost care, and let the public see that great care is taken, that no man, good or bad, shall be allowed to starve—that the workhouse shall give an ample security that every person who comes to it without food or money shall be quite secure of food and shelter. If this be carefully done many will cease to give to those of whom they know nothing, and the number will increase year by year. But if all vagrants are to be lodged and fed means must be taken to avoid this kindness becoming a temptation to idleness, without at the same time using a degree of harshness which will incline the public to pity and assist them. I think we may fairly assume that there are some vagrants, probably few in number, who travel entirely for the purpose of going direct to some place where they hope to find work or return to their parish—that

these few are anxious to make their way thither at their best speed, and that these generally deserve to be helped on the way. We may also assume that there are others, probably by far the major part, whose object is merely to live idly from day to day, and these, all will agree, ought to be sternly repressed; but neither the charitable public nor the relieving-officers can tell with any certainty whether a vagrant belongs to one class or the other. A system has been suggested of giving to every man a ticket certifying where he slept on the previous night, and to what point he professed to be going. If he then kept to his true line, and walked a fair day's journey in proportion to his strength, he should be relieved from any task-work and fairly treated. If he brought no such evidence he should be compelled after each night to perform a task, the severity of which should be increased till it was found sufficient to deter the idler. This would exactly meet the difficulty, the public would have confidence that the honest traveller would be relieved without hardship, and they would not object to hardship being enforced on the idler. On the other hand, the walking a full steady day's journey day after day would entirely destroy the charm of an easy vagabond life. It would also have the important advantage that it would enable us to know the course of our vagrants. But this system has failed, and has had to be given up for the present, not as I believe from any weakness in itself, but simply from the difficulty of getting it properly carried out. To deal with such an evil as vagrancy it is necessary to have a nearly unanimous action over a large extent of country. It is necessary also to make the labour, where it is inflicted, real and severe; but, after we had got three counties to adopt a far higher degree of uniformity than had previously been arrived at, I found that out of 37 unions 24 gave from 12 to 18 ounces of bread, and 13 gave from 8 to nothing; 8 required four hours of labour, and 9 gave none at all; 6 had baths, and 32 had none. From such a want of uniformity the system naturally failed. I endeavoured to get permission from the Poor Law Board that, where this system was established, and where all honest travellers were altogether relieved from labour, those who could not show that they were travelling straight might be called on for a six hours' task instead of four; but, failing to obtain either uniform action or a power of enforcing labour, the plan had to be abandoned. I cannot but believe, however, that in due time the care of vagrants must be altogether made over to the police, and the expense paid out of the county rate, as was suggested in 1868 by her Majesty's Poor Law Inspectors, Sir John Walsham and Mr. Corbett, and urged in Parliament by Sir Michael Beach, then secretary to the Poor Law Board. When this is done uniformity of action will be secured; and the ticket system will, I think, work well. But, though we have been unable to get that united action which alone can enable us to cope with such an evil as vagrancy from the different boards of guardians, we and several other counties have obtained some degree of unity of action from the magistrates. At the Trinity Quarter Sessions, 1869, our magistrates agreed to adopt the system which had been found to work well in Cumberland (described in a Parliamentary paper, "Vagrancy, Cumberland and Westmoreland," printed April 22, 1869), and had been more recently tried with good success in several other counties, viz.: that of the magistrates in quarter sessions recommending to their brethren throughout the county that every person proved to have begged of any one should be sent to prison. As soon as this resolution was passed the police exerted themselves vigorously, a large number of beggars were sent to prison, generally for ten days each, and the effect has been that the vagrants properly so called (that is to say those who sleep in the vagrant wards of workhouses) have diminished by about one-fifth. But the far larger number of tramps who used to pass my lodge on the road from Bristol to Birmingham have diminished by more than half, and the nuisance to the poor dwellers by the road-side is greatly abated. This system has been adopted by ten counties entirely, and by six others partially, before last October, and in all with similar good results. This last plan is simple and easily carried out. It is also sound and unobjectionable in principle wherever the rule is carefully maintained of securing the absolute necessities of life to all who are destitute. So long as this is known by the public to be done, they will more and more support us by withholding their misplaced charity. Yet, I believe that we can only hope for a real suppression of

vagrancy by the first plan of tickets where the whole care of this class is placed in the hands of the police. There is a third system to which I had not intended to revert, because I thought that the scheme of a neighbouring county would have been so well-known to you as to have needed no remarks of mine. But, however well-known to you, I must mention the scheme of my friend Captain Anyatt Browne, chief-constable of Dorset, of providing by private subscription a supplementary assistance to all travellers, which, I understand, has had the effect, which might have been expected, of inducing the public to withhold their alms from people of whom they know nothing. This again is a sound principle. It has the slight disadvantage of depending on voluntary subscription, and being, therefore, somewhat less reliable than a rate support, and it is less punitive than I would wish towards the professional tramp; but it is good and independent, and would continue to work well with either, or both the others. Forgive my asking your consideration of one other small matter. Many gentlemen, who have not gone closely into the statistics, imagine that the cost of vagrancy is a heavy item in the poor-rates. This is not so, and our object in repressing vagrants, is not the cost of the rates, but the rescuing men from a vicious life. If the most liberal allowance of food, fuel, soap, &c. that is given at any union were made universal throughout the country, the cost would then amount to about one four-hundredth part of the total rate, so that a farmer who would pay twenty pounds of poor-rate, while the most liberal allowance was made to vagrants, would pay £19 19s. if all aid to vagrants were refused.

Mr. W. PORTAL said he believed he should express the general feeling of the meeting if he thanked Mr. Baker for coming from so great a distance as Gloucester that day in order to attend the conference, and thus help them to inaugurate their first meeting. The subject of vagrancy was one of extreme importance, especially in Hampshire at the present moment, for the Earl of Carnarvon had given notice that, at the next sessions of the county magistrates, he should be prepared to bring some notion on vagrancy, more or less definite, before the Court, with the view of putting a stop to its great increase in the county. This increase was shown in the returns from all the unions. A great many gentlemen had most kindly forwarded to him (Mr. Portal) every half year a half-yearly statement of the condition of their unions. It was much to be desired that they should all be better informed on the following points: Population and area, which were generally omitted from their half-yearly abstracts, but which would be found very useful; and, also, not only the number of pounds, shillings, and pence expended, but the number of persons relieved during the past half-year, and the corresponding number for the previous half-year. Furnished with these facts, those at a distance would be much better able to judge by the returns, and when they met at that conference to compare notes for mutual advantage. He regretted its necessity, but he thought they would be obliged to revert to the system of handing over vagrants to the police. Some of the vagrants had acknowledged that they had never done a day's work in their lives, and declared that they never intended to do so.

Mr. TAYLOR referred to the efforts which had been made to check vagrancy in Berkshire. It was arranged that tramps should receive tickets through the inspector of police in the district, under the supposition that if they presented themselves before the police their number would be reduced, and thus be the means of effecting the object in view. With respect, however, to Reading, the results had not been in accordance with the wishes and expectations of the committee, who devised the scheme. After a time the number of tramps increased considerably; yet, in addition to the necessity of obtaining these tickets, a certain amount of labour was imposed, and he believed the plan was fairly carried out.

Mr. WHITCOMBE, speaking of the Portsea Union, said that in 1850 the number of tramps admitted was upwards of 5,000 but the numbers progressed, till, in 1862, they had increased to 15,155. The Guardians, finding that they increased so rapidly, co-operated with the Watch Committee of the Council, and from that time the inspector of police was paid a small salary. He gave tickets to these tramps, without which they could not obtain a night's lodging. The consequence was that, twelve months afterwards, the number was reduced to 4,735, and, in the year ending Lady-day last, the number relieved during the year had been reduced to 3,994. The

Guardians, therefore, could bear testimony to the advantages resulting from such a system being carried out. They had a population of nearly 100,000, and the vagrants were always treated to a bath.

Sir M. H. BEACH said, he had taken the greatest interest in this subject, and he thought statistics, from the different methods adopted by the various authorities who compiled them, were very fallacious things; but the statistics of the Poor Law Board respecting vagrants were taken on one particular night, and compared with those taken on that particular night again another year. The whole number of vagrants found in the casual wards on the 1st of July, 1867, only amounted to 3,854, but on the 1st Jan. in the following year the number was 4,357, and in July reached 6,933. On the 1st Jan. 1869, it decreased to 5,346, and in July to 5,104, while in Jan. 1870, the figures were reduced to 4,147 only. This, he thought, did not show vagrancy to be a great and growing evil. The main reason in favour of the local administration of the Poor Laws—namely, that the guardians were acquainted with the circumstances of applicants—was not one that applied to these vagrants. They belonged to all parts of the country, and were largely composed of the criminal or idle class. For this reason he considered their care and management should be put into the hands of the police, but if this were done it was obvious that it would be necessary to alter the area to bear the costs. The good result of this he showed from an actual test taken in London. He did not wonder at the statement of Mr. Taylor respecting Reading as to the increase of vagrants after police supervision. In Gloucestershire the authorities fitted up certain cells in a disused prison for the reception of vagrants, and this plan secured the advantages of the separate system, for if vagrants liked anything it was herding together. A superintendent policeman was appointed manager of the wards, who had 2s. a week for his trouble, and the result of effective management was curious. At first, however, the superintendent, being new to the business, the number of tramps increased, but subsequently they decreased considerably. He would remind them that it was not fair to take the effects of a system from an isolated instance, and whatever system was taken it should be uniform throughout the country. They would then know what the results were likely to be. If Mr. Baker's system could be carried out it would be of the greatest importance, as securing relief to any one travelling in a *bono fide* way in search of work. In any case he would have sufficient to keep him from starvation, and it would have this important result—that when the public knew that no man need starve they would button up their pockets, and he thought that would be dealing effectually with vagrants. Mr. Goschen had conceived that it would be possible to confine habitual vagrants for 48 hours; but he (the speaker) feared this proposition would be a dangerous one to adopt; for it would do away with the benefit of the public knowing that any man might receive relief when utterly destitute. Although vagrancy was diminishing, the question appeared to him to be one of great importance, and nothing could tend better to a solution of the difficulty than conferences of that character, where they could meet and take counsel together.

Mr. B. BAKER said the best method of employing vagrants was where there was a well at the bottom of the garden, and a large tank on a rise at the back of the house, to set all vagrants to carry 80 buckets of water in the morning before they left. That was work anybody could perform—it required no skill. Stone-breaking might be done in some places, gardening in others; but there certainly was a difficulty in providing profitable employment.

The Rev. Mr. POLE observed that the working man never objected to work. It was the professional tramp.

Sir M. H. BEACH said it was not correct to say pauper labour could not be made profitable. He had known a clear profit, though small, on each vagrant who had come into the union.

Mr. MARX said at Alresford it was found that flint-crushing was not unprofitable. An able-bodied man was required to crush a bushel of flints before he received his breakfast.

The Rev. Mr. POLE remarked upon the destruction of clothing by tramps, and inquired as to the best remedy. They did not regard punishment, and he did not think they were sent to prison for more than 21 days.

Mr. LEEs alluded to the increase in the number of vagrants in Hampshire, hoping that the discussion would result in an expression of opinion by the meeting that they should be handed over to the police.

The CHAIRMAN suggested the passing of a resolution, providing not only that vagrants should be placed under the superintendence of the police, but that there should be some interchange of communication between the police of various counties to act in concert together. Such an expression of public opinion would show what the feeling of the country was, and if his suggestion met with approval he would embody it in a resolution.

Mr. BAKER in reply, said that the employment of a police relief officer in Essex had produced an extraordinary effect at first. Since it had been established it brought the number of vagrants down in two or three unions from 32,000 to something like 1,200, in the course of a few years. Then it was a new thing, but since that it had been tried all over the country and had become like a scarecrow, which at first kept birds off, but subsequently did not frighten them. With regard to the question of what they were to do with vagrants who tore up their clothes he would remark that two years ago he visited one of their workhouses in Gloucestershire (Thornbury), where he stayed all night. During the night a man had torn up his clothes, and next morning he was invited to see the man let out. He was first made to pick oakum, and then a sack was procured. The officers cut a hole in the bottom of the sack, two at the side, and then put him in the sack, with his arms thrust through the two holes at the side, in which condition he was sent out. That was a perfect cure. It made a very strong impression, and since that there had never been a case of clothes tearing in the Thornbury union.

The CHAIRMAN then proposed a resolution to the effect that all vagrants should be placed under the superintendence of the police, and that the Chief Constables of various counties should interchange communications for the purpose of acting in concert, so that the destitute might be relieved, the habitual vagrant punished, and that the necessary cost be defrayed by the borough or county rate, which was carried unanimously.

OUT-DOOR RELIEF.

Mr. MARX read the following paper. Having been requested to place before the meeting some remarks on out-relief, a subject which will, I hope, provoke a useful discussion to-day, I venture to request your patience whilst saying a few words on pauperism generally, and on the direction in which we must look if we desire to find a remedy for it. The changes which occurred in the use and holding of land chiefly during the reigns of Henry VII. and Henry VIII. converted the peasantry from cultivators into labourers. Under that great change England might still have remained free from pauperism but for later errors. Judging from the history of Holland and England, the present painful and disgraceful state of pauperism in which we find ourselves was the result of extravagant expenditure on foreign war, and consequent debt, which led to the substitution of indirect taxation on the necessaries of life for direct taxation upon land, then almost synonymous with property. Thus the source of pauperism was the shifting of taxation from the land of the rich to the labour of the poor—from the shoulders of those who had property to the backs of those who had none. We all know that want and distress are inevitable, but it is otherwise with pauperism, which is a disease of man's creation, and, once called into being by a bad system of laws and taxes, it spreads gradually and continually like an infectious disease. Although the current belief amongst us is that poor laws, like ours, lessen poverty and prevent starvation, they probably multiply both. The poverty and misery permanently existing in our great cities is without example in any prosperous country, and the inefficiency of the poor laws in time of severe pressure, as for instance during the cotton famine in Lancashire, or during the last winter in London, is indisputable. In fact, the resource which should be reserved for an extreme case, viz., the paying of public money for the support of the poor, now only avails under ordinary circumstances, and we have to return to the natural remedy, namely, private charity, in any great crisis. There is reason to believe that more people die of want and its conse-

quences in London with a poor law and three millions of inhabitants than in Italy with twenty millions and no poor law. It is remarkable that those who live where there is a legal and compulsory rate for the support of the poor cannot believe that any well-governed country can get on without such a system, whilst those who live where there is no such provision are at a loss to understand how it can be necessary. In Scotland, where a law for compulsory assessment has long existed, although as late as 1815 it appears to have been enforced only in some exceptional parishes in which the voluntary system had been allowed to fail, the English system is now thoroughly established; but yet cases of death from want are as likely to occur as under the old state of things, when a dole of meal was given only to the poorest out of the money collected in the kirk. The consequences of the compulsory system are so fatal to private charity that the mere proposal to adopt it caused the weekly collections for the poor to fall off considerably; and, as poor laws had come to be regarded as the proof of civilisation, even the success of Dr. Chalmers in Edinburgh failed to convince the Scotch of the value and efficiency of their ancient habit of supporting the poor by local collections and unpaid administrations. One difference between a country with poor laws and another without is—that in the former there are one or more paid relieving officers in a district, whereas in the latter every man and every woman is an unpaid and self-appointed relieving officer. Of late years many taxes have been taken off the necessities of life, and the peasant is no longer bound down to the limits of his parish. These changes, combined with the enormous expansion of commerce brought about by the gold discoveries, and the immense amount of labour which has been employed in making our railways, have caused the evils of pauperism to be less apparent, and to grow upon us less quickly; but communism now rampant in Russia, powerful in France, and growing in Germany, will come upon us, either by gradual steps or by sudden revolution, unless we give up palliatives, and seek in earnest to rid ourselves of the disease of pauperism. To effect this we have to understand its causes, and to investigate the condition of countries where it does not exist. We may then be induced to revise our land laws and the system of government and taxation which have prevailed since the Great Revolution two centuries ago. Having said thus much on a somewhat distasteful and unpopular subject, I turn to the case more immediately before us. Can we prevent the present law of out-relief from increasing the distress which it was designed to prevent? I fear not. It is impossible to affirm that the present law, aided as it has been by circumstances alluded to before, viz., the discovery of gold and the formation of railways, and also by improved schools, allotments of land, and an increased number of benefit societies, has raised the agricultural labourer to a condition of wholesome independence and manly self-trust. The legislation of 1834 swept away many abuses, and saved the owners and occupiers of land from ruin; but, in spite of it, and many subsequent acts, and all the orders, counter-orders, and exceptions of the Poor Law Board, the peasant is as ready as ever to draw what he still calls "parish pay," and often objects to join a benefit club on the ground that "it would only save the parish." At the same time, an increasing number of artisans, of small tradesmen, and of other persons who have friends able to maintain them, are constantly trying to obtain out-relief. Many who are above the condition of those who depend on their daily labour for their daily bread have no shame in asking for out-relief, little hesitation in obtaining it when it is not a necessity, and no thought that the rates are extracted from people as poor, and often poorer, than themselves. All will admit that much of the money spent in out-relief really acts as a rate in aid of wages, and keeps down the latter to its lowest point, thus deeply injuring the agricultural labourers, particularly the good and prudent, and indirectly injuring those who employ them, for the men work short hours in Hampshire, and, except when at task work, give inferior labour for inferior wages. Artisans, who are better able to take care of themselves, have not suffered in the same proportion. They have succeeded, by trades combinations and emigration, in keeping their wages at a high figure, although they are at the present moment suffering seriously from want of employment—a want which would be partially removed if they would accept lower earnings. A vast number of them provide for illness and old

age by saving or by benefit clubs; but many of them trust to the poor law, and come for out-relief in case of sickness, either immediately or after a few weeks. The evils of out-relief in destroying the self-reliance of the pauperised classes, and of undermining that of the class just above them, was to have been averted by the workhouse test. This test, however, has failed, and is almost in abeyance, as the exceptions allowed by the Poor Law Board are acted upon and the general order is not. Boards of guardians are naturally reluctant, *where the option is left to them*, to take a step which may force people into the union house against their will, and break up the home of a family. They also shrink from the greater cost of keeping a family in the union house. I am sorry to say that the amount of money raised by benefit clubs in agricultural districts, although much increased, is still insignificant as compared with the sum spent in out-relief. As it may be useful to compare the out-relief given in different unions, I subjoin a table of that given at Alresford:

1. A sick man with a family receives about the ordinary amount of wages, chiefly in money and partly in bread.
2. An able-bodied widow with children receives for each child one shilling and a gallon of bread weekly.
3. An old couple receives 5s. 6d.
4. An old person receives 3s.
5. A lying-in woman whose husband is at work, if there are five or more children, receives 2s. 6d. or 3s. a week for four weeks.
6. The sick have a nurse found them when necessary, and meat, wine, porter, &c., when recommended by the doctor.
7. The funeral of a grown person costs the parish from 23s. to 27s.; that of a child less.
8. An order for medical attendance is given when applied for, except in the case of persons earning more than ordinary wages.

The earnings of the agricultural labourer average about 14s. a week, but, with the exception of carters and shepherds, who are supposed to be better off, we take their earnings at the ordinary rate of day-pay, say 10s. in considering their means of supporting a sick wife or child. If a man belongs to a benefit club, we treat him as if he had half his club allowance, considering the other half as a means of supplying him with sick comforts, and so more quickly restoring him to health. The cases with which we have the most difficulty are those of:

1. Men partially disabled who apply for out-relief, and for permission at the same time to earn what they can.
2. Children of able-bodied men in full work for whom meat, milk, &c., is recommended by the doctor.
3. Artizans and others temporarily ill, whose ordinary earnings are from 18s. to 30s. a week.
4. Widows with children occupying a house rented at £8 or £10 a year, and carrying on some business which they say does not enable them to support their children.
5. Persons unable to work, but having friends able or legally bound to support them.

If the responsibility of supporting the last class could be made to fall in the first instance on the relatives, and on the union only when these have proved their inability, a large amount of out-relief would be struck off the books. At present the relatives frequently escape their liability. Another improvement in the law would be to make relief to persons not living in the union illegal, except in the cases of schools and public institutions. The idea of charity still clings to out-relief, which in all the above cases is often given where it would be better systematically to refuse it. If the labourer could be taught to depend upon himself, and not on the rates, he would receive better wages, out of which he would be able to put by for sickness and old age, as he now puts by for fuel, rent, and clothing. It is quite clear that distress is by no means in proportion to the largeness or smallness of the earnings, but rather to the want of care and thrift on the part of the receiver. Whilst the families of the armourers of Sutton Coldfield, who earn £1 a day, form a very distressed population, as the men work about three days a week, and often leave a wife and family to be relieved by charity, or by a loan from a neighbour, most of those who are present know of highly credible instances amongst the agricultural labourers, where, notwithstanding a heavy family and small earnings, the home is kept neat, and the club money regularly paid up. In

considering the question of out-relief I commend the following figures, taken from the Poor Law Reports for 1868-69 and 1869-70, to the attention of the meeting :

	Indoor-Relief	Out-Relief.
Walsingham (Norfolk)...	1868 £775 ..	£9,262
"	1869 925 ..	9,158
Atenham (Shropshire).....	1868 1,515 ..	677
"	1869 1,512 ..	659

Having been in the habit of considering that under ordinary circumstances a union was, in so far, fairly well managed where the out-relief amounted to three times as much as the indoor, I am quite at a loss to understand these figures. In the Walsingham Union the out-relief is nearly twelve times as much as the indoor, and at Atenham it comes to little more than one-third. This contrast must be owing to exceptional circumstances or to exceptional management, and in either case it ought to throw some light on Poor Law Administration. I will conclude by asking for suggestions from those present in respect to the administration of out-relief, and by placing before the meeting two questions :

1. Is it desirable that, after a fixed date, out-relief should be given in goods only ?
2. Is it desirable that, after a fixed date, out-relief should be abolished, except in cases of urgent and immediate necessity.

I was anxious to have obtained full information about the working of the Irish Poor Law, where only a small portion of out-relief is given, but have failed to do so from want of time. It must be understood in respect to the above questions that any large change in the law of out-relief must not affect persons at the time receiving permanent out-relief.

Mr. J. B. YONGE (Otterbourne) read the following paper : In a minute of the Poor Law Board, bearing date November 20, 1869, we find, "One of the most recognised principles in our Poor Law is that relief should be given only to the actually destitute, and not in aid of wages." And in the order prohibiting out-door relief we find that every able-bodied person requiring relief shall be relieved wholly in the workhouse, to which follow certain exceptions. The chief difficulty of proper administration by the guardians lies in the exceptions under which comes by far the largest portion of the expenditure, being for the year ending Lady-day, 1869, £3,677,379, against £1,546,680 for in-maintenance. The cases to which out-relief is allowable may conveniently be divided into four classes, namely, to the aged and infirm, to widows with families, to the head of the family with all dependent on him on account of his own illness, to the head of the family on account of the sickness of a member of it dependent on him, including medical relief. With regard to the aged who have become incapable of maintaining themselves any longer, I think great consideration should be given to the wishes of the persons themselves, and also, but in a somewhat less degree, to those who are infirm from sickness in comparative youth. Some have no great objection to come into the poorhouse, while others have the greatest aversion to the restraints necessary for the well-being of any number of persons brought together. The guardians should ascertain that the person is really incapable of earning a maintenance, and that there is no near relation of sufficient ability to provide for him ; under these conditions such an amount of out-relief as is found to be necessary in the locality should be granted. Indeed the opinion of the Legislature is clearly enough expressed in the provision that two justices may direct that relief shall be given to any adult person who shall from age or infirmity be wholly unable to work, without requiring that any such person shall reside in any workhouse. Next we may consider the case of widows with young families, and these also are entitled to great consideration. If the widow be a person of anything but very bad character, so as to make it desirable to remove the children from her influence in any manner practicable, the general value of home bringing up above that in the workhouse would point to the advisability of granting out-relief. But it is to be considered that the widow, if in health, ought to be capable of maintaining herself by her own exertions, and therefore any out-relief must be granted in respect of the children only. This is ordinarily done on the general rough scale of a shilling and a gallon of bread per week for each child of tender years, and if the widow,

from skill in trade or any circumstances, can do more than maintain herself, she must as far as possible support her children. There will at times occur a case in which a widow may apply for relief, being in the receipt of a pension from a friendly society. The principles of action applicable to this have been so fully laid down in a letter contained in the last report of the Poor Law Board as to give a clear guidance. They point out that an income arising from such a source can no more be overlooked than if it came from any other source whatever. And I would further observe that inasmuch as it is the bounden duty of any parent to maintain her children to the utmost of her power, such income from a friendly society could not be considered as applicable exclusively to the widow, whatever might be attempted to be set up of that kind, but must be employed in addition to her own labour, as far as it will go, for the maintenance of her children. The great thing to be borne in mind by the administrators of relief to the poor, as well as by possible recipients, is that nothing but destitution gives any person a title to be maintained at the expense of their neighbours ; that the poor-rate is not a fund to be drawn on, and to get as much out of as possible, but that it is the duty of every person to make provision and to use the utmost of their power to avoid being driven to make any call on others. These two classes are comparatively easy to deal with, except in a point common to both, and that is whether guardians should grant relief to persons legally chargeable to their union, but not resident within it. A few cases will occur when this may be desirable, but they are very rare, and should be discouraged as much as possible from the much greater difficulty of proper superintendence, and allowances should not exceed the sum found sufficient for similar cases within the union granting relief. From the impossibility of exercising the necessary vigilance by the officers of the union directly interested, these cases are more liable than most to degenerate into relief in aid of wages, with its terrible evils. With regard to all out relief, and especially with regard to the classes of persons now to follow, it must be considered that, if any persons in higher rank were assured that in case of illness to themselves or any member of their family, medical advice would be provided gratis—that, in the case of those making an income by their own personal exertion, sustenance in their own rank would be provided in case of any cessation of employment, would it not be a great inducement to spend all at the moment, and not to attempt any provision for the future ? And yet this is precisely what a system of relief unwisely administered offers to persons who have to live a life of toil and care at the best, while we all know instances that show how much is in the power of those who have the will to help themselves and keep from need of relief. There are instances of men who can earn in half a week an ample provision, yet spend all in drink, and are in destitution till pay day comes again. Should such a man fall ill, is his a case for granting the relaxation of out relief ? It is true that there is a power of advancing relief by way of loan, but what slender chance is there of getting anything back from such a man ? He might never be reclaimed, and probably would not be, but the example should be given that a man in need of medical or other aid from his own recklessness in making no provision for the future when able to do so, should not be relieved anywhere but in the workhouse. I draw a somewhat extreme case, but there are an infinite number of gradations. It is not right for a man in regular employment, with a moderate family, to be calling on the relieving officer the first moment he falls ill to supply necessities. And yet where is the line to be drawn ? It seems impossible to require such a man to break up his cottage home and bring his whole family immediately into the workhouse when he falls ill. In practice it cannot be done. Indeed, it appears politic to be rather liberal of relief in cases where the bread winner is sick, in order to restore him as quickly as possible. The broad conditions of out-relief are laid down for us, but within them lies the duty of the guardians in discriminating and using the workhouse test in such a way as to prevent the feeling that there is a sort of right to out-door relief in all cases that come within these conditions. And here I may mention how difficult it often is to arrive at a real estimate of a man's ability. Take the artisan who gets a pound a week in a town, and a labourer whose nominal wages appear in the relieving officer's book as twelve shillings a week, when, perhaps, he is in reality the best off of the two. The townsman, probably, has

much more rent to pay, has no garden, no means of making much by task-work, no thatching, hoeing, or harvest; while the labourer very likely averages in money over 15s. a week for the year, besides advantages, and the comparative condition of the two men is not such as the first glance would suggest. I think in the country that out-relief must generally be given when applied for when the head of the family is disabled by sickness, but not if a man was in receipt of rather exceptionally large wages for himself, and sons at home, or of ability to help, or if the family were light—that he should then be expected to have some provision by him, and not to ask for out-relief unless his disability continue some space of time. In towns especially there must be other elements of consideration. If the habitation be likely to retard recovery from over-crowding, or unhealthy situation, it might be better to take a man into the workhouse, even family and all, for his more speedy cure. An intelligent relieving officer may here afford most valuable assistance by making observations on the cleanliness and accommodations of the home. If a home be worth having, and show signs of care, it is always a pity and discouragement to break it up. I now come to the class of relief given for the illness of some member of the family—the wife or child, and generally consisting of medical attendance with or without the addition of nourishment. There is reason to believe that the practice of different unions has been dissimilar, and might with advantage be brought nearer together. In some places the attendance of the doctor is granted with the utmost freedom, and mischief must arise from this practice making almost the whole population paupers. The duty of providing medical attendance for a member of the family lies first on the head of it, and he has no more claim to be relieved from that duty at the expense of others than from any other. Such cases as men in regular work, with not more than two children, should generally not be allowed the attendance of the union doctor. A long-continued course of illness might cause such a drain as to produce a necessity of applying for relief at last. In that case a voucher should be produced to show that exertion had been made, such as a receipted doctor's bill, or satisfactory evidence that a great expense had been paid, not only incurred. I may also point out that there is an amount of injustice towards the medical officers in throwing on them a large amount of attendance on persons who should not really be considered paupers, and that in two ways: First, by throwing more on them than they contracted for; and, secondly, by depriving them of the reasonable payments that they should receive. And the scale generally adopted by medical men in their dealings with the poor is not such as to be beyond their means. Such a case as that mentioned above is not one of real destitution, and really a man who should neglect to provide medical attendance would render himself liable for the consequences of such neglect; and if the doctor attended a child on an order given by the relieving officer, I suppose that the father would be as much liable to punishment for allowing a member of his family to become chargeable as if he had neglected to find food. But, as this would be too harsh a method to employ in practice, the alternative must be adopted of saying, "If you like to come into the house all your wants will be provided for, but we cannot relieve you out of it." It will be observed that I am endeavouring to propose for discussion some points that may assist in ascertaining whether a person comes within the line of being rightly considered so far destitute and unable to provide what is requisite as to be entitled to receive it, and advocating the offer of indoor relief in many cases as a test, and that my opinion is that the general practice has become too easy. Take, again, the case of a domestic servant coming home ill from a good place. Guardians would hardly be justified in treating such a person as one who could have made no provision. On the contrary, there has been opportunity of laying-by against a bad time, and, if nothing has been done, such a person ought not to expect out-relief. There are other causes that should also be considered, such as the nature of the habitation, the ability of relatives to perform nursing efficiently, and the nature of the disorder; these are sufficiently obvious. Two other points I can only touch on, to show that what is commonly called the doctor's order for meat or other subsistence is nothing but his certificate that he considers such diet desirable, and that on the guardians lies the duty of decision who is to provide this. It should be far from a matter of course to allow it as relief. Also, in case of funerals, that no assistance should ever be given un-

less the funerals have been conducted in the most inexpensive manner—no expending private means on ornaments, and coming on the rates for necessities. I have lately heard of a parish, in another county, where the relieving officer gives 2s. 6d. or 3s. as a matter of course on a death. Complaints are universal of the increase of expenditure for relief within the last few years. May not a large portion be attributed to the laxity of guardians in allowing out-relief too freely, and thus engendering a spirit of running to the relieving officer for every trouble, instead of exertion to get on without assistance? It has been observed that in proportion as the amount of out-relief is smaller as regards the sum expended on in-maintenance, so will the pauperism of the inhabitants of the union be found to be less, and the population hold a more independent spirit.

The Rev. J. G. JOYCE thought it was a matter of extreme importance that every one connected with the working of unions should ascertain whether it was possible to have an understood scale of wages at which relief should be granted.

Mr. W. PORTAL said this subject seemed enough to make everyone less diffident than himself equal, but some one must speak to ascertain the solution of the question, if it were possible to solve it. He feared that in Hampshire they were powerless to provide a remedy for the evil. The fact was that pauperism was still increasing, and the number of applicants for relief in regard to the per centage of the population was assuming a most gigantic phase. He would refer to Aitcham, the chairman of which Union (Sir B. Leighton) he knew: and who was supposed to be the model chairman of England, and no one had paid more attention to the subject. He had been chairman ever since the year 1836 or 1837, and he (Mr. Portal) attended a meeting at Malvern at which Sir Baldwin Leighton presided. He must confess that Sir Baldwin did not carry the meeting with him, for he laid down rules which others and himself (the speaker) thought in practice would work very hard; but his accounts showed the most astonishing results. The whole of the outdoor relief did not come to more than a-third of the indoor relief. He asked Sir Baldwin certain questions which he thought would be posers. He asked him one with respect to the militia, namely, when that body was called out what amount of relief should be given to the men's families? Sir Baldwin expressed extreme surprise that any gentleman calling himself a guardian of the poor should put such a question. They knew so well in his locality that they would never get relief and that it was never even applied for. Mr. Marx had made a proposition with which he could not agree at all—that non-resident relief should be made illegal, for he thought it would be most hard that guardians should refuse to give relief unless they had the people under their control. He (Mr. Portal) did not suppose he should carry the meeting with him. He knew that the practices of boards differed very much, but he could not regard this proposition as kind, liberal, or Christian. Take the case of a poor person, perhaps eighty or ninety years old, who wished to go and live with her daughter, yet because she lived in the next union the guardians should say they would give her no relief. He should be glad to abolish the law of settlement. Where the tree fell, there let it lie, but he should be very sorry to see aged people prevented from living with their children in different parts of the country. Another proposition was to get rid of all relief except by goods. In Tipperary the system of out-relief was extremely simple, for they had nothing like our permanent list. They never gave relief for more than one week at a time, and every case therefore had to come before the board once a week. In England the permanent lists were revised sometimes once a quarter—very seldom once a month, and much improvement might be effected in that practice. A case came before him last week, in which it would have been much better for the family to enter the house, but they did not seem to understand that it would be so. The guardians wished it, but the family said they would not enter it. How should guardians deal with such cases? He had had a long experience, but confessed he could not tell. A man would say that he and his wife would rather starve than enter a workhouse, and although the guardians would have public opinion to back them (and that was very valuable), still the thing went on, and the guardians continued to give such a modicum of relief as prevented starvation. The present per centage in the North of Hampshire and Berkshire was very large, the number of persons receiving out-door relief being about 12 to 13 per cent. of the population. In Aitcham it was about one and a-half per cent.

Mr. SCLATER: Perhaps they have more work in that union.

Mr. W. PORTAL continued: Sir Baldwin Leighton thought he could put himself in competition with any other chairman of a union as to the number of Post-office Savings' Bank books (some forty or fifty) which he held belonging to the people around him. A domestic servant ought to save money; but when she came home, and a doctor's certificate was placed before the guardians, and she applied for out-door relief, it seemed hard that a person like that should be ordered into the house. A domestic servant should not be destitute, or a burden on the rates, or kept by her relatives. It was extraordinary, too, how wonderfully well the poor population thought they knew the state of the poor law. Adults imagined that, if over sixteen, they, if ill, could not be refused out-relief. He knew several instances in which efforts had been made to discover friends who were able to support their poor relatives, and with good results. They would say, perhaps, that certain relatives were employed in such a business, but they never heard from them, and it was impossible to get any support from them. He thought boards of guardians might take means to discover those who were liable by law to support their relatives, and thus prevent many people from becoming paupers. He considered that it would be better for many of the poor sick people to be taken to the workhouse; and he wished he could persuade medical gentlemen to change their mixtures to a more simple diet than wine, brandy, &c. He thought of all cases that came before them the most painful and the most difficult to deal with were those which he was sorry to say were more frequent this June than in any previous June of which he had had experience, and were likely to be more prevalent next autumn and winter—the case of those who did not want money, but work; the men who came and told the guardians that they wanted not relief, but only work. He had felt deeply such applications. As chairman, he had told a man before now that he must strike out into the country and get work, and he had been so foolish as to listen to his advice. He had gone forth, tramped the country for six weeks or two months, walked hundreds of miles, could get no work, and all he had done was to wear out his shoes. As in the metropolitan districts they had power given them by law to provide district works, so he thought they might now and for the next winter have the same privilege accorded to the country. He did not know how they were to meet the case, though he did not wish to “eroak” or be despondent. At their last meeting of the Basingstoke board, they had the case of a man not being able to get a day's work. These men were not, of course, the cream of society, but they must live, and, if they could not obtain work under the present condition of things, they would be in danger of starvation.

Mr. SCLATER wished to say a word on behalf of the ratepayers with regard to out-relief. He perceived that the general feeling of the meeting was against out-door relief, but something must be done for the sick and destitute. Let them take the case of a sick man with an average number of young children—say four, which with his wife and himself would make six in family. He was not, probably, the member of any club, and found himself, perhaps, unable to support himself and those dependent upon him during a temporary illness. The guardians refuse him relief, and the whole family enter the workhouse. The expense would be a guinea a week to the ratepayers, whereas it was quite certain less than half that sum would suffice given as out-relief. He should like to know whether the ratepayers were prepared to submit to that immense augmentation of expense, for it would certainly happen if people who required temporary relief were taken into the house.

Mr. R. A. DAVIS, as a guardian, expressed himself in favour of out door relief, considering that the wages of an agricultural labourer were insufficient to enable him to save money as a resource in old age, and, after devoting their whole life to a special purpose, it would be very hard to say to such people “You must go into the workhouse.” In his opinion there must be some means of giving employment, or people must be better paid, to enable them “to provide for a rainy day.” Put the wages at 12s. a week for a Hampshire agricultural labourer, how was it possible for a man with a family to provide for the future? The subject of medical relief frequently came before the board at Basingstoke, and he always upheld the orders of the medical man, for he thought, as an educated, professional man, he was called in, and should be the best judge of what

was necessary to restore the sick to health. If the medical man prescribed certain things, he did not think they were justified in interfering in the matter, thus setting their opinions against his medical knowledge.

The Rev. J. H. STEWART agreed with Mr. Davis when he said that the wages of any agricultural labourer were insufficient to meet all the wants that other classes of society were expected to meet. The Poor-Laws, he understood, were founded on two principles—Christianity and necessity. It had struck him, as a guardian, that one of the practical difficulties in dealing with cases of out-door relief arose from sickness, old age, and infirmity—in giving that relief which they were allowed to dole out by the law. The principal difficulty was in the theory that every person should be perfectly destitute before entitled to relief, but he questioned whether the persons relieved now were utterly destitute. All possessed something. It was very rare that a person came before them who was a friendless being without anything in the world. Many who came before them had the means of paying into a sick club, friends in a position able to help, and when they could relieve they knew the amount was not sufficient to maintain these persons. The sum given was not sufficient without other sources of income to keep them. The fact was that they gave these people less because they were conscious they had other sources of income; but this fact was not recognized by the law. That they belonged to benefit clubs was thoroughly recognized, in which case, perhaps, certain deductions were made. The guardians must at certain times ignore the letter of the law. That was a difficulty which at often struck him, but the solution of which he was not able to offer.

Sir NELSON RYCROFT said that where a militiaman was called out, he would at the end of the month receive about £2 for his bounty. In addition to this he received articles worth about 12s. 6d., but the board of guardians had no power to put a stop on that money. On his return, however, if the board chose to take that man before the magistrates, and prosecute him for leaving his family chargeable to the parish, they would be perfectly justified in so doing.

Sir M. H. BEACH thought this suggestion did not quite hit the nail on the head. In the North Gloucestershire Militia they found the following plan the best: The colonel and other officers persuaded the men to send money home to their families, and this was easily done, for they could say, “We shall not allow you to re-enter again at the close of your service unless you send money home to your family.” As to prosecuting the men, he was afraid guardians would not be able to get much out of them. He had listened with great attention to the remarks of Mr. W. Portal, with whom on one or two points he could not agree. He said that relief should be given in cases of destitution only, and that it should be given in accordance with Christianity. Now he (Sir M. Beach) would venture to say that the Poor Law and Christianity had nothing to do with one another. The real fact was that out-relief should be given only in cases of destitution. It was a legal and moral fact that boards of guardians had not only the right, but were compelled to inquire into the circumstances of the applicant. If he were a member of a benefit society, if he had property of his own, or any possible source of income, the guardians had the power of determining how much relief it was necessary to give in order to preserve the family from destitution. Mr. Portal spoke of kindness and liberality, but he (the speaker) considered these were connected simply with private charity, not with the law of poor relief; and, in justice to the ratepayers and every one concerned, he thought it would be a great pity if kindness and liberality should enter into the matter at all. With regard to non-resident relief, it might be hard that guardians should refuse to administer relief to the persons named, but the line must be drawn somewhere. And what was their protection? The relieving officer; and how was he to make satisfactory inquiries beyond the bounds of his charge? These cases, however, were so few in number that they should not be allowed to outweigh the rule that no relief should be given unless due inquiry be made. He looked with great dread and distrust on any system of public works. They were burdened enough with rates, without adding anything to increase them, and establishing public works throughout the country would be to add to the rates.

The Rev. J. G. JOYCE observed that the highest guide was true Christianity, and the intention of the law in this respect

was clearly shown in providing that the master of a union should read prayers daily to the inmates.

Mr. HURLEY said that in Reading they did not relieve the family of a militiaman, except in very unusual cases. He recommended the unions of Hampshire to discontinue the practice.

Mr. B. W. CARTER asked if, after the medical officer had once given an order, there was any power of revising that order.

Mr. W. PORTAL said such order had been revised in many instances.

Mr. CAVE remarked that the medical order was taken only as a recommendation, and the guardians discussed the question. They did not doubt it should be carried out, but the question with the guardians was: Who was to pay for it?

Mr. LEWIS thought it would be most injudicious to obstruct the action of the medical officer in the application of remedies, and it would not contribute in any way to the economy or welfare of the country. The extra nourishment and stimulants ordered were not given without consideration of the necessities of each case, and the absence of either might prove very prejudicial to the progress of the patient.

Several speakers added corroborative testimony to the fact of the order of the medical officer having been "revised." It appeared that the relieving officer had the power of stopping its execution if the applicant was not considered "destitute."

Mr. WESTLAKE spoke of the various difficulties which a man had to contend with who could not get work, and said if guardians could give such a one only a shilling a day, it would prevent his becoming quite pauperised.

Mr. W. PORTAL quoted "Glen's Consolidated Orders of the Poor-Law Board," to show that the medical officer had not power to order—simply to recommend—such and such nourishments and stimulants; but

Sir M. H. BEACH said that the notes in that work had not the authority of the Poor-Law Board.

Mr. B. BAKER pointed out how beneficial the steps taken by Sir Baldwin Leighton had been in the interests of the poor population around him. One method which he took for benefiting the poor was the fencing off a piece of land that he might keep a cow, or it was arranged so that it was allowed to run with a farmer's cow in the neighbourhood. But nobody was allowed to keep such an animal before he had deposited a good sum in the savings bank. Mr. Baker quoted from a pamphlet which he had published on "The Poor," in which he advised that an Act should be passed authorising boards of guardians or their relieving officers to detain any who had claimed relief, and to take them, if necessary, before the petty session; and if they cannot show either that they from weakness or ill-health have never had an opportunity of laying by some money, or that when in good work they have laid by something, but from recent ill-health have been obliged to spend it, the magistrates may order them to be detained in the

workhouse, and kept to such hard labour as their health and strength will admit of, not exceeding six months, after the illness which has caused them to apply shall have passed away. They might laugh at his proposition; he had heard many persons laugh at it at first, but they had often come round to his opinion subsequently.

Mr. MARX, in his reply, said Sir Baldwin Leighton had certainly done great good in his district. He had raised a people from a state of pauperism to one of manly independence. In his (Mr. Marx's) own small way he had tried in vain the same thing. Twenty years ago he started to help a union which was then improperly managed. The poor rates were sometimes as much as 6s. and 6s. 6d. in the pound. He represented that they should be reduced—a thing they seemed to think impossible; but since then they had been reduced to 3s. 6d., 3s., and 2s. 6d. No man could be employed in a more Christian work than that of trying to raise the character of the labourers around him. He thought Mr. Portal's ideas of finding work by means of district public works was thoroughly wrong, and hoped it would never be entertained, for he believed he was utterly wrong. He was sorry to differ from him, but he always did so in the most friendly way, for he was one of his best friends.

Mr. C. TUNNELL referred to the greatly improved state of the Scilly Isles under their present owner. Pauperism was at the first period of the ownership very common, and the first thing done was to establish good schools and make education compulsory. The main cause of the improvement was due to these measures, and pauperism he found, when he visited the isles some nine or ten years ago, had been nearly banished.

Mr. YONGE spoke of the extreme danger of allowing outdoor relief in order to save in-door relief, believing it to be one of the greatest dangers they could possibly fall into. He thought they must follow not only the letter, but the spirit of the Poor Laws in their daily practice. With regard to what had been said as to Christianity in connection with the Poor Laws, the apparently contradictory expressions might be reconciled. Christianity, in the sense of liberal dealing, which the first speaker appeared to mean, was quite foreign to the Poor Law, as had been pointed out. In the sense of the presentation of the means of religion to all inmates, as expressed by another speaker, it was most necessary. But he would add, in a sense with the first speaker, that no one could hope to approach to the proper performance of functions connected with the matter in hand without endeavouring to find his guidance in Christian charity, which would inculcate the most strict performance of these duties of trust to all.

Mr. W. PORTAL, who had succeeded to the chair, then put the following resolution, which was unanimously agreed to: "That out-door relief requires to be administered with great care and discrimination, and in conformity with the spirit of the Poor Law; and that out-relief should not be given when the parents, grand-parents, or children of the applicants can give adequate support."

RATIONAL CULTIVATION.

At the quarterly meeting of the Victorian Agricultural Society, Mr. Josiah MITCHELL, of the Experimental Farm, read the following paper:

In the first place, then, the growth of the same crop year after year on the same land, "wheat after wheat," for instance; the production of successive grain crops with out any manure, and with only an occasional bare fallow when the land becomes foul; burning straw instead of converting it into manure by the aid of stock, and restoring it again to the land; the laying down of land to grass after it has been exhausted by the growth of grain—these are some of our practices that are not rational because opposed to the laws of nature—rotation and restitution—which govern the growth of plants and the continued fertility of the soil. Rotation, I have said, is a law of nature that governs the growth of plants; it compels change of soil or situation. No plant will thrive continuously on the same spot. This applies as well to oak and pine forests as it does to wheat, oats, or any of our cultivated crops. The necessity for rotation or change of crop is caused, partly by exhaustion in the soil of elements essential for the healthy growth of the plant, and partly in consequence of the excretory matter thrown off by the roots, rendering the

soil unfit for its further growth. Yet one plant by its death and decay from these causes makes the most suitable preparation for the healthy growth of some other plant belonging to a different order. In this way, the great globe we inhabit has been converted out of barren rocks into the thing of beauty we now see it, and become fitted for the sustenance of man. It is upon this law that the modern practice of British agriculture is founded, and no system of cultivation can be deemed rational if it does not embrace some rotation of crops. I need only instance the well-known success of wheat grown after peas, beans, or clover, to illustrate the advantages of rotation. At one time it was supposed that by attention to a proper rotation of crops—one crop preparing the ground for another—the farmer could go on producing crops without any manure to the end of time. Increased knowledge has dispelled that illusion. We now know that in conjunction with rotation we must also have restitution, or compensation, if we would maintain the fertility of the soil, and avoid barrenness. Restitution and rotation should be the watchword, the creed, not merely as a matter of faith, but the everyday practice of all who desire to cultivate rationally. We cannot go on ploughing and sowing, reaping and mowing, taking all away, and giv-

ing nothing back to replace the mineral substances removed from the land. We cannot, I say, long continue this system of robbery, even with some sort of rotation, without being brought face to face in the long run with one of these two alternatives, restitution or barrenness. The time, of course, will vary with the quality of the soil, but the end must come. How little this inexorable law of restitution seems to be understood, or if understood, how much we, by pursuing our present exhaustive practice, seem to disregard it! Yet it is no light matter, but one fraught with serious consequences to any community where a system of spoliation is carried on, instead of rational cultivation. The other day I met with the following statement bearing on this subject, in the leading columns of one of our daily journals, in an article commenting on mining leases. In making a comparison between the charge for a mining lease and the cost of agricultural land, the writer proceeds to say: "Agricultural land rightly passes at a small charge from the Government into the permanent possession of the cultivator, because by the labour of him and his successors, it will continue for generations without number to yield the prime necessities of life, food, and raiment to the inhabitants of the state, because, in fact, cultivation makes of it the commissariat, without which the state could not exist." Now, this holds good only where rational cultivation is carried on; under an exhaustive system there is absolutely no difference between agriculture and mining. The miner works out his claim, and the farmer works out his farm. The former abstracts the "metallic treasure," wealth's representative, and the latter abstracts by means of his crops, the real worth of any nation, the fertility or producing power of the soil, thereby destroying "the commissariat without which the state cannot exist." This is a startling fact; yet our state looks on with indifference at a condition of things that must, in the course of a few years, seriously affect its own existence. Nay, not only does the state look with indifference on the present system of spoliation without making any attempt to introduce a more rational one, but it actually, by "settling the people" on too small portions of land, renders an exhaustive practice compulsory on the part of the poor settler. With the frightful example of America before our eyes, and none of her vast resources in the shape of rich agricultural land at our back, we fail to profit by the lesson. There, in America, such is the distance grain has to be transported over country rendered more or less barren by spoliation, that unless the price of wheat rises as from 55s. to 60s. a quarter in Britain, it will not pay the farmer in the "far west," where the work of destruction is still going on, to harvest his crops; and they are allowed to shed on the fields. Nearer home, we read of an exodus of farmers from already exhausted districts of South Australia, coming to Victoria to take the benefit of our recent Land Bill, and of course, to pursue the same system here that has led to the necessity of their leaving South Australia. But to come home within our own colony, we are told by the *Hamilton Spectator* of farmers in the Western district, who, having exhausted their own freeholds, are now renting land on short lease at a high rent for the purpose, no doubt, of carrying on the same exhaustive practice. Meantime they have laid their own farms down to grass, to recover the lost fertility. Delusive hope! If it be the mineral constituents of which the soil has been exhausted, there is but one way of restoration, and that is by restitution. However, "the convenience of the arrangement," it is said, "is quite mutual, for the landowner will get a far higher return by letting his land for 15s. to 20s. per acre, than he would by keeping a couple of sheep to the acre, and the tenants will be able to make larger annual gains." From this it would appear that the American system, when "the settler subdues a piece of land, flogs it to death and abandons the carcass, and then repeats the operation on a new subject," a system that has been condemned by thinking men in all countries, is in full force among us; indeed, some, it would appear, have already managed to compass the death of the first victim, and are seriously setting to at the second. With our "limited area of good agricultural land," this is surely an unwise course to pursue, and must be attended by disastrous results. But then "the landowner gets a far higher return, and the tenant larger annual gains." Here we have the true secret—an insane desire to convert the fertility of the soil, at all hazards, into hard cash—to sell the birthright of mankind for a few pieces of glittering ore! Curious anomaly of human law this; we will not allow a poor miserable wretch to destroy his own miserable life, but

we make no attempt to prevent the destruction of that which maintains life. With lettings like that in the Western district, and the Government selections of 80 acre lots, how can we expect any attention to be paid to the natural laws of restitution and rotation, or any attempt at rational cultivation? Having pointed out some of our farm practice which I conceive is not rational, and endeavoured to show you why I think so, I shall now pass on to the question, What is rational cultivation? "The object of farming is gain. Whether an agriculturist grows bread to strengthen man, wine to gladden his heart, oil to make him of cheerful countenance, or opium to poison him; whether his barley be made into wholesome ale or deleterious gin, he has but one concern—does the cultivation pay?" This being the case, and the object gain, the system that enables the farmer to obtain the largest quantity of healthy produce at the smallest cost, and realise the greatest amount of profit, but—pray, you mark this well—"without permanently lessening the fertility of the soil"—any system that will fulfil these conditions may be pronounced a rational system of cultivation. The fertility contained in the soil is the farmer's capital; when he sells his crop, he sells part of this capital. If he does not restore to his land, in the shape of manures, the fertilising substances taken away in the crop sold, his land will be permanently so much poorer. He is then living partly on capital, instead of on interest alone. This is an erroneous and too common practice. By following it the capital originally contained in the soil is year by year diminished and the farmer, with diminishing crops of grain, as a matter of course, obtains less and less of interest, not only, mark you, on the capital in the soil, but also on the capital he employs to work his farm. True, the farmer may by this unwise course of practice, when his land is in its vigin freshness, manage to save money, but such savings cannot all be regarded as legitimate profit because he has simply been transferring part of his capital out of the soil into some bank. Should he farm the same land long enough, his bank account will dwindle away again, for "the spoliation of land leads to poverty." Now, by following the opposite, that is, the rational course, and restoring again to the soil annually, in the shape of manures, those elements of fertility carried away in the crops sold off the farm, the farmer will retain his capital in the soil intact, and will always obtain undiminished interest on both the capital in the soil and that employed in working the farm. Does some one inquire—will this rational system, this constant manuring, will it pay? Well, all I can say in reply to such a question is, if it won't we have no business with the land. Why disturb the squatter? Why destroy his rational and profitable employment of the land in the production of wool and tallow, if we take it only to pursue an exhaustive system that must in the long run end in rendering it useless for cultivation, and unfit even for the production of wool and tallow? The fact is, if we, as farmers, are to continue to cultivate we must cultivate rationally. It is a case of "Hobson's choice, that or none." We must also make it pay, for that is one of the conditions. How, then, are we to set about it? It is not my intention to attempt to lay down any course of cropping. Every one must decide this matter for himself according to circumstances, climatic conditions, and local requirements. In one part of the colony it may be dairy stock in conjunction with grain growing; in another, sheep; in a third, the purchase of phosphatic manures, and the ploughing in of an occasional crop of green manure. So that it becomes simply impossible to point out any specific course whereby to attain the desired end. But this I may say, that whatever system may be adopted it must be based on the laws of restitution and rotation. In colonial agriculture generally the natural tendency seems to be to begin at the wrong end. Instead of starting from grass and the depasturing of stock, the production of grain is made the starting point. By the continued production of grain alone, the land becomes exhausted, and thereby unable to produce grass except of the most worthless and unnutritious description. Now, the rational course would be to start from grass as a basis, and, in conjunction with this through green crops, stock, and manure, advance to grain; then, in the course of any rotation back again to grass. The laying down of cultivated land to grass, after a course of cropping, may be likened to putting it to bed; of course, the more comfortable we make it the better it will rest, and consigning it for a time to "nature's sweet restorer, balmy sleep," which, if I may be allowed a slight liberty with poetic diction—

Swiftly on dewy pinion flies from fields
Of woe, too often cropp'd with golden grain,
And lights on slopes unrufl'd by a plough.

The bare fallow is like poking up the fire to make it burn away all the faster. But a green crop put in with plenty of good muck, and fed off on the land is the true "roast beef of old England," and will be followed by plenty of bread and cheese and beer. As I have said before, if we take care of the grass the grain will take care of itself. To do this we must take care of the muck, and to get muck we must have stock of some sort. By means of stock the farmer can collect together part of the capital contained in the soil of his grass land, and apply it to his arable land for the time being. By thus concentrating his fertile capital, he will secure a larger and more certain return for his outlay on the labour of cultivation. In this way the fertility of the farm will be made to rotate on the farm itself, along with the rotation of crops, and if restitution is made for loss suffered by produce sold, this system may be carried on to the end of time. The first step, however, towards the initiation of such a course of practice is the subdivision of farms into fields; the next, keeping stock and taking care of the muck; after that rotation of crops, and last, but most important of all, restitution. Under present circumstances, as regards population and cost of labour, not less than three-fourths of a farm should be under grass, "bush grass" of course in the first instance. The larger the farm the larger should be the proportion of grass land. That a system of rational cultivation will not pay in this colony I deny. The truth in this matter is not left without witnesses. For, although an exhaustive practice is the prevailing one, and tenant farmers can hardly be expected to follow any other, yet I know several farmers who cultivate their own freeholds on a rational system, and who make it pay too. It is also a cheering sign of the times that many are now impressed with the necessity of some change, and anxious to adopt a more enduring system. Spoliation it has been found will not continue to pay; and this brings me to the third part of my subject, in which I promised to notice some things which I think would tend to promote rational cultivation. First on the list of things that would tend to promote rational agriculture, I will venture to mention Farmers' Clubs, such as this Society has had the honour of introducing to the colony, or, as they might be called, farmers' schools for grown up pupils, "Where each by turn is teacher and is taught." They are the most readily available and practicable means of agricultural education that we have at hand. These Clubs and the national shows of the Royal and Highland Societies have done more to advance British agriculture to its present position of high excellence than anything else. They have taught the British farmer to think, and to express his thoughts. I can assure you, although you may not think it, I read with far more interest and profit the papers and discussions of some of those Farmers' Clubs in the old country than I do even the Parliamentary debates in our own. Through these Clubs, and the agency of the press in diffusing the knowledge gleaned at their meetings, and by that strength which such union gives, the British farmer is fast becoming a power in the state. Instead of being considered a mere cipher, and told how he was to vote at elections, he will ere long dictate to his landlords how they must vote in Parliament on such questions as the "Game Laws" and "Tenant Right." Now, if Farmers' Clubs can effect such revolutions as they have done, in the practice, in the social and intellectual position, and in the political influence of the farmer at home, why should they not produce the same results in this country? Here we are quietly, for the want of some such union, allowing one of the curses of England, the game-laws, to be fastened upon us, and never bestowing a thought upon "Tenant Right." Farmers' Clubs are a far greater necessity as a means of collecting and diffusing information in a new country like this than in an old one. Here we have a climate so widely different from that of the old country that we have as it were to begin afresh, and elaborate a practice in accordance with climatic and local requirements. Nothing can aid us more in doing this, and in devising some course of rational cultivation, than periodical meetings of farmers, to "reason together" on questions affecting their interests and the progress of their art. By such means many valuable facts derived from practical experience, and that would otherwise be lost, will be collected and recorded. It is from Farmers' Clubs that some scheme for the education

of young farmers should emanate, and the neglect of their education, as I have already pointed out, may be attended with injurious consequences to the state. The formation of these clubs should be a simple matter; all that is requisite is fixed times for meeting, a sensible chairman, active secretary, and the apostle Paul's definition of charity, slightly modified, as rules for the guidance of members. I hope soon to see them flourishing in every district in the colony, and I feel sure their establishment will be attended by good results to farmers themselves, and to the community at large. Another thing that, in my opinion, would promote rational cultivation is a law of "Tenant Right." This may perhaps sound strange in a new country where every one is supposed to sit under his own vine and fig-tree. Still it is nevertheless a fact that we have a large and an increasing class of tenant farmers amongst us. The conditions here are very similar to those which in Ireland have led to such a complication of interests between landlord and tenant, paralysed industry and energy, and retarded the progress of rational agriculture in that country. We too have our absentee landlords, and tenants have in most instances to make all their own improvements. The sooner we have some legal enactment that will secure to the tenant-at-will, in the event of having to leave his farm, just compensation for permanent improvements made by him on the farm, and for unexhausted improvements in the soil, the sooner we have some Tenant Right of this sort the better, as such a bill would materially tend to promote rational cultivation by tenant farmers. Our meat-preserving companies, too, inasmuch as they will tend to maintain a higher standard of value of stock of all sorts, and the praiseworthy—I might say patriotic—efforts of Mr. Matthew McCaw to induce farmers to manufacture cheese and cure butter and bacon in such a way as will secure for them a European market, may be justly regarded as tending materially to aid and promote a rational system of cultivation. But above and beyond all things, I would urge upon the attention of cultivators the duty of reverence and respect for the laws of nature ordained by an all-wise Creator, without which permanent success in cultivation is simply unattainable. The more we study and examine those laws the greater will be our reverence and respect, and as we obtain clearer views of the wisdom, beauty, and harmony of creation, the stronger will our convictions become that they cannot be outraged, infringed, or disregarded with impunity. Science expounds those laws. If, in the course of my remarks, I may seem to iterate and reiterate certain things, it is because I wish them to be remembered and thought about. The subject, I need hardly say, is far from being exhausted, and I only regard the few thoughts I have thrown together in this paper as a peg upon which you will hang more valuable information; and I will conclude with the following quotation, which may be carefully studied by statesmen as well as farmers: "Thus, my friends," says the profound Goethe, "if we survey the most populous provinces and kingdoms of the firm earth, we observe on all sides that wherever an available soil appears it is cultivated, planted, shaped, beautified, and in the same proportion coveted, taken into possession, fortified, and defended. Hereby we bring home to our conceptions the high worth of property in land, and are obliged to consider it as the first and best acquirement that can be allotted to man; and if, on closer inspection, we find parental and filial love, the union of countrymen and townsmen, and therefore the universal feeling of patriotism, founded immediately on this same interest in the soil, we cannot but regard that seizing and retaining of space, in the great or the small scale, as a thing more important and venerable. Yes, nature herself has so ordered it. A man born on the glebe comes by habit to belong to it; the two grow together, and the fairest ties are spun from their union. Who is there, then, that would spitefully disturb this foundation-stone of all existence; that would blindly deny the worth and dignity of such precious and peculiar gifts of Heaven? And yet we may assert that if what man possesses is of great worth, what he does and accomplishes must be of still greater. In a wide view of things, therefore, we must look on property in land as one small part of the possessions that have been given us. Of these the greatest and most precious part consists especially in what is moveable, and in what is gained by moving life." The "moveable" and "moving life" of the soil is its fertility, and statesmen, as well as farmers will do well to prevent the ignorant or wanton destruction of this "foundation stone of all existence."

FIELDS AND FOLDS AT HOME AND ABROAD.

Every popular proverb or saying has its converse, and if that be quoted "A rolling stone gathers no moss," in proof of the advantages of remaining at home as the best way to increase in wealth, if not in wisdom, we may on the other hand quote the saying that "The rolling snow-ball gathers as it goes," in proof of the advantages of now and then, at least, moving out of the groove in which we ordinarily go, and seeing what other people do, and what lesson other places can teach us; and, in truth, a very cursory view of the matter will go far to show the many advantages that do arise from widening the sphere of our observation and extending the range of our experience. And it is just because that it is moss that a quiet, stay-at-home stone does gather, that far-seeing men maintain that movement is necessary in order to gain or gather something better than moss. It is attention and constant rubbing that polishes the gem, and to rub out is in any case better than to rust out. The merchant is ever on the look out for new markets, and there is no reason why—every reason why they should—farmers should not look out for "fresh fields and pastures new." It is this very principle which underlies the system we, as a farming community, have inaugurated and carried so successfully out of having shows. These bring together, from all quarters, great gatherings of farmers, who come in contact with each other, getting and giving new ideas, and having brought before them the evidences of progress which are being made in every department of farming; and there can be no doubt whatever of the vast advantages which arise from the becoming acquainted with modes of working and the different appliances brought thereby into requisition which have in some districts tended to raise their practice so high above others; and in a way as marked, although doubtless in a different way, at least in some of its varied aspects, are the advantages of travel both in our own country and in the best known and most advanced districts of countries other than our own. It has been the privilege of the present writer to see many famous districts, both in the old world and the new; and it appears to him to be so likely a thing that what has interested him so much will in some small measure interest the readers of this Journal, that he purposes from time to time to present in its pages some records of his rambles, some traces of his travels, which have now spread through a long series of years and over a wide extent of country.

Not only as being likely to possess greater features of novelty, but as being perhaps more appropriate to the season in which we write, we purpose taking our readers with us over a journey in various districts of Holland—a country than which none possesses so interesting a history, none stands so high in the annals of patient, persevering industry, none which has had such natural difficulties to encounter, and in which these difficulties have been so successfully overcome. It is a country, moreover—and this is more to the point for the purposes of a paper such as this—in which there is much that is of great agricultural interest, and from which lessons of great practical value, at least of considerable practical suggestiveness may be gathered. Another point renders a paper or two on this interesting country peculiarly appropriate this year, for Holland may be said to be, amidst the disturbances and disorders of war, the only country on the Continent which may be comfortably visited, at least the only one which is within easy reach of any of our ports,

Rotterdam, the chief port of Holland, at least the one most cheaply and quickly reached, may be got to by one of three routes: direct by steamer, from London, Leith, or Hull; or by rail from London to Harwich, thence by steam; or by steamer to Antwerp by Harwich, or from London, Leith, or Hull, and from Antwerp by Moerdyke and Dort (Dortrecht). This last route is peculiarly interesting, inasmuch as it enables the traveller to take the very interesting town of Antwerp on his way, and enable him further to see the fine old town of Dort, as well as something of the Lower Rhine. Of these three ways of reaching Rotterdam the direct steamer one is, to our mind, the best; it is certainly the most comfortable, always supposing that one is not of tender stomach. To the sea-sick traveller, or who is likely to be on the waves which Britannia is said to rule, and which yellow pluck had such reason to know had ruled so "plaguily uneven," the best way is by rail to Harwich, from which a short sea-passage takes him to Rotterdam or to Antwerp. This route is cheap, but we wish we could say that our experience would enable us to aver that it is convenient—convenient in the sense of finding things well managed on board the boat we cannot say it is. *We*, at all events, have found ourselves so uncomfortably attended to while at sea, that we have vowed the last time we went would literally be the last. The only way to make it at all comfortable is to go down to Harwich by an early train, secure a comfortable berth, and defy the crushing crowd of tourists who go down by the last, or "boat train," to find confusion reigning around in the boat when they arrive, and berths allotted to those only who are importunate with the steward, or have the pluck to take a berth and keep it *noles volens*. Unhappy he who is bashful and quiet: he has no chance of getting any of the good things. All this discomfort might be and could be avoided by good administration on board the boat, but if it exists as a rule, all we can say is that we must have been under the "rule of the exception" when it did not exist. Otherwise this route is a good one; it is certainly cheap, and, as before said, it has the advantage, to some, of reducing the area of sea-sickness to a minimum.

Whichever of the routes the traveller takes, he should certainly arrange to take Antwerp either in going or returning. It is a charming old city, full of much that is worth seeing, and surrounded by a charming country, at least one which abounds in much that is interesting to farmers. From it various short excursions can be made to districts in which much can be seen. We purpose taking our readers first direct to Rotterdam, thence through the most interesting districts of Holland, and back to "dear Old England" by way of Antwerp. If our readers will have but a tithe of the interest in what we say that we, on the occasion of several visits to Holland, saw, such trouble as we may have in the saying of it will be well repaid.

And here a word or two may be said as to a very popular notion of a tour through Holland, and that is, that it is very uninteresting. Thus at the outset we can only say on this point, that we never found it so. Doubtless, compared with other parts of the Continent, it is flat, and the aspect of the country is not that which raises such feelings of wonder or pleasure as the finer and bolder scenery of Switzerland, or the charming features of the Rhine, the Meuse, or the Moselle. But uninteresting it

cannot be said to be; certainly not in the higher sense of displaying evidences of that patient industry to which we have already alluded. And even from the picturesque point of view and from that which the lion-hunting and sight-seeing portion of English tourists think so much of, Holland as a country in which to spend one's holidays is not to be despised; indeed an observant traveller—and it is to readers of this class we alone address ourselves—it is one greatly to be thought of. The lawns are in themselves quaint, and possess many objects of interest, and it is not possible we conceive for any thinking mind to visit them without having feelings stirred and emotions aroused which do men good, and make them think about things of higher and holier import than inane connection with the routine of mere money-making or the excitement of seeing sights which may tickle the fancy, but cannot possibly please the taste more. Our readers who have an acquaintance with the fascinating volume of Motley, where he recites the history of the Netherlands, will understand what we mean in the direction of thought and observation; and those of our readers who have an artistic taste and have enjoyed the examples of one of the

best of the schools of painting will understand what we mean in another. Holland, therefore, we maintain is not the undulating country some hold it to be: it is rich in historical and artistic associations, and rich also in those with which our readers are more peculiarly and particularly connected. Much however depends upon the way in which the "tour" is done, to quote the cant phrase of hurrying tourists who think more of the mere getting over of ground than of what is to be seen and observed in it; to take train and hurry through the country is not the way to see it, not assuredly the way to see it so that you can "observe." The work must be gone leisurely about, and infinitely better is it to see one district well and thoroughly than to hurry through or over many and see none of them in this the only true way. We shall endeavour in the best fashion we are capable of doing, to take our readers in the way we did it, in which our object was to see as much as possible, and to economize time—not in the way some think they economize it by saving it, but by wisely distributing it. That and that alone is true economy, resulting in the maximum of work obtained with the minimum of time employed.

FARM PHOTOGRAPHS.

Scarcely less awful to look upon than a "ship on fire" is a stack-yard in flames. As a spectacle each is equally grand and painful to witness. We have seen the mansion gutted, and the manufactory destroyed by fire; but, irrespective of the question of life involved, the sight was not accompanied with that painful impression that attended the scene of a conflagration of farm produce and premises. Under every variety of circumstances it has been our lot to see this sad spectacle, and on many occasions we have been at hand when the destroying element has been let loose, and till it completed its work.

Once it was an immense hay-rick; at another time a detached wheat-stack; and, again, a row of barley-stacks that were consumed. On another occasion a noble old barn, capable when it was built of holding all the wheat grown in the township, fell a victim. The roof was oak, and the spars reached from the ridge nearly to the ground. One end was filled with straw, the centre was occupied by machinery and grain in the straw, and the other end was full of unthrashed oats. The flames were first seen at the straw end, near a loophole in the gable. The fire had commenced at the top of the "mow" or stack, and when we saw it a few minutes afterwards it was blazing up to the slates. The hard old oak smoked and charred for a short time, but at last burst forth into violent flames; the spikelets of fire running like quicksilver from spar to spar—now to the ridge, and now down to the wall-plates. Now the principal timbers became red, and the flame sprang from one to the other in great tongues reaching almost across the building, and hundreds of small lines or forks of flame ran along the laths under the slates, and in five minutes reached the opposite end of the long roof. So that, long before the straw heap where the fire began was consumed, the whole roof was in a mass of flames, which burst out of the doors and windows as though seeking outside for fresh food for its insatiate appetite.

Meantime the sparks lighted the scattered straw on the thrashing floor, and the flame ran like a twisting firework along the bottom floor, and the whole of the machinery in the middle, the grain in the chaff, and the unthrashed oats, were burning at the top and the bottom; and the enemy lapped round and over its ancient victim so greedily that in twenty minutes the roof fell in, and the flames were

confined to the lower floor, where the mingled timbers, straw, grain, and chaff smouldered and burnt, occasionally during the night breaking out into a blaze. And the fine old fabric stood out in the clear moonlight of the early morning a mass of gable and wall, naked and blackened. It was a grim ruin, without a vestige of the framework of the structure or of the internal machinery visible; the thick main beams of the roof, the iron skeletons of the machines, and the inorganic *débris* resulting from the fire forming a confused mass—a caput mortuum, without shape, beauty, or utility.

On another occasion a friend of ours, on reaching home from church at noon, took a turn round his garden before dinner, and saw the smoke curling over the roof of his barn. The stackyard was on the other side of the barn; and in an instant he saw the flames peeping out of the sheaf-window, and the smoke pouring through the tiles. He was quickly there, and found a large stack on fire at the bottom, and the flames winding round it like a snake, and throwing out its tongue, and seizing upon stack after stack. A gallop of three miles brought the news; and after a few minutes on one that had often gone well, but never at a better pace, across country, we were in the yard, and found that in one half-hour the barn and its contents, comprising 100 sacks of wheat, thrashing machinery, and straw, were every inch on fire. By great exertions, connection between stables on one side and the cow-sheds and granaries, containing beans, oats, and other property, on the other side, was cut off, and the progress of the flame at each end arrested. On the west side of the barn the tale was different—seventeen stacks of wheat, barley, and oats, one or two of clover and straw, several laden waggons and carts, ladders, poles, and other implements, and every combustible in the yard—even the hedges, gates, and quickset hedges—were in full flame. Like so many mighty furnaces, as we see them in the Black Country, the stacks burnt and blazed, the flames now rising perpendicularly, and now twisting rapidly round, as the current of air changed in force or direction. The sheaves being tightly packed, as the flames enclosed the external surface of the stacks, and prevented a full supply of the oxygen and the atmosphere, the violence of the flame appeared to diminish, and the red fire had to eat

its way into the solid mass, the stacks at such times looking like so many mighty cones of red-hot iron. A sudden gust of wind occasionally sent up showers of sparks that made the clear sky appear for a few moments studded with myriads of stars. And then the flame burst forth again, and the work of consumption by the devouring element progressed at a quicker rate.

The only use of the fire-engines was to prevent the spread of the fire, and to save the buildings and the house. The quantity of water used on the burning masses seemed simply to prolong the period of burning and to intensify the heat; and it was morning—quite day—before the flames shrank within the heaps of ashes, which still were red under the surface. In one day, the year's produce of many hands and much anxiety, the food of many hundreds of mouths, had disappeared, a few bushels of ashes in each case being the sole remains of the noble stack that on the day previous, thatched, trimmed, and finished according to the best rule of farming art, reared its tall head in the proud company of its fellows.

Nothing in the whole scene, however, impressed us more painfully than the remains of several carts, which were consumed. Quite new, gaily painted, and laden with sheaves, decorated with green boughs and ribbons, they had formed part of the rural pageant and procession and gladness and joy which a few days before had marked the successful finish of the harvest and the bringing home of the last sheaf. Now, there was the place where they had stood, but of themselves there was nothing really to see but the iron-work of each cart. Of this the fire had licked the paint, and it lay twisted and reddened by the heat in each case exactly in the position on the ground corresponding with the part of the vehicle to which it had belonged. The wheels had, as it were, suddenly collapsed, and the rim was laid on the ground, with the nave in the centre of the circle in its true position. The axle also was laid across from wheel to wheel, and every other piece of iron—the hooks in the shafts, the fastenings of the tail-board, every bolt and every nail—was present on the ground in its true relative position, as if the cart and its contents had melted away and the iron had remained. So it was, and the mighty solvent was fire.

Shakespeare or Sterne might have moralized on the theme—the skull of Yorick and the dead ass are not more striking subjects—but we can only photograph our memory of the scene and the transcript of it is, consequently, very imperfect.

Now we have seen the fire burst out of a hundred windows, and the cotton and oil blaze, and the machinery glow with red heat, till roof, floor, gable, and wall fell with loud crash into one mass of smouldering wood, iron, and brick; but upon however gigantic a scale this scene might be, we never felt the same horror and melancholy feeling associated with it, as with the farm fire we have pictured—when, after the momentary admiration of the glorious grandeur of the spectacle, the sudden chill and pain supervened, and admiration and sorrow alternated. Reason also gave her judgment upon the two scenes.

In the mill the substance destroyed merely represented capital, and cash could replace everything; but in the farm produce destroyed are not only lost human food which it may be difficult to replace from foreign sources by the aid of money, but we lost a part of the annual gift of God, which constitutes the wealth of the nation, and had so much less capital to buy imports with, as a substitute for the destroyed produce. Nor can we when this occurs, possibly, by the agency of all the capital and labour in the world, grow another crop in the same year. We have had our promised seedtime and harvest, and we have reaped the anticipated results, but we have failed to preserve them! That is *the* case. It has been destroyed, and the nation is poorer by the amount and the supply of

food less by the same. Imagine the consequences if every stack in the kingdom were so destroyed, and the argument will require no further illustration.

Now we have, as we have said, drawn this scene from our memory, and photographed it for a purpose. The particulars and facts alluded to illustrate a subject which we are anxious to bring before the farming public, and which is pertinent to the season, and certainly important to the farmer at any time. This subject is a method which we find is becoming more and more adopted on the large farms in Yorkshire, and which we have occasionally met with in other districts, of diminishing risk of, and the loss from, accidental fires upon farms.

Under the present circumstances of drought, when every substance is dry and hot, and vegetable matter catches fire easily, every precaution is absolutely necessary. In 1848 extensive areas of grass were set on fire by the railway engines. Hedges and woods were also consumed. In France, during the present summer, extensive forests have been destroyed, armies of soldiers being required to arrest the progress of the flames. Several fine woods have been consumed in England, and upon many farms hedges have been set on fire by the resting labourer's lucifer-match after it has lighted his pipe. As a case in point we may name that, upon the farm where the fire took place, to which we have previously alluded, a few weeks ago a fine thorn hedge was found blazing, and was for a great length entirely consumed. The wind fortunately drove the sparks towards a turnip-field: had the hedge burnt the opposite way the loss of standing and sheaf corn in the field might have been serious.

While, then, the dryness of the season should make us alive to every precaution now, at all times and seasons due and proper care should be taken; and therefore the practice of stacking the grain in three or four different places at safe distances from each other, and from the premises, is one that we photograph immediately as worthy of being set before the notice of the agricultural community. It may be too late to be made use of in many instances during this harvest, but it is a lesson of the season, which should be listened to, and made use of on the first favourable opportunity.

The practice of concentrating the whole year's produce in one stackyard is now almost universal. Upon moderate-sized and small farms it is practised without an exception. The neat workmanship of the full rickyard gives certainly more than an imaginary respectability to the farmhouse, but the cost of the embellishment is too great. In these cases the stacks are generally close behind the barn and stables. The haystack often stands in the row, and the straw-stacks are as near the doors of the stable and the cow-sheds as may be.

And here, early and late, the labourer, the ploughman, and the boy have to pass and repass. That they use lucifers and candles we know; and that an accident, while human nature is fallible, may occur, cannot be denied; and especially while smoking is so universal a habit. When a fire occurs under such circumstances the loss is seldom partial. In fact the risk of disaster, and the consequences when it does occur are both augmented by the practice, which would be "more honoured in the breach than in the observance," and which may be obviated so easily. The prevalent and dangerous practice has no advantage of convenience or cost in its favour. Indeed, where the farm is wide and the crops distant, it interferes with harvest labour to bring it together, and it might be stacked more readily and at less cost at a short distance from the field. In such case it has eventually to be carted home, but labour is not so expensive at thrashing-time as it is in harvest. Moreover, when the crop is brought to the premises *in* harvest, it has to be removed to some

convenient place to be thrashed, or it is thrashed where it is in stack, and the straw removed afterwards—a most costly process. So far as economy is concerned, it may as well, therefore, be stacked in any convenient isolated locality as at the farm steading; for an extra cart will at any time bring the grain to the machine as fast as is required when the stack is at some distance; and it requires two such carts to do the work when the stack is in the yard. Horses being no cost, an extra cart only involves an extra boy to drive. And this charge, belonging to the outfield stacking system, which we recommend, is more than counterbalanced by the less cost at harvest of stacking in or near the field rather than carting it home. There can, therefore, be no practical objection to the system of storing corn which we advocate, so far as expense and inconvenience are concerned; and as regards the greater freedom from accidental fire, and the certainty of diminished loss accruing should such a casualty occur, the advantage is at once patent and indisputable. When the year's crop is divided, in case fire should occur, there must be a valuable salvage.

The same farm fire to which we have previously alluded furnishes us with a fact bearing on this point, which bears conclusively on the question. In the year in which the serious fire occurred, the corn crop of the farm was stacked in *three different* places at considerable distances from each other, there being 17 stacks in each lot. The loss that occurred amounted to

£1,400, and was nearly covered by insurance. Had the prevalent system, which we now condemn, been adopted, and the 51 stacks placed together, the whole would have been consumed, and the loss threefold. We saw the three rickyards the other day, felt the good sense of that mode of securing the crop, photographed from our memory the picture of what occurred a few years ago, and transcribed the lesson for the benefit of the public interested in farm practice.

To small as well as large farms the mode advocated commends itself, and our picture applies. When all is lost nothing remains; an axiom upon which the impolicy of putting all our eggs in one basket is based.

A correspondent of the *Mark Lane Express* calls attention to the sudden change made by the insurance offices in London on the mode of insuring farming stock and produce: "Notices have been issued that, on and after June 24 last, the 'Average clause policy' system is to be introduced into insurances on farming stock. A special condition provides that 'If the sum insured on agricultural produce, either separately or in one amount with other property, shall at the breaking out of a fire be less than three-fourths of the value of all the property insured in that amount, then the company shall be liable only for such a proportion of the loss sustained as the sum so insured shall bear to the total value of all the property to which the sum applies.'"

WORSLEY AND SWINTON AGRICULTURAL SOCIETY.

This Society, which includes the district comprised within a radius of eight miles from Worsley Courthouse, held its fifth annual exhibition in the Park. The weather was all that could be desired, and although the district can scarcely be designated as one purely devoted to agriculture, yet, judged from the success experienced last week, it promises to rank high among district gatherings. The horned cattle were not a numerous show. Best bull of any breed above three years old, Henry Neild, The Grange, Worsley, for Blair Athol, an aged bull; and for the best bull, not exceeding three years old, Hugh Higson, of Pendleton. Best bull of any breed, not exceeding two years, C. W. Brierley, Rhodes House, Middleton; Thomas Statter, jun., Stand Hall, second. Best bull, not exceeding one year, Nathaniel Rothwell, Great Lever, Bolton; Thomas Statter again taking second place. Silas Dorning, of Little Wardley, Worsley, was first for the best cow for dairy purposes, in milk or in calf; and for the best lot of milch cows, Nathaniel Bothwell received the first and second prize. Best pair of two years old heifers, Hugh Higson, of Peadleton; Henry Neild, of Worsley, second. Best pair of year old heifers, Thomas Statter, jun. Best lot of calves under one year old, bred by tenant-farmers, Thomas Stone, of Old Hall Farm, Worsley; Thomas Stone was also fortunate enough to take the same place for the best heifer calf. C. W. Brierley took first prizes in three successive competitions, viz., best fat or barren cow, best cow or heifer of any breed in milk or in calf, and best one-year-old heifer, Hugh Higson, New Hall Farm, Pendleton, taking second in the two latter classes. Horses were a more numerous exhibition. There were 135 entries in the various classes. Best district stallion, Thomas Stanbank, Sinderland, Dunham Massey, for a six years old; Samuel Norbury, Cheadle, first prize, for the best thoroughbred stallion. Best roadster stallion, C. Lund, of the Castle Hotel, Preston. The hunters entered for the leaping trials numbered six. For the best hunters to carry 14 stone, the Society's silver cup was awarded to Downshire, from the stables of William Murray, of Broughton Mews, Manchester; the horse, a clever grey gelding, six years old, and born in Ireland, was established first favourite after clearing the first fence, and skimmed the re-

mainder admirably; William Thompson, of Lower Broughton, second; and Thomas Statter, jun., third. W. Murray was again successful in the competition for hunters. A seven years old brown mare, Brunette, also said to be born in Ireland, received the first award and the Society's silver cup, as the best animal for carrying 12 stone; Joseph Walker, Broomhurst, Eccles, second. Best roadster, Charles L. Clare, Higher Broughton; William Hampson, of Yew Bank Mews, Lower Broughton, second. Best cob, Joshua Fielden, Lostock Grange, Bolton. Best pair of draught horses, C. W. Brierley. Best brood mare, T. Statter, jun. Best roadster brood mare, James Higson, Thomas-street, Manchester. Best pair of horses, suitable for agricultural purposes, H. Neild. Best mare or gelding, for the same purpose, C. W. Brierley. Best filly, J. Hampson, Vicar Hall Farm. Best mare or gelding used this year in the Duke of Lancaster's Yeomanry at permanent drill, and also generally employed for agricultural purposes, W. Isaac Challinor, Worsley; Joseph Gregory, Walkden, second. Best two years old gelding, suitable for agricultural purposes, Timothy Booth, Middle Hulton; and in the same class for one year-old, Robert Barker, of Brightmet, near Bolton, was similarly placed. William Murray, of Broughton, added another to his list of prizes, by taking the first for ponies not exceeding 13½ hands high. Ponies not exceeding 12½ hands, Howarth Ashton, Polefield Hall, Prestwich. The following awards were also made by the judges: Draught foal, T. Statter, jun.; half-bred foal, Peter Nightingale, Worsley, Very few sheep were shown. The first and second awards for the best long-woolled ram fell to H. Neild, of the Grange; the same gentleman also receiving the first premiums for the best three long-woolled ewes, short-woolled ewes, and short-woolled ram. In the latter competition Mr. Neild took both first and second awards. Thomas Stone, of the Old Hall Farm, received the award for the best pen of lambs. Pigs were a better show, but Peter Eden, Salford, who exhibited in six of the classes, took first and second prizes in all. Best cottagers' breeding sow, W. Richardson, of Moorside, Swinton; for store pigs, W. Barlow, of Partington, Swinton; for the Berkshire breed, Henry Boddington, of Monton House, Eccles.

AIREDALE AGRICULTURAL SOCIETY.

MEETING AT BINGLEY.

The total entries of exhibitors were rather under those of the previous year, there being 651 in 1869, and only 628 this year. In the horned cattle department there was a marked decrease, owing to the spreading of the foot-and-mouth disease, the dread of which prevented many who would otherwise have been exhibitors from sending their animals to the show. The following is the prize list:

CATTLE.

Short-horned bull.—First prize, E. D. A. Marriner, Worthville, Keighley; second, G. Dibb, Wild Grove, Tyersal.

Short-horned cow or heifer, any age.—First prize, J. H. Hutchinson, Manor House, Catterick; second, E. D. A. Marriner.

(Open to tenant farmers, chiefly dependent on their farms for a living.)

Short-horned bull, above twelve months old.—First prize, M. Lamb, Caley Farm, Otley; second, J. Robershaw, Grange, Allerton.

Short-horned bull calf, under twelve months old.—First prize, J. H. Hutchinson; second, T. Hird, Snail House, Skipton.

Short-horned cow or heifer, above two years old.—First prize, T. Hird; second, J. Robertshaw.

Short-horned heifer, under two years old.—First prize, J. Renton, Farnley, Otley; second, J. Renton.

Short-horned heifer calf, under twelve months old.—First prize, J. H. Hutchinson; second, J. Atkinson, Bingley.

Cow, for dairy purposes.—First prize, Miss M. E. C. Bentley; second, J. Simms, Cottingley Moor, Bingley.

HORSES.

Hunter.—First prize, J. B. Booth, Killerby Hall, Catterick; second, H. Crossley, Broomfield, Halifax; third, J. Robson, Old Malton, Malton.

Leaper.—First prize, L. B. Morris, Thornton-in-Craven; second, W. Sugden, Haworth; third, H. Butler, Bingley.

Roadster stallion.—First prize, P. Kirby, North Driffield; second, J. and H. Cockshott, Cringles, Silsden.

Draught stallion.—First prize, J. Forshaw; second, T. Greenwood, Calverley Bridge.

Horse or mare in single harness.—First prize, Fox & Whitely, Allerton; second, J. Smith, Piccadilly, Bradford.

Nag or roadster.—First prize, T. Clarkson, Melbourne Street, Leeds; second, E. Charlesworth, Roley Villa, Bradford.

Cob, under fifteen hands.—First prize, W. White, Armthorpe, Doncaster; second, H. Crossley, Broomfield, Halifax.

Roadster brood mare.—First prize, J. Clark, Beeston, Leeds; second, J. White, Whetley Hall, Bradford.

Roadster gelding or filly, three years old.—First prize, B. Baxter, Elslack; second, H. Green, Glusburn.

Roadster, gelding or filly, two years old.—First prize, D. Newsome, Whack House, Yeadon; second, T. Speight, Scholes, Cleckheaton; third, W. Tillotson, Howden Park.

Roadster, gelding or filly, one year old.—First prize, G. Newsome, Carlton Grange, Dewsbury; second, John Frankland, Wilden Hill; third, A. Blakey, Addingham.

Draught brood mare.—First prize, E. and W. Pawson, Burley-in-Wharfedale; second, T. Greenwood, Calverley Bridge.

Draught gelding or filly, three years old.—First prize, W. Clough, Cottingly; second, Mrs. Dennison, Heaton Royds.

Draught gelding or filly, two years old.—First prize, J. Moore, Cottingly; second, W. Hartley, Gledhow, Leeds.

Draught gelding or filly, one year old.—First prize, E. Haley; second, J. Snowdon, Cottingly.

Draught mare or gelding.—First prize, J. Clarke, Beeston, Leeds.

Mare or gelding for general purposes.—First prize, Glover, Son and Co., Bradford; second, I. Freer, Ovenden.

Pony, above 12½ hands and not exceeding 14 hands.—First prize, J. Gresham, Far Headingley; second, W. White, Armthorpe, Doncaster.

Pony, under 12½ hands.—First prize (equal), J. Arnold, Bradford, and J. G. Hey, Cleckheaton; second (equal), J.

Anderton, Springfield, Bingley, and E. Milnes, Toller Lane, Bradford.

Pony leaper, above 12½ hands and not exceeding 14 hands.—First prize, J. W. Townsend, Newsam Green, Temple Newsam; second, S. Proctor, Bradford; third, W. Lamb, Rochdale.

Pony leaper, under 12½ hands.—First prize, T. Sunderland, Halifax; second, R. W. Hall, Eccleshall; third, J. G. Hey.

SHEEP.

LEICESTER OR LONG-WOOLLED.

Ram, any age.—First and second prizes, J. H. Hutchinson.

Ram lamb.—First and second prizes, J. H. Hutchinson.

Pen of three ewes, any age.—First and second prizes, J. H. Hutchinson.

Pen of three ewe lambs.—First prize, J. H. Hutchinson; second, M. Lamb.

LONKS.

Ram, any age.—First prize, J. M. Green, Keighley; second, J. Hoyle, Cliffe Green, Keighley.

Ram lamb.—First prize, B. Dobson, Craiglands, Ilkley; second, M. Hanson, Iligh Utley, Keighley.

Pen of three ewes, any age.—First prize, J. G. Bridge, Edge Coates, Rawtenstall; second, C. Sedgwick, Riddlesden Hall, Keighley.

Pen of three ewe lambs.—First prize, J. M. Green; second, J. G. Bridge, Rawtenstall.

Ewe lamb.—First and second prizes, J. M. Green.

CROSS-BRED SHEEP.

Pen of three ewes, any age, first cross from lonks.—First prize, C. Sedgwick; second, J. Midgley, Meadow Field, Keighley.

Pen of three ewe lambs, first cross from lonks.—First prize, J. Gill, Howden Park, Silsden; second, B. Baxter, Elslack.

PIGS.

Boar, large breed.—First and second prizes, W. Lister, Armley.

Boar, middle breed.—First prize, J. E. Fox, Great Horton; second, C. Roberts, Wakefield.

Boar, small breed.—First prize, W. Hatton, Addingham.

Sow, large breed.—First prize, W. Lister, Armley; second, G. Andrews, Tuxford, Newark.

Sow, middle breed.—First prize, W. Greetham, Legrams Lane, Bradford; second, J. Knight, Bogs, Allerton.

Sow, small breed.—First and second prizes, W. Hatton.

Store pig, under nine months old.—First prize, F. Bramfit, Manor Street, Leeds; second, J. Bullock, Bradford.

Fat pig, under twelve months old.—First prize, M. Walton, Halifax.

LABOURING MEN'S PREMIUMS:

Store pig, under nine months old.—First prize, J. Mitchell, Saltaire; second, W. Midgley, Fell Lane, Keighley; third, D. Keighly, Exleigh Head, Keighley.

Fat pig, under twelve months old.—First prize, J. Sugden, Fell Lane, Keighley; second, J. Reeday, Keighley; third, W. Dracup, Saltaire.

THE PRESERVATION OF EGGS.—The *Journal de Pharmacie de Chimie* contains an account of some experiments by M. H. Violette, on the best method of preserving eggs, a subject of much importance in France. Many methods had been tried; continued immersions in lime-water or salt-water; exclusion of air by water, sawdust, etc., and even varnishing has been tried, but respectively condemned. The simplicity of the method adopted on many farms, namely, that of closing the pores of the shell with grease or oil, had however, attracted the attention of the author, who draws the following conclusions from a series of experiments on this method; Vegetable oils, more especially linseed, simply rubbed on the egg hinders any alteration for a sufficiently extensive period, and presents a very simple and efficacious method of preservation, eclipsing any methods hitherto recommended or practised.

WORCESTERSHIRE AGRICULTURAL SOCIETY.

MEETING AT KIDDERMINSTER.

The Worcestershire agriculturists are following the example of their neighbours in Warwickshire and Gloucestershire, and instead of always holding their annual show in connection with their society in one locality, they have resolved to make it migratory. This year is the first time they have tried the experiment, and they have had every encouragement so far in their scheme.

There were 284 entries in all—viz., 76 of cattle, 67 of sheep, 32 of pigs, 53 of horses, 6 of wool, 7 of barley, and 38 of implements, &c. From these, however, a slight percentage has to be taken off for withdrawals. There were 79 exhibitors of live stock, wool, and barley, and 37 of implements.

The show of Herefords may be set down as good but few. The Shorthorns were also very fair. Amongst the sheep the Leicesters were not largely exhibited, and made but a poor competition. The shearling rams in the next class (long-woolled, not being Leicesters) were particularly good. The rams of any age were also good. Theaves and ewes in this class were less meritorious. The Shropshire sheep were excellent, and many of the best breeders competed.

The judges were:

CATTLE.—H. Haywood, Hereford; T. Morris, Gloucester; J. K. Fowler, Alesbury.

SHEEP AND PIGS.—G. A. May, Tamworth; C. Hobbs, Cricklade.

CART HORSES.—J. Manning, Ordlingbury, near Wellingborough.

HORSES (HUNTERS, HACKS, AND PONIES).—T. Haywood, Hereford.

WOOL.—J. Naylor, Kidderminster.

BARLEY.—R. Woodward, Arley Castle.

PRIZE LIST.

CATTLE.

HEREFORDS.

Bulls above two years old.—First prize, T. Rogers, Coxall, Brampton Bryan; second, J. Twinberrow, jun., Suckley, Worcester, Monarch (3260).

Bulls above one and under two years old.—First prize, R. Tanner, Prodesley, Salop (Pousonby) (2498); second, J. S. Walker, Knightwick, Worcester.

Cows in milk or in calf.—First prize, R. Tanner (Queen); second, J. Smith, Shelsley Walsh, Worcester.

Two-year-old heifers, in milk or in calf.—First prize, R. Tanner; second, P. Turner, Leen, Pembridge, Leominster.

Yearling heifers.—First prize, R. Tanner; second, P. Turner; third, J. S. Walker.

Three dairy cows of any breed, in milk.—First prize, Earl Beauchamp, Madresfield Court, Malvern (Miss Valentine); second, E. Beauchamp (Worcester 2nd).

SHORTHORNS.

A special prize of £25, for the best bull in Shorthorn classes.—Lord Sudeley (Mandarin).

Bulls above two years old.—First prize, Lord Sudeley, of Toddington, Winchcomb (Mandarin); second, G. Garne, Churchill Heath (Royal Butterfly 20th) (25007).

Bulls above one and under two years old.—First Prize, S. and J. Perry, Acton Pigott, Cawdover, Salop (Duke of Lancaster); second, Thomas Garne and Son, Broadmoor, Northleach (Rolla); third, James Webb, Fladbury, Pershore (Saturnus).

Cows in milk or in calf.—First prize, George Garne (Pride of the Heath); second, Jacob Dove, Hanbrook House, Hambrook, Gloucestershire, (Garland).

Two year old heifers in milk or in calf.—First prize, James Webb (Bella) (24829); second, Thomas Garne and Son (Nonpariel); third, Jacob Dove.

Yearling heifers.—First prize, Henry Allsopp, Hindlip Hall,

Worcester; second, Jacob Dove; third, Thomas Garne and Son (Pattern).

Three dairy cows of any breed, in milk.—First and second prizes, Earl Beauchamp (Miss Valetine and Worcester 2nd).

SHEEP.

LEICESTERS.

Five breeding ewes, having had lambs in 1870, and suckled them up to June 1st.—First and second prizes, T. Harris, Stoney Lane, Bromsgrove.

Five theaves.—First and second prizes, T. Harris.

Shearling ram.—First and second prizes, G. Turner, jun., Alexton Hall, Uppingham.

Ram of any age.—First prize, G. Turner, jun.; second T. Harris, Stoney Lane, near Bromsgrove.

LONG-WOOLLED, NOT BEING LEICESTERS.

Five breeding ewes, having had lambs in 1870, and suckled them up to June 1st.—First prize, J. Webb, Fladbury, Pershore.

Five theaves.—First prize, W. Smith, Bibury, near Fair-Fairford; second, T. Beale Browne, Salperton Park, Andoversford.

Shearling rams.—First prize, W. Smith; second, T. Beale Browne.

Ram of any age.—First and second prizes, T. Beale Browne.

SHROPSHIRE.

Five breeding ewes, having had lambs in 1870, and suckled them up to June 1st.—First prize, C. R. Keeling, Yew Tree Farm, Henkley; second, W. C. Firmston, Rockingham Hall, Hagley, Stourbridge; third, W. Baker, Moor Barns, Atherstone.

Five theaves.—First prize, W. C. Firmstone; second C. R. Keeling; third, W. Baker.

Shearling rams.—First prize, Sarah Beach, The Hattons, Brewood, Penkridge; second, C. Randell, Chadbury, Evesham.

Rams of any age.—First prize, Sarah Beach; second W. Baker.

CROSS-BRED.

Five breeding ewes, having had lambs in 1870, and suckled them up to June 1st.—First and second prizes, J. Webb.

Five theaves.—First prize, J. Webb.

PIGS.

Boar pigs of any age.—First and second prizes, J. Wheeler, Long Compton; third, R. E. Duckering, Kirton-Lindsey.

Sow with pigs, the age of the pigs not to exceed 4 months.—First prize, J. Wheeler; second, R. E. Duckering; third, M. Walker, Stockley Park, Burton-on-Trent.

Two litters, above four and under twelve months old.—First prize, R. E. Duckering; second, H. Allsopp, Hindlip Hall, Worcester; third, J. Wheeler.

HORSES.

Stallion cart horse for agricultural purposes.—First prize, W. Wynn, Cranhill Leys, Grafton, Alcester; second, W. Dukes, Cefn Cock, Llanarth, near Raglan.

Pair of cart geldings or mares (or gelding and mare), above four years old, which have been regularly worked.—First prize, S. Davis, Woolashill, Pershore; second, R. Woodward, Arley Castle, near Bewdley.

Cart mare and foal.—First prize, Lord Sudeley; second, R. Woodward.

Cart filly or gelding, two and under three years old.—First prize, J. Thayers, Crickley-hill, Gloucester; second, S. Davis, Woolashill, Pershore.

Thoroughbred stallions, that have served mares regularly in the county of Worcester during the season of 1870.—First prize, Earl of Coventry, Croome Court, Kempsey, Worcester; second, H. Cowley, Blakeshill Farm, Hinton, near Evesham.

Hunters equal to 14 stone (open to all England).—First

prize, E. W. Haywood, Sillins, Redditch; second, W. Stephenson, Cottingham, Hull, Yorkshire.

Hunters, irrespective of weight (open to all England).—First prize, C. Cook, Taddington, Wincheomb; second, T. Tayler, Manor House, Turkdean, near Northleach.

Hunters that have been ridden in the past season with hounds.—First prize, Earl Coventry; second, W. Colman, Waiton House, Tewkesbury.

Hunters, the property of tenant farmers resident in Worcestershire, and been ridden by themselves in the past season with the Worcestershire hounds.—First prize, N. Smith, Martley, Worcester; second, E. Bayliss, Hownings, Hanbury, near Droitwich.

Hunting mares or geldings, under five years old.—First prize, W. Stephenson; second, J. G. Watkins, Woodfield, Droitwich.

Hack not exceeding fifteen hands.—First prize, C. Cook, Taddington, Wincheomb.

Weight-carrying cob, not exceeding fifteen hands.—First prize, J. Hillman, Kidderminster.

Pony, above twelve and under fourteen hands.—First prize, J. G. Boraston, Sutton, Kidderminster.

Brood Mare for producing hunters.—First prize, D. Roxburgh, Little Wiley, Worcester.

WOOL.

Tod of wool of the clip of 1870, shorn from long-woolled sheep.—First and second prizes, T. Harris, Stoney Lane, near Bromsgrove.

Tod of wool, of the clip of 1870, shorn from short-woolled sheep.—First prize, R. Hickman, Cotheridge, near Worcester; second, H. Allsopp, Hindlip Hall, Worcester.

BARLEY.

Sample of barley grown in the county of Worcester in the year 1870.—Prize, G. McCann, Court Farm, Malvern.

THE KEIGHLEY AGRICULTURAL SOCIETY.

At the twenty-eighth annual meeting of the Keighley Agricultural Society the Shorthorns were fairly represented; Mr. Richard Stratton, of Burderop, Swindon, Wilts, carried off the first prize for bulls with James the First. He is a prize-taker, well known in the West of England. For bulls above one year old Mr. Statter, of Whitefield, Manchester, was first, with one which has been a prize-taker at Preston, Blackpool, Burnley, Rossendale, Penistone, and other shows. There were seven entries in the class of bull calves; the first premium being secured by Captain Tennant, of Scarcroft, Leeds. Captain Tennant was also successful in shorthorn cows in calf or milk—with White Rose, which has taken a first prize and a cup at Thirsk, and was also a prize-taker at the Yorkshire show. The classes of cows in the department of gentlemen's premiums were throughout good, the class of dairy cows being perhaps the strongest. The grand competition in this department, however, was the £50 prize for the best three Shorthorns. Mr. Stratton eventually came off victor with the bull already referred to, and a two-year-old and one-year-old heifer, which were also prize-takers in their classes. Mr. Statter was awarded a second prize of £10, and Captain Tennant a third of £5. The show of horses was not only large, but good. There were ten entries in the three classes of stallions, and several of the horses shown were prize-takers. The classes of draught geldings and fillies were but poorly represented, but there were a great many entries, and some very good horseflesh in the hunter and hack classes; while the draught horses were creditable. There were fewer entries of sheep than last year.

JUDGES.—SHORTHORNS: The Rev. M. C. Wood, Poulton-le-Fylde; W. Sandy, Holme Pierpoint, Notts; H. W. Beauford, Bedford.

HORSES: T. Gibbon, Burnfoot-on-Esk; L. Hodgson, Highthorn House, Easingwold, J. Smith, Humberston, Borough-bridge.

SHEEP: G. W. Langdale, Park House, Leconfield; W. Robson, Great Ouseburn, York. Lonk Sheep: G. Browne, Troutbeck, Windermere.

PIGS: J. Dixon, Bradford; J. Calshaw, Towneley, Burnley. CROPS: H. Ambler, Watkinson Hall; J. Renton, Farnley, Oley.

BUTTER: W. Peacock, Malham.

PRIZE LIST.

CATTLE.

(OPEN TO THE UNITED KINGDOM.)

Shorthorn bull above two years old.—First prize, R.

Stratton, Burderop, Swindon, Wilts; second, T. Statter, jun., Standhill, Whitefield, Manchester.

Bull above one year old.—First prize, T. Statter, jun.; second, A. Hathorn, Smeathalls.

Bull calf under twelve months old.—First prize, Captain R. Tennant, Scarcroft Lodge, Leeds; second, T. H. Hutchinson, Catterick.

Shorthorn cow in milk or calf.—First prize, Captain R. Tennant; second, T. Hird, Small House, Skipton.

Heifer under three years old.—First prize, R. Stratton; second, Captain R. Tennant.

Heifer under two years old.—First prize, R. Stratton; second, T. H. Hutchinson.

Heifer calf under twelve months old.—First prize, E. D. A. Marriner, Keighley; second, T. Statter, jun.

Dairy cow.—First prize, H. Crossley, Watkinson Hall, Halifax; second, Miss Bentley, Allerton.

Alderney or Guernsey cow or heifer.—First prize, E. Holmes, Keighley.

Best three Shorthorns.—First prize, R. Stratton; second, T. Statter, jun.; third, Captain R. Tennant.

Shorthorn bull above two years old.—Prize, E. D. A. Marriner.

Bull under two years old.—First prize, S. Newall, Skipton; second, B. Baxter, Elslack Hall.

Bull calf under twelve months old.—First prize, B. Baxter; second, T. Hird.

Shorthorn cow in milk or calf.—First prize, T. Hird; second, Miss M. E. C. Bentley.

Heifer under three years old.—First and second prize, T. Hird.

Heifer under two years old.—First prize, T. Hird; second, L. Robertshaw, Springfield, Allerton.

Heifer calf under twelve months old.—First prize, E. D. A. Marriner; second, B. Baxter.

HORSES.

(OPEN TO THE UNITED KINGDOM.)

Coaching stallion.—First prize, Captain Sateliffe, Sutton House, second, Parkinson Fort, Wilsden.

Roadster stallion.—First prize, H. R. W. Hart, Dunnington Lodge, York; second, J. & H. Cockshott, Cringles, Silsden.

Draught stallion.—First prize, J. Forshaw, Burley-in-Wharfedale; second, T. Greenwood, Calverley Bridge.

Two years old draught gelding or filly.—Prize, J. Moore, Cottingley.

One year old draught gelding or filly.—First prize, E. Haley, Allerton; second, E. Briggs, Wilsden.

Three years old roadster gelding or filly.—First prize, J. White, Bradford; second, R. Baines, Keighley.

Two years old roadster gelding or filly.—First prize, T. Speight, Scholes, Cleckheaton; second, D. Newsom, Yeadon.

One year old roadster gelding or filly.—First prize, J. Duckett, West Morton; second, J. Ogden, Laycock.

Draught brood mare.—First prize T. Statter, jun.; second, E. & W. Pawson, Burley-in-Wharfedale.

Roadster brood mare.—First prize, J. White; second, W. H. Davis, Gargrave.

Draught horse or mare.—First prize, J. Clarke, Beeston; second, H. Glover, Son & Co., Bradford.

Nag or roadster.—First prize, H. Mason, Bankfield, Cottingley; second, E. Charlesworth, Roley Villa, Bradford.

Cob, not to exceed 16 hands.—First prize, H. Crossley, Broomfield, Halifax; second, A. Hauxwell, Thirsk.

Pony under 13½ hands.—First prize, A. Hauxwell; second, J. Maude, Leeds.

Lady's horse or mare.—First prize, Captain Smith, Cheltenham; second, Adam Dugdale, Rose Hill, Burnley.

Horse or mare in single harness.—First prize, J. White; second, F. W. Waller, Bradford.

Best hunter.—First prize, S. J. Welfitt, Tathwell Hall, Louth; second, J. B. Booth, Killerby Hall, Catterick.

Leaper.—First prize, H. Johnson, Spofforth; second, W. M. Darley, Thorne; third, Captain Smith.

SHEEP.

(OPEN TO THE UNITED KINGDOM.)

Leicester or any other longwooled ram, two-shear or aged.—First and second prize, T. H. Hutchinson, Catterick.

Leicester or any other longwooled ram, one-shear.—First and second prize, T. H. Hutchinson.

Leicester or other longwooled tup lamb.—First prize, T. H. Hutchinson; second, G. Greaves, Poole, Otley.

Pen of three Leicester or any other longwooled ewes, two-shear.—First and second prize, T. H. Hutchinson.

Pen of three Leicester or any other longwooled ewes, one-shear.—Prize, T. H. Hutchinson.

Pen of three Leicester or any other longwooled ewe lambs.—First prize, T. H. Hutchinson; second, M. Lamb, Caley Farm.

Leicester or any other longwooled ewe lamb.—First prize, M. Lamb; second, W. Laycock, Woodville.

LONKS.

(OPEN TO THE UNITED KINGDOM.)

Ram, two-shear or aged.—First prize, J. Hoyle, Laycock; second, J. Smith, Keighley.

Ram, one-shear.—First prize, J. M. Green; second, J. Smith, Hainworth.

Tup lamb.—First prize, B. Dobson, Craiglands, Ilkley; second, M. Hanson, High Utley.

Pen of three ewes, two-shear or aged.—First prize, J. M. Green, Black Hill; second, J. B. Sidgwick, Riddlesden Hall.

Pen of three ewes, one-shear.—First prize, J. B. Sidgwick; second, J. Craven, Park House, Steeton.

Pen of three ewe lambs.—First prize, J. M. Green; second, J. Smith.

Ewe lamb.—First and second prizes, J. M. Green.

Pen of three ewe lambs, first cross from Lonk ewes.—First prize, B. Baxter, Elslack Hall; second, J. Gill, Howden Park, Silsden.

Ewe lamb, first cross from Lonk ewes.—First prize, J. M. Green; second, J. Gill.

P I G S.

(OPEN TO THE UNITED KINGDOM.)

Best pig.—Prize, P. Eden, Salford.

Boar, large breed.—First prize, P. Eden; second, W. Lister, Armley.

Boar, small breed.—First prize, P. Eden; second, W. Hatton, Addingham.

Boar, middle breed.—First prize, J. E. Fox, Great Horton; second, C. Roberts, Wakefield.

Boar, large breed, under nine months.—First prize, J. Palmer, Thorby; second, T. Trees, Skipton.

Boar, small breed, under nine months.—First prize, J. Swire, Morton; second, J. Reeday, Keighley.

Boar, middle breed, under nine months.—First prize, J. Cawood, Keighley; second, W. Birtwhistle, Bradley.

Breeding sow, large breed.—First prize, P. Eden; second, R. E. Duckering, Northorp, Kirton Kinsley.

Breeding sow, small breed.—First prize, W. Hatton; second, R. E. Duckering.

Breeding sow, middle breed.—First prize, W. Greetham, Horton; second, R. E. Duckering.

Gilt, large breed, under nine months, for breeding.—First prize, P. Eden; second, T. Slater, Keighley.

Gilt, small breed, under nine months, for breeding.—First prize, J. Hudson, Yeadon; second, J. B. Sidgwick.

Gilt, middle breed, under nine months, for breeding.—Prize, J. B. Sidgwick.

Pig of any class, in best condition.—Prize, W. Hatton.

R O O T S.

Six swede turnips.—First prize, J. Riley, Junction Cross Hills; second, T. Brigg, Guard House.

Six yellow turnips.—First prize, J. Kidd, Sutton; second, R. Petty.

Six white turnips.—Prize, A. Wilkinson, Morton Banks.

Six Scotch cabbages.—First prize, J. Riley; second, T. Brigg.

B U T T E R.

Two pounds of batter, 1lb. in roll, and 1lb. in print.—First prize, B. Smith, Kildwick Grange; second, T. Blakey, Siladen.

CRAVEN AGRICULTURAL SOCIETY.

MEETING AT SKIPTON.

In one respect the exhibition was characterised by a decline. None of the great breeders of Shorthorns were represented, although some of them had entered, but this was not attributable to any mismanagement or insufficiency of awards, but to the simple fact that those possessed of very valuable stock were frightened off the ground by supposed danger from the foot-and-mouth disease. There were only two bulls in the aged class. Captain Tennant secured the first honour, and was successful in most of the classes in which he competed, and was awarded the 20-guinea cup for the best collection of Shorthorns. Amongst the horses the stallions were good and brood mares, two-year-old geldings, cobs and ponies, were brought forward in fair numbers.

JUDGES—SHORTHORNS: George Drewry, Holker; Thomas Atherton, Speke, near Liverpool. HORSES: Wm. Owen, Norris Green, West Derby; John Bromley, Lancaster. PIGS: Stephen Barrett, Harewood; Joseph Culshaw, Towneley, Burnley. ROOTS, BUTTER, CHEESE, and OAT-CAKE: Joseph Culshaw.

P R I Z E L I S T.

CATTLE.

SHORTHORNS.

(Open to the United Kingdom.)

Bull, two years old and upwards.—First prize, Captain Tennant, Scarcroft Lodge; second, E. D. A. Marriner, Keighley. Yearling bull.—Prize, A. Hathorn, Ferrybridge.

Bull calf, under twelve months old.—First prize, Captain Tennant; second, A. Bell, Burnley.

Cow in-calf or milk, of any age.—First prize, Captain Tennant; second, T. Hird, Skipton.

Two years old heifer.—First prize, G. Hargreaves, Shipley; second, W. Gomersall, Otterburn.

Yearling heifer.—First prize, Captain Tennant; second, W. Bissett, Malham Tarn.

Heifer calf, under twelve months old.—Prize, E. D. A. Marriner.

Collection of four Shorthorns.—Prize, Captain Tennant.
(Open to Tenant Farmers in the District only).

Bull, two years old and upwards.—First prize, John Farrer, Thornyholme, near Burnley; second, Micah Lamb, Cayley Farm, Otley.

Yearling bull.—First prize, Benj. Baxter, Elslack Hall, Skipton; second, Samuel Newall, Eastby.

Bull calf, under twelve months old.—First prize, Benjamin Baxter; second, John Renton, Farnley, Otley.

Cow, in calf or milk, of any age.—First prize, Alex. Bell, Peaddle Forest, Burnley; second, Thomas Hird, Smallhouse, Skipton.

Three years old heifer, in calf or milk.—First prize, John Farrer; second, Thomas Hird.

Two years old heifer, in calf or milk.—First prize, J. Farrer, second, A. Bell.

Yearling heifer.—First prize, John Farrer; second, John Renton.

Heifer calf, under twelve months old.—First prize, Benj. Baxter; second, John Farrer.

Collection of Shorthorns, not less than three, the property of the exhibitor.—Silver cup, John Farrer.

CATTLE OF ANY BREED.

Calving cow or heifer.—First and second prizes, Thos. Hird.

Two fat Highland heifers.—First prize, J. Harrison; second, W. Butler, Carlton Biggin.

Fat cow.—First and second prizes, J. Ingleby, Clapham.

Fat heifer.—First prize, J. Heyworth, Eastby; second, W. Gomersall, Otterburn.

Two store bullocks.—First and second prizes, R. and G. Hey, Beamsley, Skipton.

HORSES.

(Open to the United Kingdom).

Thoroughbred stallion.—First prize, J. H. Wright, North Riton; second, T. Greenwood, Calverley Bridge.

Roadster stallion.—First prize, J. Gill, Howden Park, Silsden; second, T. Wharton, Skipton.

Draught stallion.—Prize, T. Greenwood.

Brood mare for hunters.—First prize, J. Clarke, Beeston; second, W. Thompson, Rawdon.

Brood mare for roadsters.—First prize, J. Clarke; second, T. Walker, Crookrise, Skipton.

Three years old gelding for hunters.—First prize, Wm. Roberts, Thornyholme, Burnley; second, G. Foster, Burley-in-Wharfedale.

Three years old gelding for roadsters.—W. Duckworth, Addingham; second, B. Baxter.

Three years old gelding or filly for draught.—First and second prizes, J. and R. Bennett, Cawder, Skipton.

Three years old filly for hunters.—First prize, H. Green, Kildwick; second, W. Foster, Stainforth, Settle.

Three years old filly for roadsters.—First prize, H. Green; second, J. Wells, Keighley.

Three years old gelding for hunters.—First prize, W. Roberts, Burnley; second, H. Morphet, Wigglesworth Hall.

Two years old gelding for roadsters.—First prize, S. Watkinson, Gargrave; second, W. H. Davis, Gargrave.

Two years old gelding or filly for draught.—First prize, T. Porter, Clithero; second, J. Moore, Cottingley.

Two years old filly for hunters.—First prize, J. Markendale, Gargrave; second, S. Watkinson.

Two years old filly for roadsters.—First prize, T. Walker, Skipton; second, A. Bowness, Rylstone.

One year old colt or gelding for hunters.—First prize, J. W. Yeadon, Fewstone; second, S. Watkinson.

One year old colt or gelding for roadsters.—First prize, S. Watkinson; second, J. and H. Cockshott, Cringles.

One year old colt or filly for draught.—First prize, J. Jackson, Fewstone; second, W. Butler, Carlton Biggin.

One year old filly for hunters.—First prize, G. Foster, Burley-in-Wharfedale; second, J. Roberts, Leeds.

One year old filly for roadsters.—First prize, J. A. Blakey, Addingham; second, W. Paley, Draughton.

Mare or gelding for roadsters, of any age.—First prize, Captain Dewhurst, Clithero; second, W. Roberts.

Cob under 15 hands high, equal to carry 15 stones.—First prize, H. Crossley, Halifax; second, J. Holroyd, Burnley.

Pony under 13 hands high.—First prize, J. Gresham, Leeds; second, Ann Sutcliffe, Burnley.

Hunters, of any age.—First prize, H. Crossley; second, J. B. Booth, Catterick.

Leaper, of any age.—First prize, L. B. Morris, Thornton; second, Captain Le Gendre N. Starkie, Burnley.

Pony leaper, not exceeding 13½ hands.—First prize, R. L. Hattersley, Keighley; second, W. Wilkinson, Skipton.

SHEEP.

(Open to the United Kingdom).

Long-woolled ram of any age.—First prize, W. Thompson, East Witton; second, J. and W. Pinder, Waddington.

Short-woolled ram of any age.—First prize, J. Coulthurst, Gargrave; second, Jowett, Black Hill.

LONG WOOLS.

(Open to Local Competition).

Ram of any age.—First prize, W. Varley, Airtou; second, J. Simpson, Spofforth Park.

Shearling ram.—First prize, W. Raper, Clint, Ripley; second, J. Simpson.

Top lamb.—First prize, J. Hartley, Bawmier; second, J. Simpson.

Pen of five shearling gimmers.—Prize, J. Simpson.

Pen of five gimmer lambs.—First prize, A. Bentley, Rumley Bridge; second, J. Hartley.

MOUNTAIN (Scotch breed).

(Open to Local Competition).

Blackfaced ram.—First and second prizes, T. Greenwood, Eastby.

Shearling ram.—First prize, J. Young, Hazlewood; second, T. Greenwood.

Top lamb.—First prize, S. Hudson, Broadshaw; second, J. Young.

Pen of five ewes.—First and second prizes, S. Newall, Eastby.

Pen of five shearling gimmers.—First prize, S. Hudson; second, W. Bisset, Malham Tarn.

Pen of five gimmer lambs.—First prize, S. Hudson; second, S. Newall.

Depastured in land the rateable value of which shall not exceed 3s. per acre, for a period of three months next previous to the show. Pen of five two-shear ewes, Scotch breed.—First prize, T. Young, Barden; second, T. Greenwood.

Pen of five wethers, Scotch breed.—First and second prizes, J. Metcalfe, Darnbrook.

LONK.

(Open to Local Competition).

Ram.—First prize, J. Hoyle, Cliffe Green; second, T. Seed, Bashall Town.

Shearling ram.—First prize, J. M. Green, Black Hill; second, W. Riley, Oakworth.

Top lamb.—First prize, B. Dobson, Craiglends; second, M. Hanson, High Utley.

Pen of five ewes.—First prize, J. M. Green; second, J. B. Sidgwick, Ryddlesden Hall.

Pen of five shearling gimmers.—First prize, J. B. Sidgwick; second, W. Butler, Carlton, Biggin.

Pen of five gimmer lambs.—First prize, J. M. Green; second, J. Barker, Brunthwaite.

HALF-BREDS.

(Open to Local Competition).

Pen of five blackfaced Scotch ewes.—First prize, H. Nutter, Skipton; second, W. Lawson, Beamsley.

Pen of five blackfaced shearling gimmers.—First prize, H. Nutter; second, T. Wellock, Toft Gate.

Pen of five blackfaced gimmer lambs.—First prize, A. Robinson, East Seale Park; second, W. Carlisle, Bordley Hall.

Pen of five blackfaced Scotch lambs, depastured upon land the rateable value of which shall not exceed 3s. per acre, for three months next previous to the show.—First prize, T. Wellock; second, T. Young.

Pen of five shearling gimmers, Cheviot.—First and second prizes, W. Wilkinson.

Pen of five gimmer lambs, Cheviot.—First and second prizes, J. Markendale, Banknewton Hall.

Pen of five ewes, Lonk.—First prize, G. Demaine, Dranghton; second, H. Nutter.

Pen of five ewes, Lonk, two-shear.—First prize, G. Demaine; second, H. Nutter.

Pen of five Lonk shearling gimmers.—First prize, J. Midgley, Steeton; second, J. Gill, Howden Park.

Pen of five Lonk gimmer lambs.—First prize, J. Gill; second, B. Baxter, Elslack Hall.

PIGS.

(Open to the United Kingdom).

Boar of the large breed.—First prize, W. Lister, Armley; second, J. Palmer, Thorley.

Boar of the middle breed.—First prize, J. E. Fox, Great Horton; second, S. Appleby, Armley.

Boar of the small breed.—First prize, W. Hatton, Addingham; second, J. Sagar, Lister Hills.

Sow of the large breed.—First prize, W. Lister; second, W. Hatton.

Sow of the middle breed.—First prize, W. Parker, Bradford; second, R. Barrett, Crosshills.

Sow of the small breed.—First and second prizes, W. Hatton.

Boar of the large breed, under nine months old.—First prize, J. Palmer; second, C. Trees, Skipton.

Boar of the middle breed, under nine months.—First prize, W. Lister; second, W. Birtwhistle.

Boar, small breed, under nine months old.—First prize, F. Bramfit, Sheepscar; second, J. Reeday, Keighley.

Gilt of the large breed, under nine months old, for breeding.—First prize, J. Reeday; second, W. Parker.

Gilt of the middle breed, under nine months old, for breeding.—W. Birtwhistle; second, J. Reeday.

Gilt of the small breed, under nine months old, for breeding.—Prize, F. Bramfit.

Store pig, under twelve months old.—First and second prizes, S. Newall, Eastby.

Premiums for Labourers only (open to Local Competition).

Store pig, above nine months old.—First prize, T. Trees; second, J. Reeday.

Store pig, under nine months old.—First prize, J. Reeday; second, D. Keighley, Exley Head.

Gilt of the large breed, under nine months old.—First prize, M. Hindle, Keighley; second, J. Slater, Keighley.

Gilt of the middle breed, under nine months old.—First prize, J. Slater; second, W. Birtwhistle.

Gilt of the small breed, under nine months old.—First prize, W. Birtwhistle; second, T. Trees.

Sow of the large breed.—First prize, T. Walton, Keighley; second, H. Binns, Keighley.

Sow of the middle breed.—First prize, H. Binns; second, T. Walton.

Sow of the small breed.—Prize, S. Wilson, Farnhill.

The annual dinner of the Society was held in the evening, at the Devonshire Arms, and was attended by a company numbering upwards of 100. The Duke of Devonshire presided.

ROCHDALE AGRICULTURAL SHOW.

The fifteenth annual show of the Whitworth and Rochdale Agricultural Society was held on the 24th August. The show surpassed those of previous years. The entries numbered 2,096, whereas last year the number was 1,131, showing an increase of 965. One new feature worthy of notice is that instead of only £10 being offered for "the best beast on the ground," two £10 prizes have been given; one for "the best male beast," and the other for "the best female beast," and the change has given general satisfaction. The entries of hunters for general competition were numerous. For the first time prizes were offered to cottagers for the best pigs, and this had the desired effect of drawing a fine muster.

JUDGES: Horned Cattle: J. Brewer, Whitehouse, Portfield, Whalley; B. Baxter, Elslack Hall, near Skipton. Horses: W. S. Atkinson, Barrowby Hall, Woodlesford, Yorkshire; T. Metcalf, Uttoxeter, Staffordshire; Captain Skipworth, Horsham, Brigg, Lincolnshire; T. Dodds, Warren Cottage, Wakefield. Sheep: W. Parker, Ridge, near Hebden Bridge; L. Crossley, Cliviger Lathie, near Burnley. Pigs: W. Gamon, Hoole Cottage, Dee Mills, Chester; T. Atherton, Chaple House, Speke, near Liverpool.

P R I Z E - L I S T.

HORNED CATTLE.

Bull of any breed.—The challenge cup, value £10, R. Hurst, Rochdale.

Best male beast on the ground, the condition being that the animal should not compete for this prize at any future show of the Society.—A piece of plate, T. Statter.

Best female beast, under similar condition as above.—A piece of plate, C. W. Brierley, Rhodes House.

Bull calf, under twelve months old.—T. Statter.

Cow in calf or in milk.—J. Walton.

Heifer, not exceeding three years old.—J. Farrar, Thornyholme, Burnley.

Heifer, not exceeding two years old.—C. W. Brierley.

Heifer calf, under twelve months old.—J. Farrar.

Two cows, in calf or in milk (open to cattle dealers only).—J. Coates, Rochdale.

Fat ox, or cow, or heifer (open to butchers and dealers).—C. W. Brierley.

Fat calf.—T. Statter.

TENANT FARMERS' PREMIUMS.

Bull of any breed.—C. W. Brierley.

Cow, in calf or in milk.—C. W. Brierley.

Heifer, not exceeding three years old.—C. W. Brierley.

Heifer, not exceeding two years old.—C. W. Brierley.

Heifer calf, not exceeding twelve months old.—J. Walton.

Two cows, in calf or in milk.—C. W. Brierley.

Heifer, not exceeding three years old.—W. Kershaw, Alderbank, Wardle.

Heifer, not exceeding two years old.—R. Fitton, Castleton, Rochdale.

Cow, in calf or in milk.—J. A. Mason, Moorhouse, Milnrow.

Heifer, not exceeding three years old.—J. Bentley, Kit Booth, near Rochdale.

Heifer, not exceeding two years old.—J. A. Mason.

Heifer calf, under twelve months old.—T. Walker, Hindle Pasture, Healey.

HORSES.

Best horse.—C. W. Brierley.

Horse under 16 hands.—Brierley Brothers, Rochdale.

Pair of horses belonging to one party or firm.—C. W. Brierley.

Pair of horses, under 16 hands.—T. Statter.

String of four horses (open to horse dealers and others).—The Mayor, Aldermen, and Burgesses of Rochdale Waterworks.

AGRICULTURAL HORSES.

Best horse.—C. W. Brierley.

Brood mare, together with foal.—T. Statter.

Three-year-old gelding or filly.—J. Willoughby Holt, Wood Road, near Bury.

Three-year-old gelding or filly, adapted for saddle or harness.—J. L. Becker, Foxdenton.

Two-year-old gelding or filly.—W. Roberts, Thornyholme, near Burnley.

One-year-old colt or filly.—R. Kay, Chamberhouse.

Foal, adapted for saddle or harness.—J. F. Crowther, Mirfield, Yorkshire.

Mare or gelding, not exceeding 15 hands, adapted for harness.—H. Crossley, Broomfield, Halifax.

SHEEP.

LONK OR SPECKLE-FACED BREED.

Best tup.—J. G. Bridge, Edge Cote, Rawtenstall.

Tup hogg.—J. M. Green, Black Hill, Keighley.

Tup lamb.—J. Pickup, Newchurch.

Three ewes.—J. G. Bridge.

Three ewe lambs.—J. G. Bridge.

Ewe lamb.—J. M. Green.

Three wethers.—T. Statter.

Finest woolled tup.—J. Bancroft, Shuttleworth, near Bury.
Finest woolled three ewes.—J. Bancroft.
Any other breed of sheep.—J. and W. Pinder, near Blackburn.

Three ewes.—G. Storey, Burnley.
Three tup lambs.—J. Pickup, Turuhill, near Rawtenstall.
Three ewe lambs.—G. Storey.
Fat sheep.—B. Truman, Bluepits.
Best tup within the parish of Rochdale.—S. Jackson, Whitworth.
Tup hogg.—S. Jackson.

Tup lamb.—S. Jackson.
Three ewes and three ewe hogs.—S. Jackson.
Three ewe lambs.—J. Hill, Cowclough, near Rochdale.
Ewe lamb.—J. Parker.
Three wethers.—T. Howarth.
Three wether lambs.—T. Howarth.
Flock of twelve sheep, bred within the parish of Rochdale.—J. Parker.

The President of the Society (Mr. A. H. Roys) entertained the committee and a large circle of private friends at dinner, at his residence, Greenhill.

THE BATH AND WEST OF ENGLAND SOCIETY, AND SOUTHERN COUNTIES ASSOCIATION.

The meeting of the Council of this Society was held on August 30 at the White Lion Hotel, Bristol, under the presidency of the Earl of Cork and Orrery. There was also present Sir J. T. B. Duckworth, Bart., the Hon. and Rev. J. Townshend Boseawen; Messrs. H. G. Andrews, R. Bremridge, Clement Bush, R. H. Bush, Thomas Danger, J. Daw, E. S. Drewe, A. F. Milton Druce, C. Edwards, Jonathan Gray, John Gray, A. Grenfell, J. D. Handcock, J. H. Holley, J. Lush, H. A. F. Luttrell (Col.), R. Neville Grenville, M.P., R. Stratton, J. C. Moore Stevens, R. J. Spiers, W. Thompson, H. Williams, H. Spackman (Official Superintendent), and J. Goodwin (Secretary and Editor).

GUILDFORD MEETING, 1871.

The following is a complete list of the Committees and Stewards for the ensuing year:

PUBLICATION COMMITTEE.—Thomas Dyke Adland, M.P. (Chairman), Hon. and Rev. S. Best, F. W. Dymond, Colonel Luttrell, G. S. Poole, Lord Portman, Herbert Williams.

FINANCE AND CONTRACTS COMMITTEE.—H. Williams (Chairman), J. C. Ramsden, Clement Bush, Charles Edwards.

STOCK PRIZE-SHEET COMMITTEE.—Col. Luttrell (Chairman), Thomas Danger, J. T. Davy, A. F. M. Druce, T. Duckham, M. Farrant, Henry Fookes, C. Gordon, John Gray, James Hole, T. Hussey, J. Webb King, Col. Lennard, H. Middleton, E. F. Mills, W. Rigden, J. S. Turner.

IMPLEMENT REGULATIONS COMMITTEE.—J. E. Knollys (Chairman), Col. Deedes, Mark Farrant, W. Froude, John Gray, Jonathan Gray, A. Grenfell, H. P. Jones, Col. Lennard.

JUDGES' SELECTION COMMITTEE.—Col. Luttrell (Chairman), H. Fookes, John Gray, C. Gordon, Thomas Hussey, Col. Lennard, W. Wippell.

RAILWAY ARRANGEMENTS COMMITTEE.—W. Adair Bruce (Chairman), Col. Brent, Sir J. T. B. Duckworth, C. Gordon, Jonathan Gray, C. Lennard, Sir M. Lopes, Bart., M.P., S. Pitman, J. C. Ramsden, R. J. Spiers; with power to add to their number.

DISQUALIFYING COMMITTEE.—John Gray (Chairman), the Stewards of Steek, the Stewards of Horses.

ARTS AND MANUFACTURES COMMITTEE.—E. S. Drewe (Chairman), T. D. Adland, M.P. (Vice-Chairman), Hon. and Rev. S. Best, Col. Brent, J. Daw, R. R. M. Daw, Sir J. T. B. Duckworth, Bart., Jonathan Gray, Rt. Hon. Sir S. H. Northcote, Bart., C. B., M.P., R. King Meade King, J. E. Knollys, Rev. T. Phillpotts, S. Pitman, W. R. Scott, P. P. Smith, R. J. Spiers, J. W. Walrood, E. W. Williams.

PLACE OF MEETING IN 1872.—As the Society's Annual Meetings are now held alternately in the Eastern and Western Districts, and as the meeting of 1872 would in due course be held in the Western District (including the county of Dorset, &c.), it was resolved to defer the consideration of the place of meeting until the October meeting of Council.

The following communications from Sir J. C. Jervoise, Bart., were read:

“Idsworth, Horndean, August 21, 1870.

“I have lately received the *Journal* of the Bath and West of England Society, 1870. At p. 42 I read that Professor Brown, the Society's Veterinary Inspector, states that persons coming from infected stocks are, perhaps, the cause of more

outbreaks of foot-and-mouth disease than the actual and direct contact of healthy with diseased animals.

“This is so contrary to my own experience that I am most desirous of bringing the question to demonstration, and with this object I shall be glad to place, for the space of one twelvemonth (from September 1st, 1870), twelve out of thirteen Irish steers, purchased in June last, to be infected by Professor Brown, or any member of the Veterinary College he may select, in the way and in the manner referred to by Professor Brown, ‘*otherwise than by actual and direct contact.*’ The visits to be paid at intervals not more frequent than 14 days. In case of his success I shall be ready to pay the sum of one hundred pounds.

“I shall not be bound to the number of twelve cattle against all casualties. I name twelve out of thirteen because one of the number has been a good deal shaken by a severe attack after his journey from Ireland.

(Signed)

“J. CLARKE JERVOISE.

“To the Secretary.

“P.S. I request you will be so good as to place my proposal before the Association. The state of affairs in Dorsetshire narrated in the *Times* of August 19, where the highway from Whitchurch Canonieorum to Bridport is stopped with a view to lessening the danger of contagion to animals passing thereon, with the sanction of Mr. Arthur Helps, will, I trust, justify this communication.”

“August 22, 1870.

“Sir,—Referring to my proposal of yesterday, I beg leave to suggest that ‘member of the Royal College of Veterinary Surgeons’ should be interpreted as any Veterinary Inspector appointed under the Contagious Diseases (Animals) Act; and that in lieu of fortnightly experiments in infection, no subsequent attempt shall be made till within 21 days after the period allowed for the incubation of the disease; and in order to avoid the errors which may arise from accident or coincidence being mistaken for consequence, it shall be necessary for the whole or the majority of the beasts submitted to the experiment to be infected during the course of the twelvemonth dating from September 1st, or, if preferred, October 1st, 1870.

“The cattle will, as a matter of course, not be subjected to any exceptional treatment or habit.

“To remove anxiety on the score of public danger, I beg leave to call to mind the experiments in vaccinating sheep instituted by the Privy Council in the year 1862. I do not know in what locality these experiments were conducted, but I believe they were unattended with evil consequences, and I trust that the experiment proposed will be equally harmless.

(Signed)

“J. CLARKE JERVOISE.

“To the Secretary.”

The reading of the letters was followed by an animated discussion, and it was ultimately resolved, “That the Council thank Sir J. Clarke Jervoise, Bart., for the communication he has made, but after giving it the fullest consideration the Council feel themselves unable to undertake the duty suggested in relation to the proposed experiments.”

NEW MEMBERS.—G. H. Farrant, Salisbury; J. Hutson, East Brent, Weston-super-mare; Rev. W. St. Aubyn Basset, West Buckland, Barnstaple; J. Ellis, Guildford.

SALE OF MESSRS. MITCHELL'S SHORTHORNS, AT ALLOA,

ON THURSDAY, AUGUST 25TH.

BY JOHN THORNTON.

The sale of this herd has for a considerable time been the subject of conversation among many of the admirers of the Booth blood of Shorthorns. Although the brothers Mitchell had not been so happy in their selection of highly fashionable female tribes, yet the known judgment of Mr. Andrew in purchasing good animals of sound lineage, and putting Mr. Booth's bulls upon them, drew together a company of breeders, but not a large assembly of the people, as harvest, which is now on in Scotland, kept many farmers away; this may have had its effect on the average of the bulls, which were not so excellent as the cows and heifers, and made £36 each against £56 for the females. There were, however, several noblemen and breeders present, amongst whom we noticed the Earl of Dunmore, Lord Kellie, Mr. T. C. Booth, Mr. Meadows (Ireland), Mr. Smith, Whittingham, Mr. Nicolmilne, Mr. L. C. Chriss, Mr. Deans from Dalkeith, Mr. Jenkins, Sec. R.A.S.E., Mr. Russell, Mr. A. Campbell, Mr. Easton, Mr. Young from Kier, Mr. Husband, Messrs. Beveridge, Messrs. Cruickshank, Mr. C. Lyall, Mr. J. Bowstead, Mr. Tod, and other noted breeders, besides those whose names are given as purchasers. The cattle had been reared, as Mr. Andrew Mitchell said in returning thanks for his health, at great inconvenience on three farms: one at Alloa, another at Clackmanan, and a third on one of the islands in the Forth; so that, as the stock had to be brought up to Alloa on the morning of sale, several appeared rather lame and foot-sore. The cows were inspected in the buildings in the town where they were certainly seen to much disadvantage, as one gentleman remarked, "he had rarely seen better animals in worse boxes." As a whole, they were really fine animals, possessing great depth of fore-quarter, fine chests and bosoms, broad loins and arched ribs, but often short and coarse hind-quarters; the heads were excellent. The heifers were shown in a field close by, and were a nice even lot, with plenty of substance; some of the calves too were very taking. It often happens that ill-luck precedes a sale. Baron Booth, the first bull and a very noted animal, formerly owned and used by Mr. Barclay, at Keavil; had fallen lame on his hind-legs, and could not be brought out. Malvolio, the second bull, had more beauty than good temper; he was really a very handsome animal out of the noted prize cow Missetoe; but a few weeks before the sale he had rushed from the herdsman and hit his head with such force against a wall that he injured his spine, and was nearly hopeless; this also pulled down the bull average: most of the others were mere calves. Three young bulls of Lord Dunmore's were also shown in nice condition; but the competition, more especially at this season, was not keen for them.

The luncheon took place in the town hall of Alloa, Lord Dunmore in the chair, and soon after one o'clock, Mr. Thornton began the business of the day, in a field opposite Mar's Hill. The majority of the pedigrees traced back to a cow called Rolla, bred by Gen. Simson, and got by Chas. Colling's North Star; this tribe is one of the oldest Scotch pedigrees, and had many very fine animals as its representatives; indeed, Lucy, lot 23, was as beautiful an animal as is often seen. The best tribe was, however, the Belle, bred from Barbelle by Cardigan (12536), a

purchase of Mr. John Wood's, Stauwick Park Sale, 1862, and the five of this tribe averaged £92 each. Blue Bell, the Smithfield prize cow, calved a white calf in April last, and has since won the challenge cup at Stirling as the best cow in-milk, made the top price, and goes to Mr. Cochrane, Canada: her heifer had a peculiar formation of the lower jaw, but was otherwise a fine animal, and went cheap at 59 gs. Cherry Queen, bred from the fashionable Cherry tribe, was a stylish-looking cow, with fine forehead, ribs, and loin; she made the same price as Blue Bell, after some sharp competition with Lord Dunmore. Her calf, a very promising young bull of five months, went for 81 gs., and goes into Staffordshire. The heifer of the Gwynne tribe was of a rich fine colour, and the prettiest of the heifers. Mr. Hay, from New Zealand opposed Sir William Stirling Maxwell and Mr. Pole Gell for her up to 120gs., but she joined her dam and goes into Derbyshire. Pride, of Mr. Chriss's stock, was considered by several the best and sweetest looking cow, and there was much competition for her, but for the other cows the biddings seemed good up to about 30 gs., but as languid afterwards as they were slow in being put up. Mr. Bethune was the largest buyer, and it was said purchased several for Sir David Baird. Mr. Arklay also got some cheap useful cows that go near to Dundee, whilst Mr. Godsman took two of the best into Aberdeenshire. The sheep were not high in condition, but of good character; they were, however, too early in the market, and although the shearlings were all sold, the prices were not high, and the ewes were not sold. Subjoined is a list of the prices and buyers' names.

COWS AND HEIFERS.

Cameron Lass, roan, calved Feb. 4, 1860, by Prince Arthur¹ (13497), dam Miss Haig; A. Bethune, Blebo, 31 gs.
 Lady of the Lake, red and white, calved Aug. 10, 1860, by Prince Arthur, dam Sonsie; A. Bethune, 33 gs.
 Comely 3rd, roan, calved May 31, 1862, by First Fruits (16048), dam Comely 2nd; R. Arklay, Ethiebeaton, 20 gs.
 Pauline, roan, calved June 8, 1862, by Highborn (13028), dam Young Polly; G. Wylie, Ardean, by Dollar, 40 gs.
 Luna, white, calved June 10, 1862, by First Fruits, dam Lucknow; R. Arklay, 32 gs.
 Blue Bell, roan, calved Feb. 4, 1863, by Knight Errant (18154), dam Barbelle; M. H. Cochrane, Compton, Canada, 160 gs.
 Sonsie, roan, calved Jan. 22, 1864, by Arthur Gwynne (19244), dam Lady of the Lake; — Godsman, Aberdeen, 32 gs.
 Maid of Lochty, white, calved Jan. 25, 1864, by Arthur Gwynne, dam Maid of Orr; — Godsman, 40 gs.
 Bella, white, calved March 1864, by Arthur Gwynne, dam Barbelle; R. Mowbray, Cambus, 54 gs.
 Amazon, roan, calved March 20, 1864, by Arthur Gwynne, dam Miss Haig; — Gordon, Cluny, 34 gs.
 Cherry Queen, calved April 27, 1865, by Warrior (23178), dam Cherry; S. Bolden, Springfield, near Lancaster, 160 gs.
 Guerilla, roan, calved May 7, 1864, by First Fruits, dam Nonpareil; J. Young, Alloa, 28 gs.
 Lady of the Isle, roan, calved Jan. 1, 1866, by Sir Samuel (15302), dam Lady Laura; A. Bethune, 35 gs.
 Sarah Gwynne, red, calved Feb. 13, 1866, by Sir Samuel, dam Susan Gwynne; H. Chaudos, Pole Gell, 46 gs.
 Beatrice, red and white, calved April 15, 1866, by Sir Samuel, dam Amazon; R. Binnie, Seton Mans, Haddingtonshire, 33 gs.
 Samuel's Farewell, roan, calved April 23, 1866, by Sir Samuel, dam Pauline; — Jolly, York, 50 gs.

Lucinda, white, calved July 23, 1866, by Brigade Major (21312), dam Luna; R. Arklay, 27 gs.
 Belle, roan, calved Aug. 15, 1866, by Red Friar (24913), dam Bella; Sir W. Stirling-Maxwell, Bart., 60 gs.
 Pride, white, calved Nov. 24, 1866, by Brigade Major, dam Pearl; Sir W. Stirling-Maxwell, 80 gs.
 Bessie Bell, red, calved Feb. 22, 1867, by Lord Eagle (22149), dam Blue Bell; A. Bethune, 59 gs.
 Sonsie 2nd, roan, calved Feb. 25, 1867, by Lord Eagle, dam Lady of the Lake; — M'Queen, Diver's Well, Alloa, 33 gs.
 Alice, red and white, calved March 26, 1867, by Lord Eagle, dam Amazon; J. Young, 24 gs.
 Lucy, roan, calved June 17, 1867, by Red Friar, dam Luna; — Hay, Pigeon Bay, New Zealand, 120 gs.
 Gipsy Girl, white, calved April 15, 1868, by The Sutler (23061), dam Guerilla; H. Scott, Brotherton, Kincardine, 29 gs.
 Beauty, red and white, calved July 18, 1868, by The Sutler, dam Amazon; — Hay, 35 gs.
 Comely 5th, red, calved Aug. 4, 1868, by The Sutler, dam Comely 3rd; — Philips, Haybridge, England, 60 gs.
 Soldier's Daughter, roan, calved Aug. 25, 1868, by The Sutler, dam Beatrice; G. Hope, Fentonbarns, Haddingtonshire, 33 gs.
 Sally Gwynne, roan, calved Nov. 15, 1868, by Islesman (26444), dam Sarah Gwynne; H. C. Pole-Gell, 125 gs.
 Lizzie, white, calved Dec. 7, 1868, by Islesman, dam Lady of the Lake; T. Jolly, 36 gs.
 Miss Blithe, red and white, calved Feb. 28, 1869, by Lord Blithe (22162), dam Queen of the Isles; H. Cochrane, 100 gs.
 Maid of the Forth, white, calved March 16, 1869, by Lord Blithe, dam Maid of Lochty; H. C. Pole-Gell, 62 gs.
 Moss Rose 2nd, roan, calved April, 1869, by Lord Blithe, dam Moss Rose; H. Scott, 30 gs.
 Blithe Belle, roan, calved May 6, 1869, by Lord Blithe, dam Belle; — Hay, 105 gs.

Countess, roan, calved Nov. 9, 1869, by Islesman, dam Beatrice; A. Bethune, 35 gs.
 Lady Samuel, roan, calved May 8, 1870, by Malvolio (24519), dam Samuel's Farewell; T. Jolly, 23 gs.
 Sonsie III., roan, calved May 9, 1870, by Islesman, dam Lady of the Lake; A. Bethune, 34 gs.

BULLS.

Island Chief, white, calved July 18, 1868, by The Sutler, dam Cameron Lass; D. Forrester, Woodcock Hall, Linlithgow, 36 gs.
 Red Rover, red, calved April 11, 1869, by Malvolio, dam Samuel's Farewell; R. Mowbray, 37 gs.
 Master Blithe, red and white, calved July 14, 1869, by Lord Blithe, dam Lady of the Lake; A. Bethune, 41 gs.
 Baron Forth, roan, calved Aug. 9, 1869, by Malvolio, dam Comely; J. M'Queen, 16 gs.
 Lord Kellie, roan, calved Sept. 10, 1869, by Malvolio, dam Cameron Lass; Capt. Armstrong, 20 gs.
 Lord Mar, roan, calved Sept., 1869, by Malvolio, dam Luna; — Cheape, 31 gs.
 Lord Burleigh, roan, calved Jan. 11, 1870, by Gondolier (26277), dam Lucy; R. Binnie, 42 gs.
 Samuel Gwynne, roan, calved Feb. 7, 1870, by Malvolio, dam Sarah Gwynne; R. Meloung, 39 gs.
 Cherry Prince, roan, calved March 20, 1870, by Islesman, dam Cherry Queen; J. N. Philips, 81 gs.
 Waterman, white, calved May 9, 1870, by Islesman, dam Moss Rose; — Peat, Manor, Stirling, 15 gs.
 Watchman, white, calved Aug. 30, 1869, by Malvolio, dam Amazon; D. M'Clane, 20 gs.

SUMMARY:

	£	s.	d.

BADMINTON FARMERS' CLUB.

JUDGES:

Hunting Stock: Col. Kingscote, C.B., M.P., Kingscote-park; F. B. Jones, V.S., Cheltenham; F. Sherborn, Bedford, Middlesex.
 Cart Horses, Sheep, Pigs, and Roots: D. Holbrow, Bagpath; Francis Pinchin, Hat Farm, Box.
 Cattle: Francis Burnet, Kingscote; Levi Cornock, Shepherdine, Thornbury; Saul P. Savage, the Leys Farm, Wotton-under-Edge.
 Cheese: W. Wright, Small-street, Bristol.
 The following is the prize-list:
 HORSES.—Brood mare and foal for hunting purposes: W. White, Greyhound Inn, Tetbury. Yearling colt or filly for hunting purposes: W. Dean, Ararat-farm, Wotton-under-Edge. Two-year-old gelding or filly for hunting purposes: Capt. Blathwayt, Dyrham, Chipping Sodbury. Hunter, mare, or gelding above three years old: J. Powney, Lansdown. Roadster, mare, or gelding above three years old: Capt. Blathwayt, Dyrham, Chipping Sodbury. Brood mare and foal for agricultural purposes: C. Beaven, Shipton Moyne. Two-year-old gelding or filly for agricultural purposes: J. Millard, Lea, Malmesbury; 2nd, G. Anstee, Hinton-farm, Chipping Sodbury.
 CATTLE.—Bull above two years old, R. H. Gould, Didmarton. Bull above one year and under two years old, D. F. Long, Oldbury-on-the-Hill. Bull calf above three and under 12 months old, John Cornock. Cow above four years old, in-milk or in-calf, John Thompson, Badminton. Cow above three and under four years old, in-milk or in-calf, John Thompson. Heifer above two and under three years old, John Thompson. Heifer above one and under two years old, John Thompson. Heifer calf above three and under 12 months old, John Thompson. Cows above three years old, in-milk or in-calf, first prize John Cornock, Hillsley; second, Robert H. Gould; third, John Cornock. Pair of heifers above two and under three years old, first prize, D. F. Long, Oldbury-on-the-Hill; second, James Goulter, Acton Turville; third, D. F. Long. Pair of heifers above one and under two years old,

first prize, James Goulter; second, J. C. Hatherell, Oldbury-on-the-Hill; third, John Neems, Wick. Heifer calf above three and under 12 months old, John Cornock.
 SHEEP.—Pen of eight long-wooled wether lambs, D. F. Long, Oldbury-on-the-Hill. Pen of long-wooled Chilver lambs, D. F. Long. Short-wooled ram of any age, R. H. Gould, Didmarton. Pen of eight cross bred ewes, Joseph Bennett, Newhouse-farm; 2nd, Samuel Witchell, Sopworth. Pen of eight cross-bred Chilver lambs, Joseph Bennett.
 PIGS.—Sow above twelve months old, James Goulter, Acton Turville.
 ROOTS.—Selection of mangold-wurtzel swedes, and common turnips, twelve specimens of each sort, R. H. Gould, Didmarton. Twelve specimens of any variety of mangold wurtzel, Mrs. Mary Witchell, Stoke Gifford. Twelve specimens of any variety of swedish turnips, Wm. Minnett, Acton Turville. Twelve specimens of any variety of common turnips, J. M. Williams, Dunkirk.
 CHEESE.—Best cwt. of thick cheese, Theos. Goulter, Acton Turville. Best cwt. of thin cheese, John Cornock, Hillsley.
 MORE EXPORTATIONS.—It seems this year that most of our best cattle and sheep are leaving the country. The European left Liverpool last month for Quebec, having on board Mr. Cochrane's purchases from Mr. Booth, including the 1,500 gs. cow Lady Grateful; also the prize-cow Blue Bell, and Miss Blithe from the Alloa sale, as well as Baddow Rose, the first-prize heifer at the Essex county show. Mr. J. S. Thomson, of Whitby, Canada West, also had a yearling bull and four heifers from the Sittyton herd on the same vessel. And besides these Shorthorns there were also several prize-sheep, including Mr. Marshall and Mr. Cartwright's Lincoln tups, and three of Mr. Wiley's prize-pen of Leicester gimmers from the Yorkshire show: these were really very beautiful sheep and go out to Mr. Wallbridge. Mr. Stone, of Guelph, also sent out several Cotswold rams recently bought at the Gloucestershire sales,

FERMENTATION.

A lecture on this subject was delivered by Professor A. W. WILLIAMSON, F.R.S., at a meeting of the Society of Arts.

I have sometimes wished, when building castles in the air, that I could, after a few hundred years, come back and see the state of science at that time. I am convinced that those who will look back, from such a period as a few hundred years hence, at the present state of our knowledge of Nature, in any one department, will be surprised at its smallness; in fact, even now, when we work at all earnestly at any one part of the field of Nature, we cannot refrain from feeling how little is our knowledge compared with our ignorance. But, if that is generally the case, I think it is peculiarly the case in those studies in which life is concerned; and the phenomena of fermentation have that peculiarity that they consist of processes in which vital organisms are concerned, and in which there is every reason to believe that vital organisms, or living beings, take an active and leading part. I need not say that, for that reason, the explanations which we have, even of the simplest and best known of the phenomena of fermentation, are, as yet, mere sketches of the reality. It is, however, not the less useful or the less important to know them for that reason. When we chemists are classifying substances, we adopt a principle of classification which I think is almost inevitable, but it may be as well that I should mention what it is. We put the simple things together, and the complex or difficult things together, and then we try to put between them, in as regular an order as possible, the intermediate links of the chain by which they can be connected; and I believe that our best—I might almost say our only explanations consist in thus arranging, in a natural order, the facts which we have to consider, and then viewing them, and stating what we see, in the clearest and least ambiguous terms. Now, the term "organic," as applied to a certain class of chemical substances, might be replaced—by the term "complex." The substances which we are in the habit of including under the term organic are peculiarly complex; in fact, they are the most complex with which we have to do. The phenomena of fermentation relate mainly to them, and consist principally of a process of change—the breaking-up of those organic bodies into rather less complex substances than themselves—a process of partial analysis. Of course, when I say that, I gave what I conceive to be a characteristic idea of the general method, and I must not be supposed to assert that all processes of fermentation are analytical. Amongst the characteristics which, I think, are particularly useful and interesting, as serving to distinguish organic from inorganic, complex from simple substances, is their different behaviour under heat. I have found it exceedingly interesting and instructive to bear in mind the fact that while simple and inorganic compounds, as we generally call them, are sometimes destroyed and resolved into other compounds by the action of a high temperature, yet many of them are not. Amongst inorganic substances we find some which are broken up or changed by exposure to a high temperature, but there are others which can stand even the highest temperature without undergoing any permanent change—that is to say, they return, on cooling, to the same state in which they were before the heat was applied. With organic substances that is not the case. All organic bodies are broken up into minute particles, and assume new arrangements, when they are heated to a sufficiently high temperature; and that is, I think, a distinction which is of considerable theoretical as well as, perhaps, of some practical importance. The processes of breaking up which are effected by heat upon organic bodies are, in the very great majority of cases, different from those which are effected by the action of these wonderful little organisms, the ferments; and it is a peculiarity of the action of the ferments that they effect the breaking-up—the analysis—of complex organic substances, and form products which, for the most part, we have obtained from those materials by no other process. Amongst the processes of fermentation there is one which, from its pre-eminence importance, and from the fact we have had occasion to study it more fully than any other, ought to be first mentioned. I allude to the process of fermentation by which alcohol is formed artificially. I may say, indeed, it is the only process by which alcohol is ever made. It is a process

which consists in breaking up some kind of sugar—for sugar is a word which, although popularly restricted to one particular substance, which is extracted sometimes from the sugar-cane and sometimes from beet-root, is used by chemists in a more general sense, serving to characterise a family of bodies which have much in common with one another, being for the most part all of them sweet, and containing the same elements, but in slightly different proportions. They all possess many properties which are of some importance. These different kinds of sugar are broken up by the action of ferment into alcohol, and also into another product, carbonic acid gas, which has been long known, and for a long time the process of alcoholic fermentation was supposed to consist simply in a separation of sugar into these two products, alcohol on the one hand and carbonic acid on the other. A more careful examination of the products has shown, however, that these two never appear alone. I believe I may safely say, from the researches of Pasteur and others, that no case of the formation of alcohol by fermentation has been known to occur in which several other products have not been formed simultaneously with these two. With regard to the difference of properties of these two bodies there are one or two points of some little interest, especially this one, that whereas alcohol is an eminently combustible substance, and is well known to have properties of that kind, being frequently used as fuel; on the other hand, carbonic acid, the other chief product, is completely burnt—it is a substance incapable of undergoing any chemical change whatever analogous to combustion. Alcohol is a substance which I need not show you, although in its pure state it is not very common; but I will, in order to remind those of you who may be less familiar with its leading properties, make a little carbonic acid by a short process. I will put a little muriatic acid upon some white marble, and the apparent ebullition which you see takes place is known to you all as due to the liberation of carbonic acid. You might imagine the thing to be fermenting, only that the process in that case would be less rapid. Now, if I plunge this little burning paper gradually into the jar containing the carbonic acid, it will burn more and more faintly, and get extinguished when it enters the gas; it is totally impossible to set fire to the gas. And there is one other fact that we may notice at the same time—the great specific gravity which characterises this gas. I will show you that, in this way. I will go through the motion of pouring from this jar containing it into another smaller jar, and no doubt the heavy carbonic acid will pass from the jar in which I first collected it into the lower one, where we shall find it by means of the taper as before. You see that, on lowering the lighted taper into this small jar, it is extinguished as it was before. I will show you the test by which we usually discover the presence of carbonic acid. I have here some water containing lime in solution—some lime water—and I will pour it into the large beaker glass, in which there is probably still some carbonic acid left. You see the solution immediately becomes turbid, or, as we express it, a precipitate is formed by the combination of the carbonic acid with the lime water. A compound is formed, which is nearly insoluble in the water, called carbonate, which goes down as a precipitate. In addition to alcohol and carbonic acid, I ought to mention another kind of alcohol, which occurs to a considerable extent in some distilleries where raw grain or potato starch is used. This substance imparts to the product a very unpleasant odour, and some unwholesome qualities. It is known by the name of fousel oil. It does not mix with water, and if I were to pour some of it on water, it would float, without dissolving to any considerable extent. There are some other products which are even more interesting and important; two especially I ought to mention. One is the clear substance which you see in this bottle, and which you might imagine to be oil. It is a fluid largely made now, and known by the name of glycerine, but in chemical language I should say that this was an alcohol. It is a substance which, by tasting, you might mistake for sugar, for it possesses a sweet taste resembling sugar; but, to chemists, it is a kind of alcohol, and its appearance during fermentation together with ordinary alcohol is no doubt due to a process of the normal kind. Another product which I might compare to the car-

bonic acid which I just now showed you, is this beautiful crystalline acid substance, which has been long known by the name of succinic acid. It got that name from the fact that it was originally prepared from amber. By subjecting the amber to dry distillation, succinic acid, among other products, is formed. Glycerine and succinic acid, as well as common alcohol and carbonic acid, are always formed when any kind of sugar is made to decompose by the process which is termed alcoholic fermentation, and it is seldom that there are not other—and probably in smaller quantities several other—products formed besides those four. In fact, the different kinds of spirit which are obtained by the process of fermentation and subsequent distillation—I mean those kinds of spirits to which no artificial flavouring material is added (gin is a general name given to certain spirits which are flavoured by artificial means), such as brandy, rum, and others—owe their distinctive peculiarities to the presence of small quantities of volatile substances which are formed during the process of fermentation, regarding which a good deal has been observed, and several important facts have been collected. There is another process of fermentation which I must mention, for it is important from its frequent occurrence, and that is a process by which another kind of sugar usually, but sometimes common sugar, is transformed. The substance which most naturally undergoes this fermentation is milk-sugar. These hard lumps in this bottle, which, if you were to take out and taste, you would not imagine to be sugar, are made by the crystallization of the solid substance in whey. The whey is evaporated carefully to a small bulk, and this substance which results is known by the name of milk-sugar. When a solution of this is mixed with cheese, which is the best ferment for the purpose, it gradually turns acid. I dare say it is known to all of you that milk itself, which contains this body, and cheese, or rather casein dissolved with it, together with the fatty globules of milk, when exposed to the air, turns acid. That acidity is due to a change which takes place in the sugar. The sugar disappears gradually, and is transformed into an acid substance, of which I have a little bottle here. It is a strong acid, and here in another bottle are a few of its salts—a lime salt and a zinc salt, which is a very beautiful and characteristic compound. I shall have occasion hereafter to show you a large bottle which is now at work, in which I dissolved, not this particular kind of sugar, but the ordinary sugar. I put with it a quantity of calcic carbonate, and some old, lean cheese, with a considerable quantity of water. The mixture was kept at a temperature above blood-heat for some considerable time; and a compound of lactic acid is being formed. That is a process analogous in its general features to the fermentation which forms alcohol; but it is a change of sugar, in which no alcohol is formed. Sometimes there is a trace of alcohol, but there is not necessarily any, and no carbonic acid is formed; but instead of those products, the elements of the sugar break up into different groups, and arrange themselves in another manner. That is really the nature of the process, as far as our most careful experiments have gone; and the acid which we make in that way, which is lactic acid, or acid of milk, is really sugar, of which the elements are arranged in a different way, so as to acquire acid properties. The third process, which I must mention from its remarkable products, is one which perhaps in some respects ought rather to be compared with putrefaction, for it is a process which has many of the most important characteristics of fermentation. In order to deal with the question of fermentation generally, it is necessary to allude to some varieties of such chemical changes which are usually classed under the term putrefaction. As a general rule, I think the characteristic of processes of putrefaction is mainly the unpleasant nature of the products which are formed. It is not long since a distinguished chemist, in speaking of alcoholic fermentation, said that it is really a putrefactive process; and in its intimate nature it is, as far as we know, a process much like the truly putrefactive processes, and different from the processes of emaciation, or oxidation. This other process to which I allude consists in forming the acid substance which I have here, and which I will not open, because it is not a very pleasant body. It is a substance which is known, although I believe not very commonly, in butter. The peculiar rancid odour which butter acquires when it is kept too long, especially in warm weather, is due to a transformation of some of its materials into this particular

acid, which Chevreul, a very distinguished French chemist, separated from butter; and he named it, from that circumstance, butyric acid. If we leave some of this product of the last fermentation—some of this lactate of lime, the lime salt of lactic acid—under the same conditions in which it was formed, that is, if we leave it in the same vessel in which it had been formed from the milk of sugar, and leave cheese with it, and keep the mixture warm, the lactate will gradually decompose, and carbonic acid will be given off together with hydrogen gas, and at the same time we find that the lactic acid will be decomposed, and in place of it we get this butyric acid, and generally some valerianic acid, and a little acetic acid. Amongst the processes which really are analogous to fermentation in their nature, but which differ in one particular, I must mention one other, the process of forming vinegar, or acetic acid. This large bottle contains vinegar in a form which most of you, I dare say, have not seen. These fine white crystals are the pure substance which, mixed with water in an impure state, are generally known by the trivial name of vinegar. We call that acetic acid, or hydric acetate. The formation of this body from alcohol represents a variety of fermentation, which is of considerable importance and of frequent occurrence. Everybody who has noticed the process which takes place when animal or vegetable matter is left to itself in contact with air, especially in moist localities, must have observed that there is a gradual disappearance of the organic matter. For instance, if you leave a piece of wood in a moist place, under certain conditions of very frequent occurrence which are favourable to this process, the wood gradually gets soft, and becomes transformed into a brown substance, and if you leave it long enough—in this country, several years generally would be needed for this purpose—it gradually disappears. If you were to put a piece of that decomposing wood into a closed glass vessel, and examine the air above it, you would find that the wood was really burning. I am using the word combustion in the ordinary chemical sense—I mean by that word that the oxygen of the air which you have enclosed with the wood is being taken up by the wood, and the products of combustion, carbonic acid and water, are being formed from the substance of the wood. One great class of the processes of fermentation is of that kind. They consist not in a mere breaking up of the materials already contained in the organic substance, but a change of their arrangements, which is due, more or less, to the absorption of oxygen, and this formation of acetic acid, or vinegar, is a case of that kind. In fact, if we were to leave some ordinary fermented wort in an open vessel, so that the alcohol were left there in the mixture in which it had been formed, we should find that the alcohol would gradually disappear and give place to an acid substance. The process is well known to wine-makers and to brewers, and their art consists, among other things, in the avoidance of this process of the oxidation of their alcohol. While the acetic acid is being formed, oxygen from the air is taken up, and in that respect this process of acetic fermentation differs from the other three processes of fermentation which I have described. When you make alcohol and carbonic acid from sugar, the air takes no part in the process; when you make lactic acid from the sugar, the air is not wanted; and when you make butyric acid from lactic acid, then again the air may be completely excluded, and the process will go on without it. But when you make acetic acid from alcohol, you must of necessity allow the free and continuous access of air, and the air gives up some of its oxygen to this fermenting alcohol to transform it into acetic acid and water by a true process of fermentation. Now, the question arises whether this formation of acetic acid ought to be classed, as I am at present classing it, amongst the processes of fermentation. If it is due to the absorption of oxygen, you might naturally inquire whether one ought not to place it amongst the common processes of combustion, and it is right that I should state that by some authorities it is at present so classed. My reason, however, for stating what I have done, that it is a process of fermentation is this, that it is usually effected by the action of a peculiar organism called the vinegar-plant, an organism which I shall have occasion to show you hereafter, which does exert in that particular process the function of taking up oxygen from the air, and of inducing the alcohol to combine with it. There are many other processes by which we could get it, but the actual process by which we do get it is a process in which this vital organism, the vinegar-

plant, is the agent of its formation. It might be made by mere processes of combustion, but it is made by a process of fermentation. There is one single feature in the first and best known of these processes—the alcoholic fermentation—which you will notice when I tell you something of the way in which the processes of fermentation present themselves, even without very great care on the part of the observer. If, for instance, you were to express the juice of some sweet fruit—say grapes—and if you were to leave that expressed juice in contact with the air for a little time, having first squeezed it through some suitable cloth or filter so as to have it clear, of course there would be no solid particles in it when you put it aside; but, if you leave that in a tolerably warm place in contact with the air, you would find that little solid particles would appear in this juice, that they increase in number, and that in proportion as they increase in number, and as the quantity of them becomes greater, so does the process of effervescence—the evolution of gas from the grape juice—become more and more rapid. These little solid particles, which are not present at first in the grape juice, but which gradually make their appearance when it is exposed to the air, are what we commonly call, in the ordinary case of alcoholic fermentation in this country, yeast—either beer yeast or wine yeast—it is the same organism in each case. The peculiarity of the process is this, that these substances—this yeast—which seems to make the sugar into those products which I enumerated to you, does not disappear while doing the work, but is produced by the very process. The more active the production of these yeast cells, and the more speedy the growth of these yeast cells, the more effective and rapid is the process of fermentation, and no fermentation of the kind which I am speaking of at present—the alcoholic fermentation—has ever been known to take place in the absence of these organisms. That circumstance I just mention briefly at present, but the fact that these yeast cells appear whenever the process is going on—and the more they grow the more rapid is the fermentation—has led people to suppose at first, and to believe afterwards, that these yeast cells were the agents of the transformation, the active substances which decomposed the sugar in contact with the water, and induced the transformation which we noticed. Now, the very fact that one of the two substances which are reacting upon one another chemically (because the changes are chemical in their fundamental nature), should not disappear, but should rather increase by the process, is entirely anomalous—it is entirely at variance with the simplest and best known facts of chemistry, so much so that if it were not established upon incontrovertible evidence, I believe that most chemists would be inclined to disbelieve it, and say it cannot be, it is a mistake. If you tell me, as a chemist, that this yeast is transforming sugar by its action on the sugar, and that instead of being consumed the yeast is actually increased in quantity by doing that work, I should say it is nonsense—it cannot be, because in all the cases of chemical action which I know best, nothing of the kind occurs, but the very opposite. When one substance acts upon another, each one disappears in the process, and is transformed into a product having other properties. I need hardly give you illustrations of that; but one or two simple cases may not be useless, as serving to fix clearly this important circumstance in your minds. I will take at first one of a particularly elementary and simple kind—a process of combustion. I will take a little strip of metal—magnesium wire, and will hold it for a short time in the flame of a spirit lamp, so as to raise it to a sufficiently high temperature. The light you see emitted is due to the combustion of the oxygen in the air with the metal magnesium, which I hold in my hand. This is one of the simplest possible cases of chemical action. The metal has disappeared. The strip of wire is gone, and oxygen from the air disappeared also. At the same time a white powder was formed. I dare say you did not notice it, but here is a quantity of the same substance in a bottle. It consists of oxygen from the air combined with the metal magnesium, and the point is this, that all the magnesium which took part in that process disappeared and went to form this white powder, and all the oxygen which took part in the process also disappeared. The two united together, each disappeared as such and went to form this new product. And, moreover, we can tell, from an examination of the proportions in which the substances combine, exactly what weight of oxygen would disappear for every part by weight of magnesium. If you burn, for instance,

three grammes or three pounds of magnesium, you would require exactly two grammes or two pounds of oxygen. For instance, three pounds weight of magnesium would combine with two pounds weight of oxygen, and the product of the two together would be five pounds in weight. I may show you the same thing with soda, not the substance which is commonly called by that name, which is a carbonate of that base. I have here a little pure soda solution in a bottle. I will pour some into a beaker-glass, and I will show you one property which characterises it, viz., that of changing the colour of this red paper into blue. Now, I will pour some of this acid body, the oil of vitriol, into another beaker-glass. If I put the paper which has been discoloured into this pure acid, it would be dissolved; but I will dilute some of it with water, and then you will see that paper, which has been rendered blue by the agency I have just used, is brought back again to red by the agency of this acid. Now, if I mix the acid with the soda, we shall have audible evidence of violent action going on. I will not go on with the process, but I have purposely taken the two substances in presence of very little water, in order to show you that the heat evolved makes the liquid boil with great violence. I could have avoided that by adding water in the first place, but I wished to show you the vigour with which they unite together. If I were to go on adding acid to the soda little by little, feeling my way until I had just completed the action, I should have got some water formed, and some of the beautiful salt which I have here, a body which is neither soda nor acid; it is a salt called Glauber salt, or sodic sulphate, and all my materials would have disappeared in the process. If I use them in proper proportions, all the acid and soda would disappear, and go to form these two other products. I might dissolve some of this sulphate in water, and might put red paper or blue into it, and it would not affect either of them; it is perfectly neutral in that respect. The proportions by weight in which this combination takes place is this. If I add 40 parts by weight of soda, and 49 of oil of vitriol in a state of purity, I should have as the result 18 parts by weight of water, and 71 of sodic sulphate; and if I add together the weight of my materials and the weight of my products, I get the same—89. Nothing disappears in the process; all the acid and all the base which takes part in it is employed. Each particle which took part in the process disappeared as such, and it passed over into another form. I will mention one other case, because it is somewhat more complex. I may take the case which I was showing you just now, the white marble and hydric chloride, or muriatic acid, which I used for making the carbonic acid gas. In that case I used two materials—carbonate of lime, as it is commonly called, and hydrochloric acid. We get three products; on the one hand is a salt, which is commonly called chloride of calcium—a solid substance used for drying gases, as it has a great affinity for water; another is water; and the third, as I showed you, carbonic acid gas. There, again, we have precisely the same thing. All the marble and all the hydric chloride which takes part in the formation of those three products disappeared as such, and they resolved themselves into other compounds possessing different properties; but the weight of the products is equal to the weight of the materials. That rule holds good throughout all ordinary cases of chemical action. On the other hand, in fermentation it is not so; one of the active substances is formed, and the more active the fermentation, the more does it grow. In fact, if you want to get yeast, you must go to a place where the breaking up of sugar into alcohol and carbonic acid is going on; or if it is in the south, you must go to where wine is being made, you go to a wine-maker and get the yeast from him. The only way of getting yeast is from that process of fermentation which sets in spontaneously under the conditions I named to you. I ought, however, in justice to the wonderful process I alluded to, give you two or three other particulars regarding it. I showed that sugar is broken up by the ferment into these products, but no case is known of pure sugar—and when I say pure sugar, I mean sugar in the purest form in which we have it—being decomposed by yeast. If you were to put some ready-made yeast—thriving, growing yeast—into a solution of chemically pure sugar, some of your yeast would decompose, some of it would resolve itself into other products, and other parts of it would be absorbing those products which are present in the liquid, and whenever the process is to be carried on

advantageously and rapidly, it is customary to add some saccharine liquid—some other substance capable of nourishing the yeast. When I want good fermentation I do not take water to dissolve my sugar, and put yeast into it, but I boil some of this malt, which is one of the best materials for this purpose, in water, and take a decoction of malt, or decoction of yeast, and put the sugar into it. In such a liquid there are several bodies which we know; and I may safely say that there are a great many others which we do not know, and there is no doubt that their presence is of considerable importance to the chemical change which takes place. There are substances which I shall presently have occasion to show you and to speak of, formed by the germination of the grain, by the formation of the malt, which are related somewhat to this body which I have here. This was some pure wheat flour—every kind of flour would not do—and it is supposed that some people mix other materials with flour. It was kneaded up with water, pressed together, and, whilst the pressure was being continued water was allowed to trickle over it. I have in another bottle some of the water that trickled over it. There is a white substance deposited from this water, which is commonly known and much used by the name of starch, and starch is, in its chemical composition, first cousin to sugar; it is a substance which passes over very readily into a kind of sugar by a process I shall presently have occasion to allude to. But the little ball of flour while being kneaded had the starch washed away from it, and I have left, as the result, a substance which is generally known by the name of gluten. If I were to describe it in chemical language, I should say it is something like flesh, or the muscular fibre of animals, for, in chemical composition, it approaches very nearly to that. When barley is malted, and kept in a warm place for some time, the grains begin to germinate and decompose, and some bodies are formed from this gluten, which is partially broken up. The malt contains also some sugar made from that starch—grape sugar, as we usually call it. If we had only those extreme cases I really do not know what we should do. If we had in our science one set of bodies which appeared so constantly to act at variance with the general laws which the others obey, I think we could not call chemistry a science. I have taken two or three examples to show you the definite proportions which we find to regulate the ordinary process of combination. I might have taken thousands, but the point is that this law does not appear to apply at all to these chemical changes which we call fermentation. One of the active substances in fermentation is being formed, it is increasing, not disappearing at all, and the contradiction is so strong and manifest that the only way out of the difficulty will be to do something of the kind which I was speaking of some time ago—that is to say, see if we cannot get some intermediate facts which will serve to connect the extreme ones; to see if we cannot get at first something between the two classes, and then try to get some further links between them. There are processes of chemical change, I will not call them processes of fermentation, for I do not know whether they are, but which are analogous to it, and some of them are very interesting and very beautiful. I have here a substance called amygdalin, made from bitter almonds; it is a bitter tasting substance, and consists of four elements which it is not necessary that I should name. In this other bottle I have a paste formed of sweet almonds, which have been crushed with a pestle and mortar, and I will put some of it into the warm distilled water in this flask. Into the mixture I will put some of this amygdalin; if I were to leave it without that addition there would be very little change; the substance would gradually subside, but there would be no product given off in the way you will presently see. After letting it stand for a few minutes I will pour some of the mixture into an open vessel, and we shall be able, without difficulty, to perceive a fragrant smell, which is due to the presence of a liquid of which I have a quantity here, a substance known by the name of oil of bitter almonds. If we were to perform the same experiment on a large scale, and macerate some of this amygdalin with almond paste, put them together with warm water, distil the mixture, and collect what comes over, we should find that water would pass over, and with it would be a few drops of oil of bitter almonds, and the amygdalin would be decomposed in the process. There is in the sweet almond paste a substance which I cannot describe in better terms than by comparing it to that gluten which I showed you

just now. It is very similar to it in its composition, and by the contact of this, the synaptase, as it is called, with the amygdalin, the elements of the amygdalin are broken up into several products; one of them is the oil of bitter almonds, another is prussic acid, which generally accompanies the oil, the third is a variety of sugar of the kind which is called grape-sugar, and there is probably also some formic acid. Here we have the breaking-up of a complex body, amygdalin, into several simpler bodies by the action of the body called synaptase; but there is not in the process, so far as I know, any living organism at work. There is a substance which is somewhat similar to these living organisms, but there is no organised structure, so far as our knowledge goes at present. Take another experiment. I have here something which is not a *blanc mange*, although it looks something like it; it was made by boiling potato-starch with water. We let it cool, and then turned it out; some was put into a flask with two or three ounces of crushed malt. It was warmed to a temperature of 60 degs. centigrade for about an hour; there was no boiling. The substance was then squeezed through a cloth to keep back the husks of the malt, and here is the liquid which ran through. It is perfectly liquid, and its consistency is entirely different from that of starch, from which it was made; it is quite sweet to the taste, and there is a large quantity of sugar in it. There is also another body which we class with the sugars; that is, there is in this liquid a good deal of a kind of gum, which we call dextrine, which would easily pass into sugar. The starch, when it was being converted by the action of the malt into those soluble bodies, did not, so far as we know, break up into simpler substances; the process was of a different kind. It assimilated the water; the starch combined with the water, and at the same time divided itself, some of it forming one and some the other product. Here, also, there was not, as far as my knowledge goes, any ferment or any organised cells in the liquid. If they were present it was an accident, and was not essential to the change which took place. I am the more confident in saying that no ferment was there present, for we can get, and we very often do get, precisely the same formation of starch without any malt at all. If, instead of warming some of that starch with the infusion of malt, I had mixed it with a little—about five per cent.—of that strong sulphuric acid, and had heated it, it would have been dissolved almost like sugar in water. In fact, there are now in Germany, and also in England, manufactories in which starch is converted, by the action of dilute sulphuric acid, into grape sugar, and the same change which we get by organic substances—that is the point—we also get by the action of this mineral acid. Another change of the same kind I may mention, especially as the subject of it is in itself interesting. I have here a substance which people have been accused of making for the purpose of adulterating quinine. It is made from willow bark, and is believed to possess febrifuge properties, so that there was some little excuse for what I have mentioned. This substance is called salicine, and when heated with dilute sulphuric acid, in the same way as the starch when so heated was converted into sugar and dextrine, this salicine breaks up in a way which I might compare with that in which some bodies are broken up by fermentation. Another case of the same kind is afforded by tannin, a substance extracted from gall nuts, and which is present in oak and many other barks. It is used for combining with gelatine, which is the principal constituent in hides, to form leather. If we dissolve this tannin in water, and leave it in an open vessel, it will get mouldy; and if you examined it after some time you would find none of it left. It would all disappear, just like sugar in the process of fermentation, and in place of it you would find, in that particular process, a body which you might easily crystallise out from the liquid, and which I have here; it is called gallic acid. It is a body resembling tannin in some respects; for instance, in the property of forming, in combination with iron, a dark substance, which is used in suspension in water for writing ink. But it will not do to form leather in combination with gelatine. If you left the tannin in an open vessel, it would decompose, and there would be left gallic acid, and some other material which was formed at the same time would have disappeared. By boiling tannin with dilute acid, we get the process performed more regularly. Upon boiling some tannin with dilute sulphuric acid, you would find that water would be taken up by it, the tannin would combine with water, and it

would break up into sugar and gallic acid, the process being exactly like that which I mentioned in the case of salicine. There is a most direct analogy between the process of breaking up with sulphuric acid effects upon tannin and that of fermentation. I ought to say, when telling you of the decomposition of the tannin, that it is effected by little animal organisms present in the liquid, and it appears that they are the agents of the transformation. Then there are some other processes of considerable importance, from their occurrence in the animal economy—processes which, I believe, must be classed between those experiments which I showed you a little while ago, and the process of fermentation—I mean processes which occur in the operation of digestion. I have here a gelatinous solid, which contains a substance called pepsine, which was made by dissolving the inner lining of a pig's stomach in diluted hydrochloric acid at about blood heat. The inner lining of the stomach of that and similar animals is dissolved gradually, and that solution possesses the property of dissolving muscular fibre, white of egg, and other similar substances; it is, in fact, artificial gastric juice, and it would, for instance, dissolve that lump of gluten which I showed you just now—which looked something like indiarubber—and when this pepsine dissolves albumen by digestion, for the process is doubtless of the same kind as that which occurs in the animal economy, it does so by breaking up into bodies which are no doubt simpler than itself, bodies which we do not know accurately and fully. They are called peptones, for it is common enough to give names to bodies, even before one knows them well. I do not know whether it is a good plan, but it is customary. These bodies are a good deal similar to those which are present in malt, and in such like mixtures which have undergone vital changes. Then I will give you one or two other cases of similar processes. Here is a singularly beautiful acid, called hippuric acid, which decomposes with very great readiness if left in the liquids in which it is originally found. When that organic mixture is exposed to the air it undergoes a process of putrefaction. The general appearances which take place in the liquid while the substance is decomposing would certainly be described by anybody as a putrefactive process, and there is formed by its decomposition some of this other beautiful acid, called benzoic acid, because it was originally obtained from the fragrant gum benzoin. At the same time there are other products given off which decompose. Now we can by mineral substances effect the same decomposition of that hippuric acid. A German chemist, to whom we owe many researches in these matters, showed some years ago, that if you boiled hippuric acid with dilute sulphuric acid, it takes up water, and breaks up into benzoic acid, and this crystalline substance called blycooc, or sugar of glue. It got that name from the circumstance that it was obtained originally from glue by decomposing action, and it has a sweet taste. It has no analogy to sugar in its nature, but it has that superficial resemblance that it is rather sweet. This hippuric acid affords another case of a body which is broken up either by putrefaction or by the action of dilute sulphuric acid. It affords a strong argument, and other cases I have adduced afford, like it, an argument that the action of these organic substances resembles the action of sulphuric acid. If we get the same change in several cases by the action of an organic body as by the action of a mineral body, the fact certainly goes some way towards showing that the two substances must be, in their mode of action, generally alike. There is another case, that of urea, which in contact with water forms a carbonate. That may be done by either class of reagent. There are, however, some chemical processes even simpler than these, and for that reason they are better known to us, which really may be studied with advantage side by side with those I have mentioned, and they will, I think, afford us, on further consideration, a key to the explanation of these processes. I will only mention two. One is a process which is well known in its general features, and it is a process of breaking up truly analogous to those I have mentioned, but a perfectly simple breaking up of alcohol into two substances, both of them well known now, one being water, and the other ether. It is a process which consists in dividing the elements of alcohol in such a way as to get nothing formed but these two products, though side by side with this change there are some secondary changes which do not belong to the process. This change is effected solely by the action of oil of vitriol or sulphuric acid. It has been long known, and it was

a subject of wonder for some time that, if sulphuric acid is mixed with alcohol and heated, you can distil off some alcohol from the mixture in the form of these two products; then you may add some more alcohol, and if you distil that off, it is also broken up into ether and water; then you may add some more again, and you may go on adding alcohol to that original quantity of sulphuric acid, and it will decompose each successive portion into these two products. There is no limit known to the extent to which sulphuric acid will effect that change. You perceive, therefore, that this, in its general features, is a process analogous to those which we were considering at first. I may illustrate that by an experiment. First, I will show you how we discover the presence of sulphuric acid. The common test is, to add some salt of baryta—this which I have here is a chloride—to the sulphate, when we get at once a precipitate sulphate of baryta. The sulphuric acid, in making the ether, passes over into a compound that does not possess this property. I have some of it here. It is a clear liquid, and on mixing it with the same re-agent I used just now you see that it will not form the precipitate. I put some of the same baryc chloride into it, but, as you see, the liquid remains clear. But I can bring back my sulphuric acid to its original state. Mr. Taylor, my assistant, was heating some of it just now, and it has been standing so long that it has returned to its original state already. It has returned from the state in which it does not precipitate baryta to the state in which it does. There is in the process a successive departure of the sulphuric acid from its ordinary state, and a return to that original state; it is a kind of circle or cycle. The substance passes over into a compound which does not precipitate baryta, and then it returns again to its original form, and that is the key to the anomaly. When the sulphuric acid has effected the decomposition of one portion of alcohol into ether and water, it comes back again to sulphuric acid, becomes exactly what it was in the beginning, and is able to recommence precisely the same combination. I will give you another example of it. I have here a substance used in one of the commonest manufactures, that of oil of vitriol, in which the same operation occurs. I have there a substance at work called nitric oxide. It is converting a quantity of sulphurous into sulphuric acid. In principle it would so convert an infinite quantity, but in practice it is limited by convenience. It acts by carrying oxygen from the air to one portion of sulphurous acid and then to another, and thus it goes on, and effects successive oxidations of a great number of particles of sulphurous acid, forming sulphuric acid from them, and it does that in virtue of a process perfectly analogous to that which I just now mentioned. The gas, after one operation, returns to the same state in which it was in the beginning of the first operation; it is a cyclical process. I have here some of the nitric oxide combined with oxygen, and when in that state it has the red colour which you see in the flask. If we blow a little sulphurous acid into it, the red colour will disappear as the nitrous acid gives up the oxygen, the nitric oxide itself being a colourless compound, but in combination with oxygen it is red. As the sulphurous acid passes into it, the nitric oxide parts with the oxygen and becomes colourless, but on again blowing in a little oxygen it returns to its former red colour. This shows you that there are processes of simple, normal chemical action, somewhat analogous to those fermentive properties which I formerly described. Each one of these processes takes place in perfectly definite proportions, the peculiarity being that one material which takes part in them returns at the end of one operation to the same state in which it was at the beginning of the operation, so that the processes are cyclical, and this re-agent is able, by acting successively on a large quantity of particles, to repeat its action very frequently upon them, and beyond what would appear to be its definite combining proportion. You see this red compound of nitric oxide and oxygen has lost a great deal of its red colour. I will not wait until it is completely bleached, but will blow in a little oxygen, when we shall get a return to the original deep red colour. This is the ordinary process by which sulphuric acid is made on a large scale in lead chambers. The sulphurous acid is allowed to remain a considerable time in the chamber, and is passed on from one to another, as it is acted on by the nitric oxide, which passes through the successive stages of its action by a process which I should be glad to name cyclical, as I shall have occasion again to revert to a similar process of the same name.

AGRICULTURE IN BRITISH INDIA.

From the Fens of Lincolnshire to the rice fields of Bengal, or from the Welsh and Cotswold Hills to the Himalaya Mountains, is a wide space to range over even in imagination; but since the Anglo-Saxon race has taken "to increase and multiply," and has spread over the globe—here with a group of colonists and there by a military settlement—regions however remote possess for all of us an interest and to some adventurous spirits a fascination which cannot be found in the homesteads of England. The government of races that have risen to splendour and civilization and then fallen to decay has devolved upon the shoulders of the descendants of Clive and Warren Hastings; and how they have fulfilled their destiny can best be chronicled by the administration formed for that purpose. Where many talents are given, much is required; and in what manner these responsible duties have been fulfilled we are in a position to ascertain more accurately than hitherto. The last report upon the moral and material progress of India furnishes much excellent matter for consideration, and not a little satisfaction in the knowledge that our rulers are equal to the task of governing an Empire, over which the Queen now reigns, in place of the Company of Merchants formerly trading to the East.

From the wide range of subjects contained in this statement, a few selected facts bearing upon the agricultural prospects of that country may not be unwelcome to our readers, amongst whom there must be some who hope to find a larger field for their enterprise than is contained in the narrow limits of the British Isles. The opening of the Suez Canal, and another great event of the year, the completion of the telegraphic communication, has brought us within speaking distance; the junction, too, of the Great Indian Peninsular and the East Indian Railways, whereby the whole breadth of the Peninsula is spanned, makes the time occupied in reaching Calcutta from London no greater than it took twenty years ago to travel from one end of India to the other. A notable increase has occurred in the receipts from and in the number of letters and newspapers, which have never been so numerous since the year following upon the mutiny. The more rapid transmission of the mails under the recent postal regulations, whereby Bombay is made the point of arrival and departure, has been the cause of greater speed and efficiency, although complaints are made about the enhanced charges. The drought, however, cast a dark shadow over the land; and great as were the sufferings of the people, they were much lessened by the liberality of the authorities. From neighbouring states many of the famine-stricken poured into British territories in search of food, aggravating the burden already felt there. In the Central Provinces, although less severe, the drought was universal: those which suffered most were the north-western, and in the Punjab, the districts lying south of the Sutlej. In Madras and the Lower Provinces the causes for anxiety on this account were but slight.

It is not therefore a matter of surprise that the finances suffered, when the large sum of £10,578,160 was expended during the years 1868-69 upon public works to give employment to the destitute. Otherwise, the prospects under British rule are decidedly better than at any former period. The principal sources of revenue are derived from the land, customs, opium, and salt; the latter is the only tax which bears alike upon all, and certain

changes are in contemplation to lessen its severity upon the poorer classes and to simplify the mode of its collection. The cotton cultivation, to which great attention has been given since the failure of our supplies during the American war, has suffered to a certain extent from natural causes. The acreage under culture was somewhat less than the previous year, and the estimate of the yields followed in like manner. The figures were—for Madras 1,466,372 in 1867-68, 1,365,720 in 1868-69; for the Bombay Presidency in 1868-69 2,165,731 acres, against 2,181,173 acres in 1876-68. In the north-western Provinces there was a falling off of 1,300,000 to 800,000 acres. Experiments during the year with foreign seeds have met with uncertain success, partly owing again to the unfavourable season, and in future it is intended that all such will be made by the Government, since it would be impolitic to place doubtful descriptions in the hands of the ryot, whose bred depends upon his land. There are strong advocates for the establishment of public cotton markets at all important stations, as a means for bringing the European merchant into direct contact with the cultivator, and of freeing the latter from the bondage of the Native middle-men and brokers.

Tea cultivation, which is another important feature originated in a discovery made in Assam in the year 1830; and since that time, by the aid of the Government and the enterprise of private companies and individuals although the results have not always been financially profitable, yet, upon the whole, success has attended the operations. The returns of the planters are not entirely reliable, but the out-turn for the Assam district is stated to have been 9,491,600 lbs., or about 2,000,000 lbs. more than 1867-68. At Kangra, where the plantations are placed on the lower slopes of the snowy range of the Himalayas, at an elevation of 2,500 to 5,000 feet above the sea, there is another experiment going on in tea-planting. The Government have disposed of nearly all their gardens at their station at Kumaon, since the cultivation has taken root and fallen into the hands of a responsible body of proprietors: and here there apparently exists a good opening for enterprising persons. The teas are chiefly gathered and sold for the Central Asia market, the transit charges being too heavy to admit of a profit in the London market. Of the quantities of teas exported during the year from Calcutta there can be no doubt, since the Customs give the total at 11,434,000 lbs., against 8,789,344 lbs. in 1867-68, showing an increase of 2,644,656 lbs.

We have an interesting description of the mode of life which is passed by the inhabitants of the hills. It appears to be the custom of these people to remain in their villages until the season commences in May, and then the whole countryside moves up, every man to his patch of land on some lofty eminence. Although the clearing of a space of dense jungle is no doubt very severe labour, yet the surroundings render the work pleasurable, compared with the toilsome and dirty work of the tillers of the plain. On the one hand, the hill man labours in the shade of the jungle he is cutting; he is in a lofty spot where every breeze reaches and refreshes him; his spirits are enlivened by the beautiful prospect stretching out before him. He is surrounded by his comrades; the scent of the wild thyme and the buzzing of the forest bee are about him; the young men and maidens sing to their

work, and the laugh and joke go round as they sit at their midday meal beneath the shade of some great mossy forest tree. The management of these extensive forests, which spread over different portions of India, has occupied the attention of the Government, and a staff of experienced officials is being prepared for that especial purpose. By the system at present adopted, a certain number of young men intended for this branch of service are annually selected and sent for a two-years' course of training in the forest schools of France and Germany. In the north-west Provinces we find the education of children has not been neglected. The number of schools of all kinds was 5,462, the pupils 197,812, and this out of a population of about 30 millions. Notwithstanding the famine, the attendance advanced, and the best results are expected from these village schools in spreading a sound education among the agricultural classes.

In the central Provinces the great bulk of the population live by agricultural pursuits, and the custom still prevails throughout the country of making the village proprietor the keystone of the system of social economy. On him the greater number, if not the whole, of his tenants depend for their seed grain, and for the means of subsistence until harvest time, while the artisans and village servants depend in their turn on the cultivators, so that unless the proprietors have stores or credit, the whole community suffers. The total area of this province is 50,865,135 acres, of which 21,032,695 acres are barren and 29,832,440 are cultivatable. About one-half of the latter is under the plough. Food grain it appears occupy 79 per cent. of the land, cotton 5, oilseed 7, and other seeds the remaining 9 per cent. The average rice crop is about 57 lbs. per acre. Much cannot be said for the success of the experimental sheep and cattle breeding.

The Punjab and the feudatory States in political relation occupy a space or 200,000 square miles, so that we have an area of nearly half as large again as France, and still unappropriated waste land at the disposal of the Government, amounting to about 13,000 square miles. The forest tracts are chiefly in the interior of the Himalayas, but it is only in localities overlooking rivers, into which the logs when cut are thrown, to be carried by the stream to the plains, that they can be turned to practical account. The agricultural are to the non-agricultural classes as nine to eight. Owing to the scanty rainfall there was a decrease of 475,920 acres in spring cultivation, and of 1,619,041 in autumn crop. From the same causes there was a great loss of cattle during the year, amounting to 450,000. There are about 150,000 camels in this province. The rhea or China grass, a plant which has been introduced from Assam, thrives luxuriantly. It

possesses a valuable fibre, for which there is an unlimited demand, but owing to the want of suitable machinery for detaching the fibre from the stem, the development of this important trade is delayed. A reward of £5,000 has been offered by the Secretary of State to the inventor whose ingenuity most completely supplies the want. It was in this region of the feudatory states that the famine raged most severely; the scarcity of grain, great as it was, was trifling, compared with that of forage. It is believed that three-fourths of the cattle have died, or have been sold out of the country in consequence.

In British Burmah the principal crop is rice, of which there were 1,667,262 acres, or about 15,000 acres less than in 1867-68. Notwithstanding the murrain, the number of cows and bullocks increased from 388,190 to 419,887, the prices of skilled labour vary from 4s. to 1s. 4d. a-day, unskilled from 1s. to 1s. 6d. Mysore, which has an area about equal to the European kingdom of Bavaria, has an extent of land under culture estimated at 3,353,799 acres, of which 2,198,476 are taken up by *ragi* and other food grains, 836,632 by rice, and 108,741 by coffee. The mulberry is cultivated on 1,700 acres; but the manufacture of silk, which is said to have been introduced by Tipoo Sultan, has been seriously affected by the disease of the worm. Two exhibitions were held during the year, with the object of introducing improved methods of flower and fruit culture, and the accounts received of their success are most encouraging.

We cannot altogether omit to mention the trigonometrical and topographical surveys. These were conducted by seven parties, and nearly all the ground traversed possessed hitherto no reliable maps, the tracts, in some cases, having been rarely visited by Europeans. Summing up the work accomplished by the latter department, it appears that during the last quarter of a century the enormous extent of nearly 600,000 square miles has been surveyed, an area about five times larger than the British islands; and what may be well imagined, the journals of the officers engaged contain much valuable information on the geography, ethnology, &c. of the localities surveyed by them. Supplies of coal for the railways, and fresh water for certain stations have been among the fruitful results of their explorations. The chief operations of the botanical department consisted in the propagation of the chincona plant, there being now 2,596,176 plants belonging to the Government on the Neigherry hills; besides 178,605, which have been distributed to private individuals. This and much other information that we have not space to reproduce, make one of the most interesting and creditable volumes that has issued from the official printing press, and were it not for the fatal blue cover, it might find a place in our circulating libraries.

DOCTORS DIFFER.

Although the country is getting habituated to the cry of *Wolf!* which is so continually being raised, there is no doubt a good deal of what may be termed second-rate disease about. Previous to the visitation of the Rinderpest very little would have been heard of such a complaint as the Foot-and-Mouth; but since then we have become more keenly alive to the disorders of stock, and there are now very few "cases" but that are taken up. In fact, from the appearance of the Cattle Plague the veterinary profession may be said to have been gradually educating itself in this way, as to have discovered how there might be even something more to study than the anatomy of the horse or the distempers of the dog. It would look, however, from what is just at present transpiring, that

this branch of the business is not as yet in a very satisfactory condition, even if the leading principles of the art are as clearly laid down as they might be. Thus, in the September number of *The Veterinarian* a contributor speaks to "the many instances of defective observation: Many cases of a catarrhal nature were condemned on farms during the prevalence of the Cattle Plague as the disease itself." Then, again, as to "the so-called 'dropping after calving', loin-fallen, milk fever and the drop, in cattle-breeding districts practitioners frequently attend these cases. In one locality we have heard of a most unprecedented series of cures being made, and forthwith lost no time in making close inquiries. The practitioner, in a certain instance

no way elary of his information, allowed us to visit some cases, and afforded all particulars required, but we discovered his nosology included parturient apoplexy, metrorrhœmia, and the ordinary nervous debility, or loun-fallen as one affection. Some died he admitted, but many recovered. "When the brain keeps all right," he said, "the cow soon gets well." Further still, and it may be very useful to extend these examples, as offered, be it remembered, on the authority of a member of the profession:—"On the subject of contagious maladies our opinions are not at all in unison. The writer was called a short time ago by a large agriculturist to pronounce upon the nature of disease among a valuable herd of cattle. The owner had been informed he had to deal with epizootic pleuro-pneumonia and was much alarmed. Four affected animals were put under treatment, and recovered without the disease spreading any farther, or the use of disinfectants of any kind. In an action for damages sustained by a farmer, it was said, by the conveyance of contagion from an adjoining farm, a witness gave the particulars of cases of sporadic pleuro-pneumonia, conscientiously believing he had treated the contagious form; and three others stated in the witness-box that in their belief contagion could remain dormant for three months and even longer, and preserve all its fatal properties, but when asked by counsel could give no proof in evidence."

All this shows a rather loose state of things, emphatically pointed as these differences are in another direction. On the subject of contagious diseases opinions are not at all in unison, either in or out of the profession. Thus, in the special appendix to the *Journal of the Bath and West of England Society*, the veterinary inspector writing on the sanitary condition of the stock at Taunton says "every precaution was taken to prevent the entrance of infected animals into the yard; but no provision could be made to exclude persons coming from infected stocks, and to this indirect cause of inspection perhaps even more outbreaks are due, than to the actual and direct contact of healthy with diseased animals." Whereupon Sir J. Clarke Jervoise straightway writes to the Council, as will be seen from a report in another part of this day's paper, to say: "This is so contrary to my own experience, that I am most desirous of bringing the question to demonstration; and, with this object, I shall be glad to place for the space of one twelvemonth (from September the 1st, 1870) twelve out of thirteen Irish steers, purchased in June last, to be infected by Professor Brown, or any member of the Veterinary College he may select, in the way and in the manner referred to by Professor Brown, otherwise than by actual and direct contact. The visits to be paid at intervals, not more frequent than 1½ days. In case of his success I shall be ready to pay the sum of one hundred pounds."

Nothing could possibly sound fairer than this, as nothing would promise to be attended with more useful results than the thorough test of such a theory as is here propagated. According to the showing of its own members and its own *Journal*, nothing can be more lamentable than the uncertainty or more determined ignorance existing amongst veterinarians as to the diseases of cattle. And yet, strange as it may sound, the Council of an Agricultural Society "feels itself unable to undertake the duty suggested," although it would be well to know why it shirks so appropriate an office—particularly if it have any confidence in the dicta of its own Professor. Failing such support it is only to be hoped that Mr. Brown himself will be ready to back his own opinions, even if the profession be not already committed to these views. In a leader, and consequently coming with all the greater weight, in the new number of *The Veterinarian* it is declared that "some of the affections are not in the ordinary sense of the word contagious; a healthy animal might be

placed in contact with a diseased one without danger, and a diseased beast might be placed in the midst of a healthy herd in a healthy locality without any risk being incurred of spreading the disease; but on the other hand, animals from a healthy district cannot with impunity be brought into the neighbourhood of the diseased and be placed under the influence of the conditions which favour the development of the malady." This reads very much in unison with the opinion advanced in the *West of England Journal* against the spread of infection from "the actual and direct contact of healthy with diseased animals;" and with this, notwithstanding anything the experience of Sir J. Clarke Jervoise may tell to the contrary, the veterinary profession is identified, for *The Veterinarian* is "edited by Professor Simonds, assisted by Professors Brown, Tuson, and Varnell." Of course we all know the increased liability of strangers to take disease, but can it be safely propounded that animals will catch infection sooner from herdsmen than they will from other beasts? Professor Brown answers that they will, and Sir J. Clarke Jervoise that they will do nothing of the kind; while surely the question is worth bringing to an issue! Again, *The Veterinarian* maintains that "a diseased beast may be placed in a healthy herd in a healthy locality without any risk being incurred!" If this be correct, what can be the use of our preventions and cordons, and so forth? You may take the animal to the disease, but you cannot take the disease to the animal! The passage is not quite so clearly put as it might be; as, indeed, these learned essays rarely read very plainly, but let us have the names of these stay-at-home disorders by all manner of means, and let us hear further that some body is prepared to accept the challenge of Sir J. Clarke Jervoise. Such an experiment might save a deal of idle talk hereafter.

INOCULATION FOR PLEURO-PNEUMONIA.—Mr. Bruce points to Belgium and Holland in support of inoculation. The latest reference which has come under our observation as regards Belgium, appeared in the pamphlet lately issued by Mr. Howard, M.P., on "European Farming and Peasantry." Mr. Howard states that when inoculation was performed during summer in Belgium, the tails of the animals operated upon drooped off, and when inoculation was performed in cool weather, such a result seldom occurred. We could give numerous extracts from Mr. Bruce's report for New South Wales of the opinions of owners of stock condemnatory of inoculation, for it is the recorded opinion of not a few of these owners that it was neither a cure nor a preventive, and that in some herds the number of deaths from inoculation was apparently greater than the number who died from pleuro-pneumonia. But as the belief in the efficacy of inoculation has recently extended in the United Kingdom, and has been lately practised in Ireland, we submit, for the consideration of the believers in inoculation, the following facts: 1st, There is no instance of inoculation with the virus obtained from a diseased animal proving a cure or preventive for the same malady as is the case by vaccinating the human subject with the virus of the cow-pox. The disease known as small-pox in man is prevented, but cow-pox and small-pox are distinct diseases, although they are somewhat analogous. What would be thought of the mental state of the veterinarian who would advocate inoculation with the virus of foot-and-mouth disease as a preventive of that irruptive fever, or the inoculation of healthy cattle with the virus obtained from the lungs of an animal affected with the cattle plague! The truth appears to us to be that inoculation of healthy animals by the virus obtained from the lungs of an animal affected with pleuro-pneumonia, can only act in the same manner as a seton does by producing a counter irritation in the system for the time being. Those who practice inoculation by inserting a tape in the tale of an animal which has been steeped in liquid obtained from the lungs of a diseased animal, which has either died of the disease or been slaughtered, when known to have been affected, are guilty of an act of cruelty which should render them liable to be prosecuted under Mr. Martin's Act.—*North British Agriculturist*.

THE LABOUR MARKET IN AUSTRALIA.

On the debate on the vote for immigration purposes, which took place in the Legislative Assembly, Melbourne,

The Attorney-General, Mr. MICHIE, said, notwithstanding the lateness of the hour, he would fulfil his promise of giving the House facts, to which, if the hon. and learned member for Brighton could, he should adapt his theories. There was no lack of these facts. He remembered, for instance, twenty-two or twenty-three years ago, when the wages of skilled labour were from 4s. to 5s. per day. What were they now? At the period of his retrospect the inhabitants of this colony were under 200,000; and what was the number now? According to the hon. and learned member's argument, each subsequent influx of population should have cut down the wages of labour; but had it done so? No, it had not; and what then became of the hon. and learned member's theory? What were the very newest lights of the hon. and learned member in comparison with all this? What had the new blood been doing, if such arguments were held? It seemed that directly the hon. and learned member came in contact with the Chamber of Commerce and the merchants he lost his head. If state aid to immigration brought about these results, what was the force of an argument which contended that it should not bring about those results? According to the hon. and learned member, the wages of carpenters, now from 9s. to 10s. per day, should be reduced to 4s. or 5s. per day.

Mr. LONGMORE: Go back fourteen years only.

Mr. MICHIE might go back fourteen months, and what would be the difference? And as for the hon. member for Ripon and Hampden, why should he speak, when the regulations proposed were a mere bagatelle, in the way of introducing labour, to those which he when in office agreed to. If these regulations were indefensible, what was to be said for those of the government of which the hon. member was a member, and which would have facilitated the introduction of a vastly larger population? The hon. member might say that he was not aware of those regulations; but could that excuse hold on a subject of this vast importance? If the hon. member objected to new blood now, why did he not before? But, whether he was new, old, or middle blood, it was perfectly clear that the legitimate operation of these regulations would have been to pour a flood of population into this colony, to which the stream to be expected under the present regulations would have been a mere rivulet. But, coming to higher and fairer game, he reminded the hon. and learned member for Brighton that, whatever theory he might profess to entertain, he must adjust his theory so as to make it consistent with facts. How did he (Mr. Higinbotham) account for the facts that he had witnessed in actual operation in this colony? In the curious operations of society, where at once all the members of the body politic, skilled and unskilled, worked not merely competitively but harmoniously together, harmoniously for the general prosperity or the particular prosperity, in the limited view which the hon. gentleman had taken of the subject, each of them was indispensable to the interests of all, and all to each; and as the various interests worked together, and as all were necessary customers to everybody else at the same time that they were supplying the wants of everybody else, so all prospered and advanced in their prosperity together. The rates of wages steadily rose as they increased the population—"No, no," from Mr. VALE—excluding occasional and periodical fluctuations, to which every civilized community was subject. Would it be pretended that the normal operation of the principle was affected by the circumstance that there happened to be at the present moment a comparatively peculiar depression at Ballarat? A great portion of the capital legitimately employed at Ballarat has been transferred to Pleasant Creek and other places. A member of his own profession had within the last twelve months paid away £1,000 in calls without receiving a shilling in the way of dividends. His experience was the experience of scores of others; and the consequence was that a great deal of capital legitimately acquired at Ballarat during the twelve months had been dissipated in various

transactions, and the consequence of so much capital being recklessly and unprofitably passed away was that there was less demand for labour. But nobody who had read the elements of political economy would be surprised at that. Periodical fluctuations in wages in old and new communities were comparatively trifling, and did not interrupt material progress in long views of things, or the normal and necessary operation of the relation of capital and labour. For that reason he was prepared to recognise these regulations; and he defended them on the ground that they were precise enough, and at the same time elastic enough, to admit every form of labour, skilled and unskilled. He utterly repelled the insinuation that the hon. and learned member was unhandsome enough to make, that the policy of the Government was to introduce nothing but unskilled labour.

Mr. HIGINBOTHAM said that the objection he had made lay at the very root of the system of State aid to immigration, which had existed from the commencement of responsible government down to the present time. He blamed the Government for not stating why they maintained a policy which encouraged the immigration of all classes except one.

Mr. MICHIE: The hon. and learned member said that the Government dare not bring out skilled labour. He (Mr. Michie) said they dared and would bring it out, and the regulations were large enough to do it.

Mr. LONGMORE interjected a remark to the effect that the hon. and learned member was expressing views which would obtain for him his dismissal from Ballarat.

Mr. MICHIE said his dismissal from Ballarat would not break his heart. Rather than make a speech as the hon. member had at the Belvidere, denouncing immigration at one time, and at another time be prepared to father such a system of immigration as the hon. member had fathered, he would prefer to be hunted out of every political arena in the colony. What did state aid to immigration mean? (Mr. HIGINBOTHAM: £68,000.) Whence derived? (Mr. E. COPE: Out of the pockets of the working men.) He maintained that it came from the proceeds of the Crown lands; and if the hon. member interrupting him said that the land was the people's, he replied that the people who were here, ten, twenty, and thirty years ago—before the hon. member came out—said the same thing. The cries raised now were the same as those raised a quarter of a century ago. If the people of that day had said, "Oh, the country belongs to us." (Mr. E. COPE: "It did not.") That was exactly what he wanted to bring about. If the country did not belong to them, it did not belong to us who were here now. He denied that state aid to immigration was state aid in the sense in which we ordinarily used that expression—as, for instance, state aid to religion. When the hon. member talked about the unwholesome and objectionable spirit of pandering to the commercial desire to import persons into the colony to have more people to trade with, and connected that desire with the expression "state aid," he (Mr. Michie) requested him to give fair play to this unmistakable fact. The sea so far separated us from the large centres of population as to constitute a sort of wall of China around us. In his more candid and dispassionate moments the hon. and learned member would allow the force of the argument that if physically and effectually separated from more numerous populated communities, we should, as a necessary and inevitable result, unless artificial plans were employed, be altogether prevented from adding to our population from without; we should remain utterly insulated, as absolutely enclosed by the seas as the great wall of China might enclose a city. How under these circumstances was there to be an addition to our population from without by the natural operation of competition? When the hon. and learned member gravely said, "Oh, why do this injustice to the working classes? wait for the legitimate operation of the demand and supply of labour," he took up a position which was practically almost as absurd as was the reply made by Lord Ellenborough to John Horne Tooke, when he said: "The laws of England are open alike to the rich and to the

poor." "Yes," said Horne Tooke, "and so is the London Tavern." Lord Ellenborough was right, but John Horne Tooke was more right. Of course there was not a pauper in London who could not, if he had the money in his pocket, have partaken of a handsome champagne dinner in the London Tavern, but without that its doors would be as much closed against him as if he were in Kamtschatka. Such would be the effect of the hon. and learned member's scheme, if carried out. Without assistance of some kind the colony would be virtually closed against the working classes of the mother country, and even against the poor scholars and gentlemen whom we would also be glad to see arrive, if by honourable exertion of any kind they could contribute to the advantages enjoyed by the community at large. It was farcical to talk of the law of demand and supply being practicable under such circumstances. There might be an extraordinary demand, but if there were no means in existence to meet it, it might continue to be intense, while the supply would be ridiculously below it. Some people talked of inducing capitalists to come out here, but if the scheme proposed by the hon. and learned member were adopted, he (Mr. Michie) would advise people with money at home not to come out if they expected to do any good to themselves. He would say let no man who wants the legitimate profits that capital expects come out to this country, because there is a general confederacy against capital and the legitimate effect of it, championed by the hon. and learned member for Brighton, by which capitalists will only be east under the feet of labour. ("No! no!") That was the inevitable operation of the principle he advocated. No one could say that at the present moment the working classes were under the feet of capital. Let them take up a file of the *Argus* a short time before the mail left and read the rate of wages there, and they would find—

Mr. LONGMORE: A fiction invented for political purposes.

Mr. MICHIE: The hon. member might designate it a fiction, but he (Mr. Michie) had personally found it a fact, as no doubt had a great many others who had occasion to build or add to their houses of late. So far from those returns being fictitious, it would on inquiry, he thought, be found correct that there was quite lately a strike among some operatives at St. Kilda because their wages were not raised either to 9s. or 10s. a day. If the Government scheme were refused, and that of the hon. and learned member for Brighton adopted, the result would be that before long both skilled and unskilled labour would be crying out for the very regulations which were now opposed, in order that their legitimate operation might bring out capitalists, for of course unless there were capital to employ labour the labourer must suffer. The one required to be in proportion to the other. So long as under the regulations

capital and labour were not brought out in disproportion to each other the results would be beneficial, and the more intelligent of the working classes knew and acknowledged it, and were as prepared to defend the regulations submitted as any member of the Government. The regulations were elastic and were efficacious for the introduction of skilled as well as unskilled labour. In fact, the most wholesome, the most beneficial, the most secure, and the most virtuous form of immigration that could possibly be devised was family-assisted immigration, and it got reasonably and philosophically over the difficulties which separated us from the large centres of population. If they could secure such a class of immigration by devoting a portion of the proceeds of the sale of their Crown lands, for he denied that the resources for such a purpose necessarily came from taxation, they would be quite justified in doing so. The Crown lands belonged to the empire. Before they were surrendered to this country they were Crown lands of the empire, and not the property of this colony, nor of any community on this side the world, and he asked would it be either rational or just, after having received those lands, to say in effect, "We close this territory henceforth against you all"? for without the assistance provided by the regulations, scarcely any labourer would come to the country. [AN HON. MEMBER: Nonsense.] The hon. and learned member for Brighton did not say it was nonsense. He knew that by reason of the proximity of the United States and the Canadian dominion, the large stream of population must flow to those countries unless this colony offered advantages such as it was proposed to offer. The proposal of the hon. and learned member amounted virtually to a proposition to impose a property qualification upon immigrants. Those who were rich enough might come, but others stop must away. While tens of thousands went to the United States, immigration here was almost stopped. Was that to be perpetual? Without the addition of population, new blood, or whatever it might be called, they could not make progress. That was indispensable if ever they expected to grow into a great country, worthy of being called a nation, and able to keep up its armaments, and hold its own against any community in the world. Without population it was ridiculous for the hon. and learned member to throw himself into a warlike attitude, and abuse Rogers or any other obnoxious character on the other side of the world, with a population contemptible as compared with the power with which he was contending. All other things being equal, population was a large and most material element of power and respect in any nation, and it was because he desired by every legitimate means to advance the respect, power, influence, and prosperity of this country, that he certainly felt the necessity of supporting, regardless of what might be the personal consequences to himself, the regulations that had been submitted that night.

WHEAT GROWING IN AMERICA.

There are few practices in American farming in which there is more loss than in the careless, imperfect manner of putting in wheat. It is very probable that more than half of the land sown in the United States produces crops that range from 10 bushels per acre down to nothing, where only good management and good culture were needed to average from 20 to 30 bushels per acre. In growing winter wheat some of the main causes of and reasons for these small yields are sowing on badly-prepared land, either after spring crops or on an old grass sod, and on land too much run to produce good crops of wheat—land that in some cases is too much exhausted to grow good wheat with good cultivation, but that more generally fails to grow paying crops for want of good cultivation and good management. I believe that few of our good wheat lands are so badly run that a suitable rotation of crops, frequent seeding to clover, and a well-worked summer fallow, will not produce heavy crops of wheat; while as a general rule good land that has had this kind of management for some years will grow very fair wheat after well-managed spring crops. That so much land fails to grow paying crops of wheat when sown after spring crops, where but little attention is given to the rotation, and the wheat is sown late on badly-prepared land, is not surprising. It is true, rich new lands have grown good

wheat in this way, but it would not be expected to see them continue to do so after they have been a long time in cultivation. But in sections where wheat appears to be gradually failing under bad cultivation, good farming and fine cultivation may still grow good crops. A large part of wheat farming is on soils of this character and condition, and a large share of the failures and light crops are owing to sowing such lands after spring crops, where the land is not well managed, suitably prepared, or properly manured. A far too common practice is to break up an old sod, plant to corn, potatoes, and beans two or three years; sow to oats, barley, or some other spring crop a year or two more; and, after the land is thus pretty well run out with spring crops, sow to wheat and seed down. Now this is a very bad system, or rather way of farming, for there is no system about it. To thus reduce the soil with spring crops, and then expect to grow good wheat with the scant preparation usually given in such cases, is taxing the soil severely. In the first place an old, and in a sense exhausted, June grass and timothy sod, with most likely a good sprinkling of wire grass, is not a good, genial condition of the land to start with; it is far inferior to a good, clean clover sod. This old sod, with the scant cultivation, and very little, often no hoeing given to crops now-a-days, will seldom be well sub-

duced; but the wire grass (*Poa compressa*) roots, like those of the Canada thistle and quack grass, will grow as well one end up as the other, and other weeds will largely work in. So the spring crops are none too clean at first, and gradually get worse as the land is kept under the same general management, until the last crops are quite foul and poor. A good summer fallow is needed to subdue such land, as it will be much more difficult than when the sod was first broken up; and no one should expect to grow good wheat by the usual practice of merely turning under the stubble, smoothing down with the harrow, and sowing and harrowing in. This course is still worse from being usually done rather late. Such farmers are not generally any too well along with their work; while it is a very common practice to sow the summer fallows, or rather well prepared fields first, and leave until the last such fields are at least prepared to grow wheat with such treatment. Another bad practice is to plough up old sod, harrow down the furrow, and sow wheat immediately. Timothy and June grass being also cereals of a similar nature to wheat, exhaust the soil in much the same manner; thus leaving it in a rather bad condition for wheat. Besides the wheat plant is a delicate feeder that, unlike corn and peas which do well on a fresh sod, must have the manure, sod, or other plant food well rotted and prepared to be fairly available; while an old, dry sod, ploughed under in dry weather, is a long time in rotting. So an old sod, freshly ploughed under, makes a bad preparation for wheat. A good clover sod is a good deal better, as that, instead of exhausting the soil, furnishes additional supplies of the very elements most needed by wheat. A clean clover sod also rots much sooner than the old grass sod above described, and much sooner brings the soil into condition to give the wheat a good start. But even with clover it is much better to break up three or four weeks before seeding, as it is better to have any sod pretty well rotted when the wheat is sown. It is true that very good wheat is in many cases grown after spring crops. On rich, clean land a clover sod may be planted to corn, the next spring sown to barley or peas, and be put into wheat the same fall. If a good clover stubble is turned under, and a light dressing of manure is given before sowing

the wheat, good crops should be grown in this course. But a better way is to grow a crop of clover between the barley and wheat. Clover takes well with barley, and can thus be grown between two exhausting grain crops to the very best advantage. But there is a good deal of barley and other stubble that is not seeded, and that if the land is clean and well prepared, has a light dressing of manure, and is sown in good season, will grow good wheat, and good clover if seeded with the wheat. Of course it will be best to sow such land to wheat this fall. But where the most of these important requisites of good farming are wanting, where the land is not well subdued, reasonably sure of a good crop of wheat, and of good crop of clover if seeded with the wheat, it will in most cases be best to leave it and make a thorough summer fallow the next season. For where land is to grow wheat and two or three crops of grass from one preparation, it pays to do it well, as a small deficiency three or four times repeated in as many crops will much more than offset the cost of the extra cultivation needed. In preparing land for wheat it should be made fine and mellow, not light and huffy, but rather well worked down together. It cannot be too well and too finely cultivated and comminuted, but may be too loose and open. The latter is sometimes the case with stubbles that have been very dry and have then gone through a softening process that farmers call "slaking," leaving the soil very light and open when ploughed. When a heavy stubble is ploughed under on land in this condition, it makes it still worse, so that unless there is considerable rain it is quite difficult to work the soil down and make a good seed-bed for wheat. Cross-ploughing a fallow where the sod is not thoroughly rotted will sometimes make the land quite loose; in such cases it is often best to omit the ploughing, and make a good seed-bed with the harrow and cultivator or gang-plough. Where stubble or other land is too loose it should be well worked down with the harrow and roller. The plough, gang-plough, and cultivator all have a tendency to make the land more loose; but a good harrow and roller make it fine and mellow, and work it well together. Land in the latter condition is much less likely to heave with frost than when it is light and huffy.—*American Co. Gentleman.*

THE AGRICULTURAL RETURNS OF AUSTRALIA FOR THE YEAR 1869-70.

The usual tables of statistics for the year ending the 31st of March last were published in the *Government Gazette* of the 20th of May. The returns for shires and road districts, which embrace the whole area of cultivation, were furnished by the local councils, and special agents collected all other statistics. Nearly the whole compilations have been performed by the staff of the Registrar-General, and it is believed that superior accuracy has been attained.

The returns are considered to be highly satisfactory. The meaning of this is, that as compared with recent years there is satisfactory progress, and that the crop is a good one.

At we do not wish to take advantage of bad seasons in order to make comparisons favourable to our argument, we propose to show, by a comparison of the whole succession of seasons, how far this colony has benefited by the liberal land policy adopted in 1862.

From Mr. Archer's tables we have compiled a table showing the two principal crops, wheat and oats, and the total cultivation compared with population in the illiberal or anti-settlement period—that is previous to 1862—and the figures for an equal period after 1862. From this table some very curious facts appear.

The increase per cent. in the respective periods were as follows:

	1st period— 1854 to 1862.	2nd period— 1862 to 1870.
	Inc. per cent.	Inc. per cent.
Total acres occupied ...	277	225
Acres cultivated ...	1,166	89
Acres wheat ...	2,507	46
Acres oats ...	3,671	59
Population ...	77	29

To these we may add the respective per-centages of progress in the produce of wheat. In the first period the increase was from 154,202 bushels to 3,607,727 bushels, or 2240 per cent. In the second period the increase was from 3,607,727 bushels to 5,697,036, or 57 per cent.

The simple explanation of the above astounding results is—that so long as there was a remunerative local market for the produce, settlement and production proceeded at a railway pace, in spite of alleged illiberal land laws; but the moment the production reached a surplus, for which no market was available, progress was arrested, and must have been arrested, at whatever price the lands were sold. Thus liberal legislation was necessarily from the first abortive. The cultivation of wheat declined for years after the Duffy Act was passed, and the cultivation of oats has been at a standstill for seven years.

The theory was that by cheap land not only would cultivation be promoted, but emigration would be stimulated, and population be immensely increased. The comparison proves this theory to be false and delusive. We have all along asserted that for cultivation the first necessity of progress was a permanently remunerative market for the produce, and that the only attractions for immigration were—first, cheap passage-money; and, second, an assurance of higher rates of wages. Cheap land by itself to the masses was never an attraction.

As regards cultivation, the tables are exceedingly instructive. For ten years past the liberal politicians have been literally hounding on our population to seize upon the lands. Pastoral occupations were a sign and a type of barbarism, and the pastoral occupiers must be driven across the Murray. Have the population responded? Have the happy homes been established, and the farm substituted for station? It is true

that since 1862 between four and five millions of acres of the best agricultural lands have been taken from the pastoral tenants, and all but given away to persons professing to be agriculturists; but of these lands what proportion has been cultivated may be estimated when we find that in 1862 the amount of cultivation was four acres to five persons, while now it is no more than eight acres to seven persons; the proportion in each case remaining about one acre to each inhabitant.

The *Leader* has of late in a most emphatic manner denounced the proposal of cultivation in this colony for the production of a surplus for export as a delusion and a snare. In one of its publications it shows in the clearest manner that the two competitors for possession of the world's markets for cereals are

America and Russia. The *Leader* points out that even America will not be able to compete with Russia; and that Australia can compete with neither. With an emphasis which reminds us of the fox when he could not get the grapes, the *Leader* consoles its readers with the aphorism that a country which grows wheat for export is always poor. But we imagine that the *Leader* has learned this rather late in the day, after all the mischief has been done, and that the business of the *Leader* is not to pronounce aphorisms, but to point out to its readers what other crop they can grow, and where they can find a remunerative market for any sort of surplus produce. The unfortunate dupes cannot feed their families or recover their lost capital with an aphorism.—*Melbourne Economist*.

MANCHESTER AND LIVERPOOL AGRICULTURAL SOCIETY.

MEETING AT WIGAN.

Considering how, to a great extent, if not almost exclusively, the town and the immediate neighbourhood is devoted to manufacturing and mining pursuits, it might have been thought that an agricultural show would possess but few attractions for such a place as Wigan; but the very opposite has been the result, and there are few towns in Lancashire which could give the Society a more hearty welcome or more liberal support than has been accorded by the inhabitants of this town and district in connection with the present show.

The show of implements and machinery in motion took place on the Monday. Wednesday was the most important day, but both days were marred by the unfavourable weather. The arrangements on the show-ground during both days were very satisfactory, and considerable credit is due to the new secretary, Mr. Rigby, for the manner in which he discharged his duties. The show of cattle was altogether one of the finest that has ever been brought together in connection with the Society. The show of shorthorns was numerous, and the class included some capital specimens of the breed of cattle, but the quality on the whole was unequal. The show of horses, like that of cattle, was very good, and several local exhibitors were highly successful. There were 173 entries, the number included in the classes limited to members resident in the Society's district—the whole of south Lancashire and Cheshire, within a radius of 35 miles from Warrington market-gate—being 47. The brood mares for breeding horses for draught purposes constituted an exhibition seldom met with. There were 16 classes in the competition for sheep. Any deficiencies, so far as regarded stock from the neighbourhood of Wigan, or Lancashire generally, were more than made up by breeders from a distance. This was particularly observable in the Leicester class. The principal prizes offered for pigs were nearly all, with the exception of those for the black or Berkshire breed, given to Mr. Peter Eden, of Salford.

The following were the Judges:

CATTLE.—G. Drury, Holker Grange, Newton-in-Cartmel; B. Baxter, Elsoek Hall, Skipton; W. H. Hawdon, Walkerfield, Staindrop.

HORSES (Light).—G. Clay, Wem, Shropshire; Wm. Foster, jun., Burradon, Morpeth, Northumberland. Draught horses: J. Bromley, Lancaster; T. Gibbons, Barnfoot, near Carlisle.

SHEEP.—R. H. Masfen, Pendeford, Wolverhampton; F. Spencer, Claybrook, Lutnerworth.

PIGS.—R. H. Watson, Bolton Park, Wigton, Cumberland; T. Dods, Mount Pleasant, Wakefield.

CHEESE AND BUTTER.—G. Jennison, Belle Vue, Manchester; R. Pedley, Crewe.

GRAIN, ROOTS, AND SEEDS.—Mr. Rothwell, Croft, Warrington; Mr. Hornby, Minshull Vernon, Middlewich.

IMPLEMENTS.—J. Whalley, Mill Green, Bold, Warrington; J. J. Rowley, Rowthorne, Chesterfield.

PRIZE LIST.

HORSES.

(Competition limited to members resident in the Society's district).

Brood mares for breeding horses for draught purposes.—First, second, and third prizes, T. Statter, jun., Stand Hall, Whitfield, Manchester.

Brood mares, for breeding roadsters or carriage horses.—First prize, The Earl of Crawford and Balcarres; second, W. Taylor, Billinge Higher End, Wigan; third, Thomas Statter, jun.

Pair of draught horses.—First prize, Chas. Wm. Brierley, Rhodes House, Middleton, Manchester; second, H. B. H. Blundell, Deysbrook, West Derby, Liverpool; third, Williamson Brothers, Ramsdell Hall, Lawton, Cheshire.

Pair of agricultural horses, the property of tenant farmers.—First prize, C. W. Brierley; second, S. Lees, Preston Brook, Cheshire; third, T. Statter, jun.

Three years old colt (gelding or filly), cart breed.—First prize, W. Darbyshire, Morris Brook, Warrington; second, T. Statter, jun.

Two years old colt (gelding or filly), cart breed.—First prize, J. Hampson, Wroughton, Wigan; second, T. Hargreaves, Oakhurst, Wigan.

One year old colt (gelding or filly).—Prize, T. Statter, jun. Weaned foal (horse or filly), cart breed.—First prize, Catherine Waterworth, Upholland; second, T. Statter, jun.

Two years old colt (gelding or filly), half-bred.—First prize, The Earl of Crawford and Balcarres; second, J. Prescott, Dalton Grange, Ormskirk.

One year old colt (gelding or filly), half-bred.—First prize, Dr. McGregor, Acton, Weaverham, Cheshire; second, The Earl of Crawford and Balcarres.

(Open for Competition to the United Kingdom).

Mare or gelding for draught purposes, four years old and upwards.—First prize, C. W. Brierley, Middleton; second, Pearson and Knowles, Ince Hall Colliery, Wigan.

Three years old colt (gelding or filly), draught breed.—First prize, Williamson Brothers, Lawton, Cheshire; second, Geo. Woods, Sefton Hall Farm, Liverpool.

Two years old colt (gelding or filly), draught breed.—First prize, P. Martin, The Street, near Chorley; second, Thomas Statter.

One year old colt (gelding or filly), draught breed.—First prize, T. Statter; second, P. Martin.

Three years old colt (gelding or filly), half-bred.—First prize, H. Inman, Stretford, Manchester; second, P. Wright, Middlewich.

Two years old colt (gelding or filly), half-bred.—First prize, R. Barton, Birkenhead; second, T. Shortrede, Winstanley, Wigan.

One year old colt (gelding or filly), half-bred.—First prize, J. Wright, Middlewich; second, A. C. Smethurst, The Limes, Wigan.

Weaned foal (horse or filly), half-bred.—First and second prizes, The Earl of Crawford and Balcarres.

Brood mares for breeding hunters.—First prize, N. Ellison.

St. Helens; second, E. L. Wright, Hindley Hall, Wigan; third, T. Statter.

Roadster (mare or gelding), above 14 hands 2 inches and under 15 hands 2 inches.—First prize, T. Statter; second, H. S. Woodcock, The Elms, Wigan; third, T. Heald, Greenfield House, Billinge, Wigan.

Cobs (mares or geldings), above 13 hands 2 inches and under 14 hands 2 inches.—First prize, J. Fielden, Lostock Grange, Westhoughton; second, P. Martin, The Street, near Chorley; third, W. Woods, Wigan.

Ponies (mares or geldings), above 12 hands 2 inches and under 13 hands 2 inches.—First prize, T. Statter, jun.; second, T. Rigby, Darnhall Farm; third, J. Brookwell, Wallgate, Wigan.

Ponies (mares or geldings), under 12 hands 2 inches.—First prize, H. Ashton, Polefield Hall, Prestwich; second, J. C. Rogerson, Manchester; third, The Earl of Crawford, and Balcarres.

Stallions, thorough-bred, for getting weight-carrying hunters. Prize, Sir R. T. Gerard, Bart., Garswood.

Stallions, for getting horses for carrying or road purposes.—First prize, Lund and Redman; second, Dr. McGregor.

Stallions for getting horses.—First prize, W. Shaw; second, A. Cook; third, B. G. D. Cook.

Colts (entire), for draught purposes, foaled in 1868.—First prize, W. Barron; second, Pearson and Knowles.

Carriage horses (gelding), above four years old.—Prize, E. L. Wright.

Ladies' hackneys (mares or geldings).—First prize, R. and W. Barton; second, M. Banks.

HUNTERS.

Hunters up to 14 stone and upwards.

Extra prizes to the best leaper over hurdles and water.—First prize, T. Statter, jun.; second, E. L. Wright; third, R. A. Butcher. Leapers.—First prize, R. A. Butcher; second, E. L. Wright.

Hunters up to 12 stone and upwards.

Extra prizes to the best leaper over hurdles and water.—First prize, A. Cross; second, E. L. Wright; third, B. Goodall. Leapers.—E. L. Wright; second, Mrs. H. Johnson.

SHORTHORNS.

(Open for competition to the United Kingdom.)

Bulls above two years old.—First prize, C. W. Brierly, Rhodes House, Middleton, Manchester (Bolivar); second, A. Clough Smethurst, The Limes, Wigan; third, P. Martin, The Street, Chorley.

Bulls above one but under two years old.—First prize, W. W. Slye, Beaumont Grange, Halton; second, T. Statter, jun., Stand Hall, Whitefield, Manchester; third, P. Martin, Chorley.

Bull calves above six but under twelve months old.—Prize, N. Eckersley, Standish Hall, Wigan.

Cows above three years old, in milk or in calf.—First prize, T. Atherton, Chapel House, Speke, Garston; second, Lord Skelmersdale, Latham House; third, the Rev. L. C. Wood, Singleton Lodge, Kirkham.

Heifers above one but under two years old.—First and second prize, T. Statter, jun., Whitefield, Manchester.

Heifer calves above six but under twelve months old.—First prize, T. Atherton; second, T. Statter; third, J. Walton, Horncliffe Quarries, Rawtenstall.

OTHER BREEDS OF CATTLE.

Ayrshire cow or heifer, above two years old, in-milk or calf.—First prize, The Earl of Crawford and Balcarres, Haigh Hall; second, T. Statter.

Welsh cow or heifer, above two years old, in-milk or calf.—Prize, T. Statter.

Kerry cow or heifer, above two years old, in milk or calf.—First prize, Rev. J. C. Macdona, Hillbre House, West Kirby; second, H. Inman, Rose Bank, Stretford. Highly commended: Rev. J. C. Macdona.

French or Channel Island cow or heifer, above two years old, in milk or calf.—First prize, T. Stretch, Vine Cottage, Ormskirk; second, T. Statter. Highly commended: T. Shortrede, Park House, Winstanley, Wigan.

French or Channel Islands bull.—The Society's silver medal, H. S. Woodcock, The Elms, Wigan.

CATTLE.

(Competition limited to members resident in the Society's district.)

Bulls of any breed belonging to landlords, that are allowed to serve cows of their tenants gratis.—The Society's silver medal, the Earl of Crawford and Balcarres, Haigh Hall.

There were other local prizes.

SHEEP.

(Open for competition to the United Kingdom.)

LEICESTERS.

Shearling rams.—First and second prize, E. Riley, Kipling Cotes Farm, Beverley.

Rams of any other age.—First prize, E. Riley; second, T. H. Hutchinson, Catterick, York.

Ram lambs (Leicesters).—First and second prize, T. H. Hutchinson.

Three shearling ewes.—First prize, E. Riley; second, T. H. Hutchinson.

Three ewes of any age, having reared lambs in 1869.—First and second prize, T. H. Hutchinson.

Three ewe lambs.—First and second prize, T. H. Hutchinson.

SHROPSHIRE DOWNS.

Shearling rams.—First prize, Sarah Beach, The Hattons, Brewrod, Penkridge; second, J. Coxon, Freeford Farm, Lichfield.

Rams of any other age.—First prize, Sarah Beach; second, T. Johnson, The Hermitage.

Ram lambs.—First and second prize, Sarah Beach.

Three shearling ewes.—First prize, C. R. Keeling, Yew-tree House, Penkridge; second, T. Nock, Sutton Maddock, Shifnal.

Three ewes of any age, having reared lambs in 1869.—First prize, J. Coxon, Freeford Farm, Lichfield; second, C. R. Keeling.

Three ewe lambs.—First prize, Sarah Beach; second, J. Coxon.

OF ANY OTHER KIND.

Shearling rams.—First prize, S. Jackson, Cock Hall, Whitworth, Rochdale; second, L. Duckworth, Sheep Hay, Ramsbottom, Lancashire.

Rams of any other age.—First prize, S. Jackson; second, R. Shortreed.

Three shearling ewes.—First prize, W. Midgeley, Salisbury Old Hall, Ribchester, Preston; second, R. Shortreed.

Three ewes of any age, having reared lambs in 1869.—First and second prize, S. Ashton, Timperley.

PIGS.

WHITE BREED.

(Open for competition to the United Kingdom.)

Boars of the large breed, of any age.—First and second prize, P. Eden, Cross-lanes, Salford, Manchester; third, R. E. Duckering, Northope, Kirton Lindsey.

Boars of the middle-sized breed, of any age.—First prize, R. E. Duckering; second and third, P. Eden.

Boars of the small breed, of any age.—First prize, P. Eden; second, W. Hatton, Addingham, Leeds; third, H. Nield, The Grange, Worsley, Manchester.

Sows of the large breed, of any age.—First prize, P. Eden; second, R. E. Duckering; third, J. Birch, Sefton, Maghull.

Sows of the middle-sized breed of any age.—First and second prize, P. Eden; third, R. E. Duckering.

Sows of the small breed, of any age.—First prize, P. Eden; second and third, W. Hatton, Addingham, Leeds.

BLACK OR BERKSHIRE BREED.

Boars of any age.—First prize, M. Walton, Halifax; second and third, H. N. Abbinett, George Hotel, Liverpool.

Sows of any age.—R. Duckering; second, M. Walton; third, H. N. Abbinett.

EXTRA PRIZES.

Competition limited to residents within a radius of seven miles from the borough of Wigan.

Best boar of the large breed.—Prize, the Earl of Crawford and Balcarres.

Best boar of the small breed.—Prize, T. Comber, Redcliffe, Newton-le-Willows.

Extra stock pig.—Prize, T. Comber.

GRAIN AND ROOT CROPS.

Grown in 1870. (Open for competition to the United Kingdom.)

GRAIN.

White wheat, not less than 2 bushels.—First prize, J.

Cornes, New Farm, Hurlstone, Nautwich; second, J. K. Fowler; third, Richard Beckett.

Red or yellow wheat.—First prize, F. Lythal, The Spittal Farm, Banbury; second, T. Rigby, Darnhall Farm; third, J. Cornes.

White oats (any variety).—First and second prize, W. Birch, Stand Farm, Aintree; third, F. Lythal.

Yellow oats (any variety).—Prize, H. Nield.

Black oats.—First prize, F. Lythal; second, Henry Nield; third, Samuel Allen.

Barley (any variety).—First and second prize, J. Cartwright, Speke, near Liverpool.

Beans (any variety).—First prize, F. Lythal; second, J. K. Fowler.

ROOTS.

Six roots of Swedish turnips, any kind.—First prize, J. Cross, Gillow House, Wigan; second, the Earl of Crawford and Balcarres; third, R. Birch, Orrell, Liverpool.

Six roots of any kind of turnips.—First and second prize, the Earl of Crawford and Balcarres.

Six roots long red mangel wurzel.—First prize, J. Birch; second, J. Whitworth, Measham, Atherstone; third, J. Birch.

Six roots long red mangel wurzel.—Prize, J. Cornes, Hurlstone, Nautwich.

Six roots any kind globe mangel wurzel.—First prize, J. Whitworth, Atherstone; second, J. Birch.

Round potatoes (any variety).—First prize, H. Nield, Worsley, Manchester; second, R. and W. Barton, Leigh; third, J. Cartwright, Speke, Liverpool.

Flat potatoes (any variety).—First prize, J. Rowlinson, Warrington; second, J. Gaskell, Ashton; third, J. K. Fowler, Aylesbury.

CHEESE.

(Open for competition to the United Kingdom.)

Four cheeses above 50lbs. weight each, made on exhibitor's farm.—First prize, G. Willis, Winsford; second, G. Prescott, Middlewich.

Four cheeses less than 50lbs. each, made on exhibitor's farm.—First prize, J. Wood, Over, Cheshire; second, T. Finchett, Tarporley.

Four cheeses made in Lancashire on exhibitor's farm, not less than 20lbs. each.—Prize, H. Wood, Croft, Warrington.

BUTTER.

Six half-pounds made by exhibitor.—First prize, Henry Nield, Worsley, Manchester; second, the Earl of Crawford and Balcarres; third, S. Davies, Middlewich; fourth, E. Turner, Heywood.

Six half-pounds butter made within seven miles of the borough of Wigan.—First prize, Jane Gibson, Haigh, Wigan; second, the Earl of Crawford and Balcarres; third, R. Taylor, Aspull, Wigan.

IMPLEMENTS.

Agricultural machinery in motion.—First prize, Picketsley, Sims, and Co., Bedford Foundry, Leigh; second, J. and H. Keyworth, Liverpool.

Collection of farm implements and tools.—First prize, J. and H. Keyworth; second, Picketsley, Sims, and Co.

Dairy vessels and utensils, best assortment.—First prize, John Gidman, King-street, Knutsford; second, W. and F. Richmond, Colne.

Articles of domestic use, best assortment.—First prize, Wm. Bennett, Liverpool; second, A. Lyon, 32, Windmill-street, Finsbury, London.

Stands of carts, waggons, and drays for farm and town purposes.—Prize, Henry Hayes and Son.

Wagon for farming purposes.—Prize, H. Bracewell.

Two-horse cart for general farm purposes.—Prize, H. Bracewell.

Best one-horse cart for farm purposes.—Prize, Henry Hayes and Son.

Stable and cow-house fittings.—Prize, Musgrove Brothers, Belfast.

Two-horse cart for agricultural purposes suited to the district, with harvest gear, &c., weight not exceeding 16 cwt., wheel tyres not less than 5 inches wide.—First prize, H. Bracewell; second, A. Brown, Cottage Farm, Haigh, Wigan.

Ploughs.—Double furrow.—First prize, J. Higson, Manchester (Howard, maker); second, F. Corbett, Shrewsbury; commended, Ransomes, Sims, and Head, Ipswich, and J. and H. Keyworth, Liverpool. Swing plough.—Prize, D. Harkes, Mere, Knutsford. Wheel plough.—Prize, T. Corbett.

Cultivator for two or more horses.—Prize, J. Higson.

Link chain harrows.—Prize, T. Corbett.

Combined mowers and reapers.—First prize, Picketsley, Sims, and Co., of Bedford, Leigh; second, A. C. Bamlett, of Thirst.

One-horse reapers and mowers.—Prize, Picketsley, Sims, & Co.

Potato diggers.—A first prize of £6, and a silver medal, had been offered by the society, for improved horse potato diggers, but there were only two competitors.—Mr. Henry Nield, the Grange, Worsley, Manchester, and Mr. James Higson, 30, Thomas-street, Manchester. The judges considering that there was not sufficient improvement on last year's implements to show any merit, refused the medal, and divided the first prize between the competitors.

Mr. Bamlett has refused to accept the second prize awarded to him for combined reapers and mowers, and forwarded us a letter, which he has addressed to Mr. Rigby, the secretary of the society, in which he says: "I was induced to compete at your trials by it being represented to me, by your local secretary, that I might expect a thorough and impartial trial, and that the judges would not be local men. He also very courteously showed me over the trial ground; one portion of the meadow was of a very rough nature, having deep furrows in it, which would test a mowing machine more severely than any trial I have hitherto been at in Lancashire; the other portion of the meadow was nearly level. Now what are the facts of the case? The judges, instead of being strangers, two of them had (this season) acted as judges, viz., at Bartle and at Blackpool, in which they gave their decisions in favour of one particular machine. Was it likely they would wish to reverse their own previous decisions? Now what I have most to complain of is, the judges not testing the machines both on the rough as well as on the smooth ground. They were requested jointly by myself and Mr. Kearsley to do so, and we received evasive answers, which partly led us to expect they would. Had they given us a straight-forward answer, telling us they did not intend testing the machines on the rough ground, we would have withdrawn from the trial, as we knew that our machines would have shown to a much greater advantage on the rough ground."

RICHMONDISHIRE AGRICULTURAL SOCIETY.

MEETING AT LEYBURN.

This is a very young Society, having only been in existence a few years. It was founded to give an impetus to the pursuits of farming in the district of Richmond, and so much was its influence and usefulness felt that last year the committee agreed to extend the sphere of the Society's operations by embracing the towns of Bedale and Leyburn, both of which places had previously had their agricultural Associations. Instead, therefore, of having shows at each of these towns, and thereby making the district in effect "a house divided against itself," it was resolved to amalgamate the three towns, and to have one show for the whole. The entries on

this occasion were 65 in excess of those twelve months ago. Two new features were introduced into the show this year, namely, a display of poultry and an exhibition of agricultural produce, including cheese, butter, turnips, potatoes, and onions.

The two classes of Shorthorn bulls were all pedigree animals, descended from the purest blood. A silver cup, given by Lord Bolton, for the best animal in the cattle classes, was awarded to Messrs. Willis and Son's Windsor Fitzwindsor. The sheep department was of a very good character. We may mention the classes for shearing rams and tup lambs for crossing with black-faced ewes, the

former numbering twenty and the latter seventeen prize animals. The pigs were not so numerous as sheep. The boars of the large and small breeds were deserving of praise, and the eighteen animals, sows of any age, of the small breed, constituted a formidable competition in that class, the successful exhibitors being Mr. Greaves, of Clothierholme, and Mr. Chapman, of Seamer. The section of horses was one of considerable interest, and this department is always the source of attraction. The classes generally were well filled, that for hunting brood mares being well represented, as well as the classes for two years old geldings or fillies and colts or filly foals. The coaching horses were no less commendable, the several classes in the aggregate comprising thirty-six animals, whilst the roadsters might be said to be their powerful rivals, as they numbered forty-two, the five classes into which they were divided being in every respect worthy of the Society.

The following were the Judges :

CATTLE, LEICESTER SHEEP, AND PIGS.—Geo. Atkinson, Manor Farm, Seaham; and John Unthank, Nethercales, Penrith.

HORSES.—Hunters and Haeks: A. L. Maynard, Skinninggrove, Redcar; and Henry Lambert, Middleton Wold, Beverley. Coaching and Farm Horses: N. Clarke, Beamish Park, Fence Houses; and Robert Wade, Little Burdon, Darlington.

LONG-WOOL AND CROSS-BRED SHEEP.—Robert Wilson, Skiveden, Skipton; and John B. Beckwith, Winterburn, Skipton.

IMPLEMENTS.—Thos. Scott, Grantley, Ripon, and Broom Close, Boroughbridge; and Richard Kay, Forecett Valley, Darlington.

PRIZE LIST.

CATTLE.

Shorthorn bull, two years old or upwards.—First prize, T. Willis and Son, Manor House, Carperby; second, J. Barker, Middleham.

Shorthorn bull, not exceeding two years old.—First prize, W. Linton, Sheriff Hutton, York; second, J. Outhwaite, Baines, Catterick.

Bull calf.—First and second prizes, T. Willis and Son.

Shorthorn cow or heifer, in calf or milk, three years old or upwards.—First prize, H. T. Robinson, The Cliff, Leyburn; second, W. Linton.

Shorthorn heifer, two years old, in calf or milk.—First prize, J. Outhwaite; second, T. Willis and Son.

Yearling Shorthorn heifer.—First prize, T. H. Hutchinson, Manor House, Catterick; second, T. Willis and Son.

Heifer calf.—First prize, J. Outhwaite; second, T. H. Hutchinson.

Cow, in calf or milk, for dairy purposes, not being eligible to be entered in the herd-book.—First prize, H. T. Robinson; second, T. H. Hutchinson.

Two-years-old heifer, not being eligible to be entered in the herd-book.—First prize, T. H. Hutchinson; second, F. Dodsworth, Haraby, Leyburn.

Yearling heifer, not being eligible to be entered in the herd-book.—First prize, T. Willis and Son; second, T. R. King, Wymbury-Holme, Leyburn.

Heifer calf, not being eligible to be entered in the herd-book.—First prize, T. R. King; second, T. H. Hutchinson.

Cow, in calf or milk, for dairy purposes, the property of a cottager.—First prize, W. Busby; second, J. Tomlin.

Best animal (bull, cow, or heifer) in the show-yard.—Prize, Willis and Son.

SHEEP.

Best Leicester ram, two-shear or upwards.—First prize, T. H. Hutchinson; second, G. T. Carter, Mill Close, Bedale.

Shearling Leicester ram.—First prize, T. H. Hutchinson; second, G. T. Carter.

Leicester tup lamb.—T. H. Hutchinson; second, T. H. Hutchinson.

Three Leicester ewes, each having reared a lamb this season.—First prize, T. H. Hutchinson; second, T. H. Hutchinson.

Three shearling Leicester gimmers.—First prize, T. H. Hutchinson; second, G. T. Carter.

Long-woolled ram, not being Leicesters, two-shear or upwards.—First prize, W. Raw, High Ellington; second, J. O. and A. Trotter, Thornton Steward.

Long-woolled shearling ram, not being Leicesters.—T. H. Robinson, The Cliff, Leyburn; second, J. O. and A. Trotter.

Long-woolled tup lamb, not being Leicesters.—Prize, H. Dobson, Leyburn.

Pen of three long-woolled ewes, each having reared a lamb this season.—First prize, T. H. Hutchinson; second, J. O. and A. Trotter.

Three shearling long-woolled gimmers.—First prize, J. O. and A. Trotter; second, W. Raw.

Ram, two-shear or upwards, for crossing with blackfaced ewes.—First prize, W. Thompson, Lane House, East Witton; second, J. Styan, Mount Park.

Shearling ram, for crossing with blackfaced ewes.—First prize, J. Lambert, Swinithwaite; second, C. Other, Elm House, Leyburn.

Tup lamb, for crossing with blackfaced ewes.—First prize, C. Whitelock, Haraby, Leyburn; second, J. Burnett, Preston, Leyburn.

Pen of three ewes (each having reared a lamb this season), for breeding rams for crossing with blackfaced ewes.—First prize, T. H. Hutchinson; second, J. Theakston, Leyburn.

Pen of three gimmers, for breeding rams for crossing with blackfaced ewes.—First prize, T. Willis and Son, Carperby; second, R. Kirk, Gayle Bank, Leyburn.

Pen of three ewes, being a cross from a blackfaced ewe.—First prize, T. E. and J. Swale, Middleham; second, W. Plews, Leyburn.

Pen of three gimmers, being a cross from a blackfaced ewe.—First prize, H. Walton, Gingerfield, Richmond; second, L. Wilkinson, Cold Storms, Downholme.

Pen of five twice crossed lambs.—First prize, W. Wilson, Seales; second, T. E. and J. Swale.

The best ram (not a Leicester).—Prize, J. Lambert, of Swinithwaite.

BLACK-FACED OR MOUNTAIN SHEEP.

Ram two years old or upwards.—First prize, W. Rudsdale, Weadland's Head Yarm; second, Cass Smith, Westerdale, Yarm.

Shearling ram.—First prize, W. Rudsdale; second, C. Smith.

Pen of three ewes, each having reared a lamb this season.—First prize, C. Smith; second, W. Rudsdale.

Pen of three shearling gimmers.—First prize, W. Rudsdale; second, C. Smith.

PIGS.

Boar of any age of the large breed.—First prize, W. Rudsdale; second, G. Chapman, Seamer, Scarborough.

Boar of any age of the small breed.—First prize, G. Chapman; second, G. Chapman.

Sow of any age of the large breed.—First prize, G. Chapman; second, W. Rudsdale.

Sow of any age of the small breed.—First prize, J. Greaves, Clothierholme, Ripon; second, G. Chapman.

Pig belonging to a cottager.—First prize, J. Wilson, Rain-ton, Thirsk; second, J. Spence, Leyburn.

HORSES.

HUNTERS.

Brood mare, with foal at foot or stinted.—First prize, J. T. Robinson, Asenby, Thirsk; second, G. Meynell, Patrick Brompton.

Three-year-old gelding.—First prize, R. Brunton, Marton, Middlesbro'; second, G. Meynell.

Three-year-old filly.—First prize, J. Kirby, Knayton, Thirsk; second, C. Stirke, Barden Lane.

Two-year-old gelding or filly.—First prize, R. Emmerson, Over Dinsdale; second, R. Brunton.

Yearling gelding or filly.—First prize, R. Emmerson; second, G. T. Carter, Mill Close.

Colt or filly foal, to be shown with dam.—First prize, J. Close, Whiteaside, Reeth; second, Rev. E. C. Topham, Hauxwell.

COACHING HORSES.

Brood mare with foal at foot or stinted.—First prize, M. Robinson, Glass House, Hauxwell; second, M. Robinson.

Three-year-old gelding or filly.—First prize, C. Stirke; second, J. Hopps, High Burton.

Two-year-old gelding or filly.—First prize, W. Mothersill, Brockholme, Thornton-le-Moor; second, W. White, Leyburn.

Yearling colt or filly.—First prize, Rev. J. C. Wharton, Gilling; second, C. Stirke.

Colt or filly foal to be shown with dam.—First prize, M. Robinson; second, R. M. Jaques, Easby, Richmond.

ROADSTERS.

Brood mare, with foal at foot or stunted.—First prize, A. Hauxwell, Thirsk; second, Miss Stainton, Hauxwell, Bedale.

Three-year-old colt or filly.—First prize, W. Snowdon, Slingsby; second, G. Morton, Bedale.

Two-year-old colt or filly.—First prize, J. T. Stowell, Faverdale House, Darlington; second, W. Snowdon.

Yearling colt or filly.—First prize, J. C. Wharton; second, R. Jackson, Ainderby Myers, Catterick.

Colt or filly foal, to be shown with dam.—First prize, J. Greaves, Clothholme; second, J. Tidyman, Bellerby.

HORSES FOR AGRICULTURAL PURPOSES.

Brood mare, with foal at foot or stunted.—First prize, J. Hopps, High Burton; second, G. Linton, Bedale.

Three-year-old gelding or filly.—First prize, N. Stonehouse and Son, Skelton Mill, Marske-by-the-Sea; second, Mrs. Hedon, Hewfield House, Baldersby.

Two-year-old gelding or filly.—First prize, Mrs. Hedon; second, W. Pratt, Pond House, Bedale.

Yearling gelding or filly.—First prize, J. Holmes, Hauxwell, Bedale; second, J. O. and A. Trotter.

Colt or filly foal to be shown with dam.—First prize, H. Walton, Richmond; second, C. Stirke, Barden Lane.

Pair of horses, either sex, to be shown in plough harness.—First prize, J. Ambler, East Witton; second, J. Outhwaite, Catterick.

SPECIAL PRIZES.

Four years old hunting gelding or filly.—First prize, J. B. Booth, Catterick; second, R. Metcalfe, Malton.

Five years old or upwards hunting gelding or mare, by a thorough-bred horse.—First prize, J. B. Booth; second, C. G. Tate, Richmond.

Horse or mare of any age, which shall leap fences for the

purpose in the best style.—First prize, C. Other, jun., Richmond; second, C. Rose, Malton.

Hunting gelding or filly, not exceeding five years old, the property of tenant-farmers or tradesmen residing within the limits of the Bedale Hunt.—Prize, J. S. Atkinson, Yafforth Lodge.

Roadster gelding or mare, not more than 15 hands, and not less than four years old.—First prize, J. Robinson, Old Malton; second, A. Hauxwell, Thirsk.

Pony gelding or mare of any age, and not exceeding 14 hands high.—First prize, A. Hauxwell; second, A. Young, Richmond.

Gelding or mare for single harness, to be driven on the ground.—First prize, T. M. Fryer, Wensley House; second, C. Other, junr.

CHEESE, BUTTER, ROOTS, &c.

New milk cheese.—First prize, W. Hewgill, Bedale; second, C. Thompson, Askrigg; third, J. Pickard, Bedale.

Butter.—First prize, W. Trotter, Bedale; second, Mrs. C. Chapleo, Leyburn.

Swede turnips.—First prize, C. Stirke, Bedale; second, M. Robinson, Thornton Steward.

Yellow bullock or white turnips.—Prize, W. Trotter.

Kidney potatoes.—First prize, G. Mudd, Bedale; second, T. Mallaby, Spennithorne.

Round potatoes.—First prize, W. Ward, Leyburn; second, W. Trotter.

Onions.—First prize, G. Mudd; second, R. Hood, Leyburn.

IMPLEMENTS.

W. Waide, Leeds, £1, for improvements in barrel churn; J. Teasdale, Bedale, £1, for eleven-row steerage drill; C. Busby, Newton-le-Willows, £1, for ploughs; W. Richardson, Leyburn, £1, for collection; H. Bushell, York, £1, for assortment; W. Mattison, Bedale, £1, for improvement and cheapness in new reaping machine.

CLEVELAND AGRICULTURAL SOCIETY.

MEETING AT GUISBOROUGH.

The Cleveland is one of the oldest Societies of its class in Yorkshire, having been established nearly forty years. It has had a long career of usefulness, having visited repeatedly the whole of the towns included within its extensive area. The display of cattle was a credit to the Society. The class for bulls of any age was represented by eleven animals, the picking out of the prize beasts being a work of no little difficulty on the part of the judges. The cows in-calf or milk comprised eight prime head of cattle, the cows for dairy purposes were five in number, and the other classes of cattle included animals of some excellence, the general remark being that there was not a single mediocre beast in the yard. As regarded the sheep there was much to commend, and in the pig section were many excellent animals, the boars of the large breed under two years old all being without doubt large in the fullest sense of the word, as it would be almost impossible to produce animals of greater weight and size. The Cleveland Society has long been proverbial for its display of horses, and, as Guisborough and the district around is the home of the renowned Cleveland bays, there was at this show one of the best arrays of prime horses that could well be witnessed. It was said, indeed, there was a thorough weeding out of inferior cattle, the owners of which for very shame dared not bring bad animals to disgrace the show, and therefore there was only the very cream of horseflesh present. The Cleveland bays were not in such large force as usual, but their quality was never surpassed, whether as regarded symmetry or colour. For the agricultural stallions, adapted to improve the breed of agricultural horses, the tempting prize of £40 was offered, but, the conditions being somewhat strict and difficult to comply with, there were only three entries. The terms were, that the horse receiving the prize must be perfectly sound in every respect, and be required to travel the season of 1871, the

route within the district of the Society to be fixed in accordance with the decision of the Council, and serve mares at not more than 30s. each; the £40, which was the gift equally of the inhabitants of Guisborough and a few of the landowners in the district, to be held in the hands of the secretary of the Society until the conditions be complied with.

JUDGES.

CATTLE, SHEEP, AND PIGS.—S. Rowlandson, Newton Morrell, Darlington; G. Atkinson, Hall Farm, Seaham; T. Outhwaite, Goldsboro' House, Knaresborough.

HORSES.—Hunters and Special Prizes: C. Wood, South Dalton, Beverley; T. Ellerby, Whitwell; W. Searth, Keverstone, Darlington. Cleveland, Bays, and Coaching: J. Johnson, Brigham, Driffild; J. S. Darrell, West Aytou; J. Outhwaite, Baines, Catterick. Draught Horses, Roadsters, and Ponies: T. Scott, Broom Close, Borough-bridge, and Grantley, Ripon; P. Stevenson, Rainton, Thirsk; J. Harrison, White House, Middlesborough.

EGGS, BUTTER, AND CHEESE.—G. Watson, Middlesborough.

SHORTHORN CATTLE.

OPEN TO ALL.

Bull, any age.—First prize, W. Linton, Sheriff-Hutton; second, Jackson and Cleasby, Wilton, Redcar.

Cows in-calf or milk.—First prize, W. Linton; second, Rear-Admiral Chaloner, Longhull, Guisborough.

Heifers in-calf or milk.—Rear-Admiral Chaloner.

DISTRICT CLASSES.

Shorthorn bulls under three years old.—First prize, D. Hartley, Westerdale, Yarm; second, W. Coates, Skelton, Marske-by-the-Sea.

Shorthorn bulls under two years old.—First prize, T. Curry,

Morton Carr, Great Ayton : second, J. Peirson, Ayreholme, Great Ayton.

Shorthorn bulls under twelve months old.—Prize, C. Smith, Westerdale, Yarm.

Shorthorn cows in-calf or milk.—First prize, I. Garbutt, Brag House, Farndale, Kirbymoorside ; second, C. Smith.

Cows for dairy purposes, in-calf or milk.—First prize, J. Herring, Acklam, Middlesborough ; second, T. Atkinson, Ingley Greenhow, Northallerton.

Shorthorn two-year-old heifers, in-calf or in-milk.—Prize, I. Garbutt.

Shorthorn yearling heifers.—First prize, C. Smith ; second, I. Garbutt.

LEICESTER AND BLACK-FACED SHEEP.

DISTRICT PRIZES.

Shearling rams.—First prize, J. Peirson ; second, R. P. Petch, Priest Croft, Marske-by-the-Sea.

Two shear and upwards.—First prize, J. Peirson ; second, R. Jackson, Thornton Grange, Stockton.

Pens of five breeding ewes.—First prize, R. Peirson, Kirbybridge, Carlton ; second, T. Rickinson, Seamer, Yarm ; third, R. P. Petch.

Pens of five shearling gimmers.—First prize, R. P. Petch ; second, T. Rickinson.

Tup lambs.—First prize, R. P. Petch ; second, T. Rickinson.

Blackfaced tups.—First prize, W. Rudsdale, Danby End, near Yarm ; second, C. Smith.

Pens of five blackfaced breeding ewes.—First prize, C. Smith ; second, W. Rudsdale.

PIGS.

DISTRICT PRIZES.

Boar, under two years old, of large breed.—First prize, W. Rudsdale, Danby End ; second, J. Russell, Guisborough.

Boar, under two years old, small breed.—First and second prizes, W. Rudsdale, Danby End, near Yarm.

Sow of any age, large breed, in pig or milk.—Prize, J. Watson, Great Ayton, Northallerton.

Sow of any age, small breed, in pig or milk.—First prize, J. Nightingale, Guisborough ; second, W. Dixon, Marton, Middlesborough.

Grazing pig, the property of labourers, tradesmen, or mechanics.—First prize, J. Fidler, Stokesley ; second, S. Pitt, Marton, Middlesborough ; third, J. Ord, Upsall Pit, Gisborough.

Litter of pigs, under eight weeks of age.—First prize, R. Fidler, Stokesley ; second, R. Jackson, Normanby.

HORSES.

Best Cleveland bay brood mare.—First prize, R. J. Sayer, Great Ayton, Northallerton ; second, J. Porritt, Guisborough.

Cleveland bay colt foal.—First prize, G. Sayer, Hclbeck ; second, C. Smith, Westerdale, Yarm.

Cleveland bay filly foal.—First prize, R. Welford, Newton Mulgrave, Whitby ; second, T. Wood, Skelton, Marske-by-the-Sea.

Cleveland bay yearling filly.—First prize, I. Garbutt, Farndale, Kirbymoorside ; second, R. Welford.

Coaching brood mare.—First prize, R. Watson, Maltby House, near Stockton ; second, J. Featherstone, Marton, Middlesborough.

Coaching colt foal.—First prize, R. Johnson, Brotton, Saltburn-by-the-Sea ; second, J. Jackson, Great Ayton, Northallerton.

Coaching filly foal.—First prize, Mrs. F. Stainthorpe, Newton, near Whitby ; second, G. Coates, Redcar.

Coaching yearling gelding.—First prize, T. Curry, Great Ayton, Northallerton ; second, W. Lancaster, Cleveland, Northallerton.

Coaching two-year-old gelding.—First prize, R. Watson, Stockton ; second, W. Searth, Skelton.

Coaching two-year-old filly.—First prize, G. Gill, Brotton, Saltburn-by-the-Sea ; second, J. C. Johnson, Manfield, Darlington.

Coaching three-year-old gelding.—First prize, T. Jackson, Baraby, near Lythe ; second, Earl of Zetland.

Coaching three-year-old filly.—First prize, J. Featherstone, Marton ; second, W. Wright, Middlesborough.

Roadster brood mare.—First prize, Isaac Garbutt, Brag-

house, Farndale, Kirby Moorside ; second, T. Harrison, Wheldrake, York.

Roadster foal, colt, or filly.—First prize, F. Emmerson, Hulam, Castle Eden ; second, T. Harrison.

Roadster yearling, colt, or filly.—First prize, R. Jordison, Redcar.

Roadster two-year-old colt or filly.—First prize, W. Snowden and Son, Slingsby, York.

Roadster three-year-old colt or filly.—First prize, W. Snowden and Son ; second, H. R. W. Hart, Dunnington Lodge, York.

Draught brood mare.—First prize, T. Makin, Fairburn, South Milford ; second, W. R. I. Hopkins, Grey Towers, Middlesborough.

Draught colt foal.—First prize, T. Makin ; second, T. Upton, Pallathorpe, Tadcaster.

Draught filly foal.—First prize, A. H. T. Newcomen, Kirkleatham Hall, Redcar ; second, H. Trotter, Marske-by-the-Sea.

Draught yearling, gelding, or filly.—First prize, N. Stonehouse and Son, Skelton Mill, Marske-by-the-Sea ; second, R. Ward, Pinchingthorpe, Guisborough.

Draught two-year-old gelding or filly.—First prize, Mrs. Ann Headon, Hew Field House, Baldersby, Thirsk ; second, N. Stonehouse and Son.

Draught three-year-old gelding or filly.—First and second prizes, N. Stonehouse and Son.

In pairs for agricultural purposes, mares or geldings under eight years old, the property of a tenant farmer.—First prize, T. Curry, Morton Carr, Great Ayton, Northallerton ; second, W. and J. Wilson, Longlands Farm, Middlesborough.

Pair of young draught horses, mares or geldings, either two or three years old, the *bound fide* property of one or two persons resident within the district.—First prize, N. Stonehouse and Son ; second, N. Stonehouse and Son and R. Stevenson.

Mare or gelding under eight years of age, from 13 to 14 hands 2 inches high.—First prize, J. S. Darrell, West Ayton ; second, H. J. Curry, Stockton-on-Tees.

Mare or gelding under eight years of age, not to exceed 13 hands high.—First prize, J. T. Wharton, Skelton Castle ; second, A. Hauxwell, Thirsk.

Hunting brood mare.—First prize, J. T. Robinson, Lecky Palace, Asenby ; second, R. Jackson, Normanby.

Hunting colt foal.—First prize, J. T. Robinson ; second, T. Boys, Fryup, Danby End.

Hunting filly foal.—First prize, J. Dodsworth, Great Stainton ; second, Paul Shimmins, Blackhouse, Whitby.

Hunting yearling gelding.—First prize, Paul Shimmins ; second, J. Mewburn, Fell Briggs.

Hunting yearling filly.—First prize, R. Emmerson, Dinsdale Grange, Darlington ; second, A. H. T. Newcomen, Kirleatham Hall, Redcar.

Hunting two-year-old gelding.—First prize, J. Cattle, Barton-le-Street, Maltou ; second, R. F. Trenholm, Butterwick, Sedgfield.

Hunting two-year-old filly.—First prize, J. T. Robinson, Lecky Palace, Asenby ; second, T. Bradley, Newton, Great Ayton.

Hunting three-year-old gelding.—First prize, R. Brunton, Marton ; second, W. Ward, Bannil Flat, Whitby.

Hunting three-year-old filly.—First prize, R. Jackson, Normanby ; second, W. A. Loy, Great Ayton.

SPECIAL PRIZES.

AGRICULTURAL STALLIONS.

Stallion adapted to improve the breed of agricultural horses.—Prize, T. Johnson, Beaumont Hill, Darlington (Premier).

Five years old and upwards hunting geldings, by a thoroughbred horse.—First prize, J. B. Booth, Killerby Hall, Catterick ; second, J. S. Darrell, West Ayton.

Five years old and upwards hunting mare, by a thoroughbred horse.—First prize, Lady de L'Isle and Dudley, Ingley Manor, Northallerton ; second, R. C. Walker, Greatham, Stockton.

Four years old hunting gelding, by a thoroughbred horse.—First prize, J. B. Booth ; second, W. Stephenson, Cottingham, Hull.

Four years old hunting mare, by a thoroughbred horse.—First prize, J. Harrison, Redcar ; second, S. B. Robson, Windle Beck, Ganton.

Hunting gelding or mare of any age, by a thoroughbred horse, which had been hunted during the last season with the Cleveland or Hurworth hounds.—First prize, G. Robinson, Marton, Middlesborough; second, T. Petch, Skelton, Marske-by-the-Sea.

Horse of any age, sex, or breed, which jumped the artificial fences in the best style.—First prize, W. Duell, Low Borrowby, Hinderswell, Saltburn-by-the-Sea; second, R. Jackson, Normanby, Middlesborough.

Roadster, gelding or mare, not more than 15 hands 2 inches high, and not less than four but under eight years of age, qualified to carry 12 stones weight on the road.—First prize, J. Robson, Old Malton; second, A. Hauxwell, York Union Bank, Thirsk.

Ladies' hackney, gelding, or mare, not exceeding 15 hands 2 inches high, and not less than four but under eight years of age.—First prize, J. Cross, Ruswarp Hall, Whitby; second, T. Rickinson, Seamer, Yarm.

STOW-ON-THE-WOLD AND CHIPPING-NORTON AGRICULTURAL SOCIETY.

MEETING AT CHIPPING NORTON.

The annual show was held on Sept. 7th. The animals shown were not very numerous, but some valuable hunters were on the ground. There were also one or two bulls exhibited which distinguished themselves at the Royal Show this year. Among the sheep the point of attraction were three Abyssinian—a ram and ewe with a lamb. The ram and ewe were brought to this country from Abyssinia by Mr. Southam, of Chipping-Norton, who was engaged in the transport service during the late war, and by him presented to Mr. Bliss, the President of the year. Since then the lamb has been dropped, and the three shown together attracted much attention. There is nothing beyond their strange appearance to recommend them; they are small, ragged-looking, and by no means gainly. Some prime specimens of Gloucester cheese were exhibited.

The Judges were: For Stock, Mr. Hewer, of Fair Green, and Mr. Sargent; for Horses, Mr. A. Rushout and Mr. T. A. Cook, of Sherborne. The following is a list of their awards:

CATTLE.

Best bull, cow, and offspring, the calf not to exceed twelve months old.—Prize, G. Garne, Broadmoor Farm.

Best bull of any breed, exceeding two years old.—Prize, G. Garne, Churchill Heath.

Best bull of any breed, under two years old.—First prize, T. Garne, Broadmoor Farm; second, M. Savidge, Sarsden Lodge.

Best breeding cow, of any breed, and being in actual milk on the day of exhibition.—First prize, G. Garne; second, G. Garne.

Best pair of heifers, above two and not three years old.—Prize, G. Garne.

Best pair of heifers, above one and not two years old.—First prize, T. Garne; second, G. Garne.

SHEEP.

Best long-wool ram, exceeding the age of two years.—Prize, W. Cother, Middle Aston.

Best long-wool shearhog ram.—First prize, Executors of the late T. Gillett, Kilkenny; second, Executors of the late T. Gillett.

Best long-wool breeding ewes, each to have brought up a lamb this season.—Prize, J. W. Kimber, Shipton-under-Wychwood.

Ten best long-wool breeding theaves.—Prize, J. W. Kimber, Best Oxfordshire Down shearhog ram.—Prize, G. Wallis, Old Shifford.

Best six Oxfordshire Down breeding ewes.—Prize, G. Wallis.

Ten best stock ewes, of any other short-wool breed, each having brought up a lamb this season.—Prize, J. W. Conely, Odditon.

PIGS.

Best boar of any breed, exceeding the age of one year.—Prize, J. Wheeler, Long Compton.

Best boar of any breed, under the age of one year.—Prize, J. Wheeler.

Best breeding sow, of any age, with a litter of pigs under ten weeks old.—Prize, J. Wheeler.

Six best pigs of a litter, of any breed, not exceeding the age of four months.—Prize, J. Wheeler.

AGRICULTURAL HORSES.

Best draught stallion that has served mares within ten miles of Stow or Chipping-Norton.—Prize, T. Horne, Moreton-in-Marsh.

Best mare for agricultural purposes, and foal, her own offspring.—First prize, W. Hurlston, Ditchford Friary; second, T. Horne.

Best cart gelding or filly, two years old.—First prize, Lord Redesdale, Batsford Park; second, J. Thyer, Crickley Hill.

Best yearling cart colt or filly.—First prize, W. Hurlston; second, T. Horne.

HACKNEYS AND HUNTERS.

Best hackney, not exceeding six year old, or 15 hands, and capable of carrying 14 stone.—First prize, T. Sargeant, Churchill; second, E. Kightou.

Best horse or filly, four years old, bred within 11 miles of Stow or Chipping-Norton, possessing or promising to possess the qualities of a hunter.—Prize, W. Hurlston.

Best weight-carrying hunter, not exceeding seven years old, the property of a tenant farmer or his son, ridden last season with the Heythrop, Cotswold, North Cotswold, or Warwickshire hounds, and capable of carrying 14 stone.—Prize, T. Sargeant.

CHEESE.

To the exhibitor of the best cwt. of thick cheese, not more than three cheeses to the cwt., made from land in his occupation.—Prize, Mrs. S. Wilkins.

At the dinner Mr. HENLEY, M.P., said: Passing to the business of the day, he was sorry to say that he could not congratulate them on the appearance of the show. He had certainly seen better exhibitions in Chipping-Norton and Stow; but the present meeting was so close upon others in the county that one and all of them, more or less, were not quite in so healthy a state as they ought to be. He had been observing an interesting sight that day; he had seen the labourers receiving their rewards at the hands of the secretary, and he had been led to think that this was one of the best features of the exhibition, a feature which placed the show above many others of its class. Although the rewards were comparatively small, the people among whom they were distributed valued them much above their intrinsic worth when they were gained.

Colonel NORTH, M.P., recollected having seen the show-yard better filled in former years; but this year the county had had a great national exhibition, and that might have had something to do with the falling off in the local shows, and with the exhibition of that day.

Mr. CARTWRIGHT, M.P., said: Not many weeks ago the crops of France were ripening, and now most of them were burned or destroyed by the contending armies. He had recently returned from the scene of the war, having crossed the Rhine, and seen the valley of the Moselle. The peasantry had been endeavouring to get in and garner their crops, and he had been pleased to see the machinery in motion for that purpose on the various farms. On many of the farms in that district he found that an Oxfordshire manufacturer was well known and highly appreciated by the occupiers, and he had frequently seen the name of Mr. Samuelson, of Banbury, on many of the implements.

THE LEICESTERSHIRE AGRICULTURAL SOCIETY.

MEETING AT HINCKLEY.

Originally the Leicestershire Society, this next amalgamated with the Waltham Association, and ultimately joined the Sparkenhoe Club, which had proved so successful on the southern side of the shire, and year by year has grown into its present dimensions. Owing to various causes, the meeting was hardly expected to be so large as that of last year, held at Ashby. Local circumstances, or other reasons, would prevent its attracting so many visitors; but, although the latter exhibited a falling-off as compared with the attendance at Ashby, in the show itself, as regards entries, there were no grounds of complaint. Of horses of all kinds there was a very very fair show, and altogether the chief feature of the meeting. Of sheep the show was not large but still some very useful animals were penned. Mr. Isaac Wooton's cross-bred sheep were very commendable, as also were the ewes exhibited by Mr. T. W. D. Harris, Wooton, Northampton; Mr. W. Everard, Narborough Wood; and Mr. W. Baker, Moor Barns, Atherstone. Among Leicesters the competition was comparatively small, when it is considered that the breed ought to be well represented in the county from which it takes its name. There were, however, only three competitors for pure Leicesters. The ewes and theaves in the long-wool class were of very good quality, and the Shropshires were creditable. The cattle were well represented. Mr. W. Bradshaw's bull, White Satin, was much admired, and secured the head prize; while a very fine bull-calf under one year old, named Cæsar, the property of Mr. E. H. Cheney, Gaddesby, Leicester, attracted much attention. Of pigs there was a good show, comprising boars, breeding sows, and breeding pigs.

The cheese and butter were exhibited in a tent, and proved a capital show, the competition in cheese being very close. Among the successful competitors were Mr. T. Oakey, Normanton-le-Heath; Maria Barrs, Oddstone Hall; Mr. W. Grewcock, Barwell Fields; and Mr. J. Garratt. Three cheeses made on the Derby Factory system, exhibited by Mr. S. C. Pilgrim, were highly commended, although not for competition. Mr. W. N. Berry took the head prize for butter, of which there was but only a small supply. The poultry specimens shown were of a satisfactory character.

PRIZE LIST.

JUDGES:

Hunting and Hack Horses.—J. H. Bland, Thorpe Lodge, Newark; J. M. K. Elliott, Heathercote, Towcester; G. Higgins, Bedford.
 Cart Horses.—J. Earl, Earls Barton, Northampton; T. Marris, the Chase, Uleyby; J. W. Larkin, Lutterworth.
 Long-wooled Sheep.—J. Earl; T. Marris.
 Short-wooled Sheep and Pigs.—G. A. May, Elford Park, Tamworth; R. Brown, Wiggington House, Tamworth.
 Cattle.—M. Savidge, Sarsdon, Chipping Norton; J. Lyon, Church Farm, Stroxtou.
 Cheese and Butter: E. Mill, Wolverhampton; W. Nuttall, South Croxton.
 Implements.—J. C. Hicken, Dunchurch.

HORSES.

Best hunter, gelding or mare, not less than five years old and under ten (open to all England).—First prize, £20, S. Gale, Canon Ashby, Daventry; second, £5, J. E. Pannett, Husbands Bosworth Grange, Rugby. Commended, J. Drage, Moulton Lodge, Northampton.

Gelding or filly, four years old, adapted for hunting purposes.—First prize, £15, G. Bass, Bagworth Park, Leicester; second, £5, C. A. Pratt, Shenton, Nuneaton. Commended, J. Wakelin, Ravensthorpe, Northampton.

Gelding or filly, three years old, adapted for hunting purposes.—First prize, £10, A. J. Milner, Kinoulton, Nottingham; second, £5, F. L. Ward, Burton Overy, Leicester. Commended, G. J. Mitchell, Newton Mount, Burton-on-Trent.

Gelding or filly, two years old, adapted for hunting pur-

poses.—Prize, £5, G. Hill, Edenham, Bowm, Lincoln. Highly commended, G. J. Mitchell. Commended, J. Wood, Aston Flamville, Hinckley.

Mare calculated to breed hunters.—First prize, £10, J. Torbett, Rosliston, Burton-on-Trent; second, £5, J. Beale, Wolvey, Hinckley. Commended, T. Oakey, Normanton-le-Heath, Ashby.

Hack, not less than 14½ hands and not exceeding 15 hands 1 inch high.—First prize, £7, R. Milward, Thurgarton Priory, Southwell; second, £3, C. S. Pilgrim, The Outwoods, Hinckley. Highly commended, Major Wollaston, Shenton Hall, near Nuneaton. Commended, J. Davis, Gartree House, Leicester. The class generally commended.

Cob, not exceeding 14½ hands.—First prize, £5, R. Milward, Thurgarton; second, £2, W. H. Harrison, Oxendon House, Northampton. Commended, R. Milward.

Pony, not exceeding 13½ hands.—First prize, £5, Sir J. W. C. Hartopp; second, £2, J. H. Lilley, Forest Grange, Leicester. Commended, Isaac Berridge, North Kilworth, Rugby.

Gelding or filly, two years old, for purposes of agriculture.—First prize, £5, S. Bacon, Ratchife Culey, Atherstone; second, £2, J. Wood, Aston Flamville.

Gelding or filly, one year old, for purposes of agriculture.—First prize, £5, J. M. Brown, Ibstock, Ashby; second, £2, B. E. Bennett, Marston Hall, Market Harborough.

In-foal mare, for purposes of agriculture.—First prize, £5, W. H. Salt, Bird's Nest Farm, New Parks, Leicester; second, £2, J. Beale, Wolvey, Hinckley. Highly commended, J. Beale.

Cart stallion, for agricultural purposes, to travel the district of Hinckley for 1871.—Prize, £10, W. Euston, Claverdon, Warwick.

Foal, for purposes of agriculture.—First prize, £5, S. C. Pilgrim; second, £2, J. Beale. Commended, S. C. Pilgrim.

SHEEP.

Leicester shearling ram.—Prize, £5, to G. Turner, jun., Alexton Hall, Uppingham. Commended, G. Turner, jun.

Leicester ram of any age.—Prize, £5, G. Turner.

Long-wooled shearling ram.—Prize, £5, A. Hack, Buckminster, Grantham.

Long-wooled ram of any other age.—Prize, £5, A. Hack.

Pen of three under twenty months old of long-wooled fat wether sheep.—First prize, £5, Lord Berners, Keythorpe Hall; second, £2, T. W. D. Harris, Wootton, Northamptonshire.

Pen of three long-wooled ewes which have suckled lambs to the 20th of June.—First prize, £5, W. Everard, Narborough Wood; second, £2, T. W. D. Harris.

Pen of five long-wooled theaves, under twenty months old, intended for breeding purposes.—Prize, £5, T. W. D. Harris.

Pen of five long-wooled ewe lambs.—Prize, £5, T. W. D. Harris.

Shropshire shearling ram.—Prize, £5, W. Baker, Moor Barns, Atherstone. Highly commended, J. H. Bradburne, Pipe-place, Lichfield; commended, W. German, Measham Lodge, Atherstone.

Shropshire ram of any age.—Prize, £5, S. C. Pilgrim. Highly commended, W. Baker; commended, W. Baker.

Pen of three under twenty months old, of Shropshire fat wether sheep.—Prize, £5, S. C. Pilgrim.

Pen of three cross-bred fat wether sheep, under twenty months old.—Prize, £5, J. Beale.

Pen of three Shropshire ewes.—First prize, £5, S. C. Pilgrim; second, £2, W. Baker.

Pen of twenty Shropshire theaves, under twenty months old, intended for breeding purposes.—Prize, £5, J. H. Bradburne. Highly commended, W. Baker.

Pen of five Shropshire ewe lambs.—Prize, £5, W. Baker.

Pen of five long-woolled breeding ewes, that have suckled lambs.—First prize, £10, T. W. D. Harris; second, £5. No other entry.

Pen of twenty short-woolled breeding ewes, that have suckled lambs.—First prize, £10, W. Baker; second, £5, J. H. Bradburne. No other entries.

CATTLE.

Fat ox.—First prize, £10, to T. Pulver Broughton, Kettering, and a silver cup given by the butchers of Hinckley; second, £5, K. Fenton, Caldecote, Nuneaton. Highly commended, K. Fenton. Commended, J. J. Sharp, Broughton, Kettering.

Cow or heifer.—First prize £10, W. T. Cox, Spondon Hall, Derby; second, £5, R. Wood, Clapton, Thrapston. Highly commended, J. J. Sharp. Commended, J. Godfrey, Wigston Parva, Hinckley.

Bull, above one year and under two years old.—Prize, £7, W. Bradshaw, Wednesfield, Wolverhampton.

Bull, of any breed, over two years old.—First prize, £7, T. Hands, Cauley, Coventry; second, £3, W. S. Woodroffe, Normanton-on-Soar, Loughborough. Highly commended, K. Fenton.

Long-horn bull.—First prize, £5, W. T. Cox, Spondon Hall, Derby; second, £2, to Taverner, Upton Park, Nuneaton.

Bull calf, under one year old.—Prize, £5, E. H. Cheney, Gaddesby, Leicester. Highly commended, R. Ratcliffe, Walton-on-Trent.

Cow, in milk, having had a live calf since January 1st, 1870.—First prize, £7, to K. Fenton; second, £3, W. S. Woodroffe, Normanton-on-Soar, Loughborough.

Shorthorn cow, above three and under four years of age, having had a live calf since January 1st, 1870.—First prize, £5, K. Fenton; second, £2, R. D. Miles, Keyham, Leicester.

In-calf heifer, above two and under three years old.—First prize, £5, K. Fenton; second, £2, R. Ratcliffe. Highly commended, K. Fenton.

Stirk, above one and under two years of age.—First prize, £7, J. J. Sharpe; second, £3, T. Hands. Highly commended, R. Ratcliffe. Commended, R. D. Miles, for two entries.

Long-horned cow, in milk, having had a live calf since December 1st, 1869.—First prize, £5, J. Godfrey; second, £2, R. H. Chapman, Upton, Nuneaton.

Long-horned heifer, in calf, above two and under three years of age.—First prize, £5, W. T. Cox; second, £2, W. T. Cox. Highly commended, N. Taverner.

Heifer calf, under one year old.—Prize £5, R. H. Chapman.

Alderney or Guernsey cow or heifer, having had a live calf since January 1st, 1870, or is now in calf.—Prize, £5, W. H. Jackson, Frolesworth, Lutterworth.

TENANT FARMERS' CLASSES.

Bull, of any age.—First prize, £5, S. Birchall, Batton, Burton-on-Trent; second, £2, J. A. Beale. Highly commended, W. J. Hands, Burton Fields, Nuneaton.

Cow, in-milk, having had a live calf since January 1st, 1870.—First prize, £5, J. Beale; second, £2 10s., S. C. Pilgrim.

Heifer under three years old.—First prize, £5, W. Bradburn; second, £2, J. A. Beale. Highly commended, J. Beale.

Pair of stirks under two years old.—First prize, £5, J. M. Grundy, Drayton, Nuneaton; second, £2, S. C. Pilgrim. Highly commended, J. M. Grundy. Commended, S. C. Pilgrim.

Lot of not less four beasts, exhibited by any tenant farmer residing in the county of Leicester.—Prize, £5, J. M. Grundy.

PIGS.

Boar of the large breed.—First prize, £3, R. E. Duckering and Son, Northorpe, Kirton Lindsay; second, £1, S. C. Pilgrim.

Boar of the small breed.—First prize, £3, S. Deacon, jun., Polebrook Hall, Oundle; second, £1, W. Carver and Son, Ingarsby, Leicester.

Berkshire boar.—First prize, £5, R. E. Duckering and Son; second, £1, W. B. Fletcher, Stemboro' Mill, Lutterworth.

Breeding sow of the large breed.—First prize, £3, M. Walker, Stockley Park, Burton-on-Trent; second, £1, M. Walker. Highly commended, R. E. Duckering and Son.

Breeding sow of the small breed.—First prize, £3, R. E. Duckering and Son; second, £1, W. Carver and Sons. Highly commended, M. Walker.

Three breeding pigs, of the large breed, of one litter, not exceeding seven months old.—First prize, £3, M. Walker; second, £1, F. Spencer Claybrook Magna, Lutterworth. Commended, F. Spencer.

Three breeding pigs of the small breed.—First prize, £3, R. E. Duckering and Son; second, £1, W. Carver and Sons. Highly commended, Sir J. W. C. Hartopp, Bart.

CHEESE.

Four cheeses weighing 40lbs. each or more.—First prize, £5, T. Oakey, Normanton-le-Heath; second, £3, Maria Barrs, Odstone Hall; third, £2, T. Grewcock and Son, Stapleton. Highly commended: W. Thomson, Osbaston.

Four cheeses weighing not more than 40lbs. and not less than 30lbs.—First prize, £5, Maria Barrs; second, £3, R. Abell; third, £2, W. Grewcock. Highly commended: T. J. Scott, Stretton Baskerville; W. Grewcock; J. Garratt, Claybrooke, Magna.

Four cheeses, weight under 30lbs.—First prize, £3, J. Choyce, Pinwall; second, £2 (not awarded); third, £1, R. Abell.

EXTRA NOT FOR COMPETITION.—Highly commended: Three cheeses made on the Derby factory system, by S. C. Pilgrim.

BUTTER.

Six pounds of fresh butter.—First prize, £1, W. N. Berry, Stoke Golding; second, 10s., T. Adcock, Lubbethorpe. Highly commended: H. Bentley, Burbage.

IMPLEMENTS.

Messrs. Hunt and Pickering, Leicester, £3 for one-horse reaper, and £2 for English grist mill.

G. Penton, Hinckley, £2 for Howard's self-acting horse-rake.

W. Choyce, Sibson, Atherstone, £1 for corn-dressing machine.

Geo. Ball, North Kilworth, Rugby, £2 for agricultural carts.

NORTHAMPTONSHIRE AGRICULTURAL SOCIETY.

MEETING AT WELLINGBOROUGH.

This being the first year of returning to the old system of holding the show in the autumn instead of at midsummer, considerable anxiety was felt as to the weather, but the Thursday turned out to be an exceedingly fine day; the consequence was that there was a large attendance. The first prize in Class 1, open to All-England, for the best ox, was adjudged to a beast shown by Mr. Pulver, of Broughton. Mr. Robert Searson, a Lincolnshire breeder, carried off the blue ribbon for the best steer under the above age, with a symmetrical animal, all white, the Marquis of Exeter being second

with a red and white beast; a steer shown by Mr. R. E. Oliver, of Sholebrook Lodge, in this class, was in capital form, but failed only narrowly of securing the red ribbon (second). In class 5, the Burghley bull Telemachus carried off the first prize, and Mr. Pualett's Baron Killerby second, the bulls Royal Errant (22739), Royal Butterfly 20th, and Royal Booth (commended) being in competition. In class 6, for a bull above 2 years old, the Grand Duke blood was well represented; Mr. Charles Bayes, of Kettering, however, took first with the roan bull Prince Royal. In class 7, for a bull between one and

two years, Mr. J. A. Mumford, of Thame, obtained the first award with his Editor, which took first prize the day before at the Aylesbury show. The bull calves were of good character, and gave promise of development into fine specimens; Mr. T. E. Pawlett, of Beeston, was the winner of the £10 prize. The whole of the cows were commended, and heifers were in capital exhibition. There was a good competition in Alderneys and Guernseys. The sheep pens contained some good animals, among which were worthy of mention the long-wooled exhibited by Mr. T. W. D. Harris, of Wootton, who was, as usual, a very successful exhibitor. The classes for short-wooled or cross-bred ewes and theaves were very good, Mr. J. Treadwell, of Upper Winchendon, taking two firsts and two seconds for ewes and theaves. Lambs were in considerable number, and were a fair competition. There was a very fine show in the hunting class, Mr. H. H. Langham, of Cottesbrooke Park, taking the first prize for mares or geldings 5 years old and upwards, with a son of Cornerstone. The competition the classes for riding purposes, hackneys, and cart horses was good. The number of pigs exhibited was scarcely up to the average of former years. The poultry, on the whole, was good; but there was a meagre show of butter. Amongst the principal exhibitors of implements were: Mills and Co., Wellingborough; Amies and Barford, Peterborough; Bradford and Co. (washing machines), Manchester; Corbett, Shrewsbury; Gill, Wellingborough; Roberts, Deanshanger; Wallis, Wellingborough; Ball and Sons, Rothwell and Northampton; Hayes and Son, Peterborough; Marshall and Sons, Gainsborough; Hilton and Co. (refrigerators), London; Mobbs, Snow, and Wood, Northampton; Ransome, Simms, and Head, Ipswich; Robey and Co., Lincoln; Jeremiah Rouse, Lincoln; Stafford, Nassington; Smyth and Sons, Peasenhall; Watson, Andover; Nobles, Wellingborough; Allechin and Sons, Northampton; J. Coeh, Harlestone and Northampton; and Robinson and Co. (sewing machines), Kettering. Mr. Hope, of Wellingborough, had a tent with samples of his cattle food.

PRIZE LIST.

JUDGES.

Cattle: W. Allitt, Ginton, Peterborough; C. Howard, Bid-denham, Beds; T. Morris, Maisemore Court, Gloucester.
Riding Horses: R. Arkwright, Knuston Hall; J. Berridge, Drayton Lodge, Banbury.
Cart Horses: T. Woods, Wytchley Warren, Stamford; R. Ward, Harringworth; F. J. Berry, Stanion, Thrapston.
Sheep and Pigs: G. Hine, Oakley, Beds; C. H. Simpkin, Wardley, Uppingham; J. H. Caswell, Laughton, Folkingham.
Poultry: R. Hewitt, Eden Cottage, Sparkbrook, Birmingham.
Butter: J. Hudson, Ludgate-hill, London.
Implements: T. Wagstaff, Hull Farm, Chesterton, Peterborough; T. Pulver, Broughton, Kettering.
Ploughing: G. Underwood, Little Gaddesden, Herts; R. Dearlove, Higham Park; J. W. Whitton, Poteote, Towcester; S. Chambers, Doddington; J. Sheffield, Barton Seagrave, Kettering; R. B. Seaton, Harwick Lodge, Stamford.

CATTLE.

Ox, exceeding three years and three months old on 1st December next.—First prize, T. Pulver, Broughton; second, Earl Spencer, K.G., Althorp Park. Commended, R. Wood, Clapton, Thrapstone.

Steer, not exceeding three years and three months old on the 1st of December next.—First prize, R. Searson, Cranmore Lodge, Market Deeping; second, Marquis of Exeter. Highly commended, J. J. Sharp, Broughton, Kettering; commended, R. E. Oliver, Sholebrooke Lodge, Towcester.

Cow of any breed or age.—First prize, J. A. Mumford, Chilton Park Farm, Thame; second, J. W. Perridge, Adstone.
Heifer of any breed, not exceeding four years old.—First prize, R. Wood; second, J. J. Sharp.

BREEDING AND STORE STOCK.

Bull of any age.—First prize, Marquis of Exeter (Tele-machus); second, T. E. Pawlett, Beeston, Sandy (Baron Killerby). Commended, T. E. Pawlett.

Bull above two years old.—First prize, C. Bayes, Kettering (Prince Royal); second, R. E. Oliver. Commended, Earl Spencer, K.G., and Sir W. de Capel Brooke.

Bull above one and under two years of age.—First prize, J. A. Mumford; second, J. N. Beasley, Pitsford Hall, Northampton (Jaz).

Bull calf above six and under twelve months old.—First prize, T. E. Pawlett (Majestic); second, R. Wood (Lord Aberdeen 2nd). Commended, G. Pell, Heyford.

Cow, in-milk or in-calf.—First prize, J. How, Broughton, Hunts (Lady Anne); second R. Searson (Magnolia). Highly commended, The Marquis of Exeter.

Pair of cows, of any breed, in-milk or in-calf.—First prize, R. Searson (Beauty's Queen and Sprightly); second, J. A. Mumford (Etona).

Heifer, of any breed, in-milk or in-calf, above three and under four years old.—First prize, R. Searson (Winter Rose); second, Sir W. de Capel Brooke, Bart, Geddington Grrange, Kettering.

Heifer, of any breed, in-milk or in-calf, above two and under three years old.—First prize, J. A. Mumford (Camilla); second, R. Searson (Sweetheart). Highly commended, The Duke of Buccleuch.

Heifer, of any breed, above one and under two years old.—First prize, J. How (Vesper Queen); second, G. Pell. Highly commended, The Duke of Buccleuch.

Heifer calf, of any breed, under twelve months old.—Prize, T. E. Pawlett (British Queen).

Short-horned heifer, above one and under two years old.—First prize, J. J. Sharp; second, R. E. Oliver. Highly commended, R. E. Oliver; commended, J. N. Beasley.

Alderney or Guernsey cow or heifer, in-milk or in-calf.—First prize, A. A. Young, Orlingbury, Wellingborough; second, J. Shaw, Hunsbury Hill, Northampton. Commended, D. Dulley, jun., Wellingborough.

SHEEP.

Pen of ten long-wooled ewes, that have suckled lambs to the 1st June, 1870, bred by and property of exhibitor.—First prize, C. Clarke, Ashby-de-la-Launde, Sleaford; second, T. W. D. Harris, Wootton, Northampton.

Pen of five long-wooled theaves, bred by and property of exhibitor.—First prize, T. W. D. Harris; second, Marquis of Exeter.

Pen of five short-wooled or cross-bred ewes, that have suckled lambs to the 1st of June, 1870.—First and second prizes, J. Treadwell, Upper Winchendon, Aylesbury.

Pen of five short-wooled or cross-bred theaves.—First and second prizes, J. Treadwell. Commended, J. Woolston, Wellingborough.

Pen of three short-wooled or cross-bred shearhogs.—First prize, H. Purser, Wellington Manor, Beds; second, M. E. Jones, Wellingborough. Commended, J. Woolston.

Pen of three long-wooled shearhogs.—First and second prizes, T. W. D. Harris.

Shearling long-wooled tup.—First prize, A. Hack, Buckminster, Grantham; second, C. Clarke.

Long-wooled tup, of any breed, two-shear and upwards.—First prize, A. Hack; second, T. W. D. Harris.

Shearling down tup, of any distinct breed.—First prize, F. Street, Harwood House, Bedford; second, J. Longland, Grendon, Northampton.

Down tup, of any distinct breed, two-shear and upwards.—First prize, J. Longland; second, R. E. Oliver.

Five long-wooled wether lambs.—Prize, S. Middleton, Water Newton, Wansford.

Five long-wooled ewe lambs.—First and second prizes, T. W. D. Harris.

Five short-wooled or cross-bred wether lambs.—First prize, J. Woolston; second, W. Wykes, Bozeat.

Five short-wooled or cross-bred ewe lambs.—First and second prizes, F. Street.

PIGS.

Boar of any breed.—First prize, S. Deacon, Polebrook Hall, Oundle; second, R. E. Duckering, Northorpe, Kirton Lindsey.

Breeding or suckling sow, of any breed.—First prize, R. E. Duckering; second, R. Sykes, Geddington, Kettering.

Breeding or suckling sow, of a small breed.—First prize, R. E. Duckering; second, J. Wheeler, Long Compton, Shipston-on-Stour.

Three fat pigs of one litter of any breed or age.—Prize, R. E. Duckering.

Five breeding pigs of one litter, exceeding three and not exceeding six months old.—First prize, J. Wheeler; second, R. Sykes.

HORSES.

Mare and foal, for hunting purposes.—First prize, T. Stokes, Caldecott, Rockingham; second, Captain M. Clerk, Spratton Hall, Northampton.

Mare or gelding, five years old and upwards, adapted for hunting purposes.—First prize, H. H. Langham, Cottesbrooke Park; second, L. Lucas, Irthlingborough. Commended, W. G. Maxwell, Walton House, Peterborough, and W. Whitehead, jun., Wollaston.

Mare or gelding, above four and under five years old, adapted for hunting purposes.—First prize, A. Britton, Great Billing Farm; second, J. Drage, Moulton Lodge. Commended, T. D. Hensman, Harlestone.

Gelding or filly, above three and under four years old, adapted for riding purposes.—First prize, G. B. Lynes, Preston Deanery; second, W. Franklin, Barford Lodge.

Gelding or filly, above two and under three years old, adapted for riding purposes.—First prize, W. Core, Fletton Lodge, Peterborough; second, J. E. Parsons, Charwelton. Highly commended, J. Dix, Seywell Grounds, Blakesley.

Gelding or filly, above one and under two years old, adapted for riding purposes.—First prize, R. Battams, Oxendon; second, J. Goodliff, Connington Lane, Hufts. Commended, A. Goodman, jun., Willow Hall, Thorney.

Mare, not exceeding 15 hands 1 inch high, with foal at foot, for breeding hackneys.—First prize, S. Wallis, Barton Seagrave, Kettering; second, T. J. Adkins, the Booth Farm, Northamptonshire.

Hackney (mare or gelding), not exceeding 15 hands 1 inch high.—First prize, W. H. Harrison, Oxendon House, Northampton; second, G. B. Lynes. Commended, J. N. Beasley and W. Whitehead, jun.

Cob (mare or gelding), not exceeding 14 hands high.—First prize, J. E. Parsons, Charwelton, Daventry.

Pony (mare or gelding), not exceeding 13 hands high.—

Prize, J. Tew, West Haddon, Rugby. Highly commended, J. Goodliff, Connington Lane, Hufts.

Cart mare, with a foal at foot.—First prize, F. Furnaby, Pipewell Lodge, Kettering; second, J. Moore, jun., Bugbrooke, Weedon.

Cart gelding or filly, above three and under four years old.—First prize, R. H. Timms, Manor House, Braunston, Rugby; second, R. H. Hewitt, Dodford, Weedon.

Cart gelding or filly, above two and under three years old.—First prize, C. B. Bletsoe, Grendon Hall, Northampton; second, R. H. Timms, Manor House, Braunston, Rugby.

Cart gelding or filly, above one and under two years old.—Prize, C. Richards, Bunker's Hill, Glendon.

BUTTER.

Best 12 lbs. of butter, made up in 2lb. lumps, wholly or partially the produce of Alderney cows.—Prize, General Bouverie, Delapre Abbey.

Best 12 lbs. of butter, made up in 2lb. lumps.—J. Tew, West Haddon.

Best 6 lbs. of butter, made up in 1lb. rolls.—First prize, J. Craig, Fotheringhay; second, W. Walker, Cranford St. Andrew; third, A. Britten, Great Billing Farm; fourth, W. Goodliff, Stowe.

IMPLEMENTS.

Medals awarded to Mills and Co., Wellingborough, for general collection; Amies, Barford, and Co., Peterborough, general collection, also for grist mill and dressing apparatus, and for improved Champion's patent anchor; E. and H. Roberts, Deanshanger, improved fastenings to V. R. plough; P. R. Wallis, Wellingborough, general collection; Ball and Son, Rothwell and Northampton, improved leverage to share; Hayes and Son, Stamford and Peterborough, collection of waggons and carts; Marshall, Son, and Co., Gainsborough, improved engine and thrashing machine; Mobbs, Snow, and Wood, Parade, Northampton, general collection. Highly commended: A set of draining tools, exhibited by Mobbs, Snow, and Wood.

WARWICKSHIRE AGRICULTURAL SOCIETY.

MEETING AT LEAMINGTON.

The competition was somewhat limited in several classes, notably in those for Hereford and Devon cattle, and in most of those for sheep. In the Shorthorns numerous entries were made by Messrs. Garne, but none of the animals put in an appearance, and in the aged bull class there was nothing to approach Mr. Pawlett's Baron Killerby, whose value as a sire was attested by the merit of his two sons, Royal Booth and Fitzkillerby, the former shown by Mr. Pawlett and the latter by Mr. E. Lythall, which occupied the second place in their respective classes. The first in two-year-olds was the Marquis of Exeter's Telemachus, a very level deep-grown bull, excellent in his girth, and a previous prizetaker in Lincolnshire and Rutland. Another Bingley Hall purchase at the spring show was first in yearlings: a large-framed red bull from Mr. R. Robbins, who now exhibited him. The second prizetaker was shown by Mr. Hamer and bred by Mr. Sheldon. The cows and heifers were inferior to the bulls. In the Hereford class Messrs. Baldwin and Whitehouse were the only exhibitors, and prizes were awarded to every animal they sent. A solitary Devon, from Westoa Hall, received first prize. Mr. J. H. Burbury, in very short classes obtained both the bull and cow prizes for Longhorns. As far as regarded the Leicester and Shropshire sheep, the awards of the judges were completely at variance with those at the recent shows at Kidderminster and Hinckley. Mr. Francis Spencer here had the best of Mr. G. Turner all through with Leicester rams. A very short show of Shropshires is to be accounted for by the lateness of the season for rams, and would be classes for lambs as more likely to fill at this time of the year. The ram classes were almost reduced to a match between Mrs. Beach and Mr. Baker. Mr. G. Wallis was the only exhibitor of Oxfords. He sent two very useful rams, and a magnificent looking pen of yearling ewes, winning two firsts and a silver

cup open to all breeds. Upwards of 120 horses were entered. Amongst the hunters Mr. J. E. Bennett took the £25 piece of plate, with a good-looking son of Artillery. Some very useful hacks and ponies were shown in the class under 15 hands. The white pigs of Messrs. Duckering, Wheeler, and M. Walker have been so frequently commented on of late that it seems almost needless to repeat that the honours were shared by these breeders, one first being, however, wrested from them with a small-bred sow, by Mr. E. Umbers. A few good Berkshires were shown. For implements the society gave £50, to be awarded in sums at the discretion of the judges. The following were the successful exhibitors: Messrs. Penney and Co., Lincoln, £5; G. Ball, North Kilworth, Rugby, £5; W. Glover and Sons, Warwick, £5; T. Baker, Compton Newbury, Berks, £3; G. W. Grove, Leamington, £3; Richmond and Chandler, Salford, Manchester, £3; T. Corbett, Perseverance Ironworks, Shrewsbury, £2; Woods, Cocksedge, and Warner, Stowmarket, £2; T. Radclyffe, Leamington, £2; Bowen and Horncastle, Leamington, £2; J. Le Butt, Bury St. Edmunds, £1. Highly commended, Milburn and Co., Whitechapel, London.

JUDGES.

CATTLE.—W. Sanday, Radcliffe-upon-Trent, Nottingham; J. Walker, Knightwick, Worcester; Toone, High Cross, Lutterworth.

SHEEP AND PIGS.—J. Bryan, Southleigh, Witney; W. Smith, Bibury, Fairford.

HORSES.—Agricultural: Phipps, Marshgibbon, Bicester; S. Spencer, Snareson, Ashby-de-la-Zouch. Hunters and Hacks: R. Leeds, Wicken House, Castleacre, Norfolk; T. Percival, Wansford.

CHEESE: P. Jacks, Leamington.

PLOUGHING, DRAINING, HEDGING, AND THATCHING.—R. H. Chapman, Upton, Neuneaton; G. Keeling, Hampton House, Penkridge; J. Beale, Brockhurst, Luticworth; J. Coxon, Freeford, Tamworth.
The following is the prize list:

C A T T L E.**SHORTHORNS.**

Best bull above three years old.—Prize, T. Pawlett, Brees-ton, Sanday (Baron Killerley).

Best bull over twenty months and under three years old.—First prize, the Marquis of Exeter (Telemachus); second, T. E. Pawlett (Royal Booth).

Best bull over ten and under twenty months old.—First prize, R. Robbins, Kenilworth; second, C. M. Hamer, Snitterfield (Blue Gown).

Best cow, in-milk, above three years old.—First prize, W. Bradburn, Wednesfield (Miss Chesterfield); second, Captain Seehouse, Ashby St. Legers.

Best pair of heifers under three years old, in-milk or in-calf.—First prize, T. Hands, Canley; second, R. Robbins, Kenilworth.

Best pair of heifers under two years old.—First prize, T. Hands; second, W. Bradburn, Wednesfield.

HEREFORDS.

Best bull above three years old.—Prize, J. H. Whitehouse, Ipsley Court.

Best bull above ten months and under three years old.—First prize, J. Baldwin, Luddington; second, J. Baldwin.

Best cow, in-milk, above three years old.—First prize, J. Baldwin; second, J. H. Whitehouse.

DEVONS.

Best bull.—Prize, the Executors of the late A. Umbers, Weston Hall.

LONGHORNS.

Best bull.—Prize, J. H. Burbury, Kenilworth Chase.

Best cow or heifer, in-milk.—Prize, J. H. Burbury.

Best bull for breeding purposes, of any pure breed.—Prize, G. H. Canning, Shottony (Bedford).

Best pair of steers, of any breed, under three years old.—Prize, W. Caless, jun., Adderbury Grounds.

Best pair of cows, in-milk, which have been used in the exhibitor's dairy for the last two seasons.—First prize, T. Hands, Canley; second, E. Lythall, Radford Hall.

SHEEP.**LEICESTERS.**

Best shearing ram.—First and second prizes, F. Spencer, Claybrooke.

Best two-shear ram.—First prize, F. Spencer; second, G. Turner, jun., Alexton Hall.

Best pen of five ewes that have suckled lambs to the 1st of June, 1870.—Prize, W. Hurleston, Heathcote.

OTHER LONGWOOLLED SHEEP.

Best shearing ram.—First and second prizes, J. Wheeler, Long Compton.

COTSWOLD SHEEP.

Best shearing ram.—First and second prizes, Executors of the late T. Gillett, Kilkenny, Faringdon.

Best two-shear ram.—First prize, J. Godwin, Troy Farm, Somerton; second, T. Beale Brown, Salperton Park.

Best pen of five ewes that have suckled lambs to the 1st of June, 1870.—Prize, Executors of the late T. Gillett.

SHROPSHIRE SHEEP.

Best shearing ram.—First prize, W. Baker, Moor Barns, Atherstone; second, Sarah Beach, The Hattons, Breewood.

Best two-shear ram.—First prize, W. Baker; second, Sarah Beach.

Best pen of five ewes that have suckled lambs to the 1st of June, 1870.—Prize, W. Baker.

OTHER SHORTWOOLLED SHEEP.

Best shearing ram.—Prize, G. Wallis, Old Shifford, Bampton.

Best two-shear ram.—Prize, G. Wallis.

HORSES.**AGRICULTURAL.**

Best stallion.—First prize, J. Jennaway, Cryfield; second, J. Manning, Orlingbury.

Best mare in foal, or with a foal at her foot.—First prize, A. H. Thursby, Wormleighton; second, J. Davies, Budbrook.
Best filly, under three years old.—Prize, J. Canning, Sherbourne.

Best cart gelding, above four years old, that has been regularly worked.—Prize, G. Cook, Grove Fields.

Best cart mare, above four years old, that has been regularly worked.—Prize, J. Canning.

HUNTERS.

Stallion best adapted for hunting purposes.—Prize, T. Whittington, Wootton Waven (Glenlyon).

Best hunter that has been ridden in the past season with the Warwickshire hounds.—First prize, Miss E. M. Davey, Radford Manor House; second, S. Gale, Canons Ashby.

Best hunter, four years old and upwards, to be jumped on the ground.—First prize, W. Rose, Offchurch; second, S. Cat-terns, Binley.

Best four years old gelding or filly, adapted for hunting purposes, the property of a tenant farmer.—Prize, L. Riley, Packington, Coventry.

Best half-bred two years old colt or filly.—Prize, E. Scriven, Wormleighton.

Mare best calculated to breed hunters, with a foal at her foot.—Prize, J. Beale, Wolvey Grange.

Best hunter belonging to a Warwickshire farmer.—First prize, J. G. Bennett, Bosworth Grange; second, S. M. Simpson, Stoneleigh.

Best weight-carrier, equal to not less than 15 stone.—Prize, E. Righton, Thornton House, Eatington.

HACKNEYS AND PONIES.

Best hackney, exceeding 15 hands high.—Prize, R. S. Whitehouse, Leamington.

Best hackney, not exceeding 15 hands high.—Prize, W. Mann, Chesterton.

Best pony, above 13 and not exceeding 14 hands high.—Prize, W. Walker, Hillmorton.

Best pony, above 12 and not exceeding 13 hands high.—Prize, T. Garrett, Compton Scorpion.

Best hackney, exceeding 15 hands high, belonging to a Warwickshire farmer.—Prize, H. Stilgoe, Clopton.

Best cob, not exceeding 14 hands.—Prize, E. Lythall, Radford Hall.

Best pair of carriage horses, not less than 15 hands 2 in.—Prize, W. Root, Leamington.

PIGS.

Best boar pig of the large breed (except Berkshire), under 18 months old.—First prize, R. E. Duckering, Northorpe; second, J. Wheeler, Long Compton.

Best boar pig of the large breed (except Berkshire), above 18 months old.—First prize, R. E. Duckering; second, J. Wheeler.

Best boar pig of the small breed, under 18 months old.—First prize, J. Wheeler; second, R. E. Duckering.

Best boar pig of the small breed, above 18 months old.—First prize, E. Umbers, Wappenbury; second, R. E. Duckering.

Best boar pig of the Berkshire breed, under 18 months old.—First prize, J. Spencer, Villiers Hill; second, H. Humphrey, Kingstone Farm, Shriveham.

Best boar pig of the Berkshire breed, above 18 months old.—First prize, H. Humphrey; second, J. Smith, Henley-in-Arden.

Best breeding sow, suckling pigs of her own farrow, of the large breed (except Berkshire).—First prize, M. Walker, Stockley Park; second, F. F. Wells, Weston-under-Wetherley.

Best breeding sow of the small breed.—First prize, M. Walker; second, J. Wheeler.

Best Berkshire sow.—First prize, H. Humphrey; second, J. Stanley, Leamington.

Three best breeding pigs, of one farrow of 1870, of large breed.—Prize, M. Walker.

Three best breeding pigs, of one farrow of 1870, of small breed.—Prize, R. E. Duckering.

Three best breeding pigs, of one farrow of 1870, of Berkshire breed.—Prize, Rev. H. G. Baily, Swindon Vicarage.

EXTRA STOCK.**SHEEP.**

Five shearing Oxfordshire down ewes, 20 months old.—Prize, G. Wallis, Old Shifford, Bampton.

CHEESE.

Three best cheeses, not less than 70lb. each, the property of the exhibitor, a member, and made from his own dairy in 1870.—Prize, G. Gibbons, Tunley Farm, Bath.

Best three cheeses, not exceeding 50lb. each, the property of the exhibitor, a member, and made from his own dairy in 1870.—Prize, S. C. Pilgrim, Burbage.

IMPLEMENTS.

For implements, £50, to be given at the discretion of the

judges.—T. Corbett, Perseverance Ironworks, Shrewsbury, £2; Milburn and Co., 76, Church-lane, Whitechapel, London, highly commended; J. Le Butt, Bury St. Edmunds, £1; Woods, Coekesedge, and Warner, Stowmarket, £2; Barrows and Stewart, Banbury, £5; G. Ball, North Kilworth, Rugby, £5; Richmond and Chandler, Salford, Manchester, £3; W. Glover and Sons, Warwick, £5; T. Radclyffe, High-street, Leamington, £2; J. W. Mann, Market-square, Warwick, £3; T. Baker, Compton, Newbury, Berks, £3; Bowen and Horn-castle, Leamington, £2.

NORTH SHROPSHIRE AGRICULTURAL SHOW.

MEETING AT WELLINGTON.

The annual show was held at Wellington. Of the cattle, the Shorthorns were decidedly the best represented, the class for bulls of any age being remarkably good. There were some choice animals among the Herefords, but as a class they did not come up to the Shorthorns. The sheep were confined to Shropshires entirely, and were not so meritorious as one would have expected to find on their own native soil. As it was the most successful exhibitor came from the neighbouring county of Stafford—Mrs. Beach, of Brewood, who exhibited some excellent pens. The judging was very much commented on in the classes for ewes, in which some apparently very fine pens, exhibited by a well-known Staffordshire breeder, were entirely passed over. The judges excluded them on the ground that they were not of the pure Shropshire type, were wanting in uniformity, were over-fed, and otherwise got up for exhibition. There was a good show of horses; those for agricultural purposes, especially the pairs, were perhaps the best. The bay mare and foal which took the first prize in the class for mares and foals for hunting purposes was much admired. There was a good entry of pigs, and a large proportion of them were of superior quality. The Wellington district not being a dairy country, there was not much competition for the prizes offered for butter and cheese.

JUDGES.

LEAPING HORSES.—Capt. Lloyd, Shawbury; Capt. Boughey, Bridgnorth; and Sir. H. G. Harnage.

HORSES.—Mr. Lea, Stoke Grange; Mr. Bourne, Burleydam.

CATTLE.—Shorthorns: Mr. Heatley, Wem; W. Hassall, Bubney, Whitehurch. Herefords: Jos. Meire, Abbotsfield; R. Jones, Norton Condover.

SHEEP AND PIGS.—G. Cureton, Beam House; S. Hudson, Wytheford Hall.

IMPLEMENTS.—E. Davies, Patton, Wenlock; Mr. Brewster, Balderton Hall, Middle.

CHEESE AND BUTTER.—T. Burgess, Whitechurch; Mr. Platt, Manchester.

PRIZE LIST.

HORSES.

Leaping horses.—First prize, W. Wright, Stanford's Bridge; second, E. Beddard, Wolverhampton.

AGRICULTURAL AND OTHER HORSES.

Mare and foal.—First prize, T. Mansell, Ereal Park, Wellington; second, C. Felton, Long Lane Farm, near Wellington.

Pair of horses.—First prize, J. Shepard, Wellington; second, G. Smith, Eaton Constantine, Wellington.

Single horses.—First prize, C. Felton; second, T. Campbell, Eytton Hall, near Wellington.

Colts foaled in 1868.—First prize, Mrs. Sankey, Bratton, near Wellington; second, E. B. Steedman, High Ercall, Wellington.

Colts foaled in 1869.—First prize, St. J. C. Charlton, Apley Castle, Wellington; second, C. Felton.

For hunting purposes: Mare with foal.—First prize, P. Everall, Uckington, Wroxeter; second, St. J. Charlton, Apley Castle, Wellington.

Colts foaled in 1869.—First prize, T. Dicken, Ellerdine, Wellington; second, W. Ford, Elford Hill, Eccleshall.

Saddle and harness horses.—First prize, G. McKnight, Mossy Green, near Oakengates; second, T. Mansell.

Colts.—First prize, G. McKnight; second, M. Billing, Meeson Hall, near Wellington.

SHROPSHIRE SHEEP.

Rams.—First prize, Mrs. S. Beach, Brewood; second, W. Fowler, Acton Reynald.

Rams of 1869.—First prize, Mrs. S. Beach; second, T. Nock, Sutton House, near Shiffnal.

Rams of 1870.—First and second prizes, Mrs. S. Beach.

Ewes.—First prize, T. Mansell; second, R. Tanner, Dorrington.

Ewes of 1869.—First prize, T. Nock; second, T. Mansell.

Ewe lambs.—First prize, Mrs. S. Beach; second, M. Williams.

CATTLE.

Shorthorn bulls.—First prize, S. L. Horton, Park House, Shiffnal; second, J. E. Stanier, Uppington, Wellington.

Shorthorn bull, calved 1869.—First prize, Sir C. F. Smythe, Bart., Acton Burnell Park, Shrewsbury; second, S. Dicken, Little Ness, Baschurch.

Shorthorn cow.—First and second prizes, C. Jukes, Beslow Hall, Wroxeter, Shrewsbury.

Heifers calved 1868.—First prize, S. and J. Perry, Acton Pigott, Condover; second, S. L. Horton, Shiffnal.

Pair of Shorthorn heifers, calved 1869.—First prize, W. Bradburn, Wednesfield, Wolverhampton; second, S. and J. Perry.

Herefords, bulls.—First prize, Rev. W. B. G. Botfield, Decker Hill, Shiffnal; second, G. Smith, Wellington.

Bulls of 1869.—First prize, J. Harding, Bieton, Shrewsbury; second, R. Tanner, Frodesley, Dorrington.

Cows.—First and second prizes, M. Williams, Dryton, Wroxeter.

Heifers.—First prize, R. Tanner, Dorrington; second, H. Davies, Patton, Mueh Wenlock.

Heifers of 1869.—First prize, J. Harding, Shrewsbury; second, R. Tanner, Dorrington.

Best ewe, of any breed, for dairy purposes.—First prize, R. Dicken, Wellington; second, St. J. C. Charlton, Wellington.

EXTRA STOCK.

Horses.—First-class medal, St. J. C. Charlton; second-class medal, H. J. Wilde, Claverley, Bridgnorth.

Cattle.—First-class medal, R. Everall; second-class medals, S. and J. Perry, Condover.

PIGS.

Boar.—First prize, J. Heatley, Old Springs Farm, Market Drayton; second, Mrs. Allen, Upton Magna.

Breeding sow, in pig.—First prize, Sir H. G. Harnage, Bart., Belwardyne Hall, Much Wenlock; second, T. Jukes, Wellington.

Farrow of pigs.—First prize, T. Radcliffe, Cheswell Grange; second, W. Ford, Elford Hill, Eccleshall.

Cottager's pig.—First prize, R. Richards, Wellington; second, W. Hendley, Wellington.

CHEESE.

First prize, J. Heatley, Market Drayton; second, T. Simon, Ternhill, Market Drayton.

BUTTER.

First prize, H. Smith, Eaton Constantine, Wellington; second, G. Smith.

CHESHIRE AGRICULTURAL SOCIETY.

MEETING AT SANDBACH.

The entries of cheese were scarcely so numerous as they have been in previous years, but it was observable that there was much less disparity as to merit in the different classes. There were nineteen entries for the first premium, the champion prize being taken by a well-known Cheshire maker, Mr. Jos. Aston, of Brassey Green; and very close upon his heels came Mr. Balmer, of Tattenhall-lanes. The judges remarked that they had never seen a finer show of cheese. The butter taking prizes was good, but perhaps not up to the ideal of what fresh butter should be. The flavour can be seriously impaired or disguised by salt. The stock was most noticeable on account of the younger bulls and the dairy cows, there being a marked falling-off in the other young stock, as only for one premium was there competition, that offered for heifer calves; both heifers and stirks were conspicuous by their absence. Of the pigs, the entries both of the large and small breeds brought together some good pens. There was just the right class of agricultural horses, and the hunters were fully up to the average standard of merit. None of the Shropshire sheep breeders had entered, but still there was no lack of competition, or rather entries, for one exhibitor had entered five sheep for one premium, three for another, two for another, and so on. His enterprize was rewarded by a second prize. They were long-woolled, and perhaps the quality of these was better than that of the short-woolled, where Mr. Johnson, of Frodsham, possessed an undoubted advantage over the other exhibitors. The vegetables and seeds were good. The show of implements was very fair. The following is the list of prizes:

CHEESE.

For the best dairy of cheese, either old or new, not less than 50lbs. weight each.—First prize, J. Aston, Brassey Green, Tarporley; second, T. Balmer, Tattenhall Lanes.

Best dairy of new cheese, not less than 20lbs. nor more than 50lbs. weight each.—First prize, S. Willis, Clotton, Tarporley; second, W. Beckett, Clive.

For the best dairy of cheese averaging above 40lbs. weight each, not made on the Sabbath Day.—Prize, W. Beckett.

Best dairy of cheese not on the average exceeding 40lbs. weight each, not made on the Sabbath Day.—Prize, J. Beckett, Thurlwood Farm, Lawton.

BUTTER.

For the best six dishes of butter, made by the exhibitor.—First prize, S. Davies, Eardswick Hall; second, S. Willis, Clotton, Tarporley; third, J. Parry, Weetwood, Tarporley.

CATTLE.

Best bull of any age.—Prize, C. Sherwin, Bostock.

For the best bull above two years old.—First prize, G. Willis, Ridley Hall, Tarporley; second, R. Barnett, Wettenhall.

Best yearling bull.—First prize, J. Barker, Rushton; second, A. Bibbey, Astbury; third, J. Vernon, Willingtons.

Best bull calf.—Prize, C. T. Dean.

Best pair of dairy cows.—First prize, Lord Crewe, Crewe Hall; second, G. Willis; third, J. Farr, Hatton Hall.

Best dairy cow in-milk.—First prize, J. Hart, Bulkeley; second, J. Parr, Hatton; third, G. Willis.

Best pair of heifer calves.—First prize, J. Goolden, Hale, Altrincham; second, J. Hart, Bulkeley; third, J. Barker, Rushton.

PIGS.

For the cottager's or labourer's best fattened pig.—First prize, C. Duning, Chapel-street, Sandbach; second, J. Morrey, Well-street, Sandbach.

LARGE BREED.

Best boar pig of any age.—First prize, H. Goodall, Arclid; second, Sir Philip de M. Grey Egerton, Oulton Park.

Best breeding sow of any age.—First prize, J. Robinson,

Lee Green Hall, Middlewich; second, P. Wright, Church Minshull.

Best litter of pigs not less than eight in number.—First prize, S. Davies, Eardswick Hall; second, R. T. Beckett, Oulton Park, Tarporley.

SMALL BREED.

Best boar pig of any age.—First prize, S. Davis; second, H. Goodhall.

Best breeding sow of any age.—First prize, S. Davies; second, H. Goodhall.

Best litter of pigs not less than eight in number.—Prize, S. Davies.

Best pair of gilts.—First prize, Marquis of Westminster; second, R. Beckett, Hartford.

HORSES.

Best pair of horses for agricultural purposes.—First prize, Stonetrough Colliery Company; second, S. Lees, Newton, Preston Brook.

Best mare or gelding for agricultural purposes.—First prize, J. Pover, Elton Hall, Chester; second, Stonetrough Colliery Company.

Best stallion for agricultural purposes.—First prize, R. Ash, Biddulph; second, E. Burgess, Smallwood.

Best mare or gelding as a roadster.—First prize, G. F. and A. Brown, Nantwilt; second, G. Millington, Ravenscroft.

Best brood mare, with the foal at her foot, for agricultural purposes.—First prize, P. Leather, Stretton; second, Marquis of Westminster.

Best two-year-old gelding or filly for agricultural purposes.—First prize, J. Garner, Tattenhall; second, J. Hornby, Minshull Vernon.

Best yearling gelding or filly for agricultural purposes.—First prize, C. Hollingshead, Minshull Vernon; second, J. Hornby.

Best brood mare for breeding hunters.—Prize, Stonetrough Colliery Company.

Best three-year-old colt for hunting purposes.—Prize, J. W. McGill, Sparrow-lane, Sandbach.

Best mare or gelding suitable for a hunter.—First prize, W. R. Court, Newton Manor, Middlewich; second, J. Poinons, Tiverton.

Mare or gelding who is the best performer as a hunter.—First prize, P. H. Taylor, Congleton; second, J. Gibbs, Worleston.

SHEEP.

Best longwoolled ram.—First and second prizes, R. Johnson, Kirkireton, Wirksworth.

Best shearing longwoolled ram.—First and second prizes, R. Johnson.

Best longwoolled tup lamb.—First prize, R. Johnson; second, R. Richardson, Sandbach.

Best three longwoolled ewes.—First prize, J. Cheers, Barrow; second, R. Johnson.

Best three longwoolled shearing ewes.—First prize, R. Richardson; second, R. Johnson.

Best three longwoolled ewe lambs.—First prize, S. Davies, Eardswick Hall; second, T. Richardson, Booth Lane, Sandbach.

Best shortwoolled ram.—First prize, T. Johnson, The Hermitage, Frodsham; second, T. Rigby, Over, Winsford.

Best shearing shortwoolled ram.—First prize, T. Johnson; second, R. O. Leycester, Toft.

Best shortwoolled tup lamb.—First prize, T. Johnson; second, S. Allen, Onston, Weaverham.

Best three shortwoolled ewes.—First prize, T. Johnson; second, J. Barker, Rushton.

Best three shortwoolled shearing ewes.—First prize, T. Johnson; second, R. O. Leycester, Toft.

Best three shortwoolled ewe lambs.—First prize, R. O.

Leycester, second, Sir P. de M. Grey Egerton, Oulton Park.

VEGETABLES AND SEEDS.

For the best sample of white wheat.—Prize, T. H. Hodson, Edleston Farm, Nantwich.

For the best sample of yellow or red wheat.—Prize, T. Rigby, Over.

Best sample of oats, any variety.—Prize, J. Robinson, Lee Green Hall, Middlewich.

Best sample of barley, any variety.—Prize, T. H. Hodson.

Best sample of beans, any variety.—Prize, S. Davis, Eardswick Hall.

Best six roots of turnips.—Prize, Colonel Cholmondeley.

Best six roots of mangolds.—Prize, T. Palmer, Tattenhall Laues.

Best sample of potatoes, of any kind.—Prize, J. Wright, Church Minshull.

IMPLEMENTS.

£10 given at the discretion of the judges for the best individual implements shown at the different stands: Richmond and Chandler, Saltford, Manchester, £1 10s., for chaff cutter; T. Bostock, Burslem, £1 10s., for Howard's self acting rake; Hancock and Foden, Sandbach, £1 for Ransomes and Sims' plough and four-horse engine; D. Harkes, Mere, £1 for double-furrow plough; G. Lewis, Hassall, Sandbach, 10s. for a mill; Messrs. Keyworth, 35, Tarleton-street, Liverpool, 10s. for double turnip scarifier, also £1 for sheep rack and corn crusher.

WOOL.

Best three fleeces of short wool.—Prize, T. Finchett, Rushton.

Best three fleeces of long wool.—First and second prizes, R. Richardson, Sandbach.

EAST CHESHIRE AGRICULTURAL SOCIETY.

MEETING AT MACCLESFIELD.

At the first annual exhibition of the East Cheshire Agricultural Society, the weather seriously marred the success of the show, a violent storm of wind and rain prevailing during the day. The Society has only been in existence a short time, and in its formation amalgamates a number of small local exhibitions in the division of the county in which it is established. A sum of £500 was offered in prizes, but this amount seemed to fail in securing an exhibition of stock at all commensurate with the district.

There were 267 premiums offered, but in a great number of instances, partly on account of the weather and partly owing to the fact of the great county show at Sandbach, which opened on Thursday, there was no competition. The samples of mangold wurtzel entered for competition in the class for the large red description were of extraordinary size and fulness. John McLuckie, Batley, received the first award out of competitors from Bollington, Edgeley, Eaton, and Handforth. For swede turnips Mr. Newcombe, Bollington, was first. The staple cheese and butter created an interest in the show-ground only exhibited at a Cheshire show, and the first prize was awarded to Mr. Robert Hyam, Snelsou, the second to Margaret Wood, dairymaid to Mr. E. Herford, Borris Hall. Four first premiums, awarded for cheese, were distributed as follows: Best specimen, not less than three shown, each 50lb. weight, Solomon Etchells, Batley; under 50lb. and not less than 30lb. in weight, William Weatherby, Siddington; for best three cheese, not less than 50lb., made in the present year, George Jackson, Old Withington; best three cheeses, under 50lb., made in the present year, Peter Robinson, Rainow. In the awards for grain, J. Faulkner, Oilerton, received first premium for four bushels of new white wheat grown this year; and S. Ridgway, Upton Hall, for red wheat.

A better show of cattle might reasonably have been expected in such a district. Including the open competition, and those confined to tenant farmers within the district, there were only 54 animals entered, and in many competitions the stock were of such a description, and the entries so few, that the judges withheld the awards. In the class for tenant farmers resident within the district the first prize for the best bull under three years was given to John Chetham, Norbury; Thomas Norbury, Mettram St. Andrew, second. For bulls under two years old, first Joseph Anderton, Gawsorth; second, J. Jackson, Handforth. The other awards were for bull calf, Allan Carswell, Batley; cow in-milk or in-calf, John Leather, Higher Bent House, Cheddle-Hulme; barren cow, John Chetham; cow or heifer, Captain T. W. Sykes, Cheddle; heifer in-calf or in-milk under three years, John Chetham; heifer under two years old, John Chetham. In the general competition, James Golden, Clay House Hall, Altrincham, received the first for aged bull; Daniel Ashbrook, Reddish, near Stockport, for the best cow; W. J. Legh, M.P., Lyme Park, two-year-old heifer; the same gentleman for the best

year-old heifer; best year-old bull, W. Jackson, Lyme, Handley; James Robinson, Rainow, for cows of any age in-milk or in-calf; Samuel Barlow, Rainow, for the best calf.

The horses as a class were not an exceptional show, those used for agricultural purposes predominating in point of number, although by no means numerous for such a district. Best brood mare, J. F. D'Arcy Wright; best three-year-old gelding or filly, John Millward, Sutton; and the other chief awards were as follows:—Two-year-old gelding or filly, W. C. Brocklehurst, M.P.; roadster mare, Richardson Andrew, Prestbury Hall; cob under 15 hands, H. S. Aspinwall, Macclesfield; pony, mare or gelding, James Dalziel, Batley. In the class for tenant farmers the awards were: Pair of horses for agricultural purposes, Thomas and Samuel Norbury, Chelford; mare or gelding, for agricultural purposes, S. Worthington, Woodford; brood mare for similar purposes J. and J. Hamson, Poynton; three-year-old gelding, S. Worthington; two-year-old ditto, F. Philips, Wilmslow; year-old, gelding or filly, W. Shaw, Gawsorth; weaning foal, J. and J. Hamson. In the general competition the premium for the best stallion was awarded to Thomas Standbank, Dunham, Massey, and for hunter mare, W. C. Brocklehurst, M.P. J. C. Rogerson, Manchester, took the premium for a pony not over 15 hands; Sykes and Co., Edgeley, for mare for draught purposes; and the Stoneclough Colliery Co., Lancaster, for the best pair of draught horses.

The prizes for sheep and pigs were by no means closely contested. There were 30 entries in the former, and in the latter about 25. Nathan Cotham, Norbury Hall, received the award for long-wooled ram; John Willott, Rainow, for tup lamb, pen of five long-wooled ewes, pen of ewe lambs, and pen of fat ewes; W. J. Legh, M.P., for short-wooled ram and shearing ram; the Rev. J. Thorneroff, fer tup lamb; John Wright, Walker's Heath, Gawsorth, for best pen of five year olds of the long-wooled breed; Enoch Clayton, Bosley, for pen of fat wethers; and J. F. D'Arcy Wright, Mottram Hall, for pen of short-wooled ewes and ewe lambs. For pigs Mrs. T. Mothershead, Sutton, received the first award for boars of the large breed; W. D. B. Davenport, M.P., for boars of the middle breed; Richardson Andrew, Prestbury Hall, for breeding sow of the large breed; J. Oliver, Ivy Lane, Macclesfield, for the best fat pig; and C. Bullock, Macclesfield, in the class for cottagers.

The principal premiums for implements were awarded as follows: Best stand of implements, Samuel Holland, Macclesfield; best stand of implements manufactured by the exhibitor, D. Harkes, Mere, Knutsford. Medals were awarded to J. Sinclair, London and Manchester, for chemical fire engine, and to Norton, Stockport, for patent filter.

At the annual dinner of the society, held in the Town Hall on Tuesday evening, the chair was occupied by Mr. W. C. Brocklehurst, M.P.

GLAMORGANSHIRE AGRICULTURAL SOCIETY.

MEETING AT COWBRIDGE.

The Agricultural Society of the county returned to its native place, after journeying in successive years to Cardiff and Neath. It originated in the Vale of Glamorgan near a century back. It held its meetings annually at Cowbridge for many following years, and after a short experience of migratory movement, successfully introduced three years ago, it has paid "the garden of Wales" another visit, and has proved by the result that "there is no place like home."

There were a hundred more entries than in any previous year. It is somewhat singular and certainly unusual, that the show was almost entirely confined to the county. There were no English competitors for any of the prizes, nor any entries sent in by farmers outside the limits of the county of Glamorgan. There was a slight falling off in the number of sheep, which may be accounted for by the badness of the season; but this was made up by the increase in the horses and cattle. There was a fine exhibition of Herefords, and the Shorthorn and cross-breed show was large. Some of the beasts, and particularly the bulls, were very fine, of good proportions, with plenty of flesh. Horses made the best display, and were, on the whole, good.

PRIZE LIST.

CATTLE.

HEREFORDS.

Best two cows, above three years old, in calf or in milk, and their offspring under twelve months old.—First prize, W. S. Powell, Eglwysnuyd, Taibach; second, W. S. Powell.

Best cow, above three years old, in calf or in milk.—First prize, W. S. Powell; second, W. S. Powell.

Best bull.—First prize, L. and H. Thomas, Tydraw, Cowbridge.

Best yearling bull.—Prize, W. S. Powell.

Best two-year-old heifer, in calf or in milk, for breeding purposes.—First and second prizes, W. S. Powell.

Best yearling heifer for breeding purposes.—First prize, T. Thomas, St. Hilary, Cowbridge; second, W. S. Powell.

SHORTHORNS.

Best two cows, above three years old, in calf or in milk, and their offspring under twelve months old.—First prize, J. Garsed, The Moorlands, Lantwit Major (Blanche); second, D. Owen, Ash Hall, Cowbridge (Fancy).

Best cow, above three years old, in calf or in milk.—First prize, T. Dalton, Cardiff; second, A. Watts, Coity.

Best bull.—First prize, D. Owen; second, J. H. Harding, Cardiff.

Best yearling bull.—Prize, A. Watts.

Best two-year-old heifer, in calf or in milk for breeding purposes.—First prize, J. M. Harding, Hill Earm, Swansea (Queen of the Ocean); second, J. M. Harding (Emblem).

Best yearling heifer, for breeding purposes.—First prize, D. Owen; second, J. Bruce Pryce, the Duffryn, St. Nicholas.

OTHER PURE OR CROSS-BREDS.

Best two milking cows, three years old.—First prize, W. Prichard, Bryntririon, Bridgend; second, A. Watts.

Best milking cow, above three years old.—First prize, J. Thomas, Lisworney.

Best pair of yearling steers.—Prize, W. S. Powell.

Best bull calf, of any pure breed.—First prize, T. Thomas; second, W. S. Powell.

Best heifer calf of any pure breed.—First prize, J. Williams, Llantrithyd (Fancy); second, T. Thomas.

Best bull, cow in calf or in milk, and their offspring under twelve months old, of any pure breed.—First prize, Major T. Picton Tuberville, Ewenny Abbey, Bridgend; second, W. S. Powell.

EXTRA STOCK.

Highly commended, J. Williams, Llantrithyd.

SHEEP.

LONG-WOOL.

Best yearling ram.—First prize, C. Spencer, Gileston, near Cowbridge; second, W. Donne, Monkton, near Bridgend.

Best ram lamb.—First prize, J. Williams, Caercady, Cowbridge; second, W. Donne.

Best five ewe lambs, for breeding purposes.—First prize, T. Thomas; second, J. Williams.

Best five wether lambs.—Prize, J. Williams.

Best five ewes exceeding three years old that have bred the preceding year.—First prize, J. Williams.

SHORT-WOOL.

Best yearling ram.—First prize, Morgan Rees, Garth Farm, Swansea.

Best ram lamb.—First prize, M. Rees.

Best five ewe lambs for breeding purposes.—First prize, M. Rees; second, J. B. Pryce.

Best five ewes, exceeding three years old, that have bred the preceding season.—Prize, M. Rees.

CROSS-BRED.

Best yearling ram.—First prize, J. Williams, Red Farm, Penlline.

Best five yearling ewes.—First prize, Howell Harrys, Crofta, Ystradowen.

Best pen of four breeding ewes and one ram, of Welsh mountain breed.—Prize, H. Harrys.

Best pen of five mountain wethers bred in the county.—Prize, H. Harrys.

Best pen of five yearling ewes of any pure breed.—First prize, J. Williams (long-wool); second, C. Spencer (long-wool).

Best aged ram of any breed.—Prize, J. Williams (long-wool).

WOOL.

For the best ten long-wool fleeces, the clip of 1870, from sheep bred by the exhibitor in the county of Glamorgan.—Prize, C. Spencer.

Best ten short-wool or cross-bred fleeces, the clip of 1870.—Prize, W. S. Powell.

PIGS.

Best sow, with pigs or in farrow, of any large breed.—Prize, J. Thomas, East Field House, Cowbridge.

Best sow with pigs or in farrow, of any small breed.—Prize, W. Harding, Cowbridge Mills.

Best boar of any large breed.—Prize, J. B. Pryce.

Best boar of any small breed.—Prize, T. B. Rees, Llandaff.

Best boar under a year old.—Prize, T. V. Reece, Llandaff.

Best pair of sows under a year old.—Prize, E. Thomas, Goldsland, Wenvoe.

HORSES.

Best cart stallion, which shall cover in the county during the season of 1871.—Prize, T. Earl, St. Mary Hill, Bridgend.

Best mare and foal for the general purposes of husbandry.—Prize, R. Thomas, Aberavon, near Taibach.

Best two-year-old gelding or mare for the general purposes of husbandry.—Prize, A. Watts.

Best yearling colt or filly, for the general purposes of husbandry.—Prize, R. Thomas, Upper Court, Taibach.

HUNTERS.

Thoroughbred stallion, calculated to produce weight-carrying hunters, to cover in the county for the season of 1871 at £10.—First prize, D. Earl, Cross Inn, Whitchurch, near Cardiff (Loyola, by Surplice, dam Latitude by Langar). Highly commended: D. Earl.

Brood mare, calculated to produce weight-carrying hunters, and covered by a thoroughbred horse for a weight-carrying hunter.—Prize, M. Williams, Aberpergwm.

Two-year-old gelding or mare, got by a thoroughbred horse, for a weight-carrying hunter.—Prize, L. and H. Thomas, Tydraw, near Cowbridge.

Yearling colt or filly, got by a thoroughbred horse for a weight-carrying hunter.—Prize, L. Jenkins, Tynucaia, St. Mary-hill.

Hackney gelding or mare, between 14 and 15 hands high.—Prize, W. Davis, The Meadows, Bridgend (Matchless).

Cob between 13 and 14 hands high.—Prize, Captain J. S. Ballard, The Verlands, Cowbridge.

Pony not exceeding 13 hands high.—Prize, Major T. Picton Turbervill.

Pair of cart-horses, for the general purposes of husbandry.—First prize, R. Williams, Parkuewydd, Pyle; second, D. Oweu, Ash Hall, Cowbridge.

Four-year-old hunter, up to at least 12 stone with hounds, the property of the exhibitor, who must be a tenant farmer in the county of Glamorgan, occupying 50 acres or upwards of land, open to non-subscribers £10 10s.—Prize, C. Spencer.

Weight-carrying hunter got by a thoroughbred horse, up to at least 14 stone with hounds.—First prize, Captain J. S. Ballard; second, Captain J. S. Ballard.

Light-weight hunter, got by a thoroughbred horse.—First prize, Rev. C. Stacey, Whitechurch, near Cardiff; second, J. Davies, Ely Mills, Cardiff.

Four-year-old colt or filly, for harness purposes, not under 15½ hands high, bred in the county of Glamorgan.—Prize, J. Williams, Red Farm.

DAIRY PRODUCE.

Best lot of cheese not less than 1 cwt.—First prize, T. Culverwell, Llwynhelig, Cowbridge; second, T. Culverwell; third, J. Williams.

Best lot of fresh butter in pounds, not less than ten.—First prize, J. David, Stembridge, near Cowbridge; second, J. Jones, Old Beaupre, Cowbridge; third, J. David.

Best cwt. of thin cheese, made in the county of Glamorgan.—Prize, T. Culverwell.

FRODSHAM CENTRAL FARMERS' CLUB.

The Frodsham Central Farmers' Club may be looked upon as the resuscitation of the Daresbury and Frodsham Farmers' Club, which, like many agricultural societies, collapsed when the cattle plague appeared. But the new Society has considerably extended the area of its operations, and bids fair to achieve much greater success than the old one could have ever hoped for. Proof of that was now given, but, as was the case last year, the success was not so great as was anticipated, as one very necessary element, fine weather, was again wanting. The show, as a whole, was unquestionably in advance of the last, and, despite the weather, may be looked upon as a success. The entries, excepting those of sheep and roots and corn, were in excess of last year, and the competition was consequently keener. The cheese was very good and pretty ripe; a lot of uncoloured was but poor, while the best was that taking the Marquis of Cholmondeley's prize, given to cheese made in a dairy where Sunday labour is entirely dispensed with. Of the butter we defer to the judges as to the first and second best, but the remainder had that fault common to Cheshire, too much salt. Some of the stock was very good, but this does not apply to all the classes, as it will be seen there was only a few young things shown. Of horses there was a fair show.

The judges were:

R. Broady, Manchester.	J. Griffiths, Hawarden.
- Dickenson, Upholland.	G. Jackson, Tattenhall.
Hugh Doran, Stretford.	J. Lowe, Prescott.
- Dutton, Stanthorne.	T. Rigby, Over.

PRIZE LIST.

CATTLE.

Best bull of any breed most suitable for dairy purposes under four years old.—First prize, J. W. Antrobus, Stockham; second, T. Moreton.

Best bull under two years old.—First prize, W. Darbyshire, Grappenhall; second, J. Hewitt, Norton.

Best pair of dairy cows, any breed.—First prize, W. Wilkinson, Dutton; second, J. Hewitt.

Best pair of heifers under three years old.—First prize, W. Wilkinson; second, J. Hewitt.

Best pair of heifers under two years old.—First prize, J. Hewitt; second (divided), P. Priestner, Peel Hall.

Best pair of heifer calves.—Prize, J. Hewitt.

Best bull of any age.—Prize, J. Percival, Godscroft.

Best Bull under two years old.—Prize, S. Allen, Onston.

Best dairy cow of any breed.—First prize, J. Swinton, Run-corn; second, J. Weir, Lower Walton.

Best heifer under three years old.—First prize, J. Weir; second, J. Reynolds, Frodsham.

Best heifer under two years old.—First prize, J. Highfield, Frandley House, Seven Oaks; second, T. Ditchfield, Run-corn.

Best pair of heifer calves.—First prize, W. Burgess, Stockham; second, J. Wright, Helsby.

Best bull most suitable for dairy purposes under four years old.—First and second prizes, J. Hewitt.

Best pair of dairy cows.—First and second prizes, J. Parr, Hatton.

Best pair of heifers under three years old.—First prize, J. Higson; second, J. Hewitt.

Best pair of heifers under two years old.—Prize, J. Hewitt.

HORSES.

Best stallion of the cart or waggon kind.—Prize, P. Leather, Stretton.

Best team of cart horses with or without gears.—S. Lees, Newton-by-Darcsbury; second, T. Johnson, Runcorn.

Best agricultural horse, mare, or gelding.—First prize, J. Pover, Elton Hall; second, P. Leather, Stretton.

Best brood mare of the cart breed.—First prize, S. Mort, Frodsham; second, S. Littler, Trafford.

Best gelding or filly under three years old.—First prize, J. Pover, Elton Hall; second, M. Ravenscroft, Kingsley.

Best gelding or filly under two years old.—Prize, S. Mort.

Best weaning colt.—First prize, T. Ditchfield, Runcorn; second, R. Nicholson, Chester.

HUNTERS.

Best brood mare suitable for breeding hunters.—Prize, J. Higson, Frodsham.

Best hunter of any age up to 14 stone.—First prize (silver cup), J. H. Hayes, Frodsham; second, W. K. Weaver, Chester.

Best hunter of any age, light weight.—First prize (silver cup), R. Ashton, Five Crosses; second, T. Lowe, Old Pale.

Best three or four-year-old gelding or filly best adapted for making a hunter.—Prize, J. Cossins, Blue Cap Cottage, Sandway.

PIGS.

Best boar of any breed most suitable for farmers' purposes.—First prize, W. Darbyshire, Grappenhall; second, A. Lockwood, Chester.

Best breeding sow suitable for farmers' purposes.—First prize, J. Hewitt, Norton; second, A. Stretch, Riley Bank.

For the best fat pig belonging to any cottager in the district.—First and second prizes, T. Berrington, Overton; third, R. Trelfall, Frodsham; fourth, T. Woodward, Overton.

SHEEP.

LONG-WOOLLED.

Best long-woolled ram of any age most suitable for the district.—First prize, J. Cheers, Barrow; second, J. Parr, Hatton.

Best shearing ram, as above.—First and second prizes, J. Cheers.

Best tup lamb of any age.—First prize, J. Sheen, Eddisbury; second, J. Cheers.

Best pen of three ewes of any age.—First and second prizes, J. Cheers.

Best pen of three shearing ewes.—First prize, J. Parr, Hatton; second, J. Cheers.

Best three ewe lambs.—First prize, J. Parr; second, J. Cheers.

SHORT-WOOLLED.

Best short-woolled ram of any age.—Prize, T. Johnson, Hermitage.

Best shearing ram.—First prize, T. Johnson; second, J. Lloyd, Trafford.

Best tup lamb.—First prize, S. Allen, Onston; second, T. Johnson.

Best pen of three ewes.—First prize, T. Johnson; second, G. Lloyd.

Best pen of three shearling ewes.—Prize, T. Johnson.

Best three ewe lambs.—Prize, T. Johnson.

CHEESE

(Prizes open to the county of Chester)

Best three cheeses where Sunday labour is entirely dispensed with.—Prize, W. Reece, Ashton Hall Chester.

Best three cheeses.—First prize, J. Robinson, Ernslow Grange; second, J. Pover.

Best three cheeses.—First prize, T. Golborne, Willington; second, J. Drinkwater, Seven Oaks.

BUTTER.

For the best basket of butter (six 1 lb. prints).—First prize, J. Parry, Bridge End Farm; second, J. Andrews, Frodsham; third, T. Booth, Wheatwood-cottage, near Tarporley; fourth, T. Horton, Frodsham.

ROOTS.

Best six roots of common turnips.—Prize, J. Higson, Frodsham.

Best six roots of Swedish turnips.—Prize, J. Higson.

Best six roots of mangold-wurzel.—Prize, J. Higson.

Best three Scotch cabbages.—Prize, W. Weir, Norton.

SEED CORN.

Best sample of white seed wheat.—Prize, T. Wright, Woodhouses.

Best sample of yellow or red wheat.—Prize, J. Wright, Helsby.

Best sample of white seed oats.—Prize, J. Swinton, Run-corn.

Best sample of yellow seed oats.—Prize, E. Dodd, Mouldsworth.

Best sample of black seed oats.—Prize, J. H. Hayes, Frodsham.

AGRICULTURAL IMPLEMENTS.

Selection of agricultural implements suitable for use in the district.—First prize, J. and H. Keyworth and Co., Chester; second, W. Watkin and Son, Halton; third, J. W. Rothwell, Frodsham.

ROYAL AND CENTRAL BUCKS AGRICULTURAL ASSOCIATION.

MEETING AT AYLESBURY.

The ploughing took place on the farm of Mr. T. W. Morris, of Bedgrove, about a mile from the town, where some exceedingly good work was done. The stock show was not so large as on some other occasions.

JUDGES.

PLOUGHING.—E. Freeman, Chilton; J. H. Guy, Whitchurch.

HORSES.—J. Manning, Oringbury; J. K. Elliott, Heathen-cote, Towcester.

CATTLE.—M. Savidge, Sarsden Lodge Farm, Chipping Norton; C. Howard, Biddenham, Bedford.

SHEEP.—M. Druce, Burghfield, Reading; A. Smith, Somerton, Bicester.

BUTTER.—A. J. P. Stevens, Metropolitan Meat Market, London.

ROOT CROPS AND ROOTS IN THE SHOW YARD.—J. Treadwell, Winchendon; C. Elliott, Hulcott; E. Denchfield, Burston.

POULTRY.—E. Hewitt, Eden Cottage, Sparkbrook, Birmingham.

PRIZE LIST.

HORSES.

Geldings, three years old and upwards.—First prize, £5, and second, £2, Z. W. Stilgoe, Adderbury, Bambury.

Geldings, under three years, for tenant farmers only.—First prize, £5, and second, £2, J. Hughes, Waddon Hill, Stone.

Mares, three years old and upwards.—First prize, £5 5s., W. Rose; second, £2, J. P. Terry, Putlowes, Aylesbury.

Mare and foal (the foal dropped in 1870), for tenant farmers only.—First prize, £5 5s., E. M. M. Lucas; second, £2, J. and E. Denchfield.

Mares under three years, for tenant farmers only.—Prize, £5 5s., J. and E. Denchfield.

Horses or mares for hunting purposes, for tenant farmers only.—First prize, £7 7s., G. A. Lepper, Aylesbury; second, £3 3s., F. W. Thorpe, Berryfield.

Nag geldings and mares, for riding and general purposes.—First prize, £5 5s., J. Hughes; second, £2, H. Gurney, jun., Aylesbury.

Best yearling nag colt.—Prize, silver cup, E. Clift, Weedon.

CATTLE.

Bulls, any breed, two years old and upwards.—First prize, £5 5s., J. Upson, Rivenhall, Witham, Essex; second, £2, W. S. Jessop, Dorton Camp.

Bulls under two years.—First prize, £5 5s., J. A. Mumford, Chilton Park Farm; second, £2, J. K. Fowler.

Cows, in milk or in calf.—First prize, £5 5s., C. A. Barnes, Chorley Wood, Rickmansworth; second, £2, J. A. Mumford.

Three cows, in milk or in calf, for tenant farmers only.—First prize, £10 10s., and second, £5 5s., J. and E. Denchfield. Heifers, in milk or in calf, under three and over two years.—First prize, £5 5s., and second, £2, J. A. Mumford.

Heifers, in pairs, under two years.—First prize, £5 5s., J. and E. Denchfield; second, £2, G. Underwood, Little Gadsden.

Fat cows.—First prize, £5 5s., T. L. Senior, Broughton; second, £2, J. A. Mumford.

Best animal exhibited in the classes of horned stock.—Prize, £5 5s., J. Upson.

SHEEP.

Rams, any breed.—First prize, £5 5s., J. Longland, Grendon; second, £2, Lord Chesham.

Five store ewe lambs, for breeding purposes.—First prize, £5 5s., Lord Chesham; second, £2, T. Kingsley, Boarscraft, Tring.

Five fat ewes, any breed or age.—First prize, £5 5s., J. Treadwell, Winchendon; second, £2, Lord Chesham.

Five fat wethers.—First prize, £5 5s., Lord Chesham; second, £2, Z. W. Stilgoe, Adderbury.

Five long-woolled ewes, intended for breeding purposes.—Prize, £5 5s., J. Godwin, Troy Farm, Bicester.

Five Down or cross-bred ewes, intended for breeding purposes.—First prize, £5 5s., J. Treadwell; second, £2, R. Fowler.

Five shropshire ewes, intended for breeding purposes.—First prize, £5 5s., R. Fowler; second, £2, E. Baylis, Hogstone.

Five theives, any breed, intended for breeding purposes.—First prize, £5 5s., Lord Chesham; second, £2, J. Treadwell.

Best pen of breeding ewes or theives in the yard.—Prize, £5 5s., Lord Chesham.

Best pen of fat sheep.—Prize, £3, Lord Chesham.

PIGS.

Boars, any breed.—First prize, £3 3s., J. Wheeler, Long Compton; second, £2, E. C. Clarke, Haddenham.

Sows, any breed, either in pig or with litter, for tenant farmers only.—First prize, £5 5s., J. and E. Denchfield; second, £2, J. Treadwell.

Three fat pigs.—First prize, £3 3s., W. Cooper, Winchendon; second, £2, C. Elliott, Hulcott.

PLOUGHING.

For ploughing half an acre of land in four hours.—First prize, £2, to the ploughman of A. Tindal, Aylesbury; second

prize, £1, to the ploughman of Messrs. Ransomes, Sims, and Head, Ipswich.

BUTTER.

For 12lbs. of butter, in 2lb. lumps.—First prize, £3, J. F. Perkins; second, £2, T. Matthews, Waddesdon; third, £1, A. Roads, Rowsham.

ROOTS.

For the best crop of mangold wurtzel of not less than five acres, the whole of the mangolds on the farm to be taken into consideration, for tenant farmers only.—Prize, £10 10s., E. Freeman, Chilton, Thame.

For the best crop of swedes of not less than six acres, the whole of the swedes on the farm to be taken into consideration, for tenant farmers only.—Prize, £10 10s., T. Clarke, Ellesborough, Tring.

For the best collection of roots.—First prize, £5 5s., J. K. Fowler, Aylesbury; second, J. and E. Denchfield, Barston.

For the best 25 mangolds, taken from a piece of not less than two acres.—First prize, £2, E. M. Lucas, Rowsham; second, £1, R. Fowler.

For the best 12 purple-topped swedes, (untrimmed), taken from a piece of not less than two acres.—First prize, £1, T. Clarke; second, 10s., J. H. Guy, Whitechurch.

LEICESTERS AND OTHER LONGWOOLS.

SCENE.—An office in Dublin.

Gammon.—Now tell me, Mr. Sheepshanks, what I am seriously about to ask you. How many pure breeds of long-woolled sheep does England now really produce?

Sheep.—Two: The Dorsets and other Horns excepted.

Gam.—Is that all?

Sheep.—I believe so.

Gam.—And what are they?

Sheep.—Leicesters and Cotswolds.

Gam.—You amaze me; first in regard to Leicesters, your opinion is that there is only one kind of thorough-bred?

Sheep.—Most assuredly the *Leicester* is as unmistakable as the Arabian horse. Any other *Leicester* partakes rather of the Arabian Nights, or if you will, of that figure in rhetoric under which your profession is recognised.

Gam.—You believe then that Border Leicester, Yorkshire Leicester, and Improved Leicester—

Sheep.—Are mere terms of huxtering clap-trap; heard for the first time, and soon—if she disapproves being laughed at—to be heard for the last time in Ireland.

Gam.—Are you acquainted with the soil and climate of this country, Mr. Sheepshanks?

Sheep.—Partly.

Gam.—And what do you think of them?

Sheep.—Why, that the southern and western provinces are both equal to any in the three kingdoms for the production of wool and mutton.

Gam.—You think, then, that what the eloquent and refined Carlisle termed the “weeping skies”—

Sheep.—Will do no harm whatever to the sheep they weep on, if you only put, as we do, something inside ‘em.

Gam.—Good. My next inquiry will be: Are you acquainted with our native breeds of sheep?

Sheep.—I am.

Gam.—Tell me your belief in them.

Sheep.—I believe in the wise arrangements of Providence, and in the instincts of ages thus far: that every spot of earth upon which we find a race of animals showing healthy constitutions, and a high quality of food, that upon that race should its future dynasty be founded.

Gam.—Then you would not attempt the pure breeding of either of the two distinctions you refer to in Ireland?

Sheep.—Most certainly not.

Gam.—And which would you prefer to cross with?

Sheep.—You don’t ask that question seriously, do you?

Gam.—Why not seriously?

Sheep.—Because the whole sheep-breeding community have already answered it.

Gam.—I understand; but do you say that you have only two distinct breeds of long-woolled sheep in Great Britain?

Sheep.—No: I did not say that.

Gam.—What then did you say?

Sheep.—I said we had only two pure breeds.

Gam.—How about the Lincoln?

Sheep.—The Lincoln has a distinction, and a high one, but he cannot be said to be pure, inasmuch as he owes it all to what Mr. Partner calls the visits of the Leicester.

Gam.—Is that a fact?

Sheep.—Yes. You may lay all Ireland upon it, and throw Connaught in for luck; and, what is more, you may make the

same bet upon every improved breed of long wools in England, Ireland, and Scotland.

Gam.—That is, indeed, saying a great deal for the Leicester, but how do you account, under it, for the enormous high rates obtained for the Lincoln sires?

Sheep.—Where the first judges of England, and from all parts of England, are the handicappers, I have great faith in figures, and the weight they have, by general consent, put upon the Lincoln arises, I opine, from two causes: first, it appears to have been a cross peculiarly happy in its results, and then, again, it has been so skilfully and carefully managed by the Lincoln breeders, that they have succeeded in imparting shape and touch, which they had not, without destroying that which they had, and were always for wool and size, and which now give them a position above all other cross-breeds.

Gam.—What is your opinion, Mr. Sheepshanks, of the Cotswold, as a general sire?

Sheep.—He is a noble specimen of his race, but he has not been successful as a sire out of his own class and district.

Gam.—I think I understood you to say that you would not recommend pure breeding, or close breeding, even of Leicesters in Ireland?

Sheep.—No, nor of any other foreign importation.

Gam.—Why?

Sheep.—Because it has been tried in almost every country, and in almost every country it has failed.

Gam.—Do you say so?

Sheep.—Yes; and, in the case of the Leicester, failed to a degree that alone gives the lie to these impudent pretensions of the Border gentleman.

Gam.—How?

Sheep.—How? Why, in every case where the pure breeding of the Leicester has been attempted, and a fertile genius, and an equally fertile soil and climate, brought to assist the art, he has, in spite of all, grown gradually less; but if this northern story is to be accepted, he has there, in his purity, grown more strong and large.

Gam.—What nature, then, do you assign to this Border Leicester?

Sheep.—Call him, if you please, by the name that he is known on his own side the Channel.

Gam.—And what is that?

Sheep.—The Border sheep.

Gam.—Well, then, this Border sheep?

Sheep.—If he has any nationality at all, he is a Cheviot.

Gam.—And how does that appear?

Sheep.—Because his grandmother, with the fifty G.’s before her, was a Cheviot, and if he disowns that respectable old lady in short petticoats, he is a mob.

Gam.—You amuse me.

Sheep.—Do I? You have plenty of amusement in Ireland, if it amuses you to find an animal who forgets who his grandmother was.

Gam.—Good, Mr. Sheepshanks, very good. I like your humour. Let me now inquire of you about Leicester No. 3, brought here as Yorkshire Leicesters.

Sheep.—Yorkshire, Mr. Gammon, stands very high in its eminence as a sheep-breeding county, and in it are Leicester breeders of the first position, at the head of which, I believe,

stands Mr. Borton, the winner of so many prizes at the Royal Society of England. There are also in it some good men, who carry out the plan of the Lincoln breeders on the reverse principle.

Gam.—That is, by adopting a Lincoln?

Sheep.—Precisely.

Gam.—And with what results?

Sheep.—The same happy ones that have succeeded the reverse cross; they keep what they always had from the dam—*shape and touch*, and get what they had not—*wool and size*. They seem, in fact, two families made for each other.

Gam.—At any rate, from your observations I gather that there is really little difference between a Lincoln and a Yorkshire Leicester.

Sheep.—Very little in some of the families, but I must not omit stating that all are not Yorkshire Leicesters which are bred in Yorkshire, and sheep have been quacked upon the breeders of this country as Leicesters and Yorkshire Leicesters, whose dams had no distinction whatever, and whose sires were third-rate Cotswolds.

Gam.—Is it possible?

Sheep.—I'll vouch for it. Yorkshire is still Yorkshire, and to deal with her you must be "Yorkshire too."

Gam.—But how can men of moderate judgment, or we will say with no judgment, escape these quackeries, as you call them, and avoid buying a bad animal?

Sheep.—Just as I avoid buying a bad hat. I know nothing of the hat, but I take care to know something of the hatter.

Gam.—Very good. A sound maxim to be sure.

Sheep.—The chief opportunity for these quacks arises out of the absence of that registry of animals which the herd-book furnishes in the case of shorthorns. You have no pedigrees of sheep, and, therefore, you should as in all such cases look to the breeding character of the men, and never act without that caution.

Gam.—But is this easy to get at?

Sheep.—Nothing easier, for, like the shorthorn productions,

the best blood is in comparatively few hands, and it would be easy to obtain the names of all of them, and confine yourselves to those and their next of kin. This plan would in fact be the foundation of a sheep herd-book.

Gam.—And how would you commence a unity of action to carry out a plan of this kind?

Sheep.—By the formation of a Society somewhat resembling the Turf Club, and confining your purchases of sires to its members, who, to establish a character for their flocks, should produce their pedigree, and pay a heavy penalty for a false one, or be dismissed the club.

Gam.—And do you think such a Society would take in Ireland?

Sheep.—Not a doubt about it, if it was established on a sound foundation, and tied together with something more substantial and something more useful than "red tape."

Gam.—Very good. And now about Leicester No. 4, the Improved Leicester.

Sheep.—"Improved" is a word in which there is great virtue, and may be made to mean anything or nothing. If there is any such animal at all, he is to be found in the lot last described, and you may give the title if you like to the Border sheep, it you prove by experience that his connexion with the Cheviot justifies it. It is a term hard to dispute when claimed by sportsmen for the cross of a greyhound with a bull-dog.

Gam.—Then, if I understand you, Mr. Sheepshanks, the sheep known as the English Leicester —

Sheep.—Is the only true Leicester.

Gam.—The Border?

Sheep.—A Cheviot bred in and in to the Leicester.

Gam.—The Lincoln?

Sheep.—Still a Lincoln improved by the Leicester.

Gam.—The Yorkshire Leicester?

Sheep.—Still a Leicester enlarged by a Lincoln.

—From a Pamphlet by Mr. Francis Page, of Thurles, on "The Quackeries of Sheep-breeders."

SALE OF THE REV. T. STANFORTH'S SHORTHORNS.

AT STOURS FARM, WINDERMERE.

ON TUESDAY, SEPT. 13, 1870, BY JOHN THORNTON.

Notwithstanding a very wet day a large company of between four and five hundred people assembled at this the second of the Stours draft sale. A luncheon in the barn preceded the business, Captain Gundy occupying the chair. After the Royal and usual toasts the company adjourned to the ring, situated in a fine grass field on the edge of the lake. The stock were brought out in a highly creditable manner by Mr. Robert Smith, the farm steward, whose own family history can be traced to Jacob Smith's bull (308), that is said to have been owned by his grandfather. The cattle were truthfully called drafts; but, as Mr. Thornton remarked on opening the sale, the best might be picked from some herds and be found no better than those he would bring before them. Claribel, bred by Mr. Carr, and a pure Booth cow, had caused many inquiries, but her slip in 1868 had resulted in barrenness, and she had never been in season for a year; as a fat beast she was worth three or four pounds more than the 29s. Culshaw gave for her. What the Townley pastures may do remains to be seen; but the purchase of a pure Booth cow, after the Bates combinations and the Oxford dynasty at Townley, is quite reminiscent of old times when Jeweller and Jasper flourished. Frederick's Pride, a purchase by Mr. Drewy at Townley, in '64, was in full health and breeding, being far advanced in calf to Peer of the Realm. There was comparatively little competition for her, and she returns at 62s. to her old home at 18s. cheaper, and five years older, than she left it. Graceful was of the Studley and Farnley Medora tribe, and several were of the same strain, although a plain beast, she was a regular breeder and a great milker. Mr. Meadows, who had been wandering in the Lake-district, takes her to Ireland at 39s. Ringlet was a fine cow, and out of a grand-daughter of Mr. S. Owen's Ruby, that gave thirty quarts a day. Mr. Swarbrick, after biddings from various quarters, got her at 65s., and also bought two

other good lots, Lady Grace at 56s., and Gaiety at 53s. Music and Musical (47s.) were of the Gwynne tribe, and from a purchase at Holker. Music was a fine roan cow with plenty of hair, and, after frequent "pennys" from the county men, she fell to Mr. Drewy for the Duke of Devonshire at 70s. Mr. R. Jefferson got a cheap cow, down calving to Mr. Booth's High Sheriff, in Swiss at 40s., and it was rumoured that next year will see a fine lot to be brought into the ring at Preston Hows. Sprightly, an advanced yearling, very level and full of hair, took Mr. Henry Smith's fancy, late of Durham, and he bought her at 38s. for the Ushaw College, Durham.

The first bull, Double Foggathorpe, seemed to want more middle and substance, but he had been among the heifers, which accounted for his lean state. A local man took him at 33s. The next, Sunshine, was of a rich colour and great depth, and a young bull of some promise. Mr. Smith also bought him for Ushaw College at 40s.

At the conclusion of the sale of the Shorthorns Mr. Kirkby sold the Cumberland heifers, which showed much breeding and quality, and the trade was very good for them. The company inspected the cows of the herd, and also High Sheriff, from Warlay, a young creamy-white bull of great elegance and quality, but the wet day was much against their appearance.

SUMMARY.			
21 cows averaged	43 14 0	equal to	917 14 0
4 bulls	" 35 3 6	"	140 14 0
—	25	"	£42 6 8
		"	£1,058 8 0

The Cumberland heifers, several of which were in calf, sold well at prices varying from 14 to 19 guineas each, the 20 averaging just over £17.

SHEEP SALES AND LETTINGS.

THE PANTON RAMS.—The varied and well-defined merits of Mr. H. Dudding's sheep attracted a large and influential company, which included the principal ram breeders of the county. The auctioneer was Mr. Calthrop, and the following is the result of the sale:

THE BISCATHORPE LINCOLNS.—At the letting at Mr. Thomas Kirkham's ram show, there was a very large attendance of ram breeders and sheep farmers from all parts of England, and several foreign breeders. Sixty shearling rams were let by auction, and averaged £13 7s. 6d. each. The highest price—£42—was given to Mr. H. Mackinder, of Langton. The two-shear rams (33 in number) were let at prices ranging from £7 to £40, Mr. Needham, of Huttoft, giving the latter price; the average of these pens was £11 9s. 5d. The three-shear and upwards realized prices varying from £5 10s. to £28, producing a net average of £8 2s. 9d. There were several Yorkshire breeders at the letting. One hundred and twenty rams were let, and the breeder has sustained the reputation of previous years, this being his 30th season.

MR. C. R. KEELING'S SHROPSHIRE.—The Yew Tree flock, though not of long standing, was originally founded on an admixture of animals obtained from Mr. W. Masfen, of Norton Canes, and the Shipley and Harley flocks. There was a numerous company assembled, Mr. Horley presiding at the luncheon, and competition for the rams was brisk. Prices ranged from 5½ to 50 gs., the latter sum being paid by Mr. Evans for the hire of Royalty, a son of Cardinal from a Competition ewe. No. 2 was reserved for showing at Kidderminster and Walsall, but realized 14 gs. for the season to Mr. Fellows. A very useful two-shear, bred by Mr. W. Masfen, went cheaply at 11 gs.; as also another two-shear, which Mr. R. H. Masfen obtained at 15 gs. The ewes ranged from 100s,

for one pen down to 50s.; another pen making 90s.; a third 75s. The general average for the rams would be about 12 gs. each. Mr. Prece, of Shrewsbury, conducted the sale.

THE PENDEFORD SALE OF SHROPSHIRE.—59 shearling rams, bred by Mr. R. H. Masfen, six stock rams, and 80 shearling and stock ewes were submitted for competition by Mr. W. G. Prece. Lot 1 made 16 gs., to Mr. Robinson; lot 3 was bought by Col. Lane for 25 gs.; lot 5 made 36 gs., to Mr. Chetwynd; lot 6 made 30 gs., the buyer being Mr. Waynam; lot 11 was let at 25 gs. to Mr. Pilgrim; lots 12, 13, 27, each realized 25 gs.; lot 25 made 22 gs.; the other shearlings ranging down to 5½ gs. Only one out of the 59 was unsold. The average was nearly £10 each, while the older rams averaged £13 13s. each. The ewes, which were in good condition, made from 45s. to 82s. 6d.

THE SHREWSBURY SALE.—A large Shropshire sale of 100 rams and 250 ewes, was held by Messrs. Lythall and Clarke, of Birmingham. The first lot were 15 shearling rams from Mr. J. L. Meire, of Eyton. The highest price realized was 15 gs., the lot averaging £5 15s. 6d. Next came 20 shearlings and a four-shear from Mr. H. Matthews, of Montfort. One of these made £17 17s., another £13 13s., and the rest from £11 11s. to £5 15s. 6d., the average being £8 5s. 6d. Messrs. Morris, of Gare, had 14 shearling and two old sheep. These made an average of £6 13s. Mr. W. Yates' 10 shearlings made the average of £10 2s. 6d., one of them being let at £18 18s. Lord Willoughby de Broke's 10 averaged £8 10s., the highest price being £11 11s. Mr. Sheldon, of Brailes House, had eight, which made £7 10s. each; and five from the Coalbrookdale Iron Company were sold at 5½ gs. each. The sale of the ewes was, considering the want of keep this season, very good, the whole of the lots being disposed of. Mr. Matthews' 13 pens ranged from 47s. 6d. to 60s.; Messrs. Morris' 18 pens from 44s. to 50s.; Mr. W. Yates' from 46s. to 50s.; Mr. Williams' from 49s to 54s.; and Mr. Chilwell's 44s.

SALE OF RAMS AT FORRES.—At the sale of Leicester and other rams, under the auspices of the Forres and Northern Fat Cattle Club, there was a large attendance of farmers and agriculturists of Moray, and the adjoining counties. The following were the lowest and the highest sums realised for each lot, and the average: Mr. Harris's 25 Leicester shearlings went at prices ranging from 60s. to 12 guineas, and averaged 97s. Mr. Ferguson's eleven Oxford Down lambs fetched from 35s. to 70s., and averaged 46s. Mr. Sutherland's four shearlings sold from 60s. to 80s., and averaged over 72s. Mr. Hunter's twenty shearlings went from 55s. to £6, and averaged over 80s. The principal purchasers were: Mr. Thomas Murdoch, Forres; Mr. Brown, Linkwood; Mr. Colvie, Earlsmill; Mr. Walker, Altyre; Mr. Collie, Elgin; Mr. Grant, Glen-Grant; Mr. M'Pherson, Kerrow; and Mr. M'Pherson, Muirtown.

THE BIDDENHAM RAM SALE.—The annual sale of Oxfords from the flock of Mr. Charles Howard, at Biddenham, near Bedford, was deferred to a later period than usual, and some doubts were entertained as to its success, but the well-known quality of the flock and the high reputation of the breeder always secure a good attendance at these pleasant gatherings at the old manor of Biddenham. On this occasion, notwithstanding that the season has been adverse to breeders and discouraging to farmers, a good company assembled, many of the buyers coming from distant counties; but it was remarked that the usual visitors from the continent were absent, and it is probable there was also a deficiency of those foreign commissions which give so useful a stimulus to sales of this kind. After the visitors had made an inspection of the flock, they were invited to a handsome luncheon provided in a large tent in the garden, the chair being taken by Colonel Higgins. The customary toasts having been given Mr. James Howard proposed the health of the breeders of sheep, and commented on the remark of the late Lord Leicester, that the introduction of the swede turnip and the improvement in the breed of sheep had added many millions to the wealth of this nation. It might be justly claimed by the breeders of England that they had been benefactors to their countrymen. Every man

who had travelled much in other countries could bear testimony to the great superiority of the English over the continental sheep; a superiority of which the English breeders might well be proud. Mr. WALLIS, in responding, agreed with Mr. Howard that the English sheep contrasted most favourably with the foreign; but the breeders of this country could not boast of any great pecuniary success this year: he hoped, however, that the sale to-day would show a reaction. Mr. TREADWELL, who was also called upon to respond, said that notwithstanding the difficulties of the present year, the farmers of England had reason to be satisfied with the profits to themselves as well as the honour of having added to the wealth of the nation generally, as had been stated; and for his part he thought that they could afford a bad season now and then. This sentiment was applauded, but some of the listeners gravely shook their heads, and took another sip of Mr. C. Howard's good wine. The health of the Chairman was proposed by Mr. Trethewey, who eulogised the gallant Colonel as a leading public man of the county, one of the promoters of the well-known middle class school, one who had greatly assisted in securing railway communication between this county and Northamptonshire, and one who was always foremost in the Oakley Hunt. The CHAIRMAN, after expressing the gratification he felt in meeting the agriculturists of this country, said it was peculiarly pleasing to him to know that the interests of this class were as prosperous as had been suggested by Mr. Treadwell. With reference to the middle-class school which has been established in this county mainly for the advantage of farmers' sons, it gave him, as a director, great pleasure to be able to announce that it now contained 300 boys, the full number expected. In giving the next toast, the health of their esteemed friend the host, he said it would be difficult to find a more eminent agriculturist in any county than Mr. Howard, as he had all those qualifications which that important business demanded—industry, intelligence, and enthusiasm; and it was such men as he who not only added to the wealth but also to the character of their country. The sheep now submitted had been deservedly eulogised by all who saw them; but he did not know how much the breeding of such first-class animals had turned to the advantage of the breeders. The toast having been duly honoured, Mr. CHARLES HOWARD responded, and very cordially expressed a welcome to all present. He, like every other man connected with the business of breeding animals, had for his object the realization of some reward for his own exertions; but, he added humourously in reply to the remark of the Chairman, it was not for him at that moment to tell them how much he had realized (laughter). He might say generally, however, that he was well satisfied; but there were some seasons when men in his position were perhaps a benefit to the neighbourhood yet had not succeeded in securing a corresponding benefit for themselves. On the whole, however, it was a great satisfaction to him to know that he had the credit of breeding a class of animals which would do some good wherever they went. After some brief remarks from Mr. Strafford, the company adjourned to the paddock where Mr. Strafford commented on the high qualities of the Biddenham flock, and submitted to competition 43 fine Oxfordshire Down shearing rams, together with some two-shear, three-shear, and four-shear rams. At first the biddings were given slowly and cautiously, and a few lots were withdrawn. At the invitation and suggestion of the auctioneer calls were made for certain lots, and after an active competition over one fine shearing, which eventually went at nineteen guineas to Mr. Milton Druce, the tone of the sale improved. Thirty-five of these sheep were knocked down to purchasers, twelve others remaining unsold. Amongst the lots brought into the ring there were some remarkably fine animals which at any other season would have commanded a high figure; and it was remarked by several connoisseurs, who have known the flock well, that the shearlings on this occasion looked bigger and better than any previously produced here. Notwithstanding all the disadvantages of this extraordinary season, the 35 animals sold realized an average of 9*l*. 1*s*. 6*d*.

SALE OF PURE-BRED SHEEP AT ABERDEEN.—Mr. J. Duncan, live-stock agent, Aberdeen, disposed of a number of very superior Leicester sheep, the property of Mr. Thompson, of Pitmedden, and Mr. Fortesque, of

Kingcausie. Two of the shearing rams got the first and second prizes at the recent Royal Northern Agricultural Society Show at Aberdeen, and brought high prices. The first one was sold to Mr. Garland, Cairnton, Kincardineshire, for 20 *gs.*, and the second one to Mr. Thomson, Clayhills, for £9 5*s*. The first-prize aged tup at Aberdeen, three shear, was bought by Mr. Harris, Earnhill, Forres, for £9 12*s*. 6*d*.; 26 ewe lambs brought from 22*s*. to 30*s*. each; 8 gimmers, from 4*s*. to 7*s*. each; 26 east ewes, from 3*s*. to 4*s*. a-head; 9 tup lambs, from 26*s*. to 48*s*.; 12 shearing tups from £3 7*s*. 6*d*. to £21; 3 three-shear tups, from £6 5*s*. to £9 12*s*. 6*d*. Kingcausie sheep sold readily, and were good after tups, bred by Lord Polworth and Mr. Brown, of Watton, and had for dams ewes bred by Mr. Torr of Aylesby, and Mr. Sandy. They were all shearing tups, and brought from £2*s* 6*s*. to £5 2*s*. 6*d*. each. The bidding was brisk, and the sale a good one.

SALE OF THE SUTTON MADDOCK SHROPSHIRE FLOCK.—The sale of rams, ram-lambs, and ewes, the property of Mr. Henry Smith, was held at New House, Sutton Maddock. Lord Chesham presided at the luncheon, and the agents for the Duke of Sutherland, Earl of Dartmouth, Earl of Bradford, Lord Conbermere, Lord Willoughby de Broke, Lord Boyne, Mr. W. O. Foster, M.P., and Captain Oliver attended, and were amongst the principal purchasers. The first ram, Lattiner, a four-shear, was bought by Lord Chesham, at 34 *gs.*, others making 32, 26, 17, 16, 15, 14, down to 5½ *gs*. Of the fifty-nine offered, upwards of fifty were sold, at an average of slightly over £11 each. The ram-lambs were small and in very low condition; making only from 35*s*. to 65*s*. each. But it must be stated that they were the worst end of a lot of upwards of 100. The ewes were very superior, and commanded high figures. Captain Oliver secured the Royal Agricultural Society Oxford show theaves at 16*s*. each. Lord Chesham took four pens at 115*s*., 85*s*., 80*s*., and 80*s*. per head; Lord Bradford two pens at 120*s*. and 115*s*.; Mr. Morgan Jones one at 90*s*.; Mr. Robert Smith several good lots at 80*s*., 70*s*., 62*s*. 6*d*., down to 47*s*. 6*d*., the lowest price given; Mr. Nicholl one pen at 85*s*.; Mr. Keeling one pen at 80*s*.; Messrs. Webb and Sons and Mr. W. O. Foster one pen each at 62*s*. 6*d*. The whole 120 averaged nearly £4 each. Messrs. Lythall and Clarke, of Birmingham, conducted the sale.

THE HUTTOFT LINCOLN RAMS.—At the eighth annual show at Mr. St. Peter Robinson's farm the results were—SHEARLINGS: No. 1, Mr. R. Brooks, £6 15*s*.; 2, Mr. Dring, Claxby, £6 15*s*.; 3, Mr. Higgins, £6; 4, Mr. Glossop, Anderby, £7; 5, Mr. North, South Thoresby, £20; 6, Mr. Bancroft, South Somercotes, £21; 7, Mr. Holden, Revesby, £14; 8, Mr. Williams, Hatcliffe, £16; 9, Mr. North, £11; 10, Mr. Kirkham, Markby, £17; 11, Mr. J. Hill, Strubby, £7; 12, Mr. Dring, £8; 13, Mr. Hill, £11 10*s*.; 14, Mr. Foster, Scremby, £8 10*s*.; 15, Mr. R. Williams, £8 5*s*.; 16, Mr. Mackinder, Hanby, £8 10*s*.; 17, Mr. Dring, Scremby, £10; 18, Mr. Higgins, jun., £7 10*s*.; 19, Mr. Rinder, Skelduley, £5 5*s*.; 20, Mr. Hill, Huttoft, £13 10*s*.; 21, Mr. T. C. Johnson, Tothby, £6 15; 22, Mr. T. C. Johnson, £5 15*s*.; 23, Mr. Merrikin, Grainthorpe, £8 10*s*.; 24, Mr. Crow, £7 10*s*.; 25, Mr. Higgins, jun., £7 15*s*.; 26, Mr. Crow, £8; 27, Mr. T. C. Johnson, £5 10*s*.; 28, Mr. Rinder, £6 5*s*.; 29, Mr. Higgins, £7 5*s*.—TWO-SHEARS: 30, Mr. George Cartwright, Well, £7; 31, Mr. J. Nelson, Wylham, £10 10*s*.; 32, Mr. Higgins, £10 10*s*.; 33, Mr. W. Wells, Withern, £10 10*s*.; 34, Mr. J. W. Bancroft, £8 5*s*.; 35, Mr. Higgins, £5 15*s*.; 36, Mr. Higgins, £9 10*s*.; 37, Mr. R. Brooks, £8; 38, Mr. Glossop, £7 10*s*.; 39, Mr. G. Cartwright, £6 15*s*.; 40, Mr. Bycroft, South Reston, £6 15*s*.—THREE-SHEARS: 41, Mr. Wallis Wells, £8; 42, Mr. William Chatterton, Hallington, £20; 43, Mr. Parkes, Swaby, £10 10*s*.; 44, Mr. Geo. Holden, Revesby, £10 10*s*.; 45, Mr. North, £9; 46, Mr. Mason, Huttoft Bank, £7; 47, Mr. Mackinder, Hanby, £5 10*s*.; 48, Mr. G. Cartwright, £5 10*s*.; 49, Mr. John Budbent, Anderby, £10; 50, Mr. T. Young, £11; 51, Mr. S. Abrahams, Wainfleet, £6 10*s*.; 52, Mr. G. Cartwright, £6; 53, Mr. Wm. Hay, South Reston, £6; 54, Mr. Wallis Wells, £5 5*s*.; 55, Mr. Chatterton, £10.

THE WOOTTON DALE LINCOLN RAMS.—This flock was placed under the hammer of Mr. Calthrop, when the following prices were realized: Lot 1, £28, Mr. R. Wright, Nocton Heath; 2, £8, Mr. Cordeaux, Great

Coates, Grimsby; 3, £12, Mr. J. Beaulah, Seawby; 4, £17 10s., Mr. W. Nainby, Barnoldby-le-Beck; 5, £7, Mr. F. R. Marshall, Elsham; 6, £7, Mr. Jackson, Ulceby; 7, £7, Mr. F. R. Marshall; 8, £6 10s., Mr. J. Dexter, Ulceby; 9, £12, Mr. Rt. Walker, Somerby, Brigg; 10, £10, Mr. R. H. Pearson, Stallingboro', Ulceby; 11, £10 10s., Mr. J. Danby, Hibaldstow, Brigg; 12, £8, Mr. W. Marris's exors., Limber; 13, £13, Mr. Bygott, Barton; 14, £10 10s., Mr. Sharpe, West Halton, Brigg; 15, £10, Mr. J. Campbell's exors., Gokewell, Brigg; 16, £9 10s., Mr. East, Hibaldstow; 17, £15, Mr. Champion, Lincoln; 18, £19 10s., Mr. J. Bygott; 19, £19, Mr. R. Walker; 20, £23, Mr. J. Beaulah; 21, £10 10s., Mr. R. J. Pearson; 22, £13, Mr. J. Sharpe; 23, £9 10s., Mr. W. Dunn, Warlaby, Brigg; 24, £11 10s., Messrs. E. and R. Empson, Bonby, Barton; 25, £16, Mr. G. Nelson, Great Limber; 26, £12, Mr. Hill, Poolethorpe, Brigg; 27, £15, Mr. Sharpe; 28, £8, Mr. W. Brooks, East Halton; 29, £10, Mr. Ingham, Yorkshire; 30, £11 10s., Mr. Sharpe; 31, £12 10s., Mr. Nainby; 32, £11, Mr. F. Pearson, Ulceby; 33, £10, Mr. Sargeant, Thornton Curtis; 34, £8, Mr. J. Campbell's exors.; 35, £8 10s., Mr. J. Beaulah; 36, £14 10s., Mr. Pease, Broughton Vale, Brigg; 37, £10, Mr. R. Raven, Little Limber Grange; 38, £8 10s., Mr. W. Marris's exors.; 39, £9, Mr. F. R. Marshall; 40, £12 10s., Mr. G. Houghton, South Killingholme; 41, £8 10s., Mr. Brooks; 42, £10, Mr. J. West, Melton Ross, Ulceby; 43, £10 10s., Mr. W. Brooks, East Halton; 44, £9, Mr. F. R. Marshall; 45, £10 10s., Mr. W. Brooks; 46, £12, Mr. J. Sharpe; 47, £9, Mr. J. Campbell's exors.; 48, £10, Mr. E. Abraham, Barnetby-le-Wold; 49, £10, Mr. Jackson, Ulceby; 50, £8 10s., Mr. Beaulah; 51, £8, Mr. R. Brooks, Doncaster; 52, £9, Mr. F. R. Marshall; 53, £8 10s., Mr. W. Brooks; 54, £8 10s., Mr. F. R. Marshall; 55, £10 10s., Mr. W. Smith, Kirmington, Ulceby. The average was £11 4s. each lot.

THE EAST KEAL LINCOLN RAMS.—The flock the property of Mr. J. Skinn, of East Keal, were let by Mr. E. Raney. The company was by far the largest with which Mr. Skinn has ever been honoured. With the exception of a few shearlings the sheep were all let by the hammer at prices varying from £4 to £11 5s., at which sum an aged sheep was taken by Mr. Moore.

HALTON HOLGATE LINCOLN RAMS.—At the let of Mr. J. H. Vessey's flock of Lincolnshire longwool sheep, numbering nearly 200, after an inspection, the sheep were taken by private arrangement, only 20 remaining unlet at the close. Some of the rams went for from £30 to £40 each; but farmers requiring rams for general service were accommodated with suitable animals at from £8 to £11 each.

THE OWERSBY RAMS.—The flock of the late Mr. John Davey averaged as follows: Shearlings £15 1s. 9d., two-shears £12 19s. 7d., three-shears and upwards £12 5s. 6½d.; gross average £14 0s. 4½d. One hundred and fifty ewes and gimmers were afterwards sold in lots of ten each. The ewes were knocked down at from 7s. to 80s. each, and the gimmers at 70s. to 74s. each; the whole being bought by Mr. Edward Davey, of Thoresway, and they will remain on the farm with the exception of one lot of gimmers, which were bought at 74s. by Mr. Bell, agent for Mr. Bankes Stanhope.

THE ASHBY RAMS.—These rams, the property of Mr. Clarke, sold as follows: The sale commenced with the shearlings. The first was knocked off at 12 gs., and the sale went on prosperously to nearly the end of the yearlings, when a smart shower drove the company from the ring side, and slightly depreciated the prices of the few last lots. The prime yearlings were—No. 6, sold to Mr. Johnson, of Wellington, for 25 gs.; No. 30 sold to Mr. Woolhouse for 31 gs.; and No. 20 bought by Mr. Patterson for 25 gs.; Mr. Trotter bought No. 32 (a very handsome sheep) for 20 gs.; and Mr. James Hutchinson got No. 44 very cheap at 14 gs. The prices made for the two-shears were very satisfactory; No. 70 making 20 gs., and No. 80 25 gs. The two old sheep (99 and 100) were perfect models of symmetry, and went to Mr. Cappe and Mr. Harston respectively for 20 gs. and 14 gs. The average was £10 18s. 6d. each, which, all things considered, may be regarded as satisfactory to the breeder, and certainly to the purchasers.

Mr. Wm. Baker's second annual sale of Shropshire rams and ewes, was held at Moor Barns, Atherstone. A few rams had been bred and sold privately for several years until 1867, when Mr. Baker determined to try the test of the show yard, and with such success that, since then, no

fewer than seventy-three prizes have been obtained by the flock. This fact, no doubt, much increased the attendance, which included several gentlemen from North Wales, Lincolnshire, Northamptonshire, and most of the midland counties. Six two-shear rams, including the winner at Wakefield, averaged £14 3s. 6d., one being let; and thirty-one shearlings, (all sold but two), made £9 6s. each; four of these were let, one for the latter part of the season only. The ewes were of good size, and included two or three from the Montford flock. The competition was brisk, at from 52s. to 75s. per head; the average of the seventy being 59s. 9d. No ram went higher than seventeen guineas, the sum paid by Mr. Timmis for Sparkenhoe, by Viceroy; a like figure being given by Mr. Shaw for Blenheim, by Superior. The other principal buyers were Messrs. Bate, Flint; Battams, Northampton; Marris, Lincoln; Maxwell, Northampton; Dormer, Grundy, Vergette, Sanders, Wykes, Welb, Abel Bentley, Lee, Pegg, Felthouse, Principle, Powers, Drakely, Arnold, Wood, and Adams, &c. Messrs. Lythall and Clarke, conducted the sale.

A sale of Hampshire Down sheep, belonging to the executors of the late Mr. G. D. Cookeram, was held by Mr. J. Waters, at Niton Farm. The average of all ages of ewes was 33s. per head, the two-teeth ewes realising 41s. (Mr. Olding), 34s. 35s. 30s., to 28s., the average of this age being 32s. 5d. per head. Four-teeth ewes brought 45s. (Mr. Crook), 35s. 34s. to 29s., averaging 34s. 8d. The six-teeth ewes sold at 45s. (Mr. Sloper), 38s., 37s., to 30s., and averaged 36s. Full-mouthed ewes ranged from 34s. (Mr. Moore) to 20s., and averaged 29s. 9d. per head. The Chilver lambs brought 39s. (Mr. Moore), 35s., 29s., the cull lot realising 14s., and the average being 27s. Wether lambs brought 31s. and 26s., and the cull lot 12s. per head. The cart horses all aged ranged from 37 gs., 33 gs., 31 gs., 28½ gs., &c., down to 14 gs. It rained hard during the sale, but the result was considered satisfactory.

At Compton Farm, Enford, Mr. J. Waters, submitted for sale by auction the breeding flock of the late Mr. James Martin, which consisted of about 1,100 ewes and lambs, including 220 two-teeth ewes, 230 four-teeth ewes, 206 six-teeth ewes, 180 full-mouth ewes, 250 chilver lambs, and eight rams. The following were the average prices realised: Two-teeth ewes, highest, 47s., Mr. Chisman; lowest, 35s.; average 38s. 3d. per head. Four-teeth ewes, highest, 60s. Mr. Moore; lowest 37s.; average 44s. 6d. per head. Six-teeth ewes, highest 51s.; Mr. Ferris; lowest, 34s.; average, 39s. 5d. Full-mouth ewes, highest, 50s., Mr. Wadman; lowest, 34s.; average, 38s. 1d. per head. Chilver lambs, highest, 52s., Mr. Carpenter; lowest, 23s.; average, 30s. 10d. per head. The cart horses realised 51 gs., 43 gs., 39 gs., 38 gs., 36½ gs., 32½ gs., 30 gs., &c., &c., the whole (21) having averaged £28 15s. 6d. each.

THE ULCEBY GRANGE RAMS.—There were submitted 49 Lincolns, descended from well-selected sires, and dams from the flocks of Mr. Marshall of Branston, Mr. Lincoln, Mr. Mackinder of Langton Grange, Mr. Kirkham of Biscathorpe, Messrs. Dudding of Panton, Mr. Needham, and Mr. Topham. The 49 rams, all shearlings, were offered by Mr. Calthrop, and realized the following prices, viz.: Lot 1, Mr. Thomas Edlington, Brumby, £6; 2, Mr. John Brooks, Wootton, £8 10s.; 3, Mr. Beaumont, Faldingworth, £6 10s.; 4, Mr. Leonard, Patrington, £8 10s.; Mr. Brady Nicholson, Leeds, £12; 6, ditto, £12; 7, Mr. Nicholson, Willoughton, £14 10s.; 8, Mr. Wm. Maw, Walk House, £12 10s.; 9, Mr. W. Youhill, Luceby, £6 10s.; 10, Mr. Jordesson, Bishop Burton, £6 5s.; 11, Mr. John Brooks, £6; 12, Mr. George Cartwright, Kirmington, £6 10s.; 13, Mr. F. Hookham, Thornton, £6; 14, Mr. Musgrave, Owersby, £11 10s.; 15, ditto, £15 10s.; 16, Mr. Atkin, £10; 17, Mr. Wood, Snaford, £6; 18, Mr. Nicholson, £6 10s.; 19, Mr. Smith, Hull, £5 10s.; 20, Mr. Thos. Rollett, Northorpe, £7; 21, Mr. Jonas Webb, Melton Ross, £7 10s.; 22, Mr. Leonard, £13 15s.; 23, do., £13 15s.; 24, Mr. Brady Nicholson, £17; 25, Jonas Webb, £10; 26, Mr. Geo. Bland Herring, Redbourne, £8 5s.; 27, Mr. Smith, £7; 28, Mr. Morris, Faldingworth, £7; 29, Mr. Jordesson, £6 10s.; 30, Mr. Thos. Rollett, £8; 31, Mr. John Brooks, £11 10s.; 32, ditto, £8 10s.; 33, Mr. Smith, £7; 34, Mr. Beaumont, £7; 35, Mr. George Cartwright, £8; 36, Mr. Smith, £6 10s.; 37, ditto, £6; 38, Mr. John Brooks, £6; 39, Mr. George Gurnell, Brumby, £9 15s.; 40, Mr. John Ste-

phenson, "The Beeches," £13 5s.; 41, Mr. Abraham, Scartho, £9 10s.; 42, Mr. Nicholson, Willoughton, £7 10s.; 43, Mr. John Brooks, £7 15s.; 44, Mr. Wm. Hudson, Kirmington, £13; 45, Mr. Jonas Webb, £7 10s.; 46, Mr. Smith, £6 10s.; 47, Mr. W. J. Frankish, Kirmington, £8 5s.; 48, Mr. Smith, £7; 49, ditto, £6 10s. Total, £429 15s.

THE WEST WILLOUGHBY RAMS.—Mr. W. Wood offered for sale by auction sixty rams, bred by Mr. Rudkin. Annexed are the prices: No. 1, Mrs. Smart, Ropsley, £9 15s.; 2, Mr. Newton, Ancaster, £8; 3, Mr. Palmer, Willoughby, £6; 4, Mr. Widdowson, Swaton, £5 10s.; 5, Mr. Ward, Sudbrook, £6 5s.; 6, Mr. Dolby, Foston, £12 5s.; 7, Mr. Snodin, Branston, £6; 8, Mr. Ward, Ancaster, £6 15s.; 9, Mrs. Hoyes, Hanby, £6; 10, Mrs. Sardeson, Sapperton, £6; 11, Mr. Sardeson, Haydor, £9 10s.; 12, Mr. Ward, Sudbrook, £7 5s.; 13, Mr. Slight, Willoughby, £15; 14, Mr. Andrews, Somerby, £5 5s.; 15, passed; 16, Mr. Widdowson, £6; 17, Mr. Slight, Wilsford Heath, £6 15s.; 18, Mr. Rudkin, Hanby, £9 15s.; 19, Mr. Robert, £14; 20, passed; 21, Mr. Sardeson, Howell, £10; 22, Mr. Snodin, £15; 23, Mr. Brothwell, Braceby, £13; 24, Mr. Thomas Minta, Easton, £7; 25, Mr. Bull, Boothby, £15; 26, Mr. Thomas Minta, £5 5s.; 27, Mr. Boyall, Grantham, £8 10s.; 28, Mr. Brackenbury, Londonthorpe, £8 10s.; 29, Mr. Casswell, Falkingham, £5 5s.; 30, Mr. Wadeson, Normanton, £9 10s.; 31, Mr. Nixon, Kelby, £5 5s.; 32, Mr. Lord, Hough, £7; 33, Mr. Thomas Minta, £6 5s.; 34, Mr. Robinson, Sedgebrook Mill, £6 5s.; 35, Mr. Thomas Minta, £8 5s.; 36, Sir Thomas Whichcote, Aswarby, £13; 37, Mr. Blankley, Hanbeck, £9 5s.; 38, Mr. Hedworth, Oasby, £7 15s.; 39, Mr. Castle, Grantham, £6 10s.; 40, Mr. Andrews, Somerby, £6 15s.; 41, Mr. Sardeson, Howell, £5 5s.; 42, Mrs. Sardeson, Sapperton, £5 10s.; 43, passed; 44, Mr. Parkinson, Wilsford, £5 5s.; 45, Mr. Robinson, Haeby, £7 10s.; 46, Mr. Castle, £5 10s.; 47, Mr. Ward, Sudbrook, £5 5s.; 48, passed; 49, passed; 50, Mr. Robinson, Sedgebrook, £5 5s.; 51, Mr. Bull, Cranwell, £7 10s.; 52, Mr. Bull, Boothby, £5 15s.; 53, Mr. Sardeson, Haydor, £5 5s.; 54, Mr. Snodin, £9 10s.; 55, Mrs. Hoyes, £5 5s.; 56, Mr. J. Hardy, Grantham, £5 15s.; 57, Mr. Brackenbury, £5 5s.; 58, Mr. Casswell, £5 5s.; 59, passed; 60, Mr. Hoyes, Allington, £6 10s.; making an average of £7 13s. 7d.

THE CULVERTHORPE RAMS.—The twenty-sixth annual sale took place at the residence of Mr. G. King, Culverthorpe Hall, Mr. Law of Sleaford, being the auctioneer. The following were the prices made: No. 1, Mr. Pickworth, Kirkby Laythorpe, £12 12s.; 2, Mr. Wm. Thompson, Grantham, £5 18s. 6d.; 3, Sir Thomas Whichcote, Aswarby Hall, £15 4s. 6d.; 4, Mr. Draper Mackinder, Sempringham, £8 8s.; 5, Mr. Vincent, Bottesford, £11 11s.; 6, Mr. Harris, Rauceby, £7 17s. 6d.; 7, Mr. Sharp, Sleaford, £8 18s. 6d.; 8, Mr. Cooper, Swineshead, £21; 9, Mr. Ward, Ancaster, £6 16s. 6d.; 10, Mr. Lynn, Lenton, £13 2s.; 11, Mr. King, Laneham, Retford, £8 8s.; 12, Mr. W. Birkett, Silk Willoughby, £7 7s.; 13, Mr. Bowett, Rockley, Retford, £6 16s. 6d.; 14, Mr. Avery, Welby, £9 9s.; 15, Mr. Green, Knipton, £10 10s.; 16, Mr. Bacon, Rippingale, £8 8s.; 17, Mr. Hill, Ropsley, £8 8s.; 18, Mr. Richardson, Digby, £10 10s.; 19, Mr. Welborn, Woolsthorpe, £6 16s. 6d.; 20, Mr. Cooper, Swineshead, £17 6s. 6d.; 21, Mr. Roberts, Somerby £10 10s.; 22, Mr. Hind, Stroxton, £5 15s. 6d.; 23, Mr. Pilkington, Braucewell, £13 2s. 6d.; 24, Mr. Harrison, Ashby-de-la-Launde, £10 10s.; 25, Mr. Searson, Bulby, £9 19s. 6d.; 26, Mr. Read, Great Hale, £7 17s. 6d.; 27, Mr. C. Sanderson, Dumbleby, £7 7s.; 28, Mr. Sharp, Sleaford, £8 18s. 6d.; 29, Mr. Blankley, Hanbeck, £9 9s.; 30, Mr. Riggall, Threkingham, £9 9s.; 31, Mr. Bacon, Pippingale, £10 10s.; 32, Mr. Frances Leasingham, £8 18s. 6d.; 33, Mr. Wadsley, Swaton, £6 6s.; 34, Mr. Bacon, £5 5s.; 35, Mr. Lynn, £7 7s.; 36, Mr. Pope, Kirkby Underwood, £5 15s. 6d.; 37, Mr. Robinson, Haeby, £6 6s.; 38, Mr. Creasey, Ruskington, £6 6s.; 39, Mr. Mackinder, Sempringham, £5 15s. 6d.; 40, Mr. Pheasant, Threkingham, £5 15s. 6d.; 41, Mr. Brackenbury, Horbling, £6 6s.; 42, Miss Amos, Grantham, £5 15s. 6d.; 43, Mr. Hardy, Jericho Lodge, £5 15s. 6d.; 44, passed; 45, Mr. Pickworth, Kirkby Laythorpe, £8 18s. 6d.; 46, Mr. Mackinder, Sempringham Fen, £5 15s. 6d. Nos. 47, 48, 49, 50, 51, 52, and 53 were passed. The average for the

forty-five sold is £8 18s. 3½d. A number of breeding ewes were advertised for sale, but only three pens were offered, which realised 44s., 43s., and 46s. 6d.

PETERBOROUGH RAM FAIR.—This annual fair was held in the Recreation-ground. There were 497 rams penned, being 23 more than last year, the number then being 474. The following is an account of the rams sold: Messrs. Mason and Son sold 50 animals bred by Mr. T. Caswell, of Pointon; the highest prices obtained being £17 17s. for one sold to Mr. J. Byron, of Kirkby Green; £15 15s. for one sold to Mr. Moss, of Whisby; £15 15s. for one sold to Mr. Clarke, of Bythely; and £16 16s. for one sold to Mr. Staplee, of Oxney. This flock averaged £10 5s. per sheep. Messrs. Mason also sold 30 longwool shearings, the property of Mr. Byron, of Kirkby Green, who we understand has obtained three medals and 13 first and second prizes during the last 12 months. The highest price obtained was for two animals sold to the Hon. G. W. Fitzwilliam—viz., £16 16s. and £15 15s.; the average was £9 17s. Mr. J. Wilders, of Croxton Kerrial, showed 25 shearings, with very good backs and skins. The highest price obtained was £17; the average being £10 18s. Mr. W. Mann sold 40 fine rams, the property of Mr. T. Cartwright, of Dunston Pillar, the highest price obtained being £22 for a sheep sold to Mr. Gilbert; average £11 12s. Mr. J. Fox sold six prize sheep (Oxford), the property of Mr. Gummell, one of which was sold to Mr. Rudkin, of Willoughby for 39 gs. The same auctioneer also sold 47 animals, the property of Mr. W. Kirkham, of Markby Priory, the highest price obtained being £11 10s. Messrs. Briggs sold 48 animals, the property of Mr. J. R. Kirkham, of Audley Villa, the highest price being £44 given by Mr. Breverton; average £14. Messrs. Shouler and Son sold 30, the property of Mr. Hack, of Buckminster; the highest prices were—Mr. Foster £22, Mr. Sharpe £18, Mr. Saunders £14; average £10. Mr. Lumby sold 50, the property of Mr. J. H. Caswell, of Laughton; highest prices—Mr. Rook, of Weldon, £26, Mr. Wallis £23, and Mr. Lumpkin £22; average £11 10s. Mr. E. Law sold 17 animals, the property of Mr. Garner, of Willoughby Heath; the highest price being £9 10s., and the average £7 5s. Mr. Law also sold 34, the property of Mr. Woolhouse; the highest price being £10 10s., and the average £8 15s. Messrs. Lawrence and Carter sold 50 shearings, the property of Mr. S. E. Deau, of Dowsby; the highest prices being—£31 given by Mr. S. Middleton, £17 10s. by Mr. Godfrey, Mr. Seward £16, and Mr. S. Middleton £16; the average being £12 10s. There was a very good attendance of buyers and others, and the arrangements for the ground, which were carried out under the superintendence of Mr. J. Ruddle, the surveyor, to the Improvement Commissioners, gave general satisfaction.—The disgraceful way in which some of the rams were oiled, and colourwashed, says a correspondent of the *Lincoln Mercury* calls for the interference of the agricultural shows. How long will buyers allow themselves to be deceived by such practice!

SLEAFORD NEW RAM FAIR.—The Cranwell rams, 33 in number, the property of Mr. Sardeson, were sold by auction by Mr. Law at an average of £8 10s. each; the Kirkby Laythorpe rams, 22 in number, the property of Mr. Taylor, were sold by the same auctioneer at an average of £7 each. Several other lots were also disposed of at satisfactory prices.

THE AYLESBY RAM SHOW.—Last year the average price paid for the use of each ram was £15; however, the average did not now exceed £14, the highest prices ranging from £30 to £35, while none let for less than £10.

SALE OF THE PATCHAM SOUTHDOWN FLOCK.—The flock of the late Mr. William Tanner, Patcham, was submitted to public competition by Mr. Drawbridge, by the direction of the executors. The sale took place on Standean farm, in a secluded valley among the Southdown-hills between Brighton and Hassocks-gate. The attendance was rather thin, owing probably to the inaccessibility of the situation, but among those present were several flockmasters from the western part of the county. Of full-mouthed ewes there were four lots of five, and twelve lots of ten. The lots of five were sold at 60s. to Mr. Hart, Beddingham, 50s. to Mr. T. Bushby and Mr. Hayward, Gloucester, and 46s. to Mr. Stevenson, steward to Mr. F. H. Farrer, Abinger-hall, Dorking. The lots of ten were bought by Mr. Burnett, steward to Col. Kingscote, at 47s.; Mr. Arkcoll, Eastbourne, 46s.; Mr. Ste-

venison three lots at 44s. and 40s.; Mr. Claxton, Swaffham, six lots at 43s., 40s., 39s., 37s., and 36s.; and Mr. Cordy, at 34s. One lot of Broken-mouthed ewes was bought at 33s. by Messrs. Brown. Of six-tooth ewes there were four lots of five, eleven lots of ten, and one lot of sixteen. The lots of five were bought by Mr. Fox, Westhoaty, at 51s. and 58s.; and Mr. Hayward, at 53s. and 50s. The lots of ten were bought by Mr. Bannister; ten lots, at 46s., 43s., 40s., and 39s.; by Mr. Arkeoll, at 41; Mr. Claxton, two lots, at 42s. and 41s.; Mr. Burnett, 42s.; and Mr. McNaughten, 38s. The latter also bought the lot of sixteen at 36s. Of the four-tooth ewes there were four lots of five, fourteen of ten, and one of twelve. The fives were bought by Mr. Hart, at 50s.; Mr. Fox, at 47s.; Mr. Bushby, at 49s.; and Mr. Dendney, at 41s. The others were bought by Mr. Arkeoll, at 50s.; Mr. Bushby, at 48s.; Mr. Bannister, four lots, at 46s. and 44s.; Mr. James Kent, 47s.; Mr. Haward, at 48s.; Mr. McNaughten, three lots, at 46s., 44s., and 42s.; Mr. Claxton, 46s.; Mr. S. Beard, two lots, 47s.; and Mr. Deudney, 40s. Of two-tooth ewes there were four lots of five, and twenty lots of ten. The former were bought by Mr. E. Blaker, two lots, at 60s., and Mr. Claxton, two lots, at 56s. and 50s. The tens were purchased by Mr. Claxton, three lots, at 59s., 48s., and 47s.; Mr. Gibson, two lots, 49s., 47s., and 45s.; Mr. Bannister, five lots, at 50s., 46s., 43s., 41s., and 42s.; Mr. Stevenson, 45s.; Mr. Hayward, at 47s. and 41s.; Mr. Arkeoll 46s.; Mr. Hampton, three lots, at 45s. and 41s.; Mr. Beard, 45s.; Mr. McNaughten, 44s. Of ewe lambs there were seven lots of ten, five lots of twenty, and one of eighteen. The tens were bought by Mr. Russell, at 34s.; Mr. Burnett, at 37s.; Mr. Arkeoll, two lots, 31s. and 30s.; Mr. Hammond, 28s. and 27s.; Messrs. Brown, 26s. The twenties were bought by Mr. Brown, at 25s.; Mr. Russell, 23s.; Mr. Hayward, 23s.; Mr. Arkeoll, 22s.; Mr. Russell, two lots, 22s. and 20s. Full-mouthed ewes ranged between 34s. and 60s. a-head and averaged 43s.; the six-tooth ranged between 36s. and 53s., and averaged 43s. 3d. The four-tooth ranged from 40s. to 50s., and averaged 46s.; the two-tooth from 42s. to 60s., averaging 47s. 6d.; and the lambs from 20s. to 30s., averaging 27s. Rams: Three years old, by a ram of Mr. Hart's, Beddingham, Mr. Walters, £3 10s.; two years old, by ditto, Mr. Blaker, £5 10s.; ditto by Mr. Rigden's son of Webb, No. 21, Mr. J. Farncombe, £14 14s.; ditto, Mr. Bannister, £4 14s. 6d.; ditto, flock sheep, Mr. Beard, £8 18s. 6d.; one-year-old, by Mr. Hart's ram, Mr. Blaker, £21; ditto, by Mr. Brown's ram, of Patcham, Mr. Chandler, £4 5s.; ditto, Mr. Chandler, £4 10s.; one-year-old, by Mr. Brown's ram, of Patcham, W. Farncombe, £3 5s.; ditto, Lord Chichester, £8 8s.; ditto, by Mr. Hart's ram, £4 14s. 6d. Ram lambs: By No. 1 ram, dam half Heasman, £3 3s., Mr. J. S. Turner; ditto, dam half Rigden, £1 17s. 6d., Mr. Deudney; ditto, dam half Waters, £1 10s., Mr. Knight; by Mr. Boy's ram, dam half Brown, £2 5s., Mr. Chandler; ditto, £1 15s., Mr. J. Farncombe; half Brown, £2, Mr. Case; ditto, £1 15s., Mr. Arkeoll; ditto, dam half Waters, £1 15s., Mr. Botting; ditto, £1 10s., Mr. Knight; ditto, £1 15s., Mr. Knight; flock sheep, £2, Mr. Dendney. The prices for ewes were generally good, but for choice pens not so high as might have been expected for a flock of such repute. The bidding for rams was very languid, and except for a few of the best the prices were very low. The dairy cows ranged from 14 to 28 gs.

THE BIRLING SOUTH-DOWNS—The flock of Mr. John Gorringe, of Birling, was submitted to public auction by Messrs. Southerden and Morris, of Hailsham and Lewes. The sale was in consequence of Mr. Gorringe leaving his down farm for the lowlands. The sheep, not having been "made up" for sale, and having subsisted upon the produce of the land as they picked it up for themselves, were not in very high condition; but, notwithstanding, very fair prices were made. Of ewes there were 78 lots, of ten, consisting of 15 lots of full-mouthed, 20 lots of six-tooth, 20 lots of four-tooth, and 22 lots of tugs. The ewe lambs numbered 250, the rams and ram lambs 16. For the sheep the following prices were made: Ten full-mouthed ewes, Mr. Stenning, Godstone, 37s.; ten ditto, Mr. Stenning, 39s.; ten ditto, Mr. S. Stevenson, steward to the Queen's Physician, Abinger Hall, Dorking, 38s.; ten ditto, Mr. Stenning, 38s.; ten ditto, Mr. Mannington, Langhton, 33s.; ten ditto, Mr. Bradford, Wannock, 33s.; ten ditto, Mr. Stevenson, 34s.; ten ditto, Mr. Mannington, 34s.; ten ditto, Mr. T. Arkeoll, 34s. 6d.; ten ditto, Mr. Stevenson, 35.; ten ditto, Mr. T. Jenner, Heathfield, 34s.;

ten ditto, Mr. Stevenson, 33s.; ten ditto, Mr. Mannington, 34s.; ten ditto, Mr. N. Breton, 34s. Six-tooth: Sold to Messrs. Bradford at 45s.; W. Ashby, 45s.; D. Aylwin (Maresfield), seven lots at 41s., 41s. 6d., 41s., 40s. Bannister (Cuckfield), who has taken Westdean Farm, bought six lots at 40s., 39s., 38s. W. Verrall (Itford), 42s. Honeyman (Sir J. Duke), 41s., 37s. 6d. T. Arkeoll (Eastbourne), 42s. 6d. F. Tuppen (Westham), 43s. Four-tooth Sheep: W. Verrall (Itford), 51s. James Kent (Southsea), 45s. T. Arkeoll, 45s. 6d. Bannister (nine lots at), 41s., 40s., 39s., 35s., 37s. Tuppen, 41s. Joseph Gorringe (Eastbourne), two lots at 40s. Homewood (Eastbourne), 40s. Groom (Folkington), 42s. Brown (Allington), 38s., 37s. Two-tooth Sheep: Messrs. W. Verrall, 50s., 48s., 44s., and 40s. Joseph Gorringe, 50s. W. P. Ashby, 45s. Bannister, 46s., 45s. 6d., 43s., 42s. 6d., 41s., 40s., 39s., and 38s. Tuppen, 44s. R. Brown, 40s. and 38s. Aylwin, 38s. Stevenson, 38s. Noakes, 41s. Ewe-lambs: Messrs. Burnett, 33s. Messrs. Brown, 29s., 28s., 27s., 26s., 25s., 24s., 23s. Stevenson, 26s., 25s., 24s., 23s., and 21s. Noakes, 29s. Rams: No. 1, P. Gorringe, £2 15s. No. 2, P. Gorringe, £5 5s. No. 3, Tuppen, £5 5s. No. 4, Stevenson, £3 13s. 6d. No. 5, ditto, £4 4s. Ram-lambs: No. 1, Joseph Gorringe, £2 10s. No. 2, ditto, £1 17s. 6d. No. 3, Stevenson, £2 12s. 6d. No. 4, Joseph Gorringe, £2 12s. 6d. No. 5, ditto, £3 3s. No. 6, Stevenson, £2 2s. No. 7, Joseph Gorringe, £2 2s. No. 8, Mr. Osborne, £2 10s.

LINCOLN SHEEP—The ram sales in the Lincoln cattle market were not so well attended as they have been for the last few years, and the prices made showed a considerable falling off; attributable probably in some measure to the large number of rams disposed of at the homes of the breeders. The following is a summary of the business done: Mr. Cropper's rams (sold by Messrs. Tateson and Richardson): Lot 1, Mr. Johnson, £7 10s.; 3, Mr. Gaunt, £6 5s.; 5, Mr. Frierson, £5 5s. Mr. Rudgar's rams (sold by ditto): Lot 3, Mrs. Jackson, Heighington, £5 5s.; 5, Mr. Godfrey, Willingham, £6 15s.; 6, Mr. Ashton, Waddington, £3 10s.; 7, Mr. Alcock, Nottingham, £4 15s.; 8, ditto, £4 5s.; 9, Mr. Barratt, £4 10s.; 10, Mr. Hayward, Waddington, £5; 11, Mr. Vickers, Nettleham, £4 5s.; 12, Mr. Barratt, £4 15s.; 13, Mr. Spratt, Oversby, £4 10s.; 14, Mr. Cottingham, Snaforth, £5 5s. 15, Mr. Cartwright, Tattershall, £5; 16, Mr. Howell, £4 10s.; 17, Mr. Young, Chixby, £7 5s.; 18, Mr. Wilson, Saxilby, £7 5s. Mr. R. Toyabe, Red Hall (sold by ditto): Lot 1, ram, Mr. E. Davy, £16 16s.; 2, ditto, Mr. E. Davy, £14 14s.; 1, 3 gimmers, Rev. Mr. O'Grady, Derbyshire, £6 each; 2, 4 ditto, Mr. Irving, Doncaster, £5 10s.; 3, 3 ditto, ditto, £5 5s.; 4, 4 ewes, Mr. Frudd, Donington, £4 17s. 6d.; 5, 4 ditto, Mr. Irving, £3 10s.; 6, ditto, ditto, £3 7s. 6d.; 7, ditto, ditto, £3 17s. 6d.; 8, ditto, Mr. Johnson, £3 7s. 6d.; 9, ditto, Mr. Marshall, £3 2s. 6d.; 10, ditto, Mr. Hardy, £3 2s. 6d.; 11, ditto, Mr. Clarke, £2 15s.; 12, 6 gimmers, Rev. Mr. O'Grady, £6 5s.; 13, 6 ditto, ditto, £5 5s.; 14, ditto, Mr. Irving, £3 4s. Several lambs from the same flock sold at from 36s. to 45s. each. Mr. Ealand, Potterlanworth, 80 superior gimmers, with good fleeces, sold by Tateson and Co. at from 45s. to 64s. each. The Nocton Heath Rams (sold by Mr. Law): 41 ram were shown by Mr. R. Wright, of Nocton Heath. Unfortunately, however, there was such a glut of rams on offer that many really excellent animals were disposed of at nominal prices. Lot 9, a shearling, was purchased by Mr. Black, from Scotland, for 19 gs.; Mr. Holmes, of Nettleham, secured lot 10, a shearling, for 25 gs.; Mr. T. Trotter, Skellingthorpe, purchased lot 11 for 10 gs.; lot 12, a shearling, fell to the bid of Mr. W. Cartwright for 21 gs.; Mr. Markham secured lot 20 for 14½ gs.; and Mr. Greby became the possessor of lots 27 and 28 for 10½ and 13½ gs. respectively. The 40 sheep sold realized £357 9s., being an average of £9 13s. 8d. each. The Ingleyby rams (auctioneers Messrs. Briggs): Last year Mr. Paddison, of Ingleyby, whose sheep have for several seasons been bred with the greatest care, obtained the highest average in the fair, and although the rams shown by him were fully up to the mark, the prices realized were considerably lower than Mr. Paddison had a right to anticipate. The 22 rams only realized £175, being an average of a little under £8 each. The Timberland rams: Twenty-one shearlings and two aged sheep from the cid and well-known flock of Mr. Gilliatt, of Timberland, were next offered. Lot 7 (a very fine shearling) was knocked down to Mr. Wilders for £21, Mr. Topham se-

cured lot 8 for £12, Mr. Holder lot 9 for £14 10s., Mr. Hornby lot 10 for £12, Mr. P. Brown lot 11 (a remarkably handsome animal) for £20, Mr. Stainton lot 15 for £15, and Mr. Clarke lot 23 (a three shear ram) for £20. The 23 sheep made £251 10s., being an average of £10 18s. 8d.

THE TATHWELL RAMS.—The whole of the stock of rams and sheep belonging to Mr. W. Chaplin, of Tathwell, were offered unreservedly by auction, by Messrs. Briggs and Son. The following lots were then put up first at £5 each—Shearlings: 1, Mr. W. Martin, £9 10s.; 2, Mr. Marshall, £17 10s.; 3, Mr. Meredith, £7 10s.; 4, Mr. Needham, £13; 5, Mr. Clark, £10 10s.; 6, Mr. J. Iles, £9 10s.; 7, Mr. T. Young, Covenham, £10; 8, a noble animal, bought by Mr. Vessey, £40; 9, Mr. Thos. Eve, £10 10s.; 10, Mr. W. Mason, £9; 11, Mr. Marshall, Riseholme, £11; 12, Mr. Turner, £26; 13, Mr. Cartwright, Blankney, £27; 14, Mr. Sowerby, £10; 15, Rev. T. Livesey, £9 10s.; 16, Mr. Huddleby, £5; 17, Mr. Dawson, Roxby, £16 10s.; 18, Mr. Robson, £10 10s.; 19, Mr. J. Byron, £10; 20, Mr. Meredith, £12; 21, Mr. Sowerby, £8; 22, Mr. Riggall, Manby, £9 10s.; 23, Mr. C. Robson, £12 10s.; 24, Mr. Reed, Belchford, £7 10s.; 25, Mr. Phillips, £11 10s.; 26, Mr. Pears, £16; 27, Mr. Mason, £9 10s.; 28, Mr. T. Dudding, £11; 29, Mr. Young, £9; 30, Mr. Woodruffe, £7; 31, Mr. Brown, Maidenwell, £9; 32, Mr. Wright, £7 10s.; 33, Mr. Hesseltime, £15; 34, Mr. T. Wingate, £23; 35, Mr. Brown, £9; 36, Mr. Exley, £8; 37, Mr. Danby, £7 10s.; 38, Mr. Foster, Tetney, £5; 39, Mr. Kemp, Swaby, £10; 40, Mr. C. Bell, £8 10s.; 41, Mr. R. Martin, £7 10s.; 42, Mr. W. Mason, £7; 43, Mr. Chatterton, £11; 44, Mr. Needham, £11; 45, Mr. Roberts, £8; 46, Mr. Burton, £8; 47, Mr. Wright, £7; 48, Mr. Wingate, £8; 49, Mr. D. G. Briggs, £9; 50, Mr. W. S. Welbit, £11; 51, Mr. C. Bell, £8; 52, Mr. Parr, £6. Two-shears: 53, Mr. Livesey, £6 10s.; 54, Mr. J. Robinson, £6 10s.; 55, Mr. Empson, £12; 56, Mr. Trolove, £6; 57, Mr. Foster, £7; 58, Mr. C. Briggs, £6 10s.; 59, Mr. Robson, Fulleby, £6; 60, Mr. R. Martin, £5 10s.; 61, Mr. Hesseltime, £11; 62, Mr. Robson, £6; 63, Mr. Parr, £5 10s.; 64, Mr. Danby, £11 10s.; 65, ditto, £15; 66, Mr. Reast, £7 10s.; 67, Mr. R. Mason, £6 10s.; 68, Mr. Casswell, £6; 69, Mr. Wingate, £7 10s.; 70, Mr. W. Byron, £6 10s.; 71, Mr. Phillips, £6; 72, Mr. Martin, £6; 73, Mr. Byron, £10; 74, Mr. Empson, £13; 75, Mr. Oliver, £5 10s.; 76, Mr. T. Eve, £6; 77, Mr. Turner, £16. Three-shear: 80, Mr. Young, £6 10s. Four-shear: 81, Mr. Martin, £6. Six-shear: 82, Mr. Turner, £11. A large lot of ram lambs were next disposed of, at prices ranging from £2 2s. to nearly £5 each.

THE BRANSTON RAMS.—Instead of disposing of his sheep at home, as usual, Mr. Marshall this year determined to send them to Lincoln, and 48 were offered by auction by Messrs. Briggs. A shearing was secured by Mr. Christian for £12 10s., a wonderful sheep fell to the bid of Mr. Irving for £23, Mr. Horner purchased a lot for £13 10s., Mr. Mitton a lot for £12 10s., and Mr. Marshall (Scampton) a lot for £18. Amongst the two-shears were three remarkable rams—the first was bought in at 30 gs. for Mr. Wallbridge, an American gentleman, who has this year purchased a large amount of prize stock in this country; the second was secured by Mr. Hinds for £23 10s.; the third was knocked down to Mr. Harrison for £23. The 48 sheep realized £477 10s., being an average of nearly £10 each. After the announcement of the sale Mr. Marshall sold 20 rams and gimmers to Messrs. Eells and Douglas, who reside near the Falls of Niagara, at fancy prices, and he has sold this season to foreign customers 75 rams and 24 ewes and gimmers for £1,091.

THE NOCTON RISE RAMS.—Mr. Calthrop offered about 20 very good shearing rams, the property of Mr. J. E. Howard, of Nocton Rise, but as they did not reach the value placed upon them, only six were sold by auction, these realized 41 gs. Others, however, were sold by private contract.

THE BUSLINGTHORPE RAMS.—Twelve shearing rams, the property of Mr. Odling, of Buslingthorpe, were offered by Messrs. Walter and Favill, but owing to the market being overstocked the prices made were very low. The owner, however, was determined to get out of them at any price, and the 12 realized £51 5s. 6d., several being bought by Nottingham butchers.

CADEBY HALL RAMS.—The annual sale of rams belonging to Mr. John Walesby Kirkham was held on the 15th

Sept. Messrs. Briggs offered thirty-four longwool shearlings, entirely descended from the famous old Hagnaby and Biscathorpe flocks. The prices realised were, here as elsewhere, below those of previous years, and no doubt the bad crops of corn last year, the dry season of this year, the depreciation in the price of wool, and general monetary depression in the agricultural world, have all a tendency to lower the ram market. The first ram was bought by Mr. Bingham, of Thormanby, for £10 10s.; No. 2, Mr. Isaac, of Grainsby, £22; No. 3, £20; Mr. Stephenson, of Walmgate; No. 5, £15 10s, Mr. Merrikin; No. 6, Mr. J. Coatsworth, £15. Mr. Sowerby, of Withcall, purchased nine choice rams, and the whole was sold at an average of £10 10s. each. Previous to the sale a sumptuous luncheon was well served in a marquee erected on the lawn in front of the old hall.

THE BEAUMONTCOTE RAMS.—The remaining portion of this flock of Lincolnshire rams was offered for sale in the sheep market paddock, where there was a tolerably large attendance of farmers and others interested in the breeding of longwooled sheep. Mr. Calthrop was the auctioneer. The principal purchasers were Mr. John Brankley, Barrow-on-Humber; Mr. Furlow Sergeant, Godhill; Mr. Jos. Burkill, Northlands House, Winterton; Mr. Samuel Robinson, cattle salesman, Barrow; John Ferriby, Esq., Wootton Hall, Ulceby; Mr. Jos. Sergeant, Thornton Curtis; Mr. Fredk. Cooplund, Walcott; Mr. Sergeant, Barrow; Robert Taylor, Esq., Barton New Hall; and Thomas Bennett, Esq., Saxby Villa. The average price realised was £7 10s. per head. Mr. Hesseltime, we understand, realised a larger average at Caistor fair.

MR. J. J. CLARK'S RAMS.—Mr. J. J. Clark, of Welton-le-Wold, penned 26 shearing rams, which were sold by Messrs. Briggs, and realized £269, the average being about £10 7s., exclusive of commission, being £1 a-head more than anything in the fair. We hear that at Caistor, on Saturday, Mr. Clark was also at the top of the tree. The following is a list: Mr. Dawber, £7 5s.; Mr. Garniss, £7 10s.; Mr. Bingham, £11; ditto, £11; Mr. Hart, £26; Mr. Garniss, £10; Mr. Peacock, £12; ditto, £16; Mr. Oliver, £11; Mr. Caswell, £12; Mr. Hewson, £8; Mr. Harrison, £11; Mr. Sowerby, £9; Mr. Hewson, £9; Mr. Young, £11 10s.; Mr. Harrison, £10 10s.; Mr. Dixon, £7 5s.; Mr. Fieldsend, £7; Mr. Carratt, £8; Mr. Fieldsend, £4; Mr. Rannard, £12; Mr. Sowerby, £8 10s.; Mr. Fowler, £10; Mr. Bowman, £8 10s.; Mr. Bagley, £8; Mr. Ashton, £6.

THE SCOTHORNE RAMS.—Two rams belonging to Mr. A. Garnt (part of the celebrated flock of the late Mr. Battersby) were sold at £5 10s. and £5 5s. respectively.

Messrs. Tateson and Richardson had a large number of stock on offer. Three rams from the flock of Mr. Cropper, of Minting, were sold for £7 10s., £6 5s., and £8 5s. respectively.

THE REDIAL FLOCK.—This noted flock, the property of Mr. R. Toyntee, included the animals which took prizes at the shows at Lincoln in 1869, and at Sleaford this year. The following were the prices made: Ram, Mr. E. Davy, £16 10s.; ram, ditto, £14 14s.; three gimmers, Rev. T. O'Grady, Derbyshire, £6; four ditto, Mr. Irving, Doncaster, £5 10s.; three ditto, ditto, £5 5s.; four ewes, Mr. Frudd, Dorrington, £4 17s. 6d.; four ditto, Mr. Irving, £3 10s.; four ditto, ditto, £3 7s. 6d.; four ditto, ditto, £3 17s. 6d.; four ditto, Mr. Johnson, £3 7s. 6d.; four ditto, Mr. Marshall, £3 2s. 6d.; four ditto, Mr. Hardy, £3 2s. 6d.; four ditto, Mr. Clarke, £2 18s.; six gimmers, Rev. T. O'Grady, £6 5s.; six ditto, ditto, £5 5s.; six ditto, Mr. Irving, £3 4s. per head. The eighteen she-lambs from the same flock sold at from 30s. to 36s. per head.

THE POTTERHANWORTH FLOCK.—Four gimmers, Mr. Rippon, £2 18s.; five ditto, Mr. Surfleet, £2 19s.; four ditto, Mr. Johnson, £3; five ditto, Mr. Surfleet, £2 19s.; five ditto, ditto, £3; five ditto, Mr. Rippon, £2 19s.; five ditto, ditto, £2 17s.; five ditto, ditto, £2 18s.; eight ditto, ditto, £2 10s.; eight ditto, ditto, £2 14s.; eight ditto, ditto, £2 12s.; eight ditto, ditto, £2 12s.; eight ditto, ditto, £2 11s. 6d.

THE AUBURN FLOCK.—Ten gimmers, Mr. Codd, £2 1s.; ten ditto, Mr. Riley, £2; ten ditto, Mr. Hardy, £1 17s. 6d.; ten ditto, Mr. Hunt, £1 15s.; eight ditto, ditto, £1 14s.

THE MARTIN RAMS.—Twenty-three sheep were announced as the last sale in Lincoln, Mr. Gilliat having taken a farm in Yorkshire. The average of the flock was £10 18s. 8d. The following were the prices obtained: Mr.

Nelson, £7; Mr. Holder, £11; Mr. Conington, £8; Mr. Melbourne, £5 10s.; Mr. Grubb, £7 10s.; Mr. Petch, £11; Mr. Wilder, £21; Mr. Topham, £12; Mr. Holder, £14 10s.; Mr. Hornby, £12; Mr. P. Brown, £20; Mr. Coupland, £9 10s.; Mr. Holder, £12; Mr. Stephenson, £11 10s.; Mr. Stainton, £15; Mr. Preston, £9 10s.; Mr. Melbourne, £10; Mr. Snow, £7; Mr. Coppin, £5 10s.; Mr. Nelson, £7; Mr. Holder, £7 10s. Three-shears: Mr. Holder, £7 10s.; Mr. Clarke, £20.

THE NETTLEHAM RAMS.—From this flock, which belongs to Mr. Wm. Rudgard, of Nettleham, 15 were sold for £81 15s., being an average of £5 9s. per head. The prices were as follows: Mrs. Jackson, Heighington, £5 5s.; Mr. Godfrey, Fillingham, £6 15s.; Mr. Ashton, Waddington, £8 10s.; Mr. Alcock, Nottingham, £4 15s.; ditto, £4 5s.; Mr. Barratt, £4 10s.; Mr. Hayward, Waddington, £5; Mr. Vickers, Nettleham, £4 5s.; Mr. Barratt, £4 15s.; Mr. Spratt, Owersby, £4 10s.; Mr. Cottingham, Snarford, £5 5s.; Mr. Cartwright, Tattershall, £5; Mr. Howell, £4 10s. Two-shears: Mr. Young, Claxby, £7 5s.; Mr. J. Wilson, Saxilby, £7 5s.

MR. MAY'S SHROPSHIRE RAMS.—After an interval of two years Mr. G. A. May again determined to hold his annual ram sale at home; and a very business-like company responded to his invitation to attend at Elford Park, near Tamworth. The rams were of great size, carried heavy fleeces, and, although not exactly adapted for ram breeding purposes, were remarkably well suited for improving the stamina of a black-faced flock, or for crossing. One ram was let to Mr. Madan at 7 guineas, and one sold to Mr. W. Baker at 20 guineas; others making 14, 12, 11, and 10, down to 5½ guineas. The whole were disposed of at an average of £8 6s. The neighbourhood of Tamworth and Lichfield has suffered especially from the dry weather, and, consequently, few local men were buyers of store ewes, several good pens being taken by local butchers, and twenty-five purchased for an Irish nobleman. The average realised was slightly over 50s. The principal purchasers were Sir A. Walsh, Messrs. Baker, Bradburne, Coxon, Faux, Capell (Nots), Young (Mansfield), Harris, Bennett, Roberts, Kendall, Wood, Briggs, Singleton, Hopkins, Sale, Earp, Glover, Hodgson, and Oldacre. Messrs. Lythall and Clarke, of Birmingham, conducted the sale.

THE BINGLEY HALL SALE.—An extensive sale of Shropshire rams and ewes, consisting of about 140 rams and 500 ewes and lambs, consigned from various noted flockmasters in the midlands, was held in Bingley Hall, Birmingham. A fair demand was obtained for both rams and ewes, but prices were under those of former years. Mr. E. Lythall's lot of fifteen made from 8 to 13 guineas each, the average being over £10. The Earl of Warwick took the best shearling at the higher figure. Mr. Yates's sixteen made from 5½ to 10 guineas, Mr. Nock's 6½ to 10 guineas, and Lord Willoughby de Broke's 6 guineas each. Mrs. Beach's lot included the first prize aged and shearing rams at Wellington, Wigan, and Kidderminster, which were let for the season at 20 and 19 guineas respectively to Messrs. Canning and Tolfree; others selling at 21, 15, and 12 guineas. Lord Sudeley's No. 1 was bought for the Marquis of Exeter at 10 guineas, and another by Colonel Dyott, M.P., at the same figure; the average being nearly £8. Mr. Sheldon made slightly less for a lot of seven. Mr. C. Stubbs sent a few sheep, one of which was bought by the Earl of Aylesford at 24 guineas, a second by Sir John Whitworth, Bart., at 16 guineas, and a third by Mr. Thompson at 12 guineas. Mr. Tidy made 15 guineas for a two-shear, but the other lots do not call for special remark. Mr. Druce's Oxford Down rams made about £8 each, two or three being unsold. The ewes met a better trade than at the August sale, the recent rains having improved the appearance of the turnips. The 500 averaged over 50s. each, the highest prices paid being 80s. for two pens of Mrs. Beach's, 81s. for a pen of Mr. Tidy's, 70s. for a pen of Mr. Lort's, and 76s. and 70s. for others. The principal buyers of ewes were Sir J. Allan Walsh, Bart., Mr. E. Greaves, M.P., Captain Hatherall, Mr. Bate (Flint), Messrs. Solomon Ashton, Lort, Sidwell, Horton, Hawkes, Lane, Mason, Hood, Wright, Dodds, Pearman, Bennett, and Woodbridge. Fifty lambs from Sir G. Jenkinson, Bart., M.P., averaged 25s. 6d. each. Messrs. Lythall and Clarke were the auctioneers engaged.

SALE OF SHROPSHIRE SHEEP AT BRIDGNORTH.—An extensive sale of sheep took place at Messrs. Nock and Wilson's Auction Mart, Bridgnorth, when about 550 ewes and about 100 rams were sold. Among others, purchases for Lord Boyne, Lord Forester, the Earl of Dartmouth, were made. The following are some of the names of the breeders of Shropshire, together with numbers of sheep sent, and the average amount made: Mrs. Wadlow, 30 rams, averaging from £5 15s. 6d. to 11 guineas; Mr. Wadlow, of Acton Round, five rams, averaging £5 15s. 6d.; Mr. Pitt, of Posenhall, 15 rams, from £5 9s. to 8 guineas; Mr. T. Instone, 14 rams, from £6 to 17 guineas, making one of the best averages of the season; Mr. Thomas Thursfield, seven rams, from 5 guineas to 6 guineas; Mr. Wadlow's ewes fetched an average price of from 46s. to 55s. each; Mr. Instone's averaged 56s. 6d.; Mr. Massey's, from 45s. to 50s.; Mr. T. Thursfield's, from 42s. to 45s.; Mr. Pitt's, from 53s. to 56s. Strong store pigs went at from 51s. to 81s.; cows and calves, £14 to £15 2s. 6d.; barrens, from £9 to £13 10s.; fat heifers, from £16 to £17.

THE NORMANTON HILL RAMS.—The annual letting of these rams took place at the residence of the owner, Mr. C. W. Mintz, at Normanton Hill. Mr. Spreckley, of Grantham, was the auctioneer. There was a large company of farmers and sheep-breeders. Considering the scarcity of grass-keeping, the animals were brought out in very good condition, and 64 rams were disposed of, making an average of 7 guineas, the highest price, £15, going to Mr. Thomas Garner; the next, £13 15s., to Mr. F. Vincent, of Barrowby.

SALE OF CHEVIOT RAMS AT BEATTOCK.—At the biennial sale of rams at Beattock bred by Mr. Carruthers, Kirkhill, and Mr. Johnstone, Capplegill, a large attendance around the ring. There was dinner at the Beattock Hotel. About seventy gentlemen sat down, and were presided over by Mr. Stewart, Miltongill, Mr. Denham, Beattock, being croupier. The sale commenced at two o'clock, Mr. James Russell officiating as auctioneer. The stock of both breeders were in good condition. From the low price of wool, and deficiency of lambs, this season is not a very prosperous one for flockmasters, and the high prices of former sales were not anticipated; but, nevertheless, prime animals brought extremely high prices, but ordinary rams exceeded the value for butcher's purposes. The sale commenced with Mr. Carruthers's lot about two o'clock. Three three-year-old rams sold at £4 15s. to £25, to Mr. Paterson, Howleuch, and £10, the average £13 5s. At the previous sale the average of six rams was £6 6s. Thirteen two-year-olds sold from £3 10s. to £23—the latter bought by Mr. Hyslop, Clearins, and Mr. Dalgleish, Rennalburn, bought the last of the lot, Bismarck, at £20. The average was £8 2s.; in 1863 the average was £5 19s. 6d. Forty-six one-year-old rams were sold at prices from £1 10s. to £12. Two rams bringing the latter figure were bought by Mr. Johnstone, Archbank, and Mr. Grierson, Morton Mains. The average was £4 5s. 6d. The total proceeds of 62 lambs is £341 18s., and the average £5 13s. 6d., or 12s. 6d. higher than in 1863.

THE CAPPLEGILL RAMS.—This sale proceeded immediately the last of Mr. Carruthers's rams disappeared from the ring, and commenced with a five-year-old sheep, which brought £4 10s. Nine four-year-old rams were sold at prices from £2 6s. to £9 10s., the average of the lot being £4 10s. 9d. Ninety-three rams, of three years old, were sold at figures from £2 to £11, the latter a ram bred by Mr. Brydon, and bought by his son, Mr. James Brydon, jun., Dalry. The average of the lot was £4 15s. 6d. At the previous sale twenty-one rams averaged £4 16s. 8d. There were thirty-two rams, two years old, sold; prices ranged from £2 2s. to £39, the latter figure being obtained for a splendid ram bought by Mr. Archd. Johnson, Archbank. The average was £5 4s. 4d.; the average for twenty-nine, in 1863, was £5 8s. 6d. There were thirty-six one-year-old rams sold, at prices from £1 16s. to £17, the purchaser of the latter being Mr. Brydon, Kinnilhead; Mr. Johnston, Kingledoors, bought one at £11. The average was £4 18s.; in 1863, the average of thirty-nine was £4 19s. The total proceeds of clipped rams was £461 8s. 6d., and the general average £4 12s. The sale concluded at half-past 5, and prices were, on the whole, considered good, the amount of both sales being £803 3s. 6d.

LORD FALMOUTH'S ANNUAL SALE OF CATTLE.—The annual sale of pure-bred North Devon cattle and Shropshire Down sheep took place at Trewonall farm, in the parish of Lamorran, by Hussey and Son, the auctioneers, of Exeter. Ewes averaged 46s. each, lambs 25s. to 27s. each, hogg rams (two very good) fetched £5 10s. and £6 2s. 6d. respectively, cow with calf £16, cow in calf £15, two-year-old heifer £10 17s., two-year-old steer £8 12s. 6d., yearling £6 6s., a boar pig not twelve months old £7, a sow in farrow £6. Five bulls, some of which were only ten months old, brought £20 each, and one £25.

THE ELMHAM HALL STOCK SALE.—The excellence of the Elmham Southdown and Norfolk red-polled cattle attracted a large gathering at Lord Sondes' fifth annual sale and letting. The stock offered for sale comprised 400 Southdown sheep, 17 blood red polled Norfolk heifers, and three bulls; and twenty-five Southdown rams were to be let. An upset price was placed against each of the rams, and those only were brought into the ring that were called for by any customer who was prepared to give the price. Fifty shearing ewes were put up in lots of five each, which were disposed of at from £2 6s. to £3 19s., producing an average of £2 19s. per head. Sixty more shearlings, in lots of ten, made an average of £2 5s. 6d.; sixty stock ewes, £2 6s. 4d.; ninety ewe-lambs, 29s. 6d.; and one hundred and forty wether-lambs, 26s. 6d. The rams for letting included the three-shear ram, winner of the first prize and silver cup at the Harleston show, and highly commended at Oxford, which was secured for 26 guineas for Sir W. Throckmorton, one of Lord Sondes' rivals in Southdown breeding. Another animal, the first-prize shearing ram at Harleston, was knocked down to Mr. J. J. Colman's agent for 24 guineas. Mr. Clarke, of Southacre, secured a two-shear for 15 guineas; and a shearing and a three-shear were hired for the Prince of Wales at 12 guineas each. The remainder of the rams were not called into the ring. The Norfolk polled cattle comprised 15 heifers, many of which were bought by Sir A. Macdonald, the prices varying from 12 to 26 guineas. There were only three bulls, one of which, a two-year-old, the first prize-winner at Attleboro' and Harleston, brought 26 guineas; the other young animals only 9 and 4 guineas each respectively.

HEMPTON GREEN FAIR.—There was a large and excellent show of rams, whose quality was quite an average; and, contrary to expectation, they realised better prices than those obtained for the last few years. Among the rams offered for sale were a lot of forty Cotswolds from the Marham Hall Farm. They realised an average of £10 10s. 11d., the best commanding the sum of £15 10s. A lot of thirty shearing long-wool rams, bred from the West Dereham flock, the property of Mr. Thornton, averaged £9 1s. 2d., the highest price being £14 15s. An important feature in the business of the day was the sale by Mr. Robert Aylmer, who is declining rami-breeding, of the Westacre flock. This flock, which had descended from blood obtained from Messrs. Lane, Garne, and Hugh Aylmer, consisted of seventy long-wooled shearing rams and two hundred long-wooled ewes. The sale was conducted by Messrs. Salter and Simpson. The rams averaged £8 4s. 6d., the highest bid being £14 10s., and the ewes averaged £5 12s. A lot of fifty long-wooled shearing rams, the property of Mr. P. J. Starnan, averaged £7 2s., and the highest bid was £11 5s. The next sale was that of thirty-three Cotswold rams, the property of Mr. John Aylmer, which averaged £7 11s. 10d. Twelve Lincoln and half-bred sheep, the property of Mr. Butler, averaged about £4; twelve Oxford Downs (part lambs and part shearlings), the property of Mr. Applegate, averaged £5 1s. 10d.; and eight Oxford Downs and a number of Down ewes averaged for the former £6 11s. 6d. (the property of Mr. T. Case).

THE CAISTOR SALE OF SHORTHORNS.—At this sale the stock, having suffered from the dry summer, appeared to disadvantage. This, coupled with a bad hay crop and little prospect of winter keep, resulted in low prices. Nearly every cow and heifer had a calf at foot, and were only in milk. They went from 15gs. to 30gs. each, but several of the calves made as much as 15gs. each. One heifer made 32gs., and a white bull (Paradox 7th) 36gs. There was a very large company; but the competition was very languid, and the proceedings closed with an average of £20 11s. for cows, calves, and young bulls.

SALE OF MR. HARRIS' SHORTHORNS.—The entire herd of Shorthorns, of Mr. Thomas Harris, of Stoney Lane, Bromsgrove, has just been disposed of. Mr. Harris has acquired a well-earned reputation as a first-class agriculturist, and has frequently been selected to act as judge at the principal shows in England, Scotland, and Ireland. Although not prejudiced in favour of either Bates or Booth blood, he could appreciate a good animal of either strain; the best evidence of his sound judgment being found in the fact that amongst the entire herd there was not an inferior-made animal. Sir George Jenkinson, Bart., M. P., presided at the luncheon over a company of 300. The company then adjourned to the sale ring, where Mr. Lythall, of the firm of Lythall and Clarke, conducted the business. The 45 cows and heifers over 12 months old averaged 31l. 4s. 6d.; the bulls over that age 29l. 8s.; and the 17 young calves, some only a day or two old, 21l. 0s. 9d.: the total being 1,736l. 11s. 6d. The principal lots were Favourite, 51 gs. (Earl Beauchamp); Eleonor, 41 gs. (Mr. Rowbotham); Butterwort, prize heifer at Coventry, 55 gs. (Sir G. Jenkinson); Gertrude, the companion heifer, 45 gs. (Hon. Mr. Vernon); Lady Wilkinson, 41 gs. (Sir G. Jenkinson); Lavinia, 40 gs. (Earl Beauchamp); Lady Lavender, 41 gs. (Mr. F. Lythall); Lady Sarah, two years, 42 gs. (Mr. W. Price, M.P.); Lady Elizabeth, two years, 41 gs. (Mr. Z. Walker); Lady Blanche, 9 months, 30 gs. (Earl Beauchamp); Satellite, bull-calf, seven months, 30 gs. (Mr. Webb); Hogarth, bull-calf, three months, 22 gs. (Mr. Jerrard); Habaab, one day old, 13 gs. (Earl Beauchamp.) The sale was over in exactly three hours, the biddings being regulated by the glass.

A GOOD PRICE.—Mr. F. Leney has just sold his Short-horn bull-calf, Duke of Geneva, to Sir C. Lamson, through the agency of Mr. Stratford, for 700 guineas. Grand Duke of Geneva, a roan, calved on January 30th, 1870, is by Grand Duke 15th (21852), out of Duchess Geneva 3rd, by Lord Oxford (22200). At the sale of the American Shorthorns at Windsor Duchess of Geneva was knocked down to Mr. Leney for 700 guineas, as he also purchased two others of the imported heifers at long prices—at least in those days.

DEATHS OF PRIZE SHORTHORNS.—Mr. Booth's famous bull, Commander-in-Chief (21451), died from inflammation of the intestines; and Lady Pigot's prize cow, Queen of Rosalea, from a broken blood-vessel, on returning from the Northumberland show. The Queen, as our reports have continued to record, has had a very hard season of it, and perhaps no animal was ever exhibited so often.

PROFESSOR GAMGEE AND HIS MEAT-PRESERVING PROCESS.—Touching the subject of meat preserving, other shipments of meat preserved under Professor Gamgee's process have been inspected in Melbourne during the past month. I regret that I can report no better of these than of the one of which I gave you an account in a former letter. Some cases, per Crusader, consigned by the Agent-General of Victoria to our Chief Secretary, were opened recently at the Custom-house in the presence of several members of the Intercolonial Conference, and of many others more or less interested in the subject. The shipment, consisting of two cases, a cask, and an iron cylinder, appeared to be most securely packed, and the admission of air to the contents seemed to be impossible. On the opening of the iron cylinder "the gas burst out with a hiss," as one of the reporters correctly described it, and the assembled noses had not long to wait for information as to the condition of the contents. So with the other cases. When the mutton was brought out the stench was scarcely endurable. The pork, although looking better to the eye, was no better on further trial. There was no beef at all. The whole of the meat, with the tallow amounting to 527lb. weight, was at once sold to Bayldon and Graham, the tallow-makers, at 1d. a lb. A second inspection of another shipment, per Turkish Empire, to Messrs. J. White and Co., was made a few days back at the Spencer-street Railway sheds. Two cases were opened, one containing about 50lb. weight of mutton in shoulders, legs, and saddles, and the other an entire sheep packed in oat husks. The meat was quite unfit for human food, and was sold for boiling-down purposes at 2d. per lb.—*Melbourne Correspondent of The Times.*

CALENDAR OF AGRICULTURE.

This month is the general season of sowing wheat on clay fallows, ploughed with one furrow, on leys with a single ploughing, and on the clover brush of a four years' course. The grass surfaces should be ploughed early and sown in the latter part of the month in order to expose the land to the action of change for the purpose of pulverization. Sow by hand the seed at the rate of two to three bushels to an acre, and cover with three single tines of harrowing; draw the water-furrows without delay on wet soils, with the common or double mould-board plough, and make spade-cuts into the side ditches from the inside and ends of the headlands. Water furrowing will be very much superseded by the thorough draining of clay lands.

Sow wheats by the drill machine on all fine dry soils that do not require furrowing or draining. The seeds are steeped in any corrosive liquid, as stale urine, solutions of vitriol and copperas, or even in salted waters; the light grains are skimmed off, and the wheat is encrusted with a mixture of hot lime and dried for the hand and the drill. Slant up the sown fields for the winter by making secure the gates and the fences. Sow wheat on the lands that are suitable. Prepare by following the green crop lands of next year to be planted with the early plants, as potatoes and mangold wurzel. One earth of the course, in a cross-ploughing, harrowing, and rolling, and another furrow to lay the soil open against sleet and to receive and retain the winter's moisture, will much forward the following process in the spring, with the advantage of less exposure of the land to the evaporation of moisture, a large benefit in the early and arid climates, in which alone the autumn following of lands can be performed.

Raise the crops of potatoes from the ground in dry weather, and place the tubers in a longitudinal heap of six feet in width and four feet in height on a dry site, and cover the ridged sides with loose straw beneath a stratum of drawn thatch, in thickness according to the severity of the climate in rains and dry colds. Grassy turf is a good covering, but is not very convenient, and a thick covering of earth very much encourages the sweating and sprouting of the tubers. A dry coolness is the best preservative of potatoes, obtained by a covering of straw in thatch, and when a severe snow and frost occurs the heaps are well protected by a loose covering of straw dung from the stable door, as it is dry and light, and little affected by frost. The tubers are best dug from the ground by hand-fork of three prongs, which penetrate the ground into the openings for the percolation of air and moisture, which forms a large part of the advantage of digging ground over ploughing. On the other hand, the raising of the potatoes by the plough sledges the under soil by the soleplate of the implement, closing instead of opening the orifices of percolation. Hand-digging is also most convenient for the removal of any weeds and stones, which can be gathered by hand separately, and also of the haulm to the cattle yards for the bottom litter, and being indestructible will be advantageously chopped or cut into short lengths. A permanent site of potato heaps may be formed with gravels or dry earths, raised a little above the level ground, and a permanent roof made of flakes or hurdles, that are lined with straw and twine, and divided into convenient pieces to be removed and replaced in the yearly requirement. Any thickness of loose straw may be placed betwixt the

potatoes and the thatched roof to protect against severity of cold.

Mangold wurzel, carrots, and parsnips are secured in the same way, the outsides of the heap being built with root end of the plant placed outwards, and the inside in a promiscuous position, to afford many openings for the transmission of air. The roots being juicy and succulent, require small heaps in position. The hand-sickle cuts the roots and fibres from the bulb, and also the tops close from the crown, which are given to cattle in the yards or in the grass-fields, moderately at first, to prevent hoving of the animals.

The animals of the farm will be arranged by the end of this month for the winter's accommodation, cattle in houses and yards, sheep in the fields, swine in a store-yard and fattening sties, poultry in a large yard and in separate houses for each class of animals, and the milch cows in a house and yard that are permanent for the special purpose, and are never changed. After all that has been spoken, written, and practised on the subject of wintering cattle, both in the fattening and lean condition, it is concluded, and the conclusion is in accordance with a long experience of its validity, that the most advantageous arrangement places the "largest" fattening bullocks in two, three, or four together in a yard with a shelter-shed, with fresh water in a trough, fed by a ball-cock, moveable racks for hay and straws, with wooden cribs placed along the sides of the yard and under the shed, the bottoms perforated with holes for the escape of moisture and filth, and the animal may eat at pleasure in the open air or under cover. The second-sized beasts are in four, five, or six together, with an enlarged accommodation in the yard and shed. Store animals in six to ten together, with the same plan of accommodation, enlarged to suit the number of beasts, classed by age and condition. The unruly horned breeds of Scotland require a close confinement, and tied by the neck to stakes, but even these beasts are seen to thrive best in yards, after a time settling their roving habits. Single boxes have been used for fattening animals, but with no advantage. The lair becomes very dirty, and the beast is deprived of the light, fresh air, and of the exercise that is necessary for the performance of the natural functions. Animals should be classed together by age, size, and colour, polled or horned, and also by the seeming aptitude to fatten. The similarity and fitness of objects evinces an exactness of knowledge which is only obtained by exact measurements.

On turnip farms that fatten any considerable number of beasts, the shelter-sheds standing back to back with a road between of 20 feet in width, will be provided with a railway and a waggon to fetch the turnips and other roots from the store-pits at the ends of the range of houses. The fresh condition of the roots must be used and of straw and hay in the racks in two days' use, and litter in not many days' distance. A close and unceasing attention is essential on all these points. The roots for the fattening beasts are delivered from the waggon on the railway through spout-holes in the wall into the cribs in the shelter-shed, in order that the animals may be under cover in the most boisterous climates, as in Wales and the north of Scotland. In South Britain the open air may be preferable.

By the end of the month the sheep flocks will be arranged in the winter management, the lambs of the

year requiring the earliest provision on the first sown white turnips, that are now the green food of the farm and are tender for the young teeth of the sheep. Confine the animals on a certain extent of the growing turnips for a few days' supply, with nets on stakes, flakes, or hurdles, and move the fence as the meat is consumed to a fresh break of ground, and pick from the earth by a hand claw the whole of the roots that are left. In this way the whole fields are consumed, with the animals manuring the ground by being confined within a fold of two square yards to one sheep. In stormy latitudes the animals require all the open ground to wander for lair and shelter, which are not obtained in the fold.

The fattening flock are maintained in the same way, with a full allowance of the food. On the peachy loamy lands on which the best crops of turnips are grown, the wetness may render it necessary to carry the half of the turnip crop to a ley or stubble field, to be consumed in broadcast by the sheep, when the land is much improved for oats or a fallow crop. The turnips are also sliced by hand-cutter into troughs, with the tops in short lengths, and may be topped and rooted into covered heaps, that are dealt out as required. But it may be doubted if any preparation prevails over eating the roots fresh growing on the ground.

The store flock betwixt the lamb and the fattening is treated in the same way, with a less allowance of food.

On hill farms of sheep-growing that are not cultivated, the whole success depends on the quantity of winter food that is provided in hays from the meadow ground that are attached in some greater or less quantity by the sides of brooks in vallies. Being placed in ricks in convenient positions, the animals will gather around the place to receive an allowance throughout the winter from the end of this month.

Place the breeding ewes with the tup, one to forty or fifty for six weeks, on a grass ley or stubble field, and they may get a supply of small turnips and tops to maintain a fresh condition of body, which much improves the salacity. The skill and judgment of the farmer will be sharply exercised in the formation of the breeding flock by rejecting the faulty animals in age, shape, and general appearance, from those of a robust vigour in the eye and action, lengthy closeness of wool, without being matted or too open to the skin. A square frame in a round carcase is a very chief consideration, and the nearest approaches to it must be carefully observed. The rams being painted on the brisket will mark the ewes as in the order of impregnation, and the right and left ears being pierced with

a hole in the fore and back mark will distinguish the progeny of the same mark in the rams, and show the descent of the whole flock, and enable the breeding from proper consanguinities and nearness of kin. The rejected animals for breeding are sold to yield another crop of lambs or fattened on the farm, always remembering to dispose of the animals while the mouth of teeth is able to fatten the carcase. The room thus vacated in the breeding flock is supplied by an equal number of ewe hogs from the flock of eighteen months. In order to preserve special uniformity in every class of animals, the old and young must not be mixed, but form separate divisions of old and younger breeders. This arrangement will be very advantageous on large farms.

Dip sheep for a few minutes singly in a liquid of corrosive mixtures to kill vermin and remove impurities. The mountain sheep of stormy and northern climates are smeared with tar, with butter, and oil, and no chemical substitute has yet been found.

Swine are placed in a store yard for young animals, and in sties of two pigs together for bacon hogs, on boarded floors or paved with timber blocks, warmed underneath by a pipe from the cooking-house and wormed into every floor of the piggery and poultry houses. The boar and brood sows are lodged in single apartments from which the weaned pigs are sent to the store yard, fed with roots, and amply littered and sheltered. The most forward are drawn as wanted into the fattening sties in which the food is given of meals and steamed roots mixed, with a meal daily of raw grains, as beans and barley in the last month of fattening to impart a white firmness to the flesh. The season of fattening from this month will yield two casts of bacon hogs before the season of curing must cease.

Poultry are lodged in separate apartments for each kind of animals, with special purposes, and fed with light grains, and the meal as for pigs. The boarded floors of the houses are warmed underneath by the pipe as in the piggery, as the warmth will much conduce to the laying of eggs and the early hatching of chickens.

Milch cows in the shed and yard of the special use will begin to get the green food as it comes into use along with hays and chaffs.

Sow rye for a seed crop and for an early green food for ewes and lambs. Sow winter vetches for an early green food, in a thick seeding, with a small mixture of rye or winter beans, or barley, or a late cutting on clean lands of good quality. Sow winter beans and barley for seed crops.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

Plant peas and beans, with the chance of an early crop. Transplant and sow hardy lettuce, according to the directions before given. Cape brocoli requires early care; and as each head is cut the stump and leaves ought to be removed, and when dry should be burned for the sake of the ashes. Spring brocoli plants should now be sloped down, their heads to the north, and earth brought up nearly to the leaves, or if in trenches, the stems ought to be landed up.

Beet-root and carrot are partially digged up, and stored in sand, for early use.

Cauliflowers in frames or under glasses are to have an abundance of free air in dry weather, and at the end of the month remove some of the best plants to beds or warm borders, to be covered by hand lights; place three or four in a spot, making the earth firm around the roots

and stems; cover till growth be established, and then give all the air possible in fine weather.

Plant hearting cabbage and colewort, and finish as soon as possible. Sow some mazagan beans, and also small salads once more, of which the trouble is slight: the success may be uncertain, but the relish is very agreeable.

Tie up some good plants of endive for blanching, and draw fine earth around the stems. Thin out winter spinach; keep it clear from weeds, and make the ground clean. Hoe and earth brocoli, cabbage, borecole, and Brussels sprouts. Cut anon the decayed stems of mint, balm, thyme, and other sweet and aromatic herbs; hoe the ground, and, if needful, add a little nice fresh earth to the spaces; plant slips of the pot-herbs and divide mint.

Asparagus beds should be brought into winter order, not waiting for the ripening of the seeds. A good method

is the following: Cut to within two or three inches all the haulm, remove every week, then dig trenches on each side a foot deep, and spread the earth over the beds or rows, turn the haulm into these trenches, treading it even at the bottom, and sprinkle half a pound of salt over it in every trench of twenty to twenty-five feet in length; finally, fill the trenches to the ground level with half decayed stubble, dung, and leaves. Sea-kale may be treated in the same manner; the leaves of every vegetable ought to be returned to the soil, but deeply buried. Rhubarb and artichokes are mainly assisted in this way, the earth in the trenches soon becoming an admirable earth. These plants are strong feeders, and require a powerful manure, as will be found in the contents of the tank, which must be in a condition of half decay, with a moisture without dropping, at least not largely.

Raise from the ground and lay in store the potatoes of all kinds, of which the haulm is yellow in decay.

Commence to excite asparagus if any is wintered in frames, and sea-kale also.

Dig all kinds of land, and ridge-trench heavy soils. Incorporate manures, and keep all quarters clean.

FRUIT DEPARTMENT.

Trees and shrubs, deciduous and evergreen, are safely planted from the middle to the end of the month. To do the work effectually such ground ought to have a well drained bottom, and be trenched eighteen inches deep, according as the upper earth is deep or shallow; lay dung over the soil that covers the roots, as top-dressings may be the best of all manurings. In that case no digging or trenching of the land is required, but always a most complete thorough drainage in all soils inclined to wetness. Raise the grassy turf on the upper stratum a few inches in depth, root-prune the young trees, and

spread the shortened roots even and thinly on the ground over a thin layer of guano-mixture in five or six to one, and tread the earth firmly over it, fixing the tree, and cover the ground around it in a yard of extent with very moist half rotted farm-yard dung, or the vegetable contents of the liquid tank. Deep digging and horizontal covering may be eligible in all cases of fruit trees, large shrubs, and standard trees, that are planted to fill corners and to remain singly for beauty or otherwise; for groups and clumps of trees the same treatments is recommended.

Gather and store apples and keeping pears; the latter require a warmer room than apples.

FLOWER GARDEN.

Plant auriculas in airy frames; camellias and heaths in a dry, cool, and well ventilated green-house or pit; succulent plants, as cactus and pelargoniums, in a house with a full southern aspect. Reduce water in any glass erections. Neatness in the open air departments and in the shrubbery is what is now to be chiefly attended to.

The winter aspect of a garden for pleasure, or for growing fruits and vegetables in conjunction, shows the cultivation of the ground and the crops that have been obtained by the total absence of weeds, and the neat order of the grounds after cropping. Dig for the early spring sowings of the lighter plants, as peas and legumes, and rough trenched with dung in mixture to be planted with the stronger plants, as potatoes, beet, and other tap-roots. Winter manuring is preferable to the spring for succulent crops, with a deep preparation and a strength of aliment. The land lying in exposure during winter, will derive the benefit of the reciprocal action of atmospheric and terrestrial elements.

AGRICULTURAL REPORTS.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

Throughout the month a considerable increase of steadiness has been noticed in the cattle trade, and prices have ruled very high. The apparent determination of the French to resist all attempts at the spoliation of their territory, and to carry on the war to the bitter end, render the prospect of our receiving continuous supplies from the Continent somewhat uncertain. From this circumstance the total supplies at market have been less extensive. An Order has, at the same time been promulgated, forbidding the removal of French and German cattle from the waterside, owing to the prevalence of disease in those countries; and, in future, only Dutch and Spanish beasts will be allowed to pass the barriers. The quality of the stock has been very unequal, and really prime breeds have continued remarkably scarce. However, this is not a subject to be wondered at, especially when the failure of the hay crop, and the great difficulty experienced in obtaining food for the cattle are taken into consideration. Much anxiety is still felt as to the means of obtaining sufficient supplies of food during the winter months. The pastures and meadow lands have certainly improved to some extent, under the beneficial influence of the late rains, and the root crops are also turning out well, but the main staple is sadly deficient in quality, and there is therefore every probability of cheap meat during the winter season. At the present moment the best Scots and crosses are selling at 5s. 10d. to 6s. per 8lbs.

With sheep the market has been scantily supplied. The quality, as in the case of beasts, has been very indifferent; nevertheless the trade has ruled firm. At one time the best

breeds were making 6s. 2d., but the best Downs and half-breeds are now selling at 5s. 10d. to 6s. per 8lbs.

Calves have commanded a fair amount of attention, at full quotations. The supplies have been moderate.

In pigs, the business doing has not been important, and the fluctuations in values have been trifling.

The total imports of foreign stock in London, during the month have been as follows:

Beasts	9,329	Head.
Sheep and Lambs...	31,661	
Calves	2,109	
Pigs	3,039	

COMPARISON OF IMPORTS.

Sept.	Beasts.	Sheep and Lambs.	Calves.	Pigs.
1869	13,745	47,341	3,385	4,587
1868	11,951	11,846	1,493	3,116
1867	11,082	34,572	779	4,500
1866	15,405	45,625	2,183	2,942
1865	12,553	69,792	3,192	9,434
1864	14,444	48,201	3,161	5,701
1863	11,923	50,780	3,213	2,691
1862	7,219	33,985	2,257	2,546
1861	6,759	36,236	2,323	3,214
1860	8,120	37,420	2,200	3,188
1859	6,966	49,141	1,744	1,895
1858	5,999	26,205	2,735	2,472
1857	7,346	24,288	1,953	2,067
1856	7,084	23,605	2,772	1,559

The arrivals of bullocks from our own grazing districts, as

well as from Scotland and Ireland, thus compare with the three previous years:

From—	Sept. 1870.	Sept. 1869.	Sept. 1868.	Sept. 1867.
Lincolnshire, Leicestershire, and Northamptonshire	8,550	11,450	12,750	7,550
Other parts of England.....	2,800	1,730	1,990	2,770
Scotland	315	3	360	11
Ireland	1,200	830	382	1,040

The total supplies of stock exhibited and disposed of at the Metropolitan Market during the month, have been as under:

Beasts	23,115	Head.
Sheep and Lambs... ..	126,570	
Calves	2,889	
Pigs	1,115	

COMPARISON OF SUPPLIES.

Sept.	Beasts, Sheep and Lambs.	Calves.	Pigs.
1869	28,255	156,680	4,142
1868	26,940	157,440	2,643
1867	75,290	127,510	1,565
1866	26,560	129,430	1,984
1865	27,040	151,440	3,324

Calves	4	0	to 5 8	4	4	to 5 6
Pigs	3	6	to 4 4	4	0	to 5 2

The dead meat markets have been moderately supplied. The trade, has been firm, and full prices have been obtained. Beef from 3s. 4d. to 5s. 4d., mutton 3s. 8d. to 5s. 6d., veal 4s. 4d. to 5s. 4d., and pork 3s. 4d. to 5s. 10d. per 8 lbs. by the carcase.

WEST SUSSEX.

The harvest of 1870, a very short and inexpensive one, having been some time concluded, the thrashing-machine has been pretty freely used. There probably never was a greater difference of opinion as to the yield of the wheat crop. It is generally supposed that it will yield well according to the crop of straw, but the latter is certainly short and deficient in bulk. During the winter a great deal of the growing wheat looked thin and weakly, and some of it did not come up well; it appeared to be attacked by grub or wireworm, and although not done to any great extent in the aggregate in this division, a considerable number of acres were ploughed up, not being considered good enough to stand for a crop, and the land resown with barley or oats. Then came in one of the most trying springs ever known, with frosts and dry parching easterly and north-easterly winds prevailing for days and nights together. The furze and evergreens seemed scorched as if by fire; but the wheat plant passed through all this better than could have been expected, and when the more genial weather did at last come it tillered out well, and showed good strong ears, and the blooming time was favourable; and so the season continued up to harvest. To sum up, therefore, I think it may be fairly assumed that on good deep holding

soils, well farmed, there will be a good crop; but considering the quantity of hill land and the wealden clay, besides a quantity of other land (not true wheat land), it appears to be the more prevailing opinion that in West Sussex the crop will not prove an average. Barley it is supposed will be a fair crop, but the colour is not first-rate, hardly enough thrashing, however, has been done to fairly test this. Oats will be the worst crop grown in this division for years, and very deficient in straw. Early sown peas on suitable soils well farmed will turn out a fair crop. Beans are not much grown, they seemed very short in the haulm. The hay crop, both clover, seeds, and meadow grass, may be safely pronounced the worst crop grown in the memory of any farmer living; and what is to be done during the next winter, particularly should it turn out a severe and long one, can hardly be imagined. We have had some fine rains latterly, and the consequence is that some very good fields of mangel wurzel, swedes, and white turnips, are to be seen, but the failures are also sadly apparent. Fat stock, as might be expected, is hardening in price, and there will be a difficulty among the graziers to keep the local markets supplied.—Sept. 22nd.

AGRICULTURAL INTELLIGENCE, FAIRS, &c.

CAISTOR FAIR (Saturday, Sept. 17).—Good show of sheep and plenty of buyers ready to bid at recent prices; but sellers holding out for an advance, sales in most instances were slow and tedious. Beasts very few, and quickly bought up. Ram sales.—The Wold Newton: 25 sold by Mr. Richardson, highest price, lot 19, 12/ 5s.; average 7/ 3s. The Beaumont Cote: 25 sold by Mr. Calthrop, highest price, lot 8, 12/; average 7/ 15s. The Kettlebythorpe: 21 sold by the same auctioneer, highest price, lot 14, 14/ 10s.; average 6/ 10s.

DRIFFIELD FAIR AND RAM SHOW.—The second of the harvest fairs is noted as a lamb fair, and more especially as the supply amounted to 9,000, most of which were lambs. At the commencement holders asked high prices, but eventually sold at a reduction of 2s. to 3s. per head. Prices ranged from 22s. to 40s., the general average being 32s. to 37s. per head. There was a sprinkling of ewes, which sold at 38s. to 40s. per head. A few fat sheep went at 7½d. to 8d. per lb. There was a moderate show of rams, which sold at £7 to £10 each. Horned cattle were scarce, and there was not a really fat beast offered. Year-olds £8, in-calfing cows £18 to £20, heifers £14 to £16 per head. In the horse fair there was a moderate show of inferior animals, with a few draught horses, which sold at £27 to £30 each.

DUNDEE LATTER FAIR.—This annual market, the last of the season, was held on Tuesday. The show of cattle, almost exclusively two year olds, was the largest seen for some time. There could not be much under 1,000 head on the ground. The show of fat was limited, few cattle fit for the shambles being offered. Milch cows were in demand, and the supply was good. Some sold by Mr. Liddle, Denny, were superior animals, and fetched high prices. The show of horses was less than usual, but what was wanting in quantity was more than compensated for in quality, and numbers of really good farm horses changed hands, the rates for which ranged from 20/ to 43/, sales being effected at the latter figure. Some superior animals, for which as high as 50/ was asked, remained unsold. There was not the usual quantity of light animals shown, so any sales made were at higher rates owing to the want of competition.

DUNSE EWE TRYST.—The first ewe tryst in the Border district took place at Dunse, on Tuesday, and was well attended by farmers and dealers. There was a fair show of ewes, and lambs were a large show. For draft ewes there was a good demand at prices from 2s. to 3s. a-head above the figures obtained last year, and at the close all were sold off. For lambs there was not an active demand. Sales went on slowly, and at mid-day a number of the lots remained unsold. The prices asked in the morning had to be lessened somewhat before many sales took place. Among the prices obtained for draft ewes were the following:—Mr. Rutherford, Pintonan, sold his three-parts bred ewes at 45s. a head. Mr. Fogo, East Reston, sold his lot to Colonel Hay at 38s. Mr. Gillespie, Simprin

Mains, sold his lots of three-parts at 42s. Mr. Fender sold the Mount Albyn lot of half-bred ewes at 39s. Mr. Bertram, Blackerston, sold his half-bred ewes to Mr. Caw, Whitsome Hill, at 39s. Mr. Weatherhead, Whiteburn, sold his half-bred ewes at 36s. The Greenlaw Dean lot of half-breds were sold at 36s. Mr. Cowe, Old Cambus, sold his half-bred ewes at 38s. Mr. Burton, Crumstances, bought a lot of three-parts from a farmer near Dunse at 30s. Mr. Halliburton, Eiddon, sold a lot of three-parts lambs at 30s. Mr. Purves, Thorniedykes, sold a lot three-parts at 20s. Mr. Mill, Hyndeside, sold a lot of three-parts at 25s. 6d. Mr. Rae, sheep-agent, Lauder, sold the Earl of Lauderdale's lot of three-parts at 29s. 6d., the Threepwood lot at 21s. 6d., and other lots at from 23s. to 27s. Messrs. Currie, dealers, Morebattle, sold a lot of half-breds at 19s. Mr. Craw, Whitsome Hill, sold a lot at 21s. 6d. Mr. Scott, St. Boswell's, sold a lot of half-breds at 17s. Mr. Outerson, Jordanlaw, sold a lot at 21s. Sale of Tups.—About eleven o'clock, a sale of Leicester rams took place in a field adjoining the English Chapel—Mr. Penny, Kelso, wielding the hammer. The demand was not brisk, but fair prices were obtained. Mr. Fender, Rulesmaius, sold 63 rams, at an average of £5 11s. 8d., the highest price being £11 10s. The lot of 8 rams, belonging to Mr. Robertson, M.P. for the county averaged £4 14s. 6d.

GLASTONBURY TOR FAIR (Sept. 19).—There was a large attendance at this fair, and the supply of cattle, sheep, lambs, and pigs was large. Beef realised from 12s. to 13s. per score, mutton 7½d. to 8d. per lb., pigs 10s. 6d. per score. There was also a good supply of mares and foals, and many of the latter changed hands at good prices.

GLENISLA CATTLE AND SHEEP MARKET.—This large annual market for the sale of sheep and cattle was held to-day in the vicinity of the Kirkton of Glenisla. The attendance of farmers and cattle and sheep breeders was, as usual, large, while that of dealers was also numerous. The display of black Highland cattle was, as usual, large and superior, many of the animals being in good condition and ready for the butcher. The greater portion were two-year-old stots and queys, but there was also an excellent turn out of six-quarter-old beasts, which commanded considerable attention. At an early hour business began briskly, and to the close of the day. The sales began before eleven o'clock, and by two were nearly at a close. Prices were remunerative to expositors. For the best fat beef 9s. 6d. to 11s. per Dutch stone were the quotations. The best two-year-old stots, at two and rising three years, commanded from £16 5s. to £17 and £20. For the best queys of the same age the prices were from £12 10s. to £15, for the best fat cows £14 to £24, farrow cows £13 to £19 10s. per head; for best six-quarter-old cattle £9 to £11 was freely given, and at the close scarcely a lot of good cattle left the ground unsold. The show of sheep was not larger than last year, and though the animals were generally of good quality, there appeared to be but little demand, and as little desire to sell. Highland ewes sold from 14s. to 15s. per head, cross lambs 17s. to 20s. per head. A few lots changed hands at these rates. The best mutton sold at 6d. to 8d. per lb. At the close a clearance was not nearly effected, though prices indicated a downward tendency.

HAWICK TUP FAIR.—The weather was very fine; and there was a large attendance of farmers in the district north and south of the Border line, besides buyers from various parts of the three kingdoms. The Cheviot stock is the principal feature of the market, which ranks among the foremost in the country for this class of sheep. The numbers on the ground were about the average. The market may generally be pronounced a good one for the best class of sheep; but inferior beasts were a drug, and did not realise the expectations of expositors. All but a small portion were sold in the auction rings. The only transactions in private pens that we heard of were those of Mr. Grieve, Skelhill, who sold rams at from £4 to £20. The whole business of the day was concluded about five o'clock. The show of Leicesters was larger than usual, the tempting prices of late years having induced many to enter the market. The consequence was a decline in prices from the rates of last year; but, taking quality into account, they were equal to those obtained at Kelso and Edinburgh. This is more of a Cheviot than a Leicester district; but some of our local breeders have through a long course of years brought sheep to the ground which will compare with any but the very highest-priced in the Kelso rings.

LAMBERT'S CASTLE FAIR (Sept. 17) was tolerably well attended, but only about 600 sheep were penned, and trade was slow. Pigs plentiful and well sold. The horse fair was tolerably well supplied, and some business was done. Horne wool 13d. to 13½d.

LEWES GREAT SHEEP FAIR.—This old established fair was held on Wednesday last. The number of sheep and lambs penned was about 26,000, which, although somewhat less than in the two previous years—when the numbers were thirty-six and thirty-four thousand respectively—is rather over the average of the last twenty years. The cold spring was, of course, very unfavourable to lambing, and exercised a marked influence in the numbers reared, and this, coupled with the fact that many flockmasters were constrained by the severe effects of the drought to accept the low prices prevailing at the early fairs, led many to expect a short supply and better prices. The result showed that although the supply was not below the average an improvement was certainly noticeable in prices. There was a large attendance of buyers, including many from distant counties. To the stagnation of trade and agricultural industry in France and Germany may also be ascribed the fact that the choice rams and pens of ewes at the flock auction sales this season have not been so eagerly sought after, and consequently have not realised nearly so high prices as usual. Ewes ranged from 27s. to 46s. 6d. In lambs there was a wide range between 14s. and 31s. The highest price made by the large hill flockmasters was 28s. 6d. There was a splendid show of rams; the trade was not very brisk, but a considerable number were disposed of at prices ranging between 8 and 20 guineas. Of cattle there were a few score head of black runts, and there were also some horses, but in the trade there was no special feature worth notice.

LOCKERBIE LAMB FAIR (Sept. 22).—The show of stock was much less than at the corresponding market of last year, but was fully as large as at the August fair. The number would be about 24,000 head, and was composed of half-bred lambs, mostly seconds, Cheviot lambs, cross lambs, and a few lots of blackfaced lambs. Only two lots of draft ewes were on the hill; there were several lots of Cheviot wethers and gimmers. The stock was in good condition. About 2,200 lambs were sold by auction on Wednesday afternoon, and on that account fewer half-breds were shown to day. There was a large attendance of buyers from Wigtownshire, with a good number from the south. The late abundant rains have greatly improved the turnip crop in Dumfriesshire and Galloway; the young grasses and clover are now available, the fields now being cleared of crop; and in this district there is no lack of keep for stock. Business commenced briskly for the half-bred lambs, most of the best lots being picked up by Wigtownshire buyers early. After the better class of half-breds had been sold, the market grew less animated. There was a good demand for Cheviot wether lambs, and the tops were readily sold. Ewe lambs were rather slower to sell than wethers, but most of the lots went off. Crosses were not so much in request as half-breds, and the market was slow for that class in the morning, few sales being reported until near noon. After eleven o'clock there was a slight lull in the market, but after mid-day business again got brisker, and by three o'clock a clearance was nearly effected, except where a few lots were held by dealers. Half-bred Lambs were 1s. 6d. to 2s. up since August, besides paying their keep; Cheviot lambs were 6d. to 1s. 6d. higher after paying keep; prices for half-bred lambs were from 20s. to 35s. 6d.; Cheviot wether top lambs 11s. to 16s., second wethers 8s. to 10s., mid-ewe lambs 12s. to 15s., thirds 8s. to 10s., crosses 14s. to 22s. The cattle were an average in number, and included 322 Galloways, 63 Highlanders, 75 Ayrshires and crosses, 61 Irish, 12 Hereford cattle; in all, 522. Some excellent stocks were shown, but on the whole the show was scarcely an average in quality, some herds usually shown at this fair being previously sold privately.

PARTNEY SEPTEMBER FAIR.—This extensively known and celebrated mart for sheep and beasts had its commencement for sheep on Monday last. The number of sheep penned was not less than on former occasions. Good useful two or three-year ewes, well-woolled, were in request for breeding purposes. Mr. Wright, Ashby, made 63s. 6d., a superior lot, almost ready for the butcher; the general run was from 40s. to 50s. Lambs made from 20s. to 39s., according to quality.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The month of September has been most extraordinary, both in its political and commercial aspect, the success of Prussia in the war with France culminating in the complete investment of Paris, and the establishment of 650,000 Germans on the soil of France. Everybody was in hopes that peace would soon be the fruit of such decided victories, but it seems as far off as ever, and more human blood, it appears, must flow, and treasure be destroyed before these deadly foes will cease from strife. The very idea of war on such a scale, and so close to our own shores, in former times would have advanced rates fully 10s. per qr.; but no, while home supplies of new have been free, foreign abundant, and stores accumulating, the value of wheat has gone down further 2s. per qr., though the last Loudon markets seems to have reached their lowest. The fact is, no speculation is afloat, none being confident of the issue of the present conflict, and therefore all have put a reserve upon their capital till better times shall induce them to use it freely. With the prospects of peace so distant, however, it is only reasonable to calculate on the effects of a continued war; and as respects France more especially, these are easily made. Already we have heard of a destruction of food near Paris, to prevent its falling into the hands of the enemy, and should this policy of destruction apply through the length and breadth of the land, agriculture there must be forced to an involuntary rest, while the gatherings of the past year, already small enough, may be not only wasted, but wilfully destroyed. For who will till or sow, uncertain whether he or the enemy shall be the better for it? The demand for oats has fallen off, and well it may, for how many of the French cavalry have fallen from their horses, and left the animals to be bought for a song by Belgium dealers! and though peas were being shipped to the famishing armies, as more nutritious than other corn, this demand too has ceased, and we now are left to the wants of Belgium and Holland, whose supplies have hitherto been shut out by the French blockade. In the midst of all these things it is remarkable that Germany herself was so lately threatened by heavy rains, that the ports, blockaded, had they been free, would have sent us next to nothing, from the greater value at home; and though these ports are now open, they are still above our range, and yet may remain so. America and Russia are the countries whence our chief supplies have come. Russia itself has lately become too high for new transactions, and though New York has been willing to meet English views, the last advices thence show an upward movement. So all we have to say is, that the signs of the times are much more favourable to an advance than otherwise. The last price noted for flour in Paris was 48s. 6d. per 280lbs.; wheat not being quoted. White wheat of the week, New Zealand sort, was 54s., and the same was quoted at Amsterdam; at Lyons wheat was 58s., red at Antwerp 58s. 6d.; Hambro' quotations were 54s. to 58s., at Petersburg 44s. c. f. and i., the same not being worth here over 42s. 6d. Stettin and Danzig rates were much above our own, at the latter 50s. f. o. b. was the last price paid; free on board wheat at Milan was 48s., Barletta at Naples 46s. 8d., at Messina 54s. 6d., at Valladolid 51s., at Alexandria 41s., at Valparaiso 52s. 6d. cost freight and insurance; at Adelaide 42s. 6d., at Melbourne 40s.; No. 2 at New York 42s. 9d. per 480 lbs. cost freight and insurance.

The first Monday in Mark Lane commenced on a fair supply of English wheat, and very liberal arrivals from abroad. The trade opened dull, though the show of fresh samples from the near counties was but moderate, and sales could only be made at a decline of 2s. per qr., the bulk consisting chiefly of new samples. Business in foreign was very inactive, at fully 1s. per qr. less money. Notwithstanding a moderate demand for Holland and Belgium, with fair arrivals off the coast, the demand for floating cargoes was limited. This week the London advices had their usual effect on the country markets. Every report was dull, and most were cheaper. Birmingham, Bury St. Edmunds, Leeds, Maidstone, Newcastle, and Uppingham were severally 1s. per qr. lower, but a reduction of 1s. to 2s. per qr. was more general, and at a few places the fall was as much as 3s., as at Louth and Sleaford. Liverpool advices noted a decline of 4d. per cental on Tuesday, and a further reduction of 2d. on Friday, equal to 2s. 6d. per qr. on the week. Edinburgh was 1s. to 2s. per qr. cheaper, and Glasgow 6d. to 9d. per boll down. Too little Irish wheat was offering at Dublin to lower prices, but foreign samples were in favour of buyers.

On the second Monday there was a fair supply of English samples, and another heavy arrival of foreign. The show of fresh samples during the morning on the Essex and Kentish stands was limited, yet business kept dull at last week's currency. The large foreign supply, consisting mostly of American qualities, then were 1s. per qr. cheaper to sell, and other descriptions, had they been forced, were quite as much down. With large arrivals off the coasts, there was a better demand for floating cargoes at the previous week's quotations. This week was a quiet one in the country, with very little change of values. Some places experienced an improved demand; among them were Boston, Gainsborough, Market Harborough, and Uppingham, while Wakefield and a few other markets noted an advance of 1s., but Bury St. Edmunds was 1s. lower, and others tended to decline. Liverpool, after losing 2d. per cental value on Tuesday, recovered on the following market. In Scotland prices were much the same as at Glasgow and Edinburgh. More firmness was evinced at Dublin, both in foreign and home grown samples.

On the third week there were increased arrivals, both English and foreign, yet the better accounts from the country as well as a foreign inquiry disposed some factors to ask 1s. more, which was occasionally paid, but eventually the market had a duller aspect and no general advance was quoted. The foreign trade found some clearance of inferior samples for export at full prices, but there was no improvement on the higher sorts. Floating cargoes went off quietly without change of values. Country advices this week were more decidedly improved. Spalding, Market Harborough, Rugby, Lynn, Stockton, Manchester, Hull, Leeds, Rotherham, Newark, and Salisbury were all up 1s. per qr.; Sleaford, Melton Mowbray, Louth, Thirsk, Birmingham, and Newcastle were all up 1s. to 2s., and Doncaster still more. At Glasgow and Edinburgh the improvement was 1s. per qr., with a moderate sale. The Irish markets again evinced more firmness, with prices rather against buyers.

On the fourth Monday there was a fair supply of English wheat, and a good arrival of foreign, in about

LONDON CHEESE MARKET, Sept. 22.—Since our last report there has been a moderate but steady demand for the best descriptions of Cheese. We have, however, found buyers more than usually difficult to please, especially in the

question of flavour. The supply of really clean Cheese (with quality) seems exceptionally small, and good prices can be made of this article (whether English or foreign) when obtained. Firm, sound, handsome lumps are wanted. Tender-edged, cracked, or soft, bulgy Cheese are avoided by nearly all buyers, even though offered at low prices. Inferior qualities of all kinds are at present almost unobtainable. Scotch Cheddar of prime quality and flavour are moderately saleable at about 68s. to 72s. Swedish ditto at about 64s. to 68s. American Cheese are in good supply, and rather slow demand at prices varying from about 52s. to 66s. Some of the primest Factory Dairies show more or less the effects of heat. The arrivals reported since last Thursday are 37,097 boxes.—CORDEROY AND Co., Mill Lane, Tooley Street.

ENGLISH FARM AND SPORTING WORTHIES

(NORTH),

BY THE DRUID.

LONDON : ROGERSON & TUXFORD, 265, STRAND.

DR. J. COLLIS BROWNE'S CHLORODYNE.

THE ORIGINAL AND ONLY GENUINE.

CHLORODYNE is admitted by the Profession to be the most wonderful and valuable remedy ever discovered.
CHLORODYNE is the best remedy known for Coughs, Consumption, Bronchitis, Asthma.
CHLORODYNE effectually checks and arrests those too often fatal diseases—Diphtheria, Fever, Croup, Ague.
CHLORODYNE acts like a charm in Diarrhoea, and is the only specific in Cholera and Dysentery.
CHLORODYNE effectually cuts short all attacks of Epilepsy, Hysteria, Palpitation and Spasms.
CHLORODYNE is the only palliative in Neuralgia, Rheumatism, Gout, Cancer, Toothache, Meningitis, &c.

FROM LORD FRANCIS CONYNGHAM, Mount Charles, Donegal, 11th December, 1868.

"Lord Francis Conyngham, who this time last year bought some of Dr. J. Collis Browne's Chlorodyne from Mr. Davenport, and has found it a most wonderful medicine, would be glad to have half-a-dozen bottles sent at once to the above address."

Earl Russell communicated to the College of Physicians that he received a dispatch from Her Majesty's Consul at Manilla, to the effect that Cholera has been raging fearfully, and that the ONLY remedy of any service was CHLORODYNE."—See *Lancet*, 1st December, 1864.

CAUTION.—BEWARE OF PIRACY AND IMITATIONS.

CAUTION.—Vice-Chancellor Sir W. PAGE WOOD stated that Dr. J. COLLIS BROWNE was, undoubtedly, the Inventor of CHLORODYNE; that the story of the Defendant, FREEMAN, was deliberately untrue, which, he regretted to say, had been sworn to.—See *Times*, 13th July, 1864.

Sold in Bottles at 1s. 1½d., 2s. 9d., 4s. 6d., and 11s. each. None is genuine without the words, "Dr. J. COLLIS BROWNE'S CHLORODYNE" on the Government Stamp. Overwhelming Medical Testimony accompanies each bottle.

SOLE MANUFACTURER:—J. T. DAVENPORT, 33, Great Russell Street, Bloomsbury, London.

POPULAR MEDICAL WORKS,
PUBLISHED BY MANN, 39, CORNHILL, LONDON.
Post Free, 12 Stamps; Sealed Ends, 16 Stamps.

DR. CURTIS'S MEDICAL GUIDE TO MARRIAGE: A PRACTICAL TREATISE ON ITS PHYSICAL AND PERSONAL OBLIGATIONS. With instructions to the Married and Unmarried of both Sexes, for removing the special disqualifications and impediments which destroy the happiness of wedded life, founded on the result of a successful practice of 30 years.—By DR. J. L. CURTIS, M.D., 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

And, by the same Author, for 12 stamps; sealed ends, 20.

MANHOOD: A MEDICAL ESSAY on the Causes and Cure of PREMATURE DECLINE IN MAN; the Treatment of Nervous Debility, Spermatorrhœa, Impotence, and those peculiar infirmities which result from youthful abuses, adult excesses, tropical climates, and other causes; with Instructions for the Cure of Infection without Mercury, and its Prevention by the Author's Prescription (his infallible Lotion).

REVIEWS OF THE WORK.

"Manhood.—This is truly a valuable work, and should be in the hands of young and old."—*Sunday Times*, 23rd March, 1858.

"The book under review is one calculated to warn and instruct the erring, without imparting one idea that can vitiate the mind not already tutored by the vices of which it treats."—*Naval and Military Gazette*, 1st February, 1856.

"We feel no hesitation in saying that there is no member of society by whom the book will not be found useful, whether such person hold the relation of a PARENT, PRECEPTOR, or CLERGYMAN."—*Sun*, Evening Paper.

Manhood.—"Dr. Curtis has conferred a great boon by publishing this little work, in which is described the source of those diseases which produce decline in youth, or more frequently premature old age."—*Daily Telegraph*, March 27, 1856.

Consultations daily, from 10 to 3 and 6 to 8. 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

HARDING'S FLEXIBLE ROOFING.

REDUCED TO ONE PENNY PER SQUARE FOOT.

BEST and CHEAPEST COVERING for HOUSES, SHEDS, FARM and other BUILDINGS, &c.

Suitable for all Climates, and adopted by the English and Foreign Governments, Railway Companies, Metropolitan Board of Works, &c. Awarded the Silver Medal, Amsterdam Exhibition, 1869, for its Cheapness and Superiority to Felt, although the price was then 50 per cent. higher than at present, and is proved to be a much more Durable, Efficient, and Weather-tight Roofing than Corrugated Iron, at One-third the cost, and can be most easily fixed by any unpractised person. Please send for samples of present make.

PRICE ONE PENNY per Square Foot, or 23s. per Roll of 25 yards by 14 inches wide.
DRESSING, 2s. 6d. per gal.; ZINC NAILS, 5d. per lb.
SAMPLES AND TRADE TERMS FREE.

HARDING'S COMPOUND GLYCERINE DIP.

CONTAINS NO POISON, AND IS DESTRUCTIVE TO INSECT LIFE ONLY.

A certain cure for Scab in Sheep, who thrive and increase in weight after the use of this Dip. It also preserves the wool of all animals belonging to the homestead. It increases the growth of the wool, and cleanses it of all offensive accumulations which always cause functional derangement. Being a well known fact that acrid and corrupt humours allowed to remain on the surface are the cause of a great disease which afflict animal life. This preparation is most easily applied, perfectly harmless in use, and most deadly to Ticks, Lice, Maggots, and a sure cure for Foot Rot. It also prevents the Fly striking; avoiding the Animal being troubled with Maggots, and heals all Sores, &c.

Sold in Tins of 5lbs. and 10lbs., at 6d. per lb.; and in Drums of 10lbs., 50lbs. and upwards, at 5d. per lb.; by all Chemists, Seedsmen, Ironmongers, and others throughout the Kingdom.

A 5lb. TIN IS SUFFICIENT FOR TWENTY-FIVE SHEEP. Pumping Apparatus necessary, common Tubs being all required. (See the simple Directions for Use on each Tin.)

THE ROYAL FARMERS' INSURANCE COMPANY,

3, NORFOLK STREET, STRAND, LONDON, W.C.

CAPITAL.—Persons insured by this Company have the security of an extensive and wealthy proprietary as well as an ample Capital always applicable to the payment of claims without delay.

LIFE DEPARTMENT.—BONUS.—Insurers of the participating class will be entitled to four-fifths of the profits.

FIRE DEPARTMENT,—

1st Class—Not Hazardous	1s. 6d. per Cent.
2nd Class—Hazardous	2s. 6d. „
3rd Class—Doubly Hazardous	4s. 6d. „

BUILDINGS and MERCANTILE Property of every description in Public or Private Warehouses.—Distillers, Steam Engines, Goods in Boats or Canals, Ships in Port or Harbour, &c. &c., are Insured in this Office at moderate rates.

SPECIAL RISKS.—At such rates as may be considered reasonable.

NEW INSURANCES.—No charge made for Policy or Stamp.

FARMING STOCK.—5s. per cent., with liberty to use a Steam Threshing Machine without extra charge. Nearly FIVE MILLIONS Insured in this Office.

SEVEN YEARS' INSURANCES may be effected on payment of Six Years' Premium only.

LIGHTNING and GAS.—Losses by Fire occasioned by Lightning, and Losses by Explosion of Gas when used for Lighting Buildings will be allowed for.

RENT.—The Loss on Rent while Buildings remain untenanted through fire may be provided against.

HAIL DEPARTMENT.—(CROPS AND GLASS.)

Policies to protect parties from Loss by the destruction of Growing Crops or Glass, by Hail, are granted on Moderate Terms.

LOSSES.—Prompt and liberal settlement.

AGENTS WANTED.

Apply to JOHN REDDISH, Esq., Secretary and Actuary.

FOUNDED A.D. 1844.

Empowered by Special Act of Parliament, 25 & 26, Vict., cap. 74.

THE GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 101, CHEAPSIDE, LONDON.

CHAIRMAN—LORD VISCOUNT NEWRY.

SPECIAL ADVANTAGES TO ASSURERS.

The entire profits divided amongst the holders of participating policies.

The profits applied first in extinguishing the premiums at a given date, and afterwards in making the policy payable during life: this important advantage being secured without the payment of any additional premium.

ANDREW FRANCIS, SECRETARY.

EUROPEAN ASSURANCE SOCIETY.

EMPOWERED BY SPECIAL ACTS OF PARLIAMENT, FOR LIFE ASSURANCE, ANNUITIES,
AND GUARANTEE OF FIDELITY IN SITUATIONS OF TRUST.

Chief Office—17, Waterloo Place, Pall-mall, London.

ANNUAL INCOME, £300,000.

CAPITAL, subscribed by more than 1,600 Shareholders, nearly £800,000.

DIRECTORS.

CHAIRMAN—General Sir FREDERIC SMITH, K.H., F.R.S.

LONDON: ROGERSON & TUXFORD, 265, STRAND.

DR. J. COLLIS BROWNE'S CHLORODYNE.

THE ORIGINAL AND ONLY GENUINE.

CHLORODYNE is admitted by the Profession to be the most wonderful and valuable remedy ever discovered. It is the best remedy known for Coughs, Consumption, Bronchitis, Asthma, effectually checks and arrests those too often fatal diseases—Diphtheria, Fever, Croup, Ague, acts like a charm in Diarrhoea, and is the only specific in Cholera and Dysentery. **CHLORODYNE** effectually cuts short all attacks of Epilepsy, Hysteria, Palpitation and Spasms. **CHLORODYNE** is the only palliative in Neuralgia, Rheumatism, Gout, Cancer, Toothache, Meningitis, &c.

From LORD FRANCIS CONYNGHAM, Mount Charles, Donegal, 11th December, 1868.

"Lord Francis Conyngham, who this time last year bought some of Dr. J. Collis Browne's Chlorodyne from Mr. Davenport, and has found it a most wonderful medicine, would be glad to have half-a-dozen bottles sent at once to the above address."

Earl Russell communicated to the College of Physicians that he received a dispatch from Her Majesty's Consul at Manila, to the effect that Cholera has been raging fearfully, and that the ONLY remedy of any service was CHLORODYNE." —See *Lancet*, 1st December, 1864.

CAUTION.—BEWARE OF PIRACY and IMITATIONS.

CAUTION.—Vice-Chancellor Sir W. PAGE WOOD stated that Dr. J. COLLIS BROWNE was, undoubtedly, the Inventor of CHLORODYNE; that the story of the Defendant, FREEMAN, was deliberately untrue, which, he regretted to say, had been sworn to.—See *Times*, 13th July, 1864.

Sold in Bottles at 1s. 1½d., 2s. 9d., 4s. 6d., and 11s. each. None is genuine without the words, "Dr. J. COLLIS BROWNE'S CHLORODYNE" on the Government Stamp. Overwhelming Medical Testimony accompanies each bottle.

SOLE MANUFACTURER:—J. T. DAVENPORT, 33, Great Russell Street, Bloomsbury, London.

"A. Road" I wiset. Ram.

Published by the American Society of Engravers, 1850.

Mr. Staff.

THE FARMER'S MAGAZINE.

NOVEMBER, 1870.

PLATE I.

A DORSET RAM.

THE PROPERTY OF MR. HENRY MAYO, OF COKERS FROME, DORCHESTER.

This ram, bred by Mr. Mayo, took the first prize of £20 as the best yearling ram in the Somerset and Dorset horn class at the Taunton Meeting of the Bath and West of England Society and Southern Counties Association in June last; and the first prize of £20 in the shearling class of Dorsets at the Oxford Meeting of the Royal Agricultural Society of England in July. These are the only two occasions on which he has been exhibited.

At Taunton we said: "The strong point of the Taunton Meeting is no question the capital entry of Somerset and Dorset Horned sheep, where in every way some praiseworthy progress is observable. Indeed, those who know the breed best were by no means prepared for the extraordinary improvement shown in these sheep. So long as they managed to get a bit of fat on the loin and to have them ready early as house-lamb, little more was sought after. Now, however, they unite more size with more symmetry, set off as they are by those grand curling horns; and at Oxford, if we may augur from this home-show, the Dorsets and Somersets will well maintain their right to that distinction as a breed which the Royal Society has at length accorded them in the arrangement of the classes. Noticeably enough, at Southampton last year, although as handy, there were not in all a dozen entries of these sheep, whereas at Taunton there were upwards of twenty shearling rams in competition, with numerous commendations appended to the actual awards. Mr. Henry Mayo, who has given much attention to his flock, clearly understands not merely how to breed a sheep, but how to show him; and his rams were very artistically turned out. Smart, however, as is the winning shearling, Mr. Herbert Farthing's second was almost equally good; and in the smaller class of old rams, a sheep from Nether Stowey of fine character and size had a long way the best of it. There was a time when Mr. Danger was altogether too strong for his friends and neighbours, but his flock now in the hands of Mr. Bond can reach no higher than

OLD SERIES.]

seconds or commendations." Again, at Oxford, we said: "The Dorset men offered a very poor front for their special classes, there being in all only a dozen entries against thirty at Taunton. The same sheep were here pretty much in the same places, although it was discovered when too late to tutor the judges, that Mr. Mayo's otherwise big, useful shearling had black eyes instead of white, and that his horns were not nearly so well curled as they should have been. And here of course arises the question as to the judges duly appointed being quite up to this branch of their business?"

In the West of England Society's own report, published some time subsequently to either of our own, Mr. Henry Fookes, as a sheep Steward, says that at Taunton, "Of Somerset and Dorset horns there never on any previous occasion had been such an exhibition in England. In the yearling ram class, twenty-one entries, Mr. H. Mayo took the lead with a sheep of wonderful quality, with good back and loins, and of great girth, but not considered 'quite correct' in his head and horns, in which latter qualities he was surpassed by Mr. Herbert Farthing's second prize animal, which lacked the fine touch of the premier ram." The judges of the Royal Show at Oxford report that "the Dorsets were few in number, but generally good in quality; the first prize ram and the first prize pen of ewes being especially meritorious." The judges of the horned sheep at Taunton were Messrs. F. Budd, Hatchwarren, Basingstoke, and Mr. H. Woods, Merton, Norfolk; and at Oxford Messrs. W. B. Canning, Elston, Devizes; R. J. Newton, Campsfield, Woodstock; and H. Thurnall, Royston, Herts—not one of whom, we believe, is a breeder of Dorsets; so that if they did go wrong over the eyes and horns this is scarcely to be wondered at.

The peculiar merit of the Dorset sheep is their dropping lambs as early as September, and these being fattened for the London market realize capital prices about Christ-

C C

[VOL. LXVIII.—No. 5.

mas time. Mr. Tanner says: "The lambs are confined in small pens, five or six together, and, after being suckled in the morning, the ewes are turned away to a piece of sheltered grass, on which they have turnips and hay given to them. About the middle of the day the ewes are brought back again to their lambs for an hour, after which they are again turned out for the afternoon, and on their return they remain with the lambs all night. Any ewes which have had their lambs sold are brought in between the meals and held whilst other lambs suck them,

Thus, by keeping the ewes well fed and the building clean and healthy, the lambs thrive rapidly."

The Dorsets have been very much improved of late, during which time Mr. Mayo's flock has been established—now about eleven years since. He does not consider the mutton is quite equal to the Southdown or Exmoor; but he thinks it very superior to any of the longwools, and also to many of the Hampshires. No breed, of course, will lamb so early, and when crossed with a Sussex ram, the lambs, he says, are second to none, the quality being so good.

PLATE II.

THE STAFF.

The Colonel is beating the other side of the hill, which would look to be a likely place for rabbits, if, as the tenant says, it don't carry much other kind of crop. The

group smacks a good deal of Ansdell, the grey garron more especially.

WHAT WE POUR INTO THE SEA.

BY CUTHBERT W. JOHNSON, F.R.S.

The amount of organic matters which are incessantly pouring into the sea, through our countless streams, we are not wont to regard with desirable attention. These finely separated organic substances are the richest portions of our soils. They may be usefully divided into two great classes: First, those matters which are conveyed to the sea in the streams of which they naturally form a portion, and, secondly, those substances which owe their presence to the operations of mankind. Over the first great class which includes the foreign matters contained in surface drainage and springs, we have not much power to reduce the amount, although even there something considerable is to be accomplished. Thus, in our warping operations, and even in some of our water meads, where the bright spring-water is employed as soon as it issues from the earth, portions of the earthy and other matters of the water are abstracted by subsidence or by the grasses.

It is not, however, so much what man *abstracts* from the drainage waters of the earth that is most worthy of our attention, but what he *adds* to, and thereby pollutes those streams, and thus impoverishes our soils with increased rapidity; and, unfortunately, he does this, certainly until very lately, with reckless indifference. Indeed, if this fouling of the waters did not create a nuisance—did not cause the waters to become offensive and even poison the fish, nothing would perhaps have been attempted by public authorities to stay the enormous impoverishing drain upon our land to which I allude. When, however, courts of equity interposed, and constituted authorities began to awaken from their torpor, a new light began to dawn gradually upon those commissioners. An inquiry was by slow degrees commenced as to the value of the fertilising matters hitherto flowing by the rivers into the sea. Calculations were made, and it was then found that the money value of the sewage pouring into the great waters was more than equal to that of the various artificial fertilizers which great fleets were bearing to repair this vast loss. And yet how vast is the value of those fertilizers may be seen from the following short table of the weight and the declared value of a few substances imported in the year 1869:

	Weight.	Value.
Bones	85,979 tons ...	£600,019
Guano	210,010 tons ...	2,640,983
Cubic Petre	906,694 cwt. ...	702,055
Oilcake	159,259 tons ...	1,361,580

If we inquire as to the value of the sewage conducted into our rivers, we have abundant evidence of its importance. To give one instance of the amount and value of the sewage conducted into the Thames by the high and middle level sewers of London (*Mr. W. Hope, Society of Arts, March, 1870*): These were examined by Professor Way and Dr. Odling. Samples were taken every half-hour day and night, at the Wick Lane Station, for 203 days; they were mixed together at regular intervals, and repeated analyses were made. The result was to show an average of about 8 grains of ammonia to the gallon of dry weather sewage, and the following table shows the quantities passing the station during that period, during dry weather only, from the 19th of March to the 7th October, 1865. The daily average being 27,431,000 gallons.

	Gallons.
Sundays	17,705,000
Mondays	27,877,000
Tuesdays	29,514,000
Wednesdays	30,187,000
Thursdays	29,487,000
Fridays	25,293,000
Saturdays	31,943,000

In rainy weather, during the same period, the average daily flow increased 33,288,000 gallons, the average for each day being

	Gallons.
Sundays	19,259,000
Mondays	31,184,000
Tuesdays	34,230,000
Wednesdays	36,516,000
Thursdays	38,562,000
Fridays	40,124,000
Saturdays	33,134,000

Unfortunately, added Mr. Hope, there is considerable doubt as to the population represented by this flow, and

there are also one or two disturbing causes to be taken into account whose magnitude cannot be defined; but this is certainly a higher per-centage of ammonia, and, therefore, a more favourable analysis than previous observations led one to expect, and it must be remembered that, when the low level sewer is completed, an analysis of its contents may be expected to show a very perceptibly higher per-centage of ammonia, owing to the denser population, and the great throng of business men of all classes in the lower parts of the metropolis during the day, many of whom represent a temporary addition to even the total population estimated for, as they reside beyond the metropolitan boundary altogether. Now, the estimated "dry weather" sewage of London north of the Thames is 120,000,000 tons per annum, while that portion of the rainfall which does not escape into the Thames and the Lea higher up by the "storm overflows," but reaches Barking, can hardly be less than another sixty to eighty millions of tons. It appears impossible, therefore, to place the manurial value of the stream with which, at a cost of £100,000 or £150,000 a-year, the Thames is polluted at Barking at less than £1,000,000 per annum, equal to about 8s. 8d. per head of the population. And this we may take as a pretty near approach to the unit of value in estimating the yearly worth of the sewage of a given population.

I have given this analysis of the contents of one section of the drainage matters of the metropolis, because that is the most populous of all our cities; but the organic matters thus wasted are not the only impurities committed to the Thames. The towns on its upper portion, as far Oxford, and those like Banbury and Newbury, on its tributary streams, all send their sewage into our Queen of Rivers. It is moreover to be remembered that a very large number of our populous places follow the example of the citizens of London, and commit their sewage, either directly or by some river, into the sea. And, again, as I have before stated, there is an incessant flow of organic matter from the land in those waters which have not been contaminated by man, and which substances may commonly be reduced in amount by passing the water over the soil. Let us here notice the result of some of those valuable chemical examinations upon which I have in another place recently dwelt. The warp water of the Trent, as it flowed on the land, was found by Herepath to hold in an imperial gallon 259 grains of foreign matters; after resting for some time, it then held as it flowed off the soil only 49 grains (*Jour. Roy. Ag. Soc.*, vol. xi., p. 100). The waters of the great rivers of the earth vary in the amount of their impurities, according to the season of the year—such as the water of the Nile, the Mississippi, and the Ganges. Mr. Everest found in a gallon of the water of the Ganges only four grains of insoluble matter in the first week in July, but 232 grains on the 8th of August. The mud deposited by the Ganges and the Nile is composed chiefly in 100 parts, after being dried, of—

	The Nile.	The Ganges.
Water	10.70	1.00
Organic matter... ..	2.80	2.75
Oxide of iron	13.65	6.00
Silica	42.50	69.50
Carbonate of lime	3.85	8.50
Alumina	24.25	7.32
Magnesia	1.05	

The water of the Thames, in certain states of the rainfall, is as impure as any of these. After all its insoluble matters have subsided, the Thames water contains, according to Dr. Letheby, about 23 grains of solid matters per gallon; the water of the Lea, about 23; that of the Colne, 21.3; that of the Trent, 50.16. The Thames water impurities were as follows—

Carbonate of lime	11.10
Sulphate of lime	4.78
Sulphate of soda48
Common salt	1.83
Oxide of iron, &c.76
Silicic acid	1.00
Organic matter	2.75
	<hr/>
	22.75

With such impurities contained in their waters, we need hardly feel surprised at the good effects they produce when employed in irrigation, but we may reasonably conclude that much more will yet be accomplished in that way. The water of our lakes is far more pure, but still even they contain matters which are food of plants. The waters of Loch Katrine contain only about 2 grains of foreign matters in a gallon, that of the Bala Lake about 5 grains; that of some of the Cumberland lakes only about 4 grains. Three of these waters were found by Professor Way to contain in grains per gallon:

	Haweswater.	Ulleswater.	Thirlmer.
Carbonate of lime.....	0.90	1.45	0.75
" magnesia.....	0.36	0.42	0.29
" soda.....	0.56	0.40	0.20
Chlorides of soda and potassium	0.40	0.69	0.77
Sulphate of soda	0.90	0.65	0.73
Oxide of iron, silica, &c.	0.25	0.20	0.05
Organic matter	0.62	0.35	0.77
	<hr/>	<hr/>	<hr/>
Total solid matter	3.99	4.16	3.61

The same degree of purity appears to belong to the great lakes of the Old and New World. In the American lakes, the greatest of all collections of fresh water, the same transparency is remarked.

When the members of Boards of Health and other corporations began to be convinced that there is a great money value in the sewage of a town, they were soon entangled in another grave inquiry, into which they were compelled to enter by injunctions from Courts of Equity, viz., how best to remove from the sewage its most noxious and most fertilizing impurities, so as to render it admissible into the adjoining stream. It was now that a bevy of schemers appeared, each provided with a better plan than any other yet known.

Almost all those gentlemen rested their proposals upon the use of some chemical substances, which precipitated the grease and other mechanically-suspended impurities of sewage, but had hardly any effect upon its chemically-combined substances, but in almost every case added to these substances, and thus still left the sewage injurious to the fisheries of the stream. The result, therefore, of all this class of schemes, into which some unhappy corporations have entered, has been a mere waste of the ratepayers' money. They were the results of very imperfect information, were not founded upon Dame Nature's suggestions, which are ever the wisest and most secure.

Two of these great hints of her ladyship have, however, been successfully adopted, and bid fair to be generally employed in the deodorization of sewage, viz., 1st. The irrigation system, which, I take it, is by far the best in densely-populated districts; and, 2ndly, the earth-closet made, adopted since the creation of the world, by every cat, which appears to be only suitable to small collections of houses, barracks, lunatic asylums, and such other public institutions, where the most systematic removal and renewal of the earth can be ensured. On a large scale the nuisance would be intolerable. It was in vain that the Parisians struggled on upon the system of a daily removal of the excreta, for which they provided separate receivers from those which held the other por-

tions of the house sewage. They for some time adhered to this plan, tempted by the considerable sums of money paid to the authorities of Paris by the contractors, who managed the removal of these in the most careful manner, but they were compelled at last to abandon the system.

We are then to examine, 2ndly, the other mode, which appears to be the only one adapted to the wants of large towns.

It is too frequently ill-understood what those requirements are. With most persons, the contents of the water-closet are alone regarded; the liquids flowing from the sinks, the baths, the streets, and manufactories which are inadmissible into streams are deemed of no consequence, or if at all thought of, are to have, it is gravely suggested, special sewers, constructed for their use. Now it is certain that by no known process can *all* the sewage of a large town be so well and so profitably provided for as by the irrigation of land—a mode which is not only to be depended upon in all seasons, but, far from being an expense, is profitable to the town.

At Croydon, where I reside, we have two farms irrigated with sewage, both farms we chiefly rent at about £10 per acre—the one at Beddington (about 450 acres) is sublet for the present, and from which, therefore, the Board of Health derives little or no profit; but the smaller farm at Norwood (about 36 acres), which is on the London basin clay has been in our own possession since Lady-day 1868. In that year our expenditure for labour was £114 18s.; the receipts for the grass, &c., £913 18s. In the next year, 1869, the expenses for labour were £264 18s. 6d.; the receipts for the grass and other produce of the land £742 9s.

At the Lodge Farm at Barking, which consists of 207 acres, of which 112½ acres are under sewage, the balance in the year ending August 31, 1870, of the valuations and receipts was £1,232 1s. 5d. in favour of the occupiers.

Upon the whole, therefore, we may fairly conclude with Mr. R. Rawlinson, when at the meeting at the Society of Arts, after referring to some of the difficulties of the sewage utilization, he remarked that "There are two sides to the sewage shield, as to most others, but he believed, nevertheless, that in the proper application of this system there was a mine of wealth, by bringing common sense to bear, and avoiding blunders which had already been committed. On the other hand, in many places it had become a sheer necessity to do something of this sort, in order to avoid poisoning the rivers, and would be more and more so every day. The man who could solidify sewage and make it a portable manure, could invent perpetual motion and square the circle. The most perfect chemical researches had yet failed to do more than take out one-seventh of the valuable properties of sewage in a solid form; and taking a ton of sewage as being worth 17s. 6d., and treating it in any possible way—and he spoke from having been associated on the commission with some of the first chemists of the day—the result would be to take out solid matter to the value of 2s. 2d., and leave 15s. 4d. worth to go away with the effluent water, which might nevertheless appear perfectly pure and bright. On the other hand, when liquid sewage was passed through twenty inches of soil, it had but the barest trace of these valuable salts left in it. This, therefore, was the only true and profitable chemistry."

The loss of organic matters by the drainage waters is not the only source of impoverishment to the soil. The addition of those foul waters to our rivers is destructive

to their fish. And this is no trifling injury to our supply of food. I have on another occasion remarked: "Few persons indeed are now aware of the loss which has long been sustained by the owners of our rivers from the fouling of their waters. To give only a single instance—at the commencement of the present century the River Thames abounded with salmon, and those of the finest quality. 'Thames salmon' then bore a higher price than that obtained from most other streams, and so copious was once the supply, that in the olden time it was usual to insert a clause in the indentures of London apprentices, that they should not be fed upon salmon more than a certain number of days in the month. Then came the time when the river water became impure. Not only was the population enormously increased, but the metropolis became well sewered, and its vast network of drains poured their huge contents (by the authority of an Act of Parliament) into the river. Then gas works were made, and their ammoniacal water still further poisoned the stream. Against these impurities the salmon could not contend; they gradually, and at length totally, disappeared from the waters of our queen of rivers. In other streams great damage has been caused to salmon and other fish, not only by the fouling of their waters, but by the interruption of the fish by dams, and the abolition of the ladders, or water-courses, which formerly facilitated the course of the fish from the sea to their spawning grounds. Of late, however, considerable efforts have been made, and successfully too, to purify the waters and restock our rivers with salmon and other fish. Government Salmon Fishery Inspectors have been appointed, Acts of Parliament have been passed to protect the fish, and breeding ponds established. There is, indeed, great reason to believe that both our river and our sea fisheries may be rendered far more profitable and productive than at present, and that a much greater amount of fish may be produced, even in enclosed waters, than the reader would at present deem probable.

It is true that we to some small extent recover from the sea by its fish what our streams convey into it. By the report of her Majesty's Commissioners to inquire into our Sea Fisheries, we learn that the weight of what is known at Billingsgate as *prime fish* only daily consumed in our island is fully equal to 300 tons—by the term *prime fish*, merely including such fish as salmon, turbot, cod, soles, &c. And then again, to a smaller extent we procure from our rivers a much larger supply of fish than is commonly understood. For instance, the supply of salmon to the London market averages from 1,500 to 2,000 tons per annum. But after making every allowance for the fish we receive from our streams and from the sea, the amount recovered bears no comparison to the amount of organic matters we pour into them. The solid matters contained in the sewage of the metropolis alone, has been estimated to be equal to about 1,500 tons per day.

These facts can hardly be too generally understood. They are such as all classes of the community are deeply interested in; not only the owners of our river fisheries, or the agriculturist, as diminishing the produce of their waters, or their land, but to every one who regards the sanitary condition of his dwelling. It will indeed be self-evident to the reader that, by every improvement that can be *profitably* introduced into the utilization of our impure drainage waters, we strengthen the hands of those who are labouring to improve the health and the general comfort of their fellow creatures.

A NATIONAL RATE.

Notwithstanding that the war continues naturally enough to be the leading topic amongst all classes and at all assemblies, we are enabled to still take up our Echoes from the Autumn Meetings at some length, and, as it is to be hoped, not without some advantage. There has been, indeed, a deal of useful suggestive talk at these dinners, while the Farmers Clubs, like the Hexham, the Blandford, the Dorchester, the Winfrith, and others Eastern rather than Westward, have been opening the after-harvest session with something beyond their average strength. Amongst much that is strictly practical a few semi-political questions, as they would yet seem to be considered by some, like the Game Abuse, Tenant Right, the Education Bill, and Local Taxation, have often been touched upon, the course of action being generally pretty clear alike to the orator and his audience. If, however, there be a matter that nobody from the Government downwards has fairly grappled with or mastered it is, no doubt, that somewhat intricate business of Local Taxation. The further discussion of this subject is nevertheless gradually developing a proposition for which it is as well that the country should be prepared. Sir Massey Lopes suggests that the magistrates in Quarter Sessions assembled should "Simultaneously petition the Legislature to relieve them of some of those burdens which are national rather than local in their objects, and which equally concern and interest every class in the community." And accordingly, in his own county of Devon a notice has been given to the effect: "That, inasmuch as very many of the charges at present paid by county rate (*e. g.*, police, lunatic asylums, militia stores, gaols, vaccination, registration, &c.) are rendered necessary, not for the benefit of one particular class, but of the community at large, it is both just and politic that those charges should be more largely supplemented, if not altogether defrayed from the national exchequer;" while for Lincolnshire the notice runs on to "the present poor-rate, inasmuch as it bears exclusively and unjustly on incomes arising from real property," although the remedy in this case is not quite so decidedly put. Nevertheless the ice is broken, the thin end of the wedge inserted, and at Shepton Mallet only the other day Mr. Genge Andrews proceeded to drive it home after this fashion: "An association had been established in London, with the present Lord Mayor, Mr. Besley, at the head of it, for the readjustment of the poor-rate question, and for a national poor-rate. So strongly did he feel with reference to the movement in London, that he had written to Mr. Besley to tell him he should be very glad to become a member of that association for the whole being cast upon a Common Fund—a national rate for England and Wales. For it was utterly impossible to regulate the operation of a tax levied on personal property for small area, such as a union; and you could only properly apportion it for England and Wales."

We here come to something really tangible at last, and the point now to ascertain is, how ready the country would be to adopt a system of national rating, or, to put it yet more plainly, a national poor-rate? Nothing, we believe, would be more impolitic or more unpalatable to the general body of farmers, as nothing would threaten to so certainly increase the expenses of a county or a district. Anything like a wholesome check would straightway be removed, as everybody would be spending somebody else's money.

What could be the possible, or at least probable, good to arise from remodelling the management of the county finances if, as Sir Massey Lopes says, "these charges be defrayed from the national exchequer"? That which one county saved the adjoining one might spend; and as ratepayers would feel they had little real interest or control, the expenditure might be left with the magistrates as heretofore. The same argument applies, of course, with still more force, to the administration of the poor-rate. The establishment of unions freed the labourer from the fetters of a parish settlement, but by no means discharged the district of its duty to itself. As, though, will be seen from our Echoes Mr. Andrews was at once answered in a very good practical speech from a county magistrate, Mr. Clerk, who thus took up the proposition for national rating: "They were to pay out of the Consolidated Fund, they meant? Very well, who was to have the management of that fund? They said, local bodies. He said, it would never work; they would never get anyone to put it in the hands of local boards. He thought there were a very large number of classes at present massed together under the poor-rate which might come on the Consolidated Fund with advantage; but that was a very different thing from taking the relief of the poor and putting that on the Consolidated Fund. The militia and the police, he thought, they might put on the Consolidated Fund—those were not poor-rate, they were county-rate. But what did they amount to in the end? Why a mere nothing."

But even the system, as it is, that is under union management, would look to be getting somewhat lax. A London evening paper, *The Pall Mall Gazette*, has just quoted from Mr. Sewell Read's evidence on this very business of Local Taxation as to the administration of out-door relief: "It has an immense influence upon the habits of the poor, and if they could not so frequently run to the Board of Guardians on the most trivial occasions, and know that they would get our-door relief, they would be more provident than they are." And, again, before the same Parliamentary Committee, Captain Dashwood, a tenant-farmer, a poor-law guardian, and a magistrate of the county, replied, in answer to the question "With regard to out-door relief as administered now by the occupiers chiefly, do you think there is a tendency to administer the poor-law in the direction of relief in aid of wages, and is that tendency growing?" "Not directly, but indirectly; a great deal of out-door relief must lower wages. A year ago, only, I heard the vice-chairman of a board of guardians say that he would rather have high rates than high wages." There is something very suggestive in such evidence as this; but if with union rating the management has become so careless or indifferent, so ready to expend money in this way, what might we expect under a system of national rating, where no one would feel any precise pressure, nor, consequently, any inducement to economise? "Taking all England, we are now spending about £3,700,000 a-year in out-door relief, mostly in money. This is 28 per cent. higher than it was eight or nine years ago." Of course the first aim should be to reduce our expenses, but is it likely, we repeat, that we should do so, under a system that would only give us the less encouragement to look after our own affairs? The result, we believe, would be that there would be less inquiry, less interest, and less activity amongst the ratepayers, and that the whole work would gradually come

under Government direction. Our contemporary, however, goes yet further, and interprets the declaration of the Oxfordshire vice-chairman in this way: "It means, when farm work is plentiful give the labourer pay just sufficient to keep body and soul together; when farm work is slack or stopped, leave that function to the doles of the relieving officer. The English farmer, represented by this estimable vice-chairman, wants no bold peasantry to till his lands. The low-waged helot of the parish pay-table better suits his purpose." It must be borne in mind that a London Journal ventures to say so much on the evidence of men like Mr. Sewell Read and Captain Dashwood, or rather on the opinion quoted by one of them. It must be manifestly unjust to condemn a whole class on the word of such an exception as we take this same vice-chairman of guardians to be, but were we to throw the maintenance of the poor upon a general fund, his doctrine might find more followers than it does at present. A year or so since, in a discussion at the Farmers' Club on Pauperism and Vagrancy, Mr. Congreve, a clergyman, said, "What

the country wanted was a national rate," and this was met with very general cries of *No! No!* while Mr. Trask, who read the opening paper, and who took the meeting very much with him, held it to be "of the highest importance that the area of taxation should not be extended beyond the area of administration." This sounds like very practical if not political economy; while at a meeting of the same Club some years previously, Mr. Smythies said, under national rating there might, no doubt, arise "a dim consciousness that you were dipping your hands in other people's pockets, and not in your own." This is a very graphic illustration of what might ensue; and if we are to arrive at a proper adjustment of Local Taxation only by throwing everything on one common charge, it behoves us to consider very seriously what we might gain and what we might lose by a change of system that so far has found few practical men to give it their support. A National Rate is of course not a new notion to the farmer, but like the man at an awkward place with hounds, "the more he looks the less he likes it."

THE HEREFORD SHOW AND FAIR.

The untoward season and the shortness of keep have naturally done much to hasten the falling fortunes of Hereford, and whether for its annual show, its "periodical" sales, or its once famous fair, the gathering would now seem to be scarcely worth a visit from those either far or near. The comparatively few lots of half-starved steers pitched in the streets commanded but little custom at any price, and, save half-a-dozen or so good beasts from Lawton Bury, we neither saw nor heard of anything particular. Then, beyond the entry of young bulls, the show was more meagre than ever, while the elements declared against the "periodical" auctioneering on the second day, and many lots which were not bought in went often for what a butcher might be induced to offer. According to the advertisement, and the results, a dozen or so of "first-class cows," and another dozen of calves from herds of "great celebrity," reached to an average of 21½ gs. for the dams and of 12 gs. for the produce. Some of the bulls did better, although whether these were "on sale or return" we cannot undertake to say. A couple of yearlings from Mr. W. Tudge's herd, one of which had been commended in his class, were knocked down, Collegian at 56 gs., and Sir Edwin at 40 gs.; while Mr. Thomas Rogers' best yearling, Student, was bought in at 90 gs., as a hundred was asked for him in the yard. Another yearling, Mr. B. Rogers' Patentee, though merely commended by the judges, went up to 120 gs. at the hammer, the highest figure of the day; whereas the third prize, Pearl Diver, reached to only 38 gs. by public appraisal, and was then bought in. Mr. Roberts' first prize old bull, King Tom, was knocked down for 95 gs.; Mr. T. Edwards' Leominster 3rd, a Royal winner at Manchester and Oxford, for 42 gs.; Tomboy, from the same herd, but bred by the late Mr. Monkhouse, for 41 gs., and the Wintercote yearling Sir Robert, for 40 gs. Mr. Harding's two-year-old Count Fosco, another winner at Oxford, made but 35 gs., and Mr. Hill's President, who was next best to Fosco, in July, 40 gs.

The public, probably, saw more of the judging than it ever previously had any opportunity of doing at Hereford, for the judges, of cattle, that is, were noticeably deliberate if not undecided in their movements, and it really looked at one time as if the placing of the yearlings would have to be adjourned. Their grave, not to say tedious con-

sultations, only served to show how amusingly primitive are the arrangements of this meeting. No attempt is made to map out a ring, although this might easily be effected, but the several classes are put into a corner or siding, here or there, just as it happens, while the entries are brought out, without any visible numbers, but with merely a whisp of curl paper twisted into the head-stall, of which secret cypher the attendant herdsman generally knows no more than the inquiring stranger. And when a decision actually is arrived at no ribbon is handed over, no sign whatever is made for the information of the lookers-on, but the judges whisper results to the director, and in some half hour, whole hour, or couple of hours, as the case may be, the placards are put up. And this in Herefordshire is facetiously termed public judging—an admirable system, under which, to really understand what is going on, you have literally to take the bull by the horns.

In the bull, cow, and offspring class, however, Sir Hungerford, wearing well, fairly placed himself, as his fair companion is a small, mean cow, and beyond Mr. Edwards' lengthy good Tomboy there was not much to encounter. Mr. Drinkwater's were a terribly coarse lot, and we like Mr. Morris' Royal Stow only the less the more we see of him, as surely so indifferent an animal could never have had any pretensions to a place in good company. There were twenty-two yearlings entered from the herds of Mr. Richard Hill, Mr. Philip Turner, Mr. Benjamin Rogers, Mr. Thomas Rogers, Mr. Thomas Roberts, Mr. Tudge, the Reverend Archer Clive, Mr. Evans, of Swanstone, Mr. Taylor, of Showle, Mrs. Woolley, Mr. Rawlings, of Stoke, and Mr. Edwards, of Broadward. And as these were all, or nearly all, sent, the interest or the positive success of the meeting centred here. In fact, but for the yearlings, the Herefordshire Society might have amalgamated with Worcestershire and Gloucestershire, in which counties there are in every other respect much better meetings; and as even the Hereford show does not row lead on to much business in the way of sales, it is a grave question whether it would not be all the better for the breeders of the white faces that they should go away from home occasionally. In plain truth, as at present conducted, the Herefordshire Agricultural Society is fast wearing out, as the very county

people do not seem to care much about it. According to *The Midland Counties Herald* of Thursday: "There no doubt exists a great deal of apathy with reference to the show, and this is particularly manifested with reference to the staple productions of the district, viz., cider, perry, and hops. Only three entries were made in the two classes for these beverages; two of these coming from Mr. Apperley, the gentleman who kindly offered the second prizes, and who was awarded both the firsts offered by Lady Emily Foley. In hops, too, there was but little competition, and the prize was again secured by Mr. W. Taylor, of Thingehill." The same report says: "The few stands of implements do not call for special comment. No prizes were offered but the chaff-cutter of Messrs. Richmond and Chandler, the straw elevator of Mr. Lewins, the saddlery of Mr. Jones and Mr. Jennings, the liquid manure cart of Mr. James, and the plough of Mellard's Trent Foundry Company were favourably noticed by the judges." The *Hereford Journal* says: "The entries for the cider and perry, together with the money amount of the premiums offered, are and were simply a disgrace to the county;" and again, "it is a pity that our Society is so poor that it could not afford to give a prize for miscellaneous implements." Beyond this we can only say that Messrs. Richmond and Chandler's representative assured us that the charges were proportionately higher and the business less than at any meeting he attended, and that his firm would never be at the trouble or expense of sending again. We gather thus much and more of how few are the entries of sheep, how indifferent the horses, and how scarce the pigs, whilst the judges are posing and re-posing, viewing and re-viewing the yearling bulls. They do not look to work with much method, while the spectators hazard all sorts of surmises as to which they may be taking to and as to what that may be! If the aim of the management were to keep the public as much as possible in the dark as to all that were going on, this was well seconded by the somewhat systemless system by which a decision seemed to be arrived at. However, to cut a very long story short, the best yearling was eventually pronounced to be Mr. Rogers' Student, a son of those two famous prize cattle, Battenhall and Silk, and himself the reserve and highly commended calf at the Royal Oxford Show in the summer. And a very clever, useful, and compact young bull Student is, not remarkably for mere size, but very true in his frame and taking in his appearance. As Mr. Yeomans, one of the judges, candidly says of him in the *Journal* of the Society, "he bids fair some day to be placed in a higher position than at Oxford;" and this promise has already been realized, as no question Student was one of the best young bulls at Hereford. But beyond this it would not be safe to follow the award, as there were probably half a dozen better animals in the class than the second prize, which has neither symmetry, style, nor quality in his favour. Mr. Turner, of The Leen, showed a very handsome taking young bull, out of the same cow as his two-year-old heifer, but this was merely commended, though sold as he stood for 70 gs.; while the 120 gs. Patentee, as purchased at that figure by Mr. Tudge, did no better! Again, Mrs. Wooley's highly commended entry, a wonderfully good growing calf, was surely better at most points than either the second or third prizes; and, indeed, we have little faith in the line taken here being very closely followed hereafter. It was on the whole and all things considered a very good class, but the wretched arrangements, the want of numbers and the want of room, made anything like a proper examination of the several animals when out almost impossible. The two-year-old or yearling-off bulls were not so good, although Count Fosco and

President, the second and third prizes at Oxford, now got no higher than commendations, but they are neither of them beasts of any remarkable merit, their main advantage as show stock being that they were some months older than any of their competitors. The best bull was no doubt Mr. Williams' first prize, also with some advantage in the way of age, but a thick, deep, wealthy animal, and altogether a fine specimen of the more modern Hereford. Still, however, the handsomest Hereford is Battenhall, wearing wonderfully well and preserving all his good looks at eight years old; and Battenhall, as some people said, for the first time in his life was now placed second—to Mr. Roberts' King Tom, who should the rather be called King Dick, as he is as hump-backed as Richard the Third, although but for this eye-sore a very grand bull, particularly good to meet, and with plenty of quality, a very mountain of good meat. He rather oversized the neater and truer Battenhall, and the decision was more of a butcher's than a connoisseur's after all. The class of yearling heifers was deservedly commended, and no question there was not a bad pair in the entry. In fact, the yearling bulls and yearling heifers may be said to have saved the show. But Mr. Arkwright had a great pull here with three couple for the judges to choose from, and all of these high-bred and good looking. Indeed, the Hampton herd would have had it all to themselves but for Mr. Evans, of Swanstone, who sent in the only two yearling heifers he has, and with these took the second prize. One of these was the best calf at Oxford, where we spoke of her as "perhaps the best of all the heifers, straight, clean, and handsome, without being overdone with mother's milk," as she is still fulfilling her promise, and growing into a sweet, if not very large animal. Of course, with only another to pick it was difficult to match her, and they were not much of a pair. The same thing occurred, though not with the same result, with the two-year-olds in couples, where Mr. Tauner had two as like as peas, and of a very nice useful sort, too; while it was announced, perhaps, rather too loudly, considering the hole and corner where the judges were at work, that one of Mr. Philip Turner's was the handsomest animal in the yard, and that she was already sold to go to Australia. This, as we take it, is the sister to Leopold, and a lovely heifer she is, particularly forward, if a trifle short in her quarters. But there was not much to cavil, and her companion was naturally not equal to her in merit. The judges, as a consequence, did not agree, and Mr. Walker being called in went at once for the Pembridge pair, as "only look at their heads," a grand point certainly. But if there be any virtue in pairs as pairs, as were we to judge cattle, as a houndsman might an entry in couples, then the Frodesley Ladies were far away the most "sorthy." Mr. Evans' highly-bred steers have had nothing to eat, for they have no turnips at Swanstone, and are so about to grind down the apples to mix up with the cattle food, a fact that will probably cause no little surprise to the county correspondent of a contemporary. The Showe two-year-old steers were as good-looking and better done by, but of course the season told against any great display in this way; and there were only one lot of breeding cows, from Frodesley, with two or three very sweet animals amongst them, although the judges would give no more than a second prize. The fat cow class included two very handsome animals, Mr. Rogers' Silk and Mr. Hill's Excelsior, but they were neither of them so fat as Sir Joseph Bailey's cow, which accordingly took the prize, although she is so terribly faulty and unsightly about her quarters that many judges would never have looked at her, in such company at any rate. There were but two fat steers in the class, but the entry from The Leen is full of style and

quality, and needs only to be a little riper to make his mark hereafter.

There were seven classes of sheep, and in all eleven entries in the seven classes! Still these sheep were almost generally good, and the prizes deservedly awarded. Mr. Tanner showed some neat but hardly-looking Shropshires, Mr. Downing some very nice Ryelands, Mr. Davies some stylish Cotswolds, and Mr. Jowitt some good speckle-faced longwools, the particular breed of which was not so clear. Mr. Pulley also exhibited some Shropshires, as at Lower Eaton, close by, they grow Shorthorns and Alderneys, and anthing but White-faces. In the show proper there were seven pigs, the best of which was declared to be a plain hungry headed white boar from Moccas; although amongst the extra stock Colonel Fielding entered half-a-dozen as good bacon pigs as we ever saw together. These are of the white, not over large breed, and so with quality rather than coarseness to back their many other good points in the way of length and depth, good collars, and kindly heads. So good were they that the judges might fairly have laid out all their extra money over the pen.

The two prize "nags" were the main credit of the horse show. Mr. Bosley's chesnut three-year-old, by His Excellency, is a stylish powerful three-year-old filly, which should grow into a hunter; while the varmint, but rather common looking old Mermaid, has won prizes over a country as well as in a show-ground. The best cart stallion was a light-bodied shelly grey, that was kept as closely covered in, and boxed up, as if he had been the light of the harem, or, a penny peep-show pig with two heads. In fact it is too much the fashion here to cover up the animals, bulls and all, as though they were hot-house plants rather than farm stock.

The chief topic of conversation at the dinner was, naturally enough, the unsatisfactory condition into which the show has gradually drifted. Like Falstaff, though the means be small the waste is great, or at least, it was said, the expenses are heavy. If the Society will not amalgamate with others it would be manifestly impolitic to change the time of the meeting; although its conduct requires thorough revision. As an exhibition to attract the public it is made the least rather than the most of.

PRIZE LIST.

JUDGES.—CATTLE: F. Evans, Old Court, Bredwardine; J. Moore, Ham Castle, Clifton-on-Teme, Worcester. HORSES, SHEEP, and PIGS: J. Walker, Knightwick, Worcester; A. Dowle, Bernithon, Ross. The four judges acted together over extra stock, cider, and hops.

CATTLE.

Bull, cow, and offspring.—First prize, £10, J. H. Arkwright, Hampton Court, Leominster (Sir Hungerford and Lady Leicester); second, £5, T. Edwards, Wintercott, Leominster (Tomboy and heifer). Highly commended: J. Morris (Stow and Pleasant).

Bull, calved on or after the 1st July, 1869.—First prize, £10, T. Rogers, Coxall, Brampton Bryan (Student); second, £5, T. Roberts, Lawton Bury, Pembridge (Kingcraft); third, £2, R. Hill, Orleton Court, Ludlow (Pearl Diver). Highly commended: Mrs. Caroline Wolley, Weston Court, Pembridge. Commended: P. Turner, Leen, Pembridge (Leopold); Benj. Rogers, The Grove, Staunton-on-Arrow (Patentee); W. Tudge, Adforton, Leintwardine (Sir Edwin).

Bull, calved on or after the 1st of July, 1868.—First prize, £5, J. Williams, St. Mary's Kingsland; second, £3, J. Harding, Bicton, Shrewsbury (Noble Boy). Highly commended: T. Edwards (Sir Robert). Commended: J. Harding (Count Fosco); and R. Hill (President).

Bull, calved previous to the 1st of July, 1868.—First prize, £5, T. Roberts (King Tom); second, £3, T. Rogers (Battenhall). Highly commended: T. Edwards (Leominster 3rd).

Pair of heifers, calved on or after 1st of July, 1869.—First

prize, £5, J. H. Arkwright; second, £3, H. R. Evans, jun., Swanstone Court, Leominster (Lady Oxford and Gentle 5th). Highly commended: J. H. Arkwright. Commended: John Harding (Lizzie Jeffreys and Red Dahlia); J. H. Arkwright; P. Turner; and J. Williams. The Class Commended.

Pair of heifers, calved on or after 1st of July, 1868.—First prize, £5, P. Turner (Butterfly and Venus); second, £3, R. Tanner, Frodesley (Lady Milton and Lady Frodesley). Highly commended: J. Morris, Town House, Madley (Chignon and Beautiful).

Pair of steers, calved on or after 1st of July, 1869.—First prize, £5, J. Williams; second, £3, J. Price, Court House, Pembridge.

Pair of steers, calved on or after 1st of July, 1868.—First prize, £5, W. Taylor, Showle Court, Ledbury; second, £3, J. Price.

Lot of breeding cows or heifers, not under three years old, that have had a calf within six months.—Second prize, £5, R. Tanner, Frodesley, Dorrington, Salop (Queen, Marin, Linnett, Symmetry, and Spring Flower).

Fat cow or heifer.—First prize, £5, Sir J. R. Bailey, M.P., Glanusk Park, Crickhowell (Lady Alice). Highly commended: T. Rogers (Silk); Rich. Hill, Orleton Court, Ludlow (Excelsior).

Fat ox or steer.—First prize, £5, P. Turner, The Leen, Pembridge. Commended: W. Dew, Kivernoll, Much Dewchurch (Charley).

SHEEP.

Pen of 20 Shropshire Downs, or short-wooled breeding ewes, under three years eight months old.—Prize, £5, R. Tanner Frodesley, Dorrington.

Pen of 20 short-wooled whitefaced breeding ewes, under three years and eight months old.—Prize, £5, J. B. Downing, Holme Lacy, Hereford.

Pen of 20 long-wooled breeding ewes, under three years and eight months old.—Prize, £5, J. Davies, Webton Court, Madley.

Pen of five yearling wethers (long wool).—Prize, £5, T. Jowitt, The Old Weir, near Hereford.

Pen of five yearling ewes (long wool).—Prize, £5, Thomas Jowitt.

Wethers, short wool (cross-breeds not excluded).—Prize, £5, J. B. Downing.

Ewes, short wool (cross-breeds not excluded).—Prize, £5, R. Tanner.

PIGS.

Boar, under two years old.—Prize, £3, Rev. Sir G. H. Cornwall, Bart., Moccas Court, Hereford. Commended: E. King, Westhide, Hereford.

Breeding sow, in, or with pigs, of the large white breed.—Prize, £5, Lieut.-Colonel Feiden, Dulas Court, Hereford.

HORSES.

Cart stallion.—Prize, £5, M. J. Imms, Twyford, Callow, Hereford (Young Callow). Commended: J. James, Gwinllas, Llanbadarn-fynydd, Radnorshire (Invincible).

Three years old colt, gelding, or filly, suitable for hunting purposes.—Prize, £5, J. Bosley, Lyde, Hereford.

Nag mare with foal at foot.—Prize, £5, S. Smith, Woodmanton, Hereford (Mermaid).

Cart mare with her foal at foot.—Prize, £5, J. Morris, Town House, Madley (Bounce).

CIDER AND PERRY.

Dozen of cider, made by the exhibitor, and from fruit grown on land in the exhibitor's occupation.—First prize, £2 10s., W. H. Apperley, Withington, Hereford; second, £1, Wm. Taylor, Showle Court.

Dozen of perry, made by the exhibitor, and from fruit grown on land in the exhibitor's occupation.—First prize, £2 10s., W. H. Apperley.

HOPS.

Sample of hops grown in the county of Hereford.—Prize, £5, W. Taylor, Showle Court, Ledbury. Highly commended: W. Taylor, Thingehill Court, Hereford.

EXTRA STOCK.

First prize, £2, Lieutenant-Colonel Feiden, Dulas Court, Hereford (six bacon pigs); second, £1, H. Gibbons, Hampton Bishop, Hereford (bull, Grateful); third, 10s., J. Loveridge, Daffaluke, Ross (ram).

At the dinner, Mr. WREN HOSKYNs, M.P., said that the dry season we had had this year—preceded, as it had been, by several seasons of extraordinary drought—had been something hardly ever witnessed before in this country. He thought he could say, without any affectation of modesty, that he was one of the first who went into the subject of deep draining. He had had the satisfaction of draining four fete deep, from 1,400 to 2,000 acres, in which a tile had never been placed. He was then thought to be a most venturesome man, as a tile had never been put deeper than three feet before. But if the seasons we had had for the last four or five years were to continue, it would become a serious question to the agriculturist how to obtain a supply of water. If we looked at the immense value of the turnip crop—at the loss to the country not to have that most useful and valuable crop, upon which so much depended—he thought he should not be considered as going further a field in a venturesome proposition than he was in placing the draining-tile four feet deep, if he said he felt that the streams and rivers which we possess must be made to contribute to the support of that crop upon which we mainly depend. It would be no great feat for an engineer to raise water from that noble river which he had been passing by for eight miles from Mr. Stallard's house. It only required a little energy, perseverance, ingenuity, and love of agriculture to make our streams and rivers conducive to the prosperity of agriculture, while we should still have the pleasure which we now derive from them. If that were done, it would make a great change in our system of agriculture; and he felt that something must be done if our turnip crop were to be continued. He had been through the show, and although they could not congratulate themselves upon its being a large show, there were many excellent animals in the yard. Still, he must confess he should like to set his eyes upon some other animals than the Herefords. There might be some good reason for the existing conditions; but he should certainly like to see a little more competition in kind as well as in quality.

Mr. GREENLY said: With regard to Mr. Biddulph's remarks as to the late time of the year at which the show was held, he knew that there were a great many gentlemen in the county, about the county, and some in that room, who were inclined to hold it at a different time, but he protested most firmly against any alteration being made. As an old Herefordshire farmer, and as a Herefordshire breeder, he said that if they knocked on the head Hereford October fair they would do more harm than anything that could be. He strongly urged them to keep the show in connection with the October fair. Winter was coming on, and they knew what they had to prepare for; and he maintained that it was a very good time to hold the show. He had also to protest against a remark made by Mr. Hoskyns. Whatever we do, don't let us have any Shorthorn prizes offered in the Hereford showyard. The Royal Agricultural Society of England very properly has its Shorthorns, Guernseys, Jerseys, and other breeds; but let us at Hereford give prizes only to Hereford cattle, and keep the Shorthorns out of the county.

Mr. JOHN BOSLEY hoped the day was far distant when they should have an alteration in the time of holding the Hereford cattle show. The October fair and the October show were like the Siamese twins, having always been together, as he hoped they always would be. Then as to Hereford cattle. It was a pure local breed, and there was no county in England which could boast of any one breed similar to Herefordshire. He hoped, therefore, that the show would be confined to Herefords. As long as he was a member of the society he should hold up his hand in favour of keeping the show exclusively to Herefords; and, although he was not selfish, he must say he thought it was the duty of every Herefordshire man to support its breed of cattle.

Mr. BIDDULPH said other counties had their fairs, but they did not hold their cattle shows in conjunction with these fairs. He thought it was a mistaken notion to suppose that the success of the October fair depended upon the show; if so, he was sorry that the show had not been a larger one. They had had a good show, but not a large one—not such a one as they could be proud of as a county show. He did not cast any reflection upon the county, but he thought that the show ought to be a much larger one.

Mr. DUCKHAM referred to the subject which had been mooted by Mr. Hoskyns, viz., the propriety of giving prizes to other

than Hereford cattle. That, he said, was a subject which he had often heard touched upon before, and which had been dealt with in the press; but his opinion was simply this—looking at the small amount of prizes which the society was able to offer for the breed of cattle indigenous to the county it would be injudicious to alter its prize-sheet.

Mr. W. H. APPERLY regretted that better samples of the county beverages—cider and perry—were not more generally met with. Unless they went into a private house, there was scarcely any cider to be got above the class that was called "family cider." In his opinion the show was not such an one as the county of Hereford—a county furnishing almost every kind of produce which all other counties yielded—ought to have, but the great difficulty which had to be contended against was want of funds. If the society had more funds, he believed that it could do much more; and his opinion was that if the resources of the counties, instead of being frittered away on small shows—some of which were dying, while there were others which were actually dead—were concentrated on one county show, the result would be very beneficial. When they saw that in four of the sheep classes there was in each only one exhibitor, he thought they must say that the society was not carried on in the way that it ought to be by Herefordshire men.

The Rev. BERKELEY STANHOPE considered that the expenditure of the society was very large in proportion to the total amount which the society had to meet; and, therefore, it could not perhaps be a matter of wonder that the prizes were so small. For instance, there had been about £100 expended in shedding.

The Rev. A. CLIVE approved of the establishment of chambers of agriculture, but he hoped they would not go beyond the object for which they were formed. If they did so, and touched upon the general politics of the country, they would have a bad effect. If they confined themselves to discussions of the subjects which legitimately belonged to them, they were calculated to have a good effect; but not otherwise. With regard to other breeds of stock, he was ready to acknowledge their excellence; but he regarded the Hereford show as a local one, and thought they would make but a poor return to the agriculturists of the county if they admitted other breeds of cattle than the Herefords. The show had been but a small one, and in some respects it reminded him of a story which he had heard of that gallant soldier, the late Sir David Baird. When at a parish school in Scotland—one of those schools which were very good of their sort, and to which the middle and poorer classes sent their children indiscriminately—he had been rebuked by his mother for being at the bottom of the class; and once when she asked, "Where have you been to-day?" he replied, "Second best." "And how many were there in the class?" "Just myself and one lassie," was the answer. And that, he thought, was a position in which some of the competitors had that day been placed.

Mr. ARMITAGE was very anxious that nothing should be done to injure the October fair; but he considered that while Herefordshire had so many beasts that it could not show them all in one day, the show was only a prelude to the fair, to the commercial prosperity of which he did not believe the show contributed one iota. He did not think that a beast had been sold out of the showyard that day. Certainly he could say for himself that when he had exhibited here, he had never sold a sheep or a pig in the show. His opinion was, therefore, that if the show were held at another time of the year, and in other towns of the county alternately, the commercial character of the fair would never be altered thereby. He was himself convinced that the show might be held in Ledbury, Ross, Leominster, and other towns, without the least injury being done to the October fair.

Mr. DUCKHAM said: There was an important point to which he wished to refer, viz., the holding of the Royal show in 1872. In that year Hereford would come within the district selected for the holding the show; but whether the county would take as much interest in endeavouring to get the show at Hereford as it did in 1863, he could not attempt to say. The point, however, to which he wished to direct prominent notice was the mode of selecting a town adopted by the Royal Society. He did not approve of the practice of putting the towns in a given district into competition, and thus entailing upon each competing town a heavy expense as well as great labour and anxiety. As an instance, he referred to what had been done

here in 1863, when a subscription of £5,000 or £6,000 was guaranteed, and when the expenses incurred involved a deduction of 5 per cent. upon all subscriptions of £5 and upwards. Yet, after all that expense, anxiety, and labour had been incurred,

the show was held at Worcester. He gave a preference to the practice of the Bath and West of England Society, viz., the selection of a town and offering it conditions if it chose to accept them.

THE GROWTH OF SUGAR-BEET.

At a meeting of the Cirencester Chamber of Agriculture, Mr. W. J. Edmonds, the president in the chair, Professor Church, of the Royal Agricultural College, said that the possibility of cultivating sugar-beet was of great interest alike to the farmer, the sugar-manufacturer, the spirit-distiller, and the chemical manufacturer of potash both in England and Ireland. The new industry had assumed gigantic proportions in many parts of the Continent; but the few attempts made to follow it in England had not as yet been considerably successful, though the renewed attempts of the last two or three years seemed likely to have better results. In 1869 there was in France alone a total weight of 300,000 tons of beet-sugar manufactured at £25 a ton; thus the industry in France represented a value of $7\frac{1}{2}$ millions sterling. Then, in the manufacture there remained a certain amount of molasses, a sort of rough treacle, which might be made into spirits, and was also very acceptable to the palate of certain animals; and the hundred thousand tons left from the quantity of sugar named would be worth half a million sterling. The Professor claimed that the cultivation of beet had a greater interest for Ireland than that of the potato once had, and that the one was likely to replace the other, and said that insurmountable difficulties as to the excise which no politician had yet been able to overcome made tobacco culture an impossible remedy for Ireland. He then said that it was only in 1747 that a Berlin apothecary first discovered that there was sugar in the beetroot exactly as in the sugar-cane, and that he extracted from four-and-a-half to six parts of sugar from a hundred parts of beetroot. But the methods of chemical manipulation were then very poor; no one knew how to separate the saline matters from the sugar in the root; and the attempts at organised manufacture failed. In 1790 the experiment was renewed in Silesia with a very good strain of sugar-beet, and a large yield was obtained, though the quality of the sugar was not first-rate. Then between 1795 and 1815 the European wars of Napoleon Bonaparte almost entirely prevented the re-establishment of this industry, until a very scientific minister of his established enormous manufactories for carrying it on; and now the sugar-beet was grown from Austria to Sweden; and the extent of district in which it *could* be grown was enormous. The speaker admitted the extent to which the growth would use up land now devoted to cereals, but said that the same objection had been raised to the cultivation of sugar in the West Indies, especially in the parts where the sugar was turned into spirit, and observed that in England there would be counterbalancing advantages, naming particularly as one the constant employment afforded to the rural population throughout the winter months. "It will also," he said, "favour the development of many ingenious contrivances, employ a large amount of capital, facilitate enterprise, advance science, and offer altogether a new field for industry, science, and capital." The increase abroad, he said, had been enormous. France had increased the number of its manufactories from 29 in 1827 to 336 in 1860, and probably to 600 at the present time; and there were also at least 500 distilleries for converting the sugar into spirit. On the whole Continent in 1869 there were 1,800 factories, producing more than 611,000 tons of sugar yearly; and in the same year the sugar was imported into the United Kingdom as an ordinary commercial article to the extent of 55,000 tons, costing £1,600,000. Only about seven distilleries had as yet been established in England—four of them near London, and one, Mr. Campbell's, at Bascot Park. Touching, then, upon the botany of the subject, the Professor said there were many varieties even of the sugar-beet, but that some of them differed but slightly the one from the other. One kind was the Silesian, with many varieties; another was the Imperial beet, a great favourite in France, and which would now probably be called the *Republican* beet; and there was a third kind grown to a large extent in Holland. It would be needful to make experiments during two or three

years in order to ascertain what variety best suited the soil being used; the soil must be in a very fine state of division and tilth, and must especially be free from stones. Professor Church here selected from the heap of roots and pulp and sugar in front of him a root which had had its tap diverted by a small stone and its sugar-producing properties thus destroyed to a great extent. This led him to contend for the need of a goodly shape to the root, and he showed in illustration one of the two or three hundred plants he has grown, and which he said he is saving for experiment. The root should have no neck, and should not be forked, seeing that the needful removal of the forks would cause bleeding and so forth, and thus waste much of the sugar. He also showed the evil of too large a proportion of leaf, holding up a root which, with a proportion of 100 of root to 200 of leaf, yielded only $8\frac{1}{2}$ per cent. of sugar, while from another root in which the proportion was reversed to some extent was drawn 12 per cent. of sugar. He spoke of the crinkling of the leaf, and gave figures showing the gradually decreasing proportion of leaf to root in a plant he had been noticing for some weeks. He mentioned that the good average weight sought in the roots had gradually advanced from 1 lb. or $1\frac{1}{2}$ lb. to 2 lbs. or $2\frac{1}{2}$ lbs., though some had been grown as heavy as 5 lbs.; and he said that when the root was good it should sink in water. The yield of roots per acre varied in different countries; in Austria the average was ten tons, in Prussia fourteen, and in France twelve. In the latter country the scientific minister named could grow only eight tons to the acre; later another man grew ten; later still, a doctor produced sixteen; and last year, an agriculturist in the Department of the Seine produced an average of thirty-eight tons alike on his own farm and on several others in the Commune. Another man also gave thirty-eight tons as his average, and a German authority of equal value returned a like average for the district in which his method of cultivation had been used. The Irish experiments yielded from sixteen to forty tons of roots per acre, and the sugar-beet contained sixteen per cent. of sugar; the sugar-cane didn't yield more than seventeen. In France the cost of growth was 22s. an acre more than that of wheat. Turning homeward, and answering the question, "Is the climate suited to the growth?" the Professor said, "We may conclude that nearly the whole of Ireland as well as of England is capable of growing beet containing a large proportion of sugar, but that the season of sowing and harvesting must be carefully watched. In accordance with the temperature and other conditions, you must know when to put in the seed, what sort of seed and manure to use, and so forth; and then in nearly all parts of England and Ireland the crop may be grown. A moist climate and a moderate amount of sun—conditions which we can pretty well realise here—will suit the beetroot far better than a very dry, hot air, and a brilliant, powerful sun. It must not be submitted to either very great cold or very serious drought; either condition injures the growth of the plant and interferes with the percentage of sugar. The plant has been grown very nearly to the Arctic circle—from the Atlantic to the Caspian Sea; and one variety sprouts at a temperature of 44° Fahr. The root does not rot if exposed to the freezing point for a short time; but if exposed lower than that point for any considerable period it becomes soft and rotten." It was contended that England was better suited to the culture than was Belgium, for the reason that the system of culture was better here than there; and it was said also that the higher kind of culture needful in this department would tend to raise agriculture generally. One point of culture insisted upon was that the roots should be so earthed up as that it should be impossible to tell whether they were red or white without removing them, for the reason that when raised above the soil there was great resistance to the formation of the taproot and the plant would not develop itself regularly, and the result was a root forked and contracted and poor in sugar. Cut off

the top layer of an exposed root, and you would probably find only 5 per cent. of sugar; the next layer would yield $6\frac{1}{2}$ per cent.; and so the increase would advance to 16 or 18 per cent. in a root the average yield of which was perhaps only 10 per cent. With regard to soil, neither pure chalk nor chalk mixed with a little marl or clay or sand answered; it should not be a poor or simply a sandy soil. A mixed soil, not too easily dried, answered best, and a soil not too stiff was better than a soil with too large a proportion of granular matter in it; and for sugar it was essential that the alkaline matter in the soil should not be too large, for the reason that this matter would interfere much with the quality of the sugar; for distillery purposes, however, the presence of the saline matter was not of so much importance. On many soils the application of burnt lime conferred great benefit, and calcareous matter was also found to be very useful in stiff soils otherwise well adapted to the growth of beet. Deep ploughing was considered a great requisite of success, and twice was better than once. For sugar, the manure needed to be put upon the land in the autumn; for spirits it was needless to regard this point. The land must be ready for sowing about the middle of April. Taking the fair average yield, there would be twenty tons of beet and fifteen of leaves. These twenty tons of beet would remove from an acre of land 180lbs. of potash, 50lbs of phosphoric acid, 32lbs. of magnesia, 18 lbs. of sulphuric acid, and 67 lbs. of nitrogen. These substances, save the nitrogen, were solid, earthy, mineral matters, which the plant could not get except from the soil. Thirty-five bushels of wheat, 162lbs. to the bushel, would only take from the acre of land on which they grew 12lbs. of potash and 18lbs. of phosphoric acid: thus the 35 bushels extracted only 30lbs. of solid, earthy, mineral matter. But while the twenty tons of roots took away 347lbs., with their leaves they extracted 840lbs. of mineral matters, and among these potash and phosphoric acid, two of the most valuable ingredients of the soil. Allusion was made to the consequent rise in the price of potash salts and of the mineral coming from Saxony which was really sulphate of potash; and growers were exhorted to restore potash to the land by using the large quantities of valuable refuse, bone-black, and so forth, resulting from the sugar manufacture. The lime-waste in the purification of the juice—the seum that resulted from the boiling down—the worn-out sacks used for pressing the pulp, and which, being made of wool, were rich in nitrogen when they had become thoroughly rotten—the waste from the furnaces and the scrapings of the roots—the still-liquor waste, containing three-fourths of the lost potash—the manure of the animals fed upon the pulp and the leaves, embodying the other fourth—all these embraced elements of great value to the soil. As to the kind of the manures needed, the Professor said that saline matters were had if the purpose was sugar-making, but observed, "Distilleries will probably largely take the place of sugar manufactories—for a great many people who refuse a lollipop will accept a dram." As giving an idea of how much saline matter could mix with land a long distance from the sea, he told that during the past six months 8lbs. had come from the Bristol Channel in the rain-water alone upon every acre of the Cotswolds, and that probably the whole year would yield from 70lbs. to 80lbs. per acre. Therefore, he said, there was no need for the artificial application of common salt. With reference to the seed, he said it was of great importance to have a good strain, and that the time for sowing ranged from the beginning of April to the beginning of May, that the seed should be soaked in water and then rolled in fine bone-black, and that wise distances between the rows and drills would be 18in. by 22in. He spoke of the difficulties resulting from not striking the due medium of distance, and showed examples of good effect among plants grown this year upon the College soil, which was not very deep and had not been manured—and then with only a few loads of farmyard manure—for four years. In this crop were found, in every 100lbs. of beets, these per centages of sugar—on Aug. 10th 8·70, ditto 24th 9·20, Sept. 7th 9·77, ditto 21st 10·48, Oct. 5th 12·00; and it was said that in another fortnight there would probably be 13lbs. or 14lbs. of sugar. He intended, he said, to carry the experiments to a conclusion, and to watch the effect of the frosts and what changes there were, and how far the sugar was developed and when it began to lessen. Professor Church referred to the beautiful instruments used in the manufacture upon the Continent—one, like a series of cheese-tasters placed side by side, for transplanting the beet-

root, and another for earthing up any parts of the root exposed to the light. He said that the proportion of sugar varied even in plants growing side by side from 3·6 per cent. to 13·5 per cent. in every 100 parts of root. He himself didn't have a very good strain of seed last year, and his proportions were—Sept. 8th 5·8, Oct. 9th 7·6, Nov. 3rd 8·6, and Nov. 24th 10. The formation of the sugar might be tested by the growth of the leaves, seeing that undue vigour in that respect meant loss in the other. But the easiest test was to take up a few roots and rasp them upon a bread-grater, and find the specific gravity of the juice by seeing if it would float a bulb sold for the purpose: if the bulb marked 7 floated the juice was good—if not, it was poor. The specific gravity of the juice was 1·07, but was sometimes higher. Another test was as to the blackening of the root when a knife was passed through it: a good root generally turned pink when exposed to the air. The effect of a root running to seed was very injurious, the flowers and buds benefiting at the expense of the sugar. The per-centages of sugar in certain roots in different stages taken from Bascoot and elsewhere were stated; and then directions were given as to the preservation of the roots and the different rotations of crops with oats and potatoes and clover and so on. It was explained that the pulp mixed with other substances formed an admirable food for dairy cows, and if excluded from the air would keep for any length of time; a bottleful was shown which was nine years old, and appeared to be as good as ever. A ton of pulp was equal to a ton-and-a-half of the roots from which it had been made. The liquor expressed might be used either for sugar or alcohol; but in any case the waste liquor might be used on the land again. The Professor concluded by further urging the return to the land of the different constituents drawn from it by the roots.

Mr. LITTLE, jun., gave figures he had obtained while in France. A ton of beetroot cost 20 frs. at the distillery door; containing $7\frac{1}{2}$ per cent., it would yield 165lbs of sugar, which, at 6d. per lb., would fetch £4 2s. 6d.; the cost of manufacture and materials was 9s. 4d., the duty £1 8s. 4d., and, with 5s. for wear and tear of machinery and interest of money, there would be a total of £2 2s. 8d., which, added to the 20 frs. of original cost, would make £3; on the other hand, 9s. for pulp and molasses, added to the market price of the sugar, would make £4 11s. 6d.; and thus, taking the cost of production from the amount of sale, there would be left a clear profit of 31s. 6d. upon every ton. In the distillery he saw produced from a ton of beetroot $14\frac{1}{2}$ gallons of spirits, and discerned several incidental advantages connected with the manufacture in either department.

Mr. E. RUCK said: In the last week in March, 1869, a letter was published in the *Times* pointing out the great advantage to be gained by growing beet in England, and in consequence I went to Lavenham, in Suffolk, in the first week in April to see works erected there by Mr. Duncan for the purpose of manufacturing sugar from beet; and I found there a very extensive set of buildings and machinery. Mr. Duncan had been giving to the farmers for their roots £1 per ton on delivery; the farmers had taken back the pulp at 13s. per ton; and the crop averaged from 16 to 24 tons per acre. In the third week in April I went to France to examine their mode of manufacture, and inquire as to the profits derived from it. I found that a ton of beet would yield 20 gallons of spirit, and that the pulp would pay for the manufacture and the interest of the money employed; Douay was the great sugar market for France, and there were figures showing the great rise in the price of land near a manufactory or distillery. Some land yielded thirty tons to the acre, and the beet had been grown for fifteen years in succession. Thus the farmer and the manufacturer had alike £50 an acre, and the pulp paid all expenses. The two chief sorts grown in France were the red beet and the white Slesian, the last-named yielding the greater per-centage of sugar; and great care was needless in preventing coarseness in the plants by having them due distances apart and so on. The cost of a sugar manufactory, with spirit distillery attached, would be about £20,000; and such a place would consume 10,000 tons of beet in a year. But under one system a distillery could be erected and provided with machinery at a cost of £1,600. In England, the Government duty on the spirit was 10s. per gallon, so that with an acre yielding 20 tons of beet, and these producing 400 gallons of spirit, the Government would receive £200 for each acre. It has been proved from analysis that no country has a soil or climate better adapted than ours to the growing of these roots

profitably; and I believe that the successive crops of beet are not injurious to the land. Wherever we went in France in the neighbourhood of a manufactory or a distillery we saw persons who had plenty of money in their pockets, though the farmers in such a neighbourhood are, as a rule, a very poor class; and I saw therefore that this was a new and profitable industry very much needed.

In answer to Mr. SMITH, of Bibury, it was stated that a ton of pulp resulted from four tons of root.

Mr. SMITH said: Professor Church has told us that our land is suited to this culture; but I don't think our climate is sufficient. It appears that the growth has been tried in several places in England, and has come to nothing; and I think if we wait a little while we shall see Mr. Campbell's experiment come to the same end.

Professor WRIGHTSON objected to a mere expression of opinion such as that, and put it that if there was a satisfactory yield per acre the essentials of climate and soil must be present in England.

The PRINCIPAL of the College asked Professor Church whether the returning of the pulp to the soil was not giving food for the future crop in a more available form than it could otherwise be obtained.

The PROFESSOR answered that it was universally admitted that it paid the grower to give 12s. a ton for that forming the fourth part of that for which they had obtained 16s. a ton, and he read a printed opinion to this effect—"I give it as my opinion that beetroot pulp at 12s. a ton is unquestionably a cheap and valuable food which may be used as a good substitute for roots." With regard to another point, the Profes-

or said, "I am certainly convinced that all the former failures in growing beet for sugar or spirit in this country have been owing to unfortunate mistakes in regard to the apparatus or the processes used, and not in any degree to the climate or the soil: I am certain that we should have as great a success in the growth of sugar in this country as in any part of Europe. The farmers may grow from twenty to thirty tons of sugar-beet per acre, and they can get 16s. a ton, and can obtain back the pulp at 12s. or 13s. a ton—and I take it that in using that pulp they not only provide food for animals, but also manure for the soil. The greater part of the potash needed is in the farmer's own hands, for the reason that potash salts are converted into manure, and can be purchased at a very cheap rate. The crude liquor will probably be returned to the farmer for nothing—and that contains four-fifths of the potash taken away. Until potash manufactories have been established in England, the waste liquor I have named will be of no use whatever; and therefore arrangements should be made to carry it back to the land. But the whole subject demands very careful thought, and I have avoided several points for want of time."

Mr. SNOWELL said that the profit suggested was only 3s. an acre.

Mr. RUCK said, If I understand arithmetic growing 30 tons of beet on an acre, and selling them off at £1 a ton, would yield £30 an acre to go into the farmer's pocket; and you might leave the pulp with the manufacturer if you choose—which, by the way, is what I should do.

It was then decided to adjourn the discussion for a month.

STOCK MANAGEMENT AT TILLYFOUR.

In no other county of Scotland is the breeding and fattening of cattle so successfully carried out as in Aberdeenshire. Without cattle the present rents could not be paid, as the return obtained for fat cattle is the main source of agricultural wealth. The county at large is therefore deeply interested in stock management. What applies to the county of Aberdeen applies within certain limits to nearly every county of the United Kingdom.

Our attention has been frequently called within the last two or three months to the difficulties which the owners of stock have experienced to keep their cattle in a progressing state. The difficulties of the present season are not, however, exceptional, as farmers have often had to contend with the perplexing problem, how to keep cattle which are being prepared for the fat market in a progressing state from the end of July to the beginning of October. Having this summer frequently seen the scarcity of food in pastures, and the almost entire absence of forage crops which could be used as a substitute for, and an auxiliary to, the scanty and withered herbage in the pasture fields, we resolved to visit Aberdeenshire, in the expectation that we would see instances of how the problem has been satisfactorily solved—viz., the autumn keeping of cattle which were being prepared for the fat market; and knowing the practical skill and energy displayed at Tillyfour in the management of cattle by Mr. William McCombie, M.P., we visited him last week.

Taking train from Edinburgh, and proceeding by Stirling and Perth to Aberdeen, we observed almost everywhere that the pastures were bare, affording little keep for cattle, beyond the withered stalks of the grasses which had formed seed. Between Perth and Aberdeen were seen well-stocked pastures, with cattle in a condition from lean to half fat, but in no instance did the herbage appear to be so abundant or so succulent as to advance condition. In many instances it appeared to us that the cattle must be getting older without advancing in condition; or, speaking more correctly, they are losing condition acquired in the beginning of the grass season. It was after we had reached the station of Whitehouse, in the Vale of Alford, that we observed that although the herbage was comparatively browned by the summer drought, there was sufficient for the animals to eat, but the grass was not of a description calculated to fatten them.

It was only after we inspected the stock on the three farms

occupied by Mr. McCombie, M.P., viz.: Tillyfour, Bridgend, and Dorsel, amounting to between 1,100 and 1,200 acres arable, that we found the problem satisfactorily solved, how feeding cattle could be kept with a profit during the latter part of the summer and the greater part of autumn without reducing their numbers until the turnip crop was matured. At Tillyfour we found forty-one polled cattle, aged from three to four years, comfortably housed, twenty being in straw-yards, and twenty-one tied up in byres. The cattle in the sheds are fed three times a day on a mixture of oats, peas, and tares. The forage is nearly ripe, and the cattle receive as much as they can eat without waste. In addition to the forage (oats, barley, and tares), they have a feed of good clover and hay, that is, four feeds a day of forage. The cattle tied up also receive forage three times a day along with turnips, but get no cake at the present time. Water is introduced into all the sheds. The cattle in the sheds receive from two to three pounds of the best linseed cake a day. The cattle confined in byres are allowed as many turnips with the shaws attached as they can eat; the variety is the Aberdeen Yellow: the bulbs are already well grown, and promise to be a very full crop by October. The seed was sown in the latter part of May. The cattle in the sheds are expected to be ready for the London market in a month or six weeks from the present date, while the largest sized cattle confined in the byres are not to be despatched for London until the Christmas market. They will be allowed cake about the end of October until the time they leave for London "to give them their last dip."

In a somewhat high and exposed field were grazing about thirty cattle, purchased in spring at from £20 to £24 per head. The pasture, second crop clover, was very good, but the cattle seemed as if they would have been the better of shelter. There is a shed in the field. On inquiry we learned that these animals will be removed in ten days to the feeding stalls. In another field, consisting of upwards of 100 acres of old pasture, a large number of cattle were grazing. The field had been at one time under the plough, but at a distant date. Observing some draining operations proceeding, we inferred that the field is to be broken up and put through a course of cropping. Judging from the herbage, we assumed that the land was superior, but the altitude is high, being between 700 and 800 feet above the level of the sea. The cattle in this field were neither so uniform nor so good as those we had

previously seen. A few of the cattle had been worked in the plough, but all were about three-parts fat, *i. e.*, testing them by the Tillyfour standard of fatness. We also observed two or three coloured cattle in this lot.

Adjoining this field were 36 acres of Swedish turnips. The field was without a blank, and so luxuriant were the leaves that the rows could not be distinguished. Surprised at the appearance of the field, we learned that it had been for a long period in grass. Broken up in 1867, it had produced two extraordinary crops of oats. The land received about eight cartloads of farmyard dung, and from 5 to 7 cwts. of dissolved bones per acre, previous to sowing the Swede seed. We have seldom seen in any season such a promising crop, and nowhere this autumn have we observed a field at all approaching this one on the farm of Tillyfour, the result mainly, we believe, of the number of years the field has been grazed.

In a field near the house, where a part of the breeding stock was kept, we found about thirty cows in milk, generally with calves at their feet. The cows are large, handsome, and generally in very high condition. Among them was the first-prize cow at the Great International Exhibition at Paris in 1856. She is now eighteen years old; and, although fat, she shows the effects of advancing years. We learn that this year she lost her calf, but, with this exception, she has bred regularly since she was two years old. This cow, when in bloom, was one of the most perfect specimens of Polled Angus that ever was exhibited, and has never been beaten in any competition, except by her daughter, "The Pride of Aberdeen," who was in the same field with a splendid heifer-calf at her foot. Several other first-prize cows of the Highland Society were also in the field. In one of the byres was a three-year-old bull of the Polled Angus. In open sheds were three yearling bulls. One of these is a remarkable animal for his size, and shows prominently the characteristics of the breed.

On the farm of Dorsel we learned from the farm manager that he had 100 cattle on the farm—part under cover, and part in the field. A number of these cattle, however, were grazing on the adjoining farm of Astown. Of the 46 cattle under cover 24 were in open sheds, and the remainder tied up in byres. The cattle which are in open courts are expected to be despatched to London within the next six weeks. We learned they were purchased in spring at £22 10s., and that the price expected in London is from £30 to £35. The cattle tied up are not so finished, but are of larger sizes, and are intended for the Christmas market. They are not all pure Polled Angus; some of the best have a strain of the Shorthorn. The feeding at Dorsel is the same as at Tillyfour. In a well-sheltered grass field below the steading we found nearly 30 very good cattle, which under ordinary circumstances would have been considered fit enough for the market; but we learned that they are to be tied up within the next ten days to be thoroughly finished for London. In a field adjoining were a number of heifer calves, and in a high-lying field were about 15 to 20 yearling heifers which Mr. McCombie had bred. The turnips—yellow and Swedish—on this farm are very superior to anything in the district. The extent under turnips is from 65 to 70 acres.

On the farm of Bridgend we were shown a number of cattle, some of which were superior to anything we had seen housed at Tillyfour or Dorsel. The first lot we examined, numbering about twenty, had been eight weeks in the house; they were prime fat, although they had only been receiving from 2lbs. to 3lbs. of cake daily for the last six or seven weeks; but they were also receiving forage, a mixture of tares, oats, and peas all of which were nearly ripe. These cattle were purchased in April at £22 15s. per head, and should now be worth about £33 in the market. In a byre we examined a number of animals; the aged cattle were of large sizes, and in good condition, but they will not be shown in London until the season is farther advanced. In the byre there are three black steers, aged two years, bred at Tillyfour, and should they continue to improve as they have done they may be entered for competition for the great prizes offered for fat stock when they are

matured. Standing next to these were four Shorthorned Angus cross-breeds; two of these are already in a condition suitable for competition, yet we learned that they have not received any cake or corn. In another part of the byre were two cows and one heifer, victims to the pernicious system of over-feeding for the showyard, and this over-feeding had been perpetrated to gain prizes offered for breeding animals. The two, aged four and five years, competed successfully at the Highland Society's Show at Aberdeen in 1868. The heifer was first at the show of the Great Northern Agricultural Society the same year, and the first in Edinburgh at the Highland Society's Show (1869) as a two-year-old. These animals have been rendered unproductive, are being trained for competition for prizes offered for fat animals. We were also shown an ox and a heifer, intended for exhibition at the forthcoming shows of fat stock at Birmingham and London. The heifer obtained the first prize at the Highland Society's Show in Aberdeen in 1868 (in the class for two-year-old heifers). Since then she has not been exhibited, and having proved unfruitful, she is now being prepared for the fat shows. After many years Mr. McCombie appears to have at last discovered, that the training of animals of his favourite breed—the Polled Angus—is ultimately productive of disappointment, and this year he has not been an exhibitor. In the adjoining field to this farm were about 40 or 50 cattle grazing, which in a few days are to be under cover to be prepared for the Islington market, where they will probably be shown in the month of December. On the farm of Bridgend the turnips are splendid, and there appears to be a good prospect on all the farms, that there will be no want of turnips, whatever there may be of fodder, to prepare the cattle for the fat market. Mr. McCombie expects that in the course of the next seven or eight months he will despatch to the London market between 300 to 400 fat cattle. The last two years the average price obtained has been from £35 to £36 a-head. It will be apparent to the reader, that Mr. McCombie has successfully solved the problem how cattle for the fat market can be successfully kept on until the turnip crop is ready to be used for fattening. It is apparent that great care, founded on experience, is required to carry out the system followed on the farms occupied by Mr. McCombie. As regards the general management, we may state that the cattle are turned out to graze on young grass from the 10th to the 15th of May, and a portion of that young grass is cleared of stock, by the 10th to the 15th of June, to be reserved for cutting. When the clover plants are abundant a very succulent cutting is available for feeding stock kept under cover. This second crop of clover, with the forage crop of tares, oats, and peas, and a few acres of yellow early-sown turnips, with a small allowance of cake, solves the problem how cattle are to be kept during summer and autumn in any year. During Mr. McCombie's long experience as a feeder of cattle, the present year has been, he stated, one of the most difficult to carry on his stock during the trying period from the month of July to the time when the turnips will be available. We may state further that Mr. McCombie believes that profitable feeding depends in a great measure upon the proper selection of the animals to be fattened, and that cattle should not be parted with until they are fully matured for the shambles; and to secure this, early housing, with proper feeding and proper care taken, is essential to secure that ripeness which obtains the highest prices in the Islington market. Mr. McCombie does not believe in an indiscriminate use of cake or meal. He has found by experience that cake supplied beyond six or eight weeks will seldom pay the feeder of cattle in Aberdeenshire. We may add further that the period of grazing cattle is being gradually shortened in Aberdeenshire, and that house-feeding is becoming more popular every day; that at the present time, on Mr. McCombie's farms, house-feeding extends to nearly nine months of the year. We believe that the time is not distant when house-feeding will be much more generally practised, and that grazing on arable farms will be greatly curtailed.—*The North British Agriculturist.*

SALE OF SIR G. R. PHILIPS' SHORTHORNS,
AT WESTON PARK, SHIPSTON-ON-STOUR, ON OCTOBER 18TH.

BY MR. H. STRAFFORD.

Successful auction sales rarely take place of draft stock; and unless some choice young animals of fashionable blood tempt the public, few breeders will undertake a journey in the uncertain weather of mid-October days. Mr. Finlay Dun, who has the management of the Weston Herd, and is the very popular agent of Sir George, hit upon a happy project to gather together a few of the best Shorthorn men, and we found the two-twenty train from Paddington conveying a dozen or more to Moreton-in-the-Marsh or elsewhere. The last sale at Weston, three years ago, made only a third-rate average, but this took place just before the sale of Her Majesty's and Mr. Sheldon's imported American stock. When Sir Chas. Knightley departed in peace at a ripe old age, "the small but select herd," as the old baronet loved to call it, remaining at Fawsley was put up, and Mr. Finlay Dun bought the two first, and by far the best two cows, Polytint and Lactea; these, with Fawsley Garland and Fawsley from the Ilavinger Park sale, and Sweetheart 2nd and Sorceress from Milcote formed the Knightley portion of the herd. Welcome by Col. Towneley's Squire, a purchase at Mr. Dudding's sale ten years since, had by this time eleven descendants; and with the Gwyneth, a short-pedigree tribe from Sarsden, and some of the old Weston Park cattle, the catalogue comprised forty-nine head. The entire Knightley portion was sure to attract; the Welcomes were a venture, and with the sure company and the venturesome few, the other lots were pretty certain to go off. A bright morning was the beginning of good things, and by eleven o'clock there was a capital assembly looking very earnestly at the various lots in the hill field just by Mr. Dun's ivy-covered house. No better place could have been chosen, as they showed to the utmost advantage. A pretty little hairy heifer, of Mr. J. A. James' breeding, was the first to attract the eye; then a thick roan Welcome, called Winsome, and a broad, round-barrelled Gwyneth, called Genevieve. But the old cows hung to the hill top, and were really admirable, preserving, despite old age, very good flesh and remarkably fine form, they were excellent models, especially Fawsley, Garland, and Lactea. The upright staggy horns of a thick short-legged heifer were also noticeable—this was Lactea Oxoniensis—and the rough red coat of a good-headed but flat-ribbed heifer turned out to be Polycherry. A few of the heifers and calves were shown in the houses as well as the bulls, and were chiefly surrounded by a local company. Mr. Clayden took the chair at the lunch, and delivered a speech on agriculture, to which Mr. J. K. Fowler replied, with some remarks on the compulsory slaughter of foreign cattle.

It has often been asserted that the Shorthorn breed is a short-lived race, but the first lot, Sweetheart 2nd, was a living contradiction, as she walked gaily round the ring although she was within a couple of months of nineteen years old. Her countenance showed age, as well as a little heaviness in moving, but she was in good condition, and worth best part of the 20 gs. (Mr. Walton) she went for to kill. Fawsley Garland, fourteen years old, also by Earl of Dublin, had a remarkably sweet head and elegant form, with magnificent shoulders, three months gone, was however of little avail, and she made only 25 gs. from Mr. Bliss. Lot 3, Polytint, fourteen years old, calved in March last and served again in June, looked like breeding another calf, but she was lame and rather to pieces. Several were in, Mr. Thornton being the last bidder, but she fell to Mr. A. Winnall for 42 gs. Lactea 12 years, a very fine white cow, in good condition and on very short legs was also like breeding, Mr. J. C. Adkins bid and got her at 45 gs. Sorceress of the Sweetheart line, and down-calving, looked bad, having also a hip down; many were bidding and Mr. Wright got her for Mr. Hardy, M.P., at 50 gs. Wallflower, the first of the Welcomes, could hardly be called a first-rate cow, nor were any of the family particularly good; Mr. Stone bought this cow at 42 gs., and he must have been a "pearl of great price" that sleety afternoon—for it came on squally after dinner—as he took fifteen

other lots besides, as well as a nice, white Darlington bull of Mr. Sheldon's at 26 gs. Some of the lots were it was rumoured for Canada but they hardly seemed of the quality to export, considering what fine stock has already gone out to that country. Captain Barclay of Surrey, took two of the best Welcomes, Welcome 3rd, 5 years old at 40 gs., and Winsome, 3 years, for 58 gs. A very sweet heifer calf from Welcome 3rd went to Mr. Brierley at 33 gs., and a long, fine calf from Willow made 30 gs. (J. H. Blundell), two guineas more than its three years old dam. To return to the Knightleys: Fawsley, a white, with a dark nose, by Third Duke of Thorndale from Fawsley Garland, went to Mr. Cutler for 62 gs. The spirit of the sale however rose with the entrance of Lactea Oxoniensis, for which 50 gs. was offered. "She ought to have been put up at a hundred" drew out a few more bids, and at last 100 was bid. Mr. Clayden then took up the running, but Messrs. Lency finished it at 200 gs. Genevieve, three years old, made 42 gs., and a succession of low prices followed. Lot 21 was not offered, and Furiosa (newly calved) made 32 gs., her roan heifer calf 6½ gs. Polycherry, by the Cherry bull Third Duke of Geneva, a dark red, deficiently-girthed bull, from Penrhyn Castle, out of Polythorn by Fourth Duke of Thorndale, gd. Polytint, went speedily along, and in the final heat Mr. Sheldon, of Brailes, beat Messrs Lency and others at 205 gs. Her dam had been secured privately by Mr. Sartoris early last year at 200 gs. Lactine, one of the prettiest lots in the sale, by Third Duke of Geneva from Lactea, was a long sweet roan, of not the best quality. Mr. Clayden and Mr. Sheldon were both in here, but the final "five" (175 gs.) was given by Mr. Thornton for Lord Feversham. The next lot, Polygeneva, 110 gs., joined Lactine and was not quite in condition for selling. The interest of the sale ceased here, nevertheless some of the calves capering in the ring sold well.

Merimae, a white Knightley bull bred at Milcote, was somewhat slack in the back, but good in many points; three-years-old the public do not fancy, so he went for 33 gs. The next also a white Grand Duke of Wateringbury, bred by Messrs. Lency, went for a guinea less to Mr. Canning, and the bulls generally sold low. Polytechnic, a deep roan calf, with a cloudy nose and scouring as well, a son of Polytint, was also bought by Mr. Hutt for 39 gs.

Six bulls bred by Mr. Sheldon at Brailes, were afterwards offered. They were not in the best of condition, nor could they be called a blooming lot, nevertheless they sold well. Mr. George Garne gave 67 gs. for Earl of Warwickshire 3rd, a nice roan, and Mr. C. Hobbs took Lord Hastings of the Fog-gathorpe tribe at 48 gs. The six averaged 42 gs.

COWS AND HEIFERS.

Sweetheart 2nd, white, calved December 27, 1851; by Earl of Dublin (10178), out of Sweetheart by Accordion (5708).—Harris, Brailes, 21l.
Fawsley Garland, roan, calved August 26, 1856; by Earl of Dublin (10178), out of Garland by Grey Friar (9172).—Bliss, Edgcombe, 26l. 5s.
Polytint, roan, calved October 30, 1856; by Earl of Dublin (10178), out of Cornbind by Janizary (8175).—A. B. Winnall, Ledbury, 44l. 2s.
Lactea, white, calved January 16, 1858; by Sarawak (15238), out of Cornbind by Janizary (8175).—J. C. Atkins, Milcote, 47l. 5s.
Sorceress, roan, calved January 22, 1862; by Mocassin (18406), out of Syren by Amiens (14095).—John Hardy, M.P., 52l. 10s.
Wallflower, roan, calved January 28, 1862; by Rampant (20623), out of Welcome by The Squire (12217).—J. J. Stone, for exportation, 44l. 2s.
Welcome 2nd, red, calved March 1, 1863; by Chanter (19423), out of Welcome by The Squire (12217).—J. J. Stone, 42l.
Fawsley, white, calved December 22, 1863; by Third Duke

of Thorndale (17749), out of Fawsley Garland by Earl of Dublin (10178).—T. G. Curther, Droitwich, 65*l.* 2*s.*
 Hyacinth, red, calved January 21, 1864; by Pan (18516), out of Honeysuckle by Washington (17213).—Walton, Burnington, 24*l.* 3*s.*
 Genoa, red, calved March 5, 1864; by Pan (18516), out of Gwyneth by Glo'ster's Grand Duke (12949).—J. H. Blundell, Luton, Bedfordshire, 31*l.* 10*s.*
 Rosalind, red, calved January 25, 1865; by Pan (18516), out of Rosamond by Washington (17213).—J. J. Stone, for exportation, 28*l.* 7*s.*
 Welcome 3rd, roan, calved November 28, 1865; by Stepping Stone (22978), out of Welcome 2nd by Chanter (19423).—Capt. Barclay, Leatherhead, 42*l.*
 Dinorah 2nd, red roan, calved March 31, 1866; by Barleycorn the Younger (21209), out of Dinorah by Rampant (20623).—J. J. Stone, 32*l.* 11*s.*
 Lactea Oxonensis, roan, calved January 27, 1867; by Imperial Oxford (18084), out of Lactea by Sarawak (15238).—F. Leney, Wateringbury, Kent, 210*l.*
 Winsome, roan, calved February 8, 1867; by Barleycorn the Younger (21209), out of Wallflower by Rampant (20623).—Capt. Barclay, Leatherhead, 60*l.* 18*s.*
 Genevieve, roan, calved February 11, 1867; by Barleycorn the Younger (21209), out of Guinevere by Rampant (20623).—J. J. Stone, 44*l.* 2*s.*
 Dew, roan, calved April 21, 1867; by Barleycorn the Younger (21209), out of Dawn by Pan (18516).—Walton, Burnington, 28*l.* 7*s.*
 Willow, roan, calved May 18, 1867; by Barleycorn the Younger (21209), out of Westeria by Stepping Stone (22978).—J. J. Stone, 29*l.* 8*s.*
 Fair One, red and white, calved June 9, 1867; by Barleycorn the Younger (21209), out of Fairy by Pan (18516).—Walton, 23*l.* 2*s.*
 Filagree, roan, calved October 1, 1867; by Barleycorn the Younger (21209), out of Fatima by Washington (17213).—J. J. Stone, 25*l.* 4*s.*
 Bonne, red, calved February 2, 1868; by 3rd Duke of Geneva (21592), out of Barmaid by Rampant (20623).—Met with an accident and passed.
 Furiosa, red, calved February 10, 1868; by 3rd Duke of Geneva (21592), out of Fruitful by Pan (18516).—J. E. Shirley, Easington, 33*l.* 12*s.*
 Blantyre, roan, calved May 6, 1868; by 3rd Duke of Geneva (21592), out of Blamange by Rampant (20623).—Capt. Barclay, 37*l.* 16*s.*
 Tasmania, roan, calved July 1, 1868; by 3rd Duke of Geneva (21592), out of Titania by Pan (18516).—J. J. Stone, 39*l.* 18*s.*
 Lurline, roan, calved July 7, 1868; by Lackey (24291), out of Ladylike by Noble (14997).—J. J. Stone, 27*l.* 6*s.*

THE WHITEHAVEN FARMERS' CLUB.

At a meeting of this club Mr. John WILLIAMSON, of Low Walton, read the following paper on the Autumn Sowing of Wheat:

You understand that I have not come to read an elaborate paper before you, but simply to introduce it for discussion, which I shall do very briefly. *Preparation of the Land:* It is the general if not the invariable practice in this locality to

sow wheat after root crops, and in some cases after beans; and during the period of their growth we expect that the land will be well tilled and cleaned by means of the grubber, the harrow, and the hoe; so that after this crop is removed the land requires but little preparation for the wheat, the simple process of ploughing and harrowing sufficing. However, it sometimes happens, even with the greatest vigilance, that a

little couch grass will be found after the green crop is taken off; and in this case, as the plants are but few, it is an excellent plan to fork it out by hand labour. After the land is sown down, it is some time before such another opportunity comes of eradicating weeds; and during the growth of subsequent crops these few plants, that were perhaps looked upon as insignificant, are spreading their lateral suckers and ramifying over the whole field. In one of our eastern and midland counties the wheat crop in the rotation takes the place of our oat crop—that is, it is sown after clover. It is considered, I believe, that clover root forms suitable food for the wheat. I never adopted the practice, but I may say our worthy secretary has tried it and found it to answer. The land is rolled with a roller so constructed that it presses upon the furrow seams without rolling the whole surface, thus making a regular and firm seed-bed. With respect to ploughing, where the land has been previously deeply tilled, I like to have a good strong furrow for wheat. The plants are then able to strike their roots deep in the earth, and are less liable to be thrown out by spring frosts. All that I have to say of naked fallows for wheat is that on light land the practice is out of date, and mostly on heavy land. I don't know that it is unprofitable to pursue the practice on land of a stiff tenacious nature.

Manuring: Although a great admirer of Jethro Tull, yet I don't believe in trying to grow wheat without manure on strong clay or deep loamy soils—what we commonly denominate good wheat soils. Where a heavy covering of farm-yard dung has been applied to the preceding green crop, a crop of wheat may be grown without any further application of manure, but on sharp light soils, in my opinion, a better practice is either to grow the green crop with artificial manure alone, and apply a full dressing, say from ten to fifteen tons of farm-yard dung per acre, in the autumn; or, otherwise, to give for the green crop what we would call half a manuring of farm-yard dung, and then, again, in the autumn, give another dressing for the wheat. In the case of strong soils the properties of the manure can be retained, whereas porous soils require manuring at shorter intervals. A practice obtains, and one of which I quite approve, of leaving the turnip tops on the land on which they are grown, and ploughing them in for the benefit of the succeeding crop. There is no doubt they afford a rich supply of carbonaceous food for the wheat crop. It is better to cart them away if the tops are blighted, or infested with caterpillars and such like. I think a good crop of spring wheat may be grown with light manures. 5 cwt. of bones, 2 cwt. of Peruvian guano, and 1 of nitrate of soda, per acre, have yielded me a fair crop when both roots and tops were carted off.

Time of Sowing: Our rotation is such that we cannot sow very early. To the farmer holding heavy land, which no doubt is a disadvantage in a wet climate, I would say, "Embrace a fitting opportunity; sow when you can without puddling the surface. The light land farmer may sow almost when he likes. Early sowing is advantageous; less seed is required, and, other circumstances being the same, the crop will ripen sooner. I have found it to answer very well to sow any time between Martinmas and Christmas. In fact, I have seen it do better sometimes than when sown in October; and we never feel apprehensive of wet, although the horses may be sinking to the fetlocks. This would not answer on stiff land; the treading would poach the surface so that the water could not permeate.

Selection of Seed: There is perhaps no part of this subject that is of more importance to us than the selection of good seed. A change is also desirable sometimes from a different climate and soil. The seed should possess the true characteristic qualities of the variety, and be free from seeds. There can be no doubt that the sowing of dirty samples is oftentimes a fruitful source of disseminating weeds. As in the animal kingdom the ailments of the sire are frequently transmitted to the offspring, so in the vegetable. If we sow sound seed we may expect good produce; but if a poor thin sample be sown, perhaps already contaminated with disease, we cannot reasonably look for a good clean produce. With respect to the sorts of wheat, it would be difficult to say which is the best. There are a great variety of kinds in cultivation, both red and white, bearded and beardless. I will name a few: Chiddam; this is an old and much esteemed variety. Hunter's wheat; this is considered by some to be one of the best white wheats in cultivation. Then there are Hopetoun and Chevalier, &c.; and amongst red kinds there are Spalding's Prolific, and Piper's and Lammas Blood-red, and a host besides. Quantity and quality, and suitability to climate considered,

let each grow that kind which he finds to pay him the best.

Quantity of Seed: In all cases the nature and condition of the soil, the climate, and the season of the year materially affect the quantity of seed to be sown. I know there are those who cling pertinaciously to the usages of their ancestors, and who are unwilling to leave the beaten track in this matter of seeding. I feel extremely loath to disregard their advice or reject their practice, but I do think that in many cases there is more seed sown than is desirable. Although I don't believe in lavishly and indiscriminately sowing the seed, I would yet carefully abstain from following the advice of theorists who talk about sowing and reaping a crop from an imperial peck to the acre. It won't do to sow less broadcast than from eight to ten pecks imperial per acre on light land.

Method of Sowing: There are three modes of sowing, namely, by means of the drill, the dibbler, and broadcast sowing. With respect to sowing with the drill, I have not tried it; therefore, I cannot speak from experience; but my opinion is that eventually it will, in a great measure, supersede other methods, and for this reason, that it deposits the seed at a uniform depth, and as a corollary, we look for it to come up and also to ripen uniformly. There is also a saving of seed. Another advantage that this system has over broadcast sowing is this, that the land can be more effectually cleaned in the spring. Although I do not use the drill, I may say that the system is successfully adopted in our own neighbourhood. Mr. John Carter, of St. Bees, adopts this method, and fully approves of it. With respect to dibbling, there is no doubt it is a true and perfect method of depositing the seed. I have used a hand dibbler, which answers very well for a small plot of ground; but the method is so slow and tedious that it is quite impracticable to use it on a large scale. Whichever method is followed, the seed should not be put in more than about an inch in depth. I used to think, till experience taught me better, that by burying the seed pretty deep it would prevent the frost from throwing it out; but I have found that a better plan is to cultivate deep and sow shallow. To whatever country it—the wheat plant—may be indigenous, it is extremely hardy. We often see it left in the earth for weeks together, and during that time—perhaps just after the tender germ has burst—subjected alternately to keen frosts and drenching rains without apparently suffering any injury, and unlike many other plants it seems to grow and thrive equally well in hot climates as in cold. This peculiar adaptation leads us to conclude that it was intended by an All-wise Providence to form the staple food of man.

Black Ball and Wire-worm: The wheat plant, like all others, is subject to the attacks of many enemies. Perhaps the worst of all is, among vegetable parasites, what is commonly called black ball, and amongst insects the most destructive is wire-worm. With respect to the former of these, a very old and common practice obtains, as a preventive, of steeping the seed in chamber-ley, and afterwards of dusting it over with caustic lime. I have tried the plan for some years, and I must confess that I have no great faith in its efficacy. Some recommend a solution of sulphate of copper as being efficacious, but a friend told me the other day that he has tried this solution, and he is now having recourse to the old practice, as being the better of the two. With respect to wire-worm, the grub of the May beetle, I believe the best application that can be made to check its ravages is about 4 cwt. of salt to the acre. In conclusion I will just refer to some experiments that were made a few years back by Professor Bucknan, taken from the Royal Agricultural Society's Journal. They are instructive. He says: "I planted four plots of wheat in the following order. Firstly, much diseased wheat without pickle; secondly, much diseased, treated with sulphate of copper; thirdly, perfect picked seed without pickle; fourthly, perfect picked seed, with sulphate of copper. The results were as follows: Plot 1, much of the seed germinated, but the crop was much blighted both in straw and grain, in fact scarcely a perfect ear of the latter; plot 2, a very small quantity of the seed germinated, the few resulting ears were free from blight; plot 3, germinated, with a good and clean crop; plot 4, the same result as plot 3." From this it appears that the produce of the perfect picked seed without pickle was equal to the produce of the perfect picked seed which was pickled. At the same time the result shows the efficacy of sulphate of copper in destroying the germs of the disease, for in plot 2, which was diseased seed pickled, the few resulting ears were free from blight.

ABORTION IN COWS.

REPORT OF THE COMMISSIONER OF THE NEW YORK STATE AGRICULTURAL SOCIETY,
AS READ BEFORE THE SOCIETY ON THE 9TH FEB., 1870.

On June 2, 1869, the commissioner had the honour to address a letter to your secretary, containing a proposition to continue the investigation of the subject of abortions among cows for another year, as follows :

"New York, 69, West 45th St.,
June 2nd, 1869.

Mr. T. L. Harrison: Dear Sir—As you are aware, the investigation into the subject of abortions among cows was not considered closed at the time of handing in my report in February last, and although certain views were therein expressed as probably exerting a strongly unfavourable influence against the healthful performance of the process of gestation, it was still held that the information in the possession of the commissioner did not warrant an expression that these views had been established, however probable they might appear. In order that, if possible, a more decided expression may be allowed and those views confirmed, if correct, as also that measures calculated to arrest the disease may be advised; or, what is perhaps more important, in order that no false impressions may be promulgated in a semi-official form, even in the guarded manner there given, if further inquiry should throw doubt upon their probability, I would respectfully suggest, through you, to the Agricultural Society, that the investigation be continued during the coming season in certain dairy and cattle-raising districts in the Western States (where inquiries, in 1867, showed that the disease had not appeared), to a sufficient extent to determine whether the same practices in breeding and milking, during pregnancy, prevail there to the degree found to exist in Herkimer county, where the disease is so extensive. I make this suggestion with more freedom, as the whole amount of the appropriation made by the Legislature last year was not exhausted by the commission, but a sufficient sum was then left unexpended to allow the investigation here referred to to be made; and I beg leave to state, in addition, that I shall make no charge for my own services, but that all the available funds will be applied to gathering information, or used in the necessary expenses incident to the getting out of the report, so that as large a number of reports (of farms) shall be obtained as is possible.

Very respectfully yours, W. H. CARMALT.
In reply, the following letter was received, June 25, 1869:
Albany, June 24th, 1869.

W. H. Carmalt, M.D., Commissioner, &c.: Dear Sir—I have to inform you that at a meeting of the executive committee of the New York State Agricultural Society, held this day, upon reading your letter of the 2nd instant, it was ordered: That the commissioner in charge of the abortion investigation have authority to expend such a sum, not exceeding five hundred dollars, as he may see fit, in the supplementary investigations proposed by him in his communication dated the second of June, instant.

Yours respectfully, T. L. HARRISON, Secretary.

In order to carry out the especial object above given, and to make the comparisons instituted perfectly fair, two points were necessary. 1st. That the dairy products of the districts compared should be the same, and if prepared by the same methods, the comparison would be still more accurate. 2nd. That the treatment of the cows, in all points relating to their care or breeding, should be thoroughly inquired into, and whatever differences found be fully considered. The selection of a locality which would hold a fair comparison with the investigation last year was the subject of much care, and after as thorough an examination, from the means at the disposal of the commission, as possible, Geauga county, Ohio, was chosen as bearing the closest comparison, in the matter of dairy products, with Herkimer county, New York. For, in the investigation of 1867, under Dr. Dalton's direction, the farmers' reports from the States of Ohio, Michigan, Illinois, and Iowa, indicated that the so-called western reserve district in Ohio, was the most important dairy district in the west, and from an examination of the reports received from twenty-three counties in that State, together with the report of the Ohio State Board

of Agriculture for the same year, it was found that of about twenty millions of pounds of cheese made in that State, five millions, or twenty-five per cent. was made in Geauga county; and further, that more than one-third of all the cheese factories in the State were in that county, fifty-two being reported in the State, of which nineteen were in that county. This made the comparison tolerably close for the Census Report of the State of New York for 1865 (two years before), indicated that Herkimer county was the largest cheese producing county therein, manufacturing about nineteen per cent. of all made in New York; and we thus have, in each, the largest cheese producing county in their respective States, each also preparing its cheese, to a very great extent, by the means of cheese factories. With regard to the second point above mentioned, the reports and letters received in 1867, by the commission, from about one hundred farmers in the twenty-three previously mentioned counties, situated in all parts of the State of Ohio, showed no evident difference, to account for the absence of the disease there as compared with New York, so far as was included in the points inquired into that year. In order, therefore, to determine if the points in the investigation of 1868, contained the elements by which to account for the disease, a blank form of report containing the same series of questions, similar in all respects to those used in 1868 (except as to dates), was furnished to inspectors; who were instructed to pursue the investigation by personal inquiry and examination on the different farms, as had been practised for the two previous years. It is unnecessary to enter into the details of their instructions; they differ in no respect from those contained in the report of 1868, except in one particular, *i. e.*, that as in 1868, the instructions were to inspect every farm; in 1869, the following directions were substituted: "As the object of the inspection this year is to make an accurate comparison between the dairy farms, and the manner in which the dairy business is conducted, so far as relates to the care and treatment of the cows, you will please inspect those farms only on which butter and cheese (or milk) are made an article of sale, those farms on which cows are kept for the purpose of raising stock, only, not being considered to afford a proper comparison with the dairy farms of Herkimer county." In addition to the points embraced in the blank form, they were instructed to report, "How long has this farm been used for dairy purposes?" "Has the disease of abortion ever prevailed thereon?" "If so, when, how long did it continue, and when did it stop?" The commission was so fortunate as to secure the services, as assistant inspector, for a part of the time, of Dr. Benjamin R. Swan, who had been in the service of the society, and inspected the towns of Newport and Fairfield last year. The experience then obtained, of the manner in which the cows of Herkimer county were cared for, made his observations all the more valuable here, and he was furnished with a copy of the form of report used in 1867, in which the points more directly referable to their care are contained, and was instructed to note any differences therein, as between the two districts; thus establishing the accuracy, or otherwise, of the reports received, in 1867, from the farmers themselves, as also going over the whole ground with more care than any general directions would have been likely to have secured. Dr. Swan began his term of service on August 13th, and finished on September 7th. He was succeeded by Mr. George A. Vanwagenen, who entered on duty September 20th, and finished on October 16th.

Reports were received from these inspectors as follows, viz:

	Farms.	Cows carrying calf full term.	Abortions.
From the town of Chester	50	775	1
From the town of Chardon	44	649	—
From the town of Munson	63	1,042	—
From the town of Claridon	65	737	1
Total	222	3,203	2

Of the abortions, one occurred in the sixth month of pregnancy, the other in the ninth; one took place in December, the other in March; one was sired by a yearling bull, the other by a two-years-old; both occurred in cows which had borne a calf at full term the previous year; both cows had been on the respective farms upon which they then were for more than one year; no history of injury was obtained in either case. The proportion of abortions to the whole number of full term calves is too small, however, to consider these cases as otherwise than independent of influences at present affecting the cows generally, nor will they be again considered in this report, the district being assumed to be free from the disease. The investigation in Ohio being simply a continuation of that of last year, the points in the report then made will be taken up seriatim, and the two compared.

1ST. AS TO THE AGES OF THE BULLS USED.—

	In Herkimer county.		In Geauga county.	
	Per cent.	Per cent.	Per cent.	Per cent.
Cows served by yearling bulls ...	32	...	49	
Cows served by two-year-old bulls	65	...	45	
Cows served by "aged" bulls ...	3	...	6	

Showing, so far as the prevalence of abortions in Herkimer county is concerned, there can be no immediate influence against the use of yearling bulls, but arguing, so far as it goes, to an advantage in their favour. Your commissioner desires to be understood in this question; he does not in either report assert, or intend to imply, that the age of the bull is likely to influence in one way or the other the probability of a cow once impregnated carrying her calf to term; the foetus conceived by a young bull would be just as likely to live as that conceived by an older one; the ovum, once having been impregnated by healthy material, is under care of the dam, to whom we must thereafter look for any stoppage in the natural process of gestation. The influence of the age of the bull must be looked for farther on—farther than it is practicable for this commission to carry it—*i.e.*, to the point of determining whether the cow whose sire was an immature bull carries her calves to term or habitually aborts; but this is beyond any tangible information.

2ND. AS TO EXCESSIVE SERVICE OF THE BULLS.—

Average number of Cows.	In Herkimer county.	In Geauga county.
Served by yearling bulls	20	23
Served by two-year-olds.....	32	20
Served by "aged" bulls.....	41	29

There is, therefore, no indication in this table that any unusual drain is inflicted on the bulls in the affected districts to cause this disease, confirming the observations of both previous years.

3RD. AS TO THE PREGNANCY.—No marked difference has, in either of the former investigations, been shown as to liability to abortions between first and subsequent pregnancies; and it is worthy of remark here to find that about the same percentage of the herds in each district are heifers; in Herkimer county 9 per cent., in Geauga county 8 per cent.

4TH. WITH REGARD TO REMOVALS FROM FARM TO FARM.—By the investigation in Herkimer county it was found that there the per-centage of abortions among cows raised on the farm was less than among those brought on at any time during or since their first pregnancy, in the proportion of '046 to '07; and it was therefore inferred that, in a country where no abortions prevailed, the proportion of cows raised on the farm would be greater, but the investigation this year does not justify this inference. In Herkimer county 37 per cent. of the cows are raised on the farm reporting them; in Geauga county but 30 per cent. are thus raised, and the conclusion drawn from the inspection of Herkimer county is not sustained by the statistics obtained in Geauga county; though justice to the farmers of Geauga county, who have, through Dr. Swan, entered their protest against the practice of frequent changes in their herds, requires that his remarks on this subject should be given. On Aug. 19th, soon after commencing his inspection, he says: "The farmers are strongly prejudiced against cows from the West, preferring those that have been raised about here, and they seem to think that it is best to raise their own stock, and most of them raise two or three every year." On the 21st he states: "I find the herds more permanent here than in Newport; the same cows remain on a farm till too old to be profitable, while in Newport it was rare to have

the same herd in December that was on the place in January." After having finished the inspection, his final report states: "Almost all have tried the plan of 'deaconing' all the calves and buying cows to replenish the dairy, but it has been given up; all (P Com.) say it's much better to raise their own cows; that cows brought in from the west and south never do well the first year; and they find they can raise a calf about as cheaply as they can buy a cow, and then they know what they've got. I am told that, four or five years ago, it was almost universal to buy cows, and not raise calves; but it was decided that it was a ruinous process and it's been stopped, and I do not remember one who has not from one to a dozen calves growing up; the plan being, to raise the best calves, and sell the poorest cow, as the dairy increases in numbers. In this way the herd is growing better, and it is these refuse cows that drovers take to New York." It is further respectfully submitted that the apparent discrepancy between the inspectors' reports and the farmers' statements is accounted for in the letter last quoted, where it says, "four or five years ago it was almost universal to buy cows, and not raise calves." May not the inspectors' reports be, to a large per cent., made from the cows thus bought? A further investigation of this point, relates to the condition of pregnancy, or otherwise, at the time of removal. From the facts presented from Herkimer county, it appears that cows subjected to removal from one farm to another, during pregnancy, are more liable to abort than those removed non-pregnant, and who subsequently became so. No cows were reported non-pregnant at the time of their removal, in the four towns inspected in Geauga county, but the proportion of yearly removals is less, being but 12 per cent., while Herkimer county reports 17 per cent. of yearly removals. An isolated fact bearing on this point may be mentioned. Dr. Swan writes: "I met to-day, at Mr. Lester Taylor's in Claridon, a Mr. Wilder, a dairy farmer from California. He keeps about three hundred cows, two hundred milking, the others coming on; he makes butter entirely. * * * Last year he drove his cows down from one ranch on the mountain slope and through the valley to another ranch, and the next day a number aborted. Whether it was the journey, which was only seven or eight miles, and not unusual, or the change of feed, or strains, he could not tell."

5TH. PERIOD AT WHICH THE COWS FIRST BEGAN BREEDING.—The instructions to the inspectors were the same as last year and the importance of getting accurate replies was insisted upon; all doubtful cases were rejected, and they report as follows, viz.: Of eight hundred and seventy-nine cows in Geauga county, which were raised on the farms reporting them (or were brought on as unimpregnated heifers), five hundred and fifty-five, or 62 per cent., first calved at under three years of age, while in Herkimer county, last year, 83 per cent. were comprised in the same class. In other words, the farmers of Herkimer county, where abortions prevail at the rate of six per cent. of all births, subject 21 per cent. more of their heifers to the process of gestation, at an earlier period, than is the habit with the farmers of Geauga county, where abortions do not prevail. The injurious tendency, in subjecting the heifers to this process, before arriving nearly at maturity, was insisted upon last year, and subsequent investigation has but served to confirm the views then expressed; and, although the reports from Geauga county do not show that the farmers there are free from the charge of too early breeding, yet the practice is not carried the extreme degree that it is in Herkimer county. Among those who make a study of physiology, in either its scientific or its practical aspects, there is but one opinion as opposed to subjecting an animal to a process, making such great demands upon its nutritive powers, before arriving at nearly its full growth; and it is a well known rule, that the too early or the excessive exercise of any function impairs, either permanently or temporarily, its complete development. And the following conclusions, bearing directly upon this point, are drawn from the statistics of 16,953 cases in the female population of Scotland. 1st. That the comparative fertility of the female population increases gradually from the commencement of the child-bearing period of life until about the age of thirty years is reached, and then it still more gradually declines. 2nd. The initial fecundity of woman gradually waxes to a climax, and then gradually wanes. 3rd. The climax of initial fecundity is probably about the age of twenty-five years. In the case under investigation, it is requisite that all parts of the organization of a breeding heifer

should have their growth sufficiently advanced to enable them to bear the demand upon their nutrition and future development, which gestation entails; the influence of the latter being towards checking the growth of all the rest of the organization, to the hindrance, more or less remotely in the course of generations, of the development of the reproductive process, and it can therefore only be necessary to show that a heifer has not arrived at her proper breeding period, at from one year to fifteen months of age, in order to prove that the disease complained of is a direct consequence of this practice. Yet this is the time at which, as has been shown in 1867, and again in 1868, 83 per cent. of the heifers of Herkimer county are first covered by the bull, and the reproductive process initiated. The fact of the presence of that portion of the reproductive process, comprised in the phenomenon of heat, or rut, is not sufficient authority for a breeder to immediately subject a young heifer to the labour of carrying on the remainder. Habits of domestication tend powerfully to stimulate this function to an early development and more active exercise; but rules must not be assumed from exceptional cases, and although in the investigation of this subject, as well as in his personal experience as a farmer, your commissioner may have met with cases of extreme precocity, more extended observations do not justify that these should be considered otherwise than abnormal. One case is recorded where a heifer gave birth to a fully-developed calf when she (the dam) was but fifteen months and twelve days old. She must therefore have been impregnated at the age of six months, the sire being a calf, at the time of covering, of four months. Surely no one will assume from this case that it would be good or even allowable management to set all calves to breeding as soon as they will allow intercourse; yet this is the argument which the farmers, where abortions prevail so extensively, use, asserting that the artificial stimulation which habits of domestication invariably excite is the natural appetite. In a table relating to the process of reproduction in mammalia, including about fifty species, Prof. Duglison gives, under the head of "Age capable of engendering Young," that of a cow at two years. As the same table gives the human female to be capable of engendering young at fourteen years, it is evident that the compiler intended to make this the *minimum* age, at which the heifer could *naturally* conceive, for no one will claim that fourteen years is a proper child-bearing period in woman. Cuvier states, "The cow is gravid nine months, and can breed at eighteen" (months). Additional evidence would not be wanting on this point among strictly scientific authorities, but it is unnecessary. Theoretically, the practice is opposed to recognised physiological laws; but to show that these laws are not in opposition to practical experience, a few extracts, among a large number to the same effect, from the writings of those engaged in active agricultural pursuits, may be of interest, as showing the plan which they have found to be the most advantageous. Keary on the Management of Cattle in Cheshire, a celebrated cheese district, in the *Journal of the Royal Agricultural Society*, says: "The age at which the heifers are first bulled varies in different herds, some breeders putting them to the bull at eighteen months old, while others prefer allowing them to run until they *complete* their second year. Wright on Management of Breeding Cattle: "Heifers are usually put to bull at two years old—sometimes, but very rarely, before; and this arrangement is found most conducive to the fruitfulness of the animals." Bowick's Prize Essay on the Rearing of Calves: "If a cow brings her first calf when from two to three years old, which the majority probably do, though all will admit that it is too early, we should not care to milk her more than five or six months after calving." In how many instances is this latter precaution observed in these districts where abortions are so frequent? Let the report of last year answer, page 33. And it was then further reported to this commission, many times, that the habit among the farmers was to force the heifers to as long a lactation as possible, on the ground that if this process was prolonged to the extreme that her future periods of lactation would also increase—a proposition that no physiologist will admit, and which nearly every farmer who is capable, or rather who is in the habit, of putting the observations of two successive years together, will deny. Prize Essay on Management of Cattle, by Little, who is reporting the method adopted on one of the large estates in the north of England: "About fifty or sixty West Highland heifers, a year and a half old, are annually

bought at the Falkirk Tryst, or Fair, in Scotland. They are brought home, * * * where they are wintered. * * * In May they are turned out to pasture, * * * and the Shorthorn bull is put amongst them in the beginning of July.' This brings them to at least two years old before impregnation. Evershed on the Agriculture of Staffordshire, describing the manner of rearing young heifers: "The third winter, *being then in-calf*, they are fed," etc., etc. These extracts show the course pursued by English breeders. In France, Boussingault, whose position as a judicious rural economist is foremost, says: "The age at which it is advisable to put heifers to bull depends a good deal on the way in which they have been kept and brought up, and also on their growth. Young animals of a good kind that have been well fed from their birth, and received all the care which contributes so powerfully to their development, will be ready to receive the bull when they are between a year and a-half and two years old. * * * The rule, however, is not to allow the young female to be leapt until she is nearly at her full growth." It is, therefore, evident that from a year and a-half to two years is the minimum age at which it is practically economical, in its true sense, to allow a heifer to begin the process of gestation. The observations of the physiologist, and the experience of the practical breeder, who breeds for the best results to his herd, thus arrive as they always will, to the same conclusion.

6TH. THE AMOUNT OF MILK OBTAINED PER COW.— This question, as affecting the immediate result, is second in importance to none other presented; and, as will be remembered, considerable emphasis was laid upon it last year, and the results obtained by the investigation this year are sufficiently confirmatory to fully warrant the views then taken.

THE AVERAGE YIELD OF MILK PER COW	Pounds.
In Geauga county, of 2,979 cows in 1863, was	2,853
In Herkimer county, of 11,908 cows on non-affected farms, in 1867, was.....	4,386
In the State of New York, of 1,195,481 cows by the census of 1863, was	2,571

By this it is seen that in Herkimer county the average yield is 35 per cent. greater than in Geauga county, and that the average yield of the latter is 10 per cent. more than the average quantity obtained in the whole State of New York. As between the counties of Herkimer and Geauga, this comparison must be taken as nearly accurate. The inspection was made in the same manner in both counties, in part in each by the same person, and, as was stated last year, inspectors were directed to make reference to the books of cheese factories whenever desirable. It may also be here mentioned that both gentlemen expressed themselves under obligations to the proprietors of factories for the facilities afforded them in taking notes from their books. In the case of the State of New York, there are, of course, many districts in which the dairy is of a very subordinate consideration, and in which but little care is taken to collect the dairy-products. Very great differences exist between individual cows as well as between breeds, with regard to the amount of milk which they will yield; and if it could be shown that the cows of Herkimer county were a very superior race, better fed and better cared for than those in Geauga county, it might, with some propriety, be assumed that the above difference in the yield of milk is due to a natural difference between the local breeds. That, however, will not hold as between the cows of Herkimer county and those of the remainder of the State of New York (it is unnecessary to cite authorities on this point, it is a matter of too common observation); and, as between Geauga county and Herkimer county, Dr. Swan's evidence is clear, and directly opposed to the assumption of the superiority of the Herkimer county cows over those of Geauga county. This gentleman, as has already been stated, was a careful inspector of the towns of Newport and Fairfield in Herkimer county, in 1868, and was, therefore, able to make a fair comparison between the districts, and his instructions (before given) included observations on this point. He began inspecting August 18th, and writes: "I like the looks of the cows much better than in Newport." On the 21st: "I saw several herds yesterday, and was surprised at the excellence of the stock. The cows are large; the bulls at one and a-half to two years, are larger than two of the Newport bulls." On the 25th: "The more I see of the cows the more I am con-

vinced of their superiority, as a race, over the Newport cows." A man said, to-day, "They ought to have good cows in New York, for they come here to buy." Another spoke up and said, "Yet, but we only sell our poorest." On September 3rd, in reference to the manner in which the dairies are kept up, after describing which, he adds: "And it is these refuse cows that drovers take to New York, as you can't buy a man's best cow here." And an examination of the returns in the reports of 1867, from all the States above mentioned, shows no difference or peculiarity in the breeds of cows. They are reported, in a large majority, as "natives," the remainder being "grades," in no marked difference of proportion between "Shorthorns," "Alderneys," and "Ayrshires." As the evidence obtained by the commission, is opposed to the view that the cows of Herkimer county are of a superior quality, the question which would most naturally arise next, is whether the Herkimer county cows are better fed. Reports were made on this point from every farm inspected, in the three years during which this investigation has been progressing, and the result of a careful examination thereof is against this view. In the Report of last year it was shown (page 33) that the farmers of Herkimer county were in the habit of milking their cows to as late a period, during pregnancy, as possible, and that this was the means by which the increased amount was obtained. The deleterious influence of this practice upon the progress of gestation was also considered there, in some detail, to which it is only necessary to refer now. But do not farmers, in districts where abortions are unknown, pursue the same plan? It has been found impracticable to obtain absolute statistics on this point. The exact date at which conception took place is oftentimes unknown, and no record as to the time at which milking ceased is taken; but allowing farmers to state their views, those of Geauga county are found widely different from those in Herkimer county given last year. Dr. Swan states, August 19: "They (the farmers) all speak of the necessity of letting the cows rest, and think they get more out of a cow, in the long run, by letting her run dry three months, than to milk close." August 25th: "The cheese factories here are not owned by the farmers in joint stock, as in Newport, but by an individual who buys the milk out-and-out from the farmers, so much per gallon. A farmer told me that Mr. Randall, one of the factory men here, was urging farmers to sow corn for fodder, and feed it, and milk through the winter, saying they did it in New York State. The farmer said he thought a cow wanted rest, and it would be better for the farmers to dry off for three months at least; he thought they would be richer at the end of ten years than if they milked eleven months." In his final report, summing up the observations of his inspection, he says: "This country is the cheese district of the Western Reserve. The country is rolling, in some places very hilly, much more forest than in Herkimer county, New York. The soil has a large amount of clay. It is well watered, though not so well as Herkimer county; there being much more bottom land and more sluggish streams, the clay lessens in amount, and the country is better watered as we go further south. The almost universal custom is to let the cows run dry at least three months, all affirming that the cow needs rest, and that she comes out in the spring much better for it." It is, therefore, evident, from the facts actually presented, as well as from the observations of the inspectors, as thus shown in comparing these two extensive cheese-producing counties; in one where abortions

do not prevail, and in the other where they do, that the views expressed in the Report of last year are in their most essential points sustained; one element, however, *i.e.*, that of frequent removals, considered in Herkimer county to be a somewhat frequent exciting cause of the disease, has been found to exist to a greater degree, in Geauga county; but this is a minor point, and must be considered as one of the class of simply exciting causes, as distinguished from the predisposing or constitutional cause. The immediate exciting cause of an abortion may be one of many, all more or less accidental in their nature, but it became evident, as this investigation proceeded, that a disease, affecting so extensive a region of country, arising, as this did, only after the dairy business had come, in the course of years, to be the principal interest of the district, and which gradually extended itself as that interest increased, that some general predisposing or constitutional influence or influences were at the bottom, and that the various causes assigned on all sides were but indications of a *tendency* to the disease, which must not be confounded with the main element. In the first year of the investigation the attention of the Commission was mainly directed to influences affecting individual cows, but nothing positively pointing to a cause was arrived at, although immense progress was made in clearing away a mass of conflicting theories or opinions, which had previously presented themselves as important influences; against every one of which, however, more negative facts could be brought to bear than could be presented in its support. Still, even at this early stage of the investigation, indications of the practice of breeding prematurely were seen, but they could not then be classified in a manner to be made useful. In the following year the attempt was made to discover influences affecting farms, rather than cows; but still no positive reason could be found to account for the comparative immunity of one farm over another in the affected districts. The more definite form in which the inquiry, with regard to the age at which the heifers were bred from, was put, developed, however, the important fact of its very general early practice; and the increased average yield of milk, over that obtained from the cows throughout the State, who were of precisely the same breeds and cared for in the same way in other respects, indicate an additional injurious influence upon the reproductive process, which would directly react upon an animal already subjected to the labour of premature gestation found in both years to be exacted. It was then determined that whatever tendencies were at work to give rise to the disease were those of a predisposing nature, affecting the whole practice of dairying as carried on in the various districts inspected, and that in order to arrive at a satisfactory conclusion the investigation must be carried to a comparison of districts. The result of this last comparison is now before you, and the explanation of the manner in which those influences act, having been presented last year, it is unnecessary to enter upon them in more detail. And if, in the reports from time to time presented to your notice, but little reference has been made to many causes which have been advanced by authorities having every right to consideration, it has not been because they did not have value in the mind of your commissioner, but because, after investigation, they were found to hold the secondary position of being simply exciting or accidental in their action as affecting individual cows, and not predisposing causes, influencing whole districts.

W. H. CARMALT, M.D., Commissioner, &c.

LAVENHAM FARMERS' CLUB.

This club has held its first meeting for the autumn season, when the chair was taken by Mr. F. P. Hitchcock.

Mr. VINCE read the following paper on "Cultivation; or, how to draw the largest amount of value from the soil at the least expense."

You will excuse me when I tell you I have prefaced my paper on cultivation with notes borrowed from history, and some remarks from better informed persons than myself. I trust the heading of my paper will not mislead some of our young members to think my object is to teach them to farm without capital, if so they will be disappointed. Cultivation

is the art of tilling and managing land. The history of a nation celebrated for wealth and power is in every way intimately connected with cultivation; the soil may be said to be the true riches of a country. In ancient, as well as in modern times, nations have increased in wealth, power, and importance, just in proportion as they cultivated the soil. Commerce and manufactures are, no doubt, powerful resources for multiplying the wealth, and greatness of a nation; but then, I think I may say they never have, nor ever can flourish until the cultivation of its soil has reached a certain degree of perfection. In the earliest ages of the world it is not

probable that man made himself much acquainted with a culture of the soil; whilst the inhabitants of the earth were few and thinly scattered over its surface, hunting and fishing, with the addition of fruit, &c., afforded ample provisions; but as mankind increased, they turned their attention to cultivation, to supply their wants with a more certain subsistence. The first attempt at cultivation was, probably, by the use of the spade, which was evidently used prior to the plough. We read Adam himself was placed in the midst of a garden to keep and till it; his sons, after the expulsion from Paradise, cultivated the ground; and, in after-times, the rise and progress of cultivation appears to have improved, so as to supply the increasing wants of mankind. The Greeks were an ingenious and literary people, and were the first who taught the cultivation of the soil as a science. The Romans, as well, held agriculture in the highest estimation; their senators and generals often worked at the plough when their services were not required elsewhere. In the present age the cultivation of the soil takes a prominent place in the history of a country, as institutions to stimulate production, and honours to encourage talent and discovery have long been and are bestowed amongst the nations in Europe. In Persia the husbandmen are yearly admitted to the presence of royalty, and in China the emperor performs once every year the task of holding the plough; thus, by example, showing that no man ought to be ashamed of being a farmer. In several countries of Europe the cultivation of the soil is taught, as one of the most useful branches of education; and history tells us, when nations have become exhausted by wars, governments have given encouragement to this science, as the only means of recruiting the permanent resources of the country; and perhaps it would be well if our neighbours that have caused within the last few weeks so much bloodshed and misery should, after this, turn their attention to this humble employment. I think I may say an example of this may be found amongst the acts of our own Governments in days passed by. Sometimes in a state of comparative depression rather than one of prosperity may be looked to as favourable to permanent improvement. Necessity is said to be the mother of invention. The best cultivators have often been made from the poorest soils, whilst many farming such soils as require little more than mowing, ploughing, and sowing, manifest an indifference, and sometimes an aversion, to improvement. Now, gentlemen, if we take a glance at the ancient and modern practices of cultivation and implements of husbandry, some idea may be formed of the advancement of the science. I have said, no doubt cultivation was first commenced by spade husbandry; there are some even now who would persuade us it can be done to some profit. Chemical science has thrown much light upon the subject of soils and manures as well as the effect of atmospheric influences upon our soils, and the consequent necessity of deep and shallow ploughing, according to the circumstances. Our forefathers commenced their instruction by recommending alternate fallows. I well remember one or two poor heavy land farms, where the plan was adopted furthest from the homestead. The last half century has worked a revolution in grazing and farming. Our martial neighbours can boast of their Sniders, Chassepots, and needle-guns as engines of destruction: we can rejoice over our steam-draining, steam-ploughing, and steam-threshing engines, assisting us in developing the products of the soil. The art of cultivation differs materially from any other art practised by man. Man can prepare and sow, whilst the bringing up and the bringing to maturity remains in the hands of an ever wise and indulgent Providence. We have known some foolish enough to wish for a wet harvest or a bloody war. We had the first in 1860. The last, I think we have had to perfection in 1870. Have we really received any benefit from either? I fear not; but I do think the last few years the seasons have been somewhat favourable for our operations in this neighbourhood, although, I fear, not for very light land occupations. That knowledge is power, is certainly applicable to the business of the farm. Knowledge is a capital of the greatest value in the absence of more available advantages. There is no class who rely more on their own skill than the farmers; we must admit there are many of us who have not acquired a thorough knowledge of our business. In these days of modern or rather model farming, we must always be acquiring fresh knowledge; it cannot be said that the cultivation of our soils has yet been brought to that degree of perfection which it is capable of reaching.

In a business point of view the intention is to obtain the greatest possible amount of produce from the soil, and the farmers object is to raise it at the least cost to afford him the greatest profit. In this a tenant may be assisted materially by his landlord allowing useless pollard trees and fences to be removed, and suitable buildings and yards arranged for all grazing purposes. Half the rent of a farm may be lost for the want of proper accommodation. Good farm-yard manure, well-prepared, is the farmer's best friend. I am fully convinced, let what may be said to the contrary, that really good farming cannot be maintained without good grazing. Our forefathers' chief wealth consisted in cattle, and our dependence must be, in a great measure, upon cattle also. How can we enrich the soil better than with good substantial manure? Manufacturers and their agents will dispute it, but sound practical farmers will not. I am convinced the more cattle we can keep the better it will be for us, directly or indirectly. Of course it requires discretion and judgment in buying and selling at the proper time. The English nation is a large meat-consuming community; for some years past, in spite of all the imports of foreign cattle, meat has realised a fair remunerative price. I remember saying to a sheep-grazing farmer in Hadleigh some 15 years since, "You keep a large flock of sheep, and feed them at a heavy expense." His answer was, "We can't make meat too fast when it will fetch 8s. per stone." As something above that price has been realised of late years, I think the same remark will apply now. I am not one of those who would say, "Sheep pay best, or beasts pay best"; I would say, keep all you can fairly of each; keep them well, and should they at the year's end not show so favourably upon your balance-sheet as you could wish, you will have the consolation of hoping for some better results from the manure heaps they have manufactured. Now, gentlemen, I have not recommended a small expenditure per acre to produce the largest amount of value from the soil at the least expense. Farming under the most economical principle possible is expensive, and requires close application and good management. I think steam-power has in some measure cheapened our labour, and also relieved the labourer from some of his most laborious work. Steam ploughing, I am convinced will become more general, and with much better results than were by many anticipated. Reaping and mowing machines, with their improvements, are more in favour, and have this year more than realised the anticipations of those that employed them, and will ultimately become as necessary an implement as the corn drill. I was very pleased this harvest in seeing one of Burgess and Key's two-horse reapers, with one man only to drive, laying the whole field in even sheaves in workman-like manner ready for tying. Thanks to science for these modern appliances. When we can reconcile ourselves to the general use of them, I believe they will cheapen labour and assist to increase the value of our produce. You have already heard able papers from some of our most intelligent and practical members, upon the waste of force in farming operations, economy in the keep of farm horses, deep and fleet draining, &c. I shall not enter upon these matters. The chief object of my paper is to enforce the necessity of breeding stock, &c. Good grazing in connection with our modern cultivation, as far as my own experience goes, has been satisfactory, and I think there are many of our members who expend a large sum for stock and feeding stuff who will admit they have received a fair return for their outlay. We have heard £10 an acre as a fair outlay upon an occupation, and many no doubt think they manage very well with that sum. I would not go so far as our friend Mechi, and say £20 would be much better, but I would urge upon our young members the necessity of breeding stock and grazing as a means to increase their profits and improve the land; always bearing in mind the producing man is the man for his country, and the man who will ultimately receive the best return upon his capital.

The CHAIRMAN said Mr. Vince had referred to steam cultivation, and he would produce for their inspection some beet roots which he was told were the result of deep cultivation. Mr. Hitchcock then placed upon the table four roots, two of extraordinary dimensions and two much smaller, and also some of the subsoil, which, he said, was unmitigated clay. The beet came from Mr. Campbell's, Basket Park, near Faringdon, Berks, the large ones having been taken from the bottom of the field, where the soil was less tenacious, but all were grown upon pure clay. On the

same farm there were 1,300 acres of roots, as good as those he had produced. He (the Chairman) was at the farm on the previous day, and saw two engines of 30-horse power each, tearing up the land to the depth of two feet. It was sugar-beet farming, and not a system that they could well follow. The beet was not for making sugar with, but to make spirits, therefore the distillery was more taken into consideration than the farm. Beet was also used to feed a great number of cattle and sheep, there being at the present time 1,500 bullocks and 5,000 sheep on the farm. The proprietor sold 50 fat bullocks, and from 300 to 400 sheep by auction every week. He (the Chairman) thought they must all thoroughly agree that deep cultivation was the thing for roots.

Dr. WHITE said the specimen of subsoil produced had plenty of carbonic acid in it. It was partly dolomite, which was a mixture of limestone and magnesia.

The CHAIRMAN said he did not think there was any limestone in the soil, as they had in that neighbourhood to cart material for the roads a distance of 40 miles, whereas they might use limestone.

The SECRETARY read a telegram he had received from Mr.

Duncan, stating that he would give a prize of £10 to the grower of beet whose roots were the richest in sugar; the roots to be tried to weigh not less than 2lbs., and to be judged by density of juice in an average of 6 roots.

It was agreed that the Secretary should write to Mr. Duncan, thanking him for the offer, and ask him by what time the roots must be sent in.

Dr. WHITE said he had seen the steam plough at work on Mr. Hitchcock's land, but he thought there was a great loss of power in only having one grubber to two engines.

Mr. VINCE said if any man could invent a means of two grubbers being worked at once with any state of efficiency he could soon get a patent.

Mr. HUSTLER asked Mr. Vince's opinion upon the four course system of farming.

Mr. VINCE said as regards the shift of farming, the tenant farmer could not say much about that. Many of them were tied to the four-course shift, although, perhaps, they would like to alter the course a little. He thought they were often not forward enough in preparing their lands for mangolds; it ought to be done in the autumn. A person could not keep cattle unless he had roots for them.

NORTON FARMERS' CLUB AND EAST DERBYSHIRE AGRICULTURAL SOCIETY.

MEETING AT CHESTERFIELD.

At the twenty-eighth annual meeting of these united Societies the entries were fully as large as in former years, and considering the want of herbage during the drought, which has kept animals in poor condition, the stock was fully an average. Amongst the cattle, the dairy cows were a very good class; the heifers were rather poor; but the stirks much better. The first cow-calf, and the first bull-calf were good. The sheep were a superior show. There were also some good pigs. The older draught horses were a good class. Only three hunters faced the hurdles. There was good competition for the prizes for butter and cheese. The roots, for the season, were good, the only poor class being the cabbages.

PRIZE LIST.

JUDGES.

HORSES: J. Robinson, Grove Horse Repository, Mauchester; T. Rodgers, Wath-upon-Dearne.

CATTLE AND SHEEP: W. Tomlinson, Bradley Pastures, Ashborne; F. Smith, Ashborne Grange.

PIGS: J. Byrom, Penistone; H. Jenkinson, Unstone.

DAIRY PRODUCE: R. Wright, Chesterfield.

AGRICULTURAL PRODUCE: Messrs. Tomlinson and Smith.

CATTLE.

Bull.—First prize, £3, Mrs. Packman, Tupton Hall; second, £1 10s., J. Fletcher, Eckington.

Yearling bull.—Prize, £3, Mrs. Packman.

Cows.—First prize, £2, and second, £1, Mrs. Packman; third, 10s., J. Fox, Plesley.

A sweepstakes for pair of dairy cows in-milk or calf was awarded to Mr. Hopkinson, Woodthorpe, who showed against Mrs. Packman.

Heifer.—First prize, £2, J. Fox; second, £1, S. Lowe, Tupton; third, 10s., R. Crofts, Slitting Mill.

Stirk.—First prize, £2, J. Fox; second, £1, G. Cox, Elmton Park; third, 10s., M. Hopkinson.

Wye calf.—First prize, £1, W. Fowler, Whittington; second, 10s., W. J. Cawton, Park Hall.

Bull calf.—Prizes, £1, Mrs. Packman, and £1, S. Lowe.

SHEEP.

Long-woolled shearing ram.—Prize, £3, M. Scorer, Scarcliffe.

Long-woolled above a shearing.—First prize, £3, and second, £1 10s., R. W. Crawshaw, The Hagge.

Of any breed.—Prize, £2, G. Sampson, jun., Beauchieff.

Five breeding ewes.—First prize, £2, R. Croft; second, £1, M. Scorer.

Five theaves.—First prize, £2, M. Scorer; second, £1, R. W. Crawshaw.

Five theaves, Shropshires or Southdowns.—Prize, £3, J. Rooth, Stretton. Highly commended, G. Sampson.

Five ewe lambs.—First prize, £2, R. Crofts; second, £1, Mrs. Renshaw, Bank House, Staveley.

PIGS.

Boar of the large or middle breed.—First prize, J. B. Gregory, Ravensnest, Ashover; second, C. B. Speight.

Boar of the small breed.—Prize, C. B. Speight.

Sow of the large or middle breed, in milk or in pig.—First prize, B. Hardy, Ashover; second, J. B. Gregory.

Gelt of the large or middle breed, in milk or in pig.—First prize, C. B. Speight; second, E. Holland, Grassmoor.

Sow or gelt of the small breed.—Prize, C. B. Speight.

Store pig.—First prize, C. B. Speight; second, C. Wright, Stonegravel.

Cottagers' pig, the owner not to occupy more than half an acre of land.—First prize, W. Clayton, Chesterfield; second, Conway, Chesterfield; third, G. Wilcockson, Chesterfield; fourth, W. Clayton.

EXTRA STOCK, &c.

Best pig, not exceeding six months old, fed on Littlewood's cattle spice.—Prize, timepiece value £5, J. Wright, Clay Cross.

Best pig in showyard under 18 months, fed on Littlewood's cattle spice.—Prize, a silver cup, B. Hardy, Ashover.

Best pig under one year old, fed on food seasoned with Simpson's cattle spice.—First prize, J. B. Gregory; second, L. Mountney, Bakewell; third, C. B. Speight.

DAIRY PRODUCE.

BUTTER.

First prize, £1 1s., Mrs. T. O. Hazard, The Herdings, Norton; second, 10s., Mrs. Blanksby, Hardwick Inn; third, 5s., Mrs. Ewing, Tupton.

CHEESE.

Cream.—First prize, £1 1s., W. J. Cawton; second, 10s., Mrs. W. Whetton; third, 5s., Mrs. T. O. Hazard.

Ordinary cheese.—First prize, £2, B. Hardy, Ashover; second of £1, M. Hopkinson.

AGRICULTURAL PRODUCE.

Swedes.—Prize, G. Sampson.

Common turnips.—Prize, J. Rooth.

Mangolds.—Prize, R. W. Crawshaw.

Cabbage.—Prize, W. Blanksby.

HORSES.

Hunter not less than three years of age.—First prize, a silver cup and £5 5s., T. Berry, Sheffield; second of £2 10s., T. Kirk, Oak Mount, Sheffield.

Entire horse of the draught kind.—Prize, £5 5s., W. Whetton, Sutton.

Yearling nag.—First prize, £2, J. Bradbury, Unstone Hall; second, £1, J. Wilcockson, Brampton.

Two-year-old gelding or filly, of the nag or riding kind.—First prize, £2, Mr. Hoyalnd, Wingfield; second of £1, T. Heywood, Chesterfield.

Three-year-old gelding or filly of the riding or nag kind.—First prize, £2, J. J. Crofts, Staveley; second of £1, G. Wetton, Brimington.

Roadster from 14 to 15½ hands high.—First prize, £3 3s., R. W. Crawshaw, The Ilagge; second of £1 1s., S. Burkitt, Chesterfield.

Harness horse, not under 15 hands.—First prize, £3 3s., W. Gaitskell, Duckmanton; second of £1 1s., E. Goodwin, Chesterfield.

Brood mare of the nag kind, with a foal at her foot.—Prize, £2, J. Rooth.

Yearling gelding or filly of the cart kind.—First prize, £2, J. Wilcockson; second, £1 1s., J. Fletcher.

Two-year-old gelding or filly of the cart kind.—First prize, £2, Mr. Fletcher, Owl Cotes, Heath; second of £1 1s., R. W. Crawshaw.

Three-year-old carting colt or filly.—First and second prizes, £2 2 and £1 1s., T. Ward, Intake. Highly commended: T. Marples.

Brood cart mare, with foal at her foot.—First prize, £3 3s., W. Rogers, Linacre; second of £1 10s., J. Bradbury, Unstone Hall.

Draught gelding or mare above three years old.—First prize, £5, T. Ward; second of £2, W. Lister, Greenhill Hall; third of £1, R. W. Crawshaw.

Pony, mare or gelding, under 14 hands.—First prize, £2, J. Martin, V.S., Chesterfield; second of £1, W. Stamford, surgeon, Tibshelf. Highly commended: J. Ewing.

HUNTINGDONSHIRE AGRICULTURAL SOCIETY.

MEETING AT ST. NEOTS.

For many years past the meeting of this Society have been migratory, and having been held alternately at St. Ives, Ramsey, and Huntingdon, this year came round again to St. Neots. Of horses the supply was good, and some really fine animals were exhibited. The same may be said of the breeding stock, Mr. Pawlett, Beeston, Bedfordshire, being always a great exhibitor. The show of sheep was small, not being nearly so large as at Huntingdon last year. Several classes did not fill. Pigs were indifferently represented; there were only five classes, and the entries were by no means large. The poultry show was likewise small, and much below the average.

PRIZE LIST.

HORSES.

Best stallion for agricultural purposes.—First prize, £15, J. Flintham, Somersham; second, £7, Mr. Battock, Hemingford Abbots.

Cart mare and foal.—First prize, a cup value £10, J. Warth, jun., Sutton, Isle of Ely; second, £3, J. Fryer, Chatteris.

Two-year-old cart gelding.—First prize, £4, and second, £2, T. and S. Fyson, Warboys.

Two-year-old cart filly.—Prize, £4, Mr. Wilkinson, Godmanchester.

Cart foal.—Prize, £2 2s., R. H. Ekins, Wennington.

Mare or gelding, above four and under five years old.—Prize, a cup value £25, Mr. Cheney, Gidding Grove.

Mare or gelding, five years old.—Prize, £10, D. Cooper, Spaldwick.

Mare and foal.—Prize, a cup value £10, J. Patterson, jun., Walesby.

Mare or gelding, above four and under five years old, not exceeding 15 hands 1 inch.—Prize, a cup value £10, J. Warth, jun.

Mare or gelding, above five years old.—Prize, a cup value £5, J. Topham, Crown Farm, Great Staughton.

Pony, not exceeding 13 hands high.—Prize, £2 2s., J. Warth, jun.

EXTRA PRIZE.

Mare or gelding, entered in either of the above classes, which shall jump in the best form.—Prize, a cup value £5, J. T. Blott, Basmeade.

CATTLE.

Bull, not under two years old.—First prize, £8, and second, £4, Mr. Pawlett, Beeston, Sandy, Beds.

Bull, under two years old.—First prize, £6, Mr. Pawlett; second, £3, P. Brown, Houghton.

Cow, of any age, having produced a calf within nine months.—First prize, £5, J. How, Broughton; second, £3, P. Brown.

Cow, of any age, in calf, or having produced a calf within nine months.—First prize, £5, P. Brown; second, £3, B. H. Rowell, Oldhurst.

Heifer, under three years old.—First prize, £4, J. How; second, £2, C. Hall, St. Neots.

Heifer, under two years old.—First prize, £3, J. How; second, £1 10s., Mr. Pawlett.

Steer, under three years old.—Prize, £5, Mr. Sisman, Buckworth.

Steer, under two years old.—First prize, £3, J. How; second, £1 10s., Mr. Sisman.

Pair of steers.—Prize, £4, Mr. Squire, Cross Hall, St. Neots.

EXTRA PRIZE.

Bull, to be kept in the district for 12 months.—Prize, a cup value 20 gs., Mr. Pawlett.

SHEEP.

LONG WOOLS.

Pen of 5 theaves, under two years old.—First prize, £4, and second, £2, Mr. Cranfield, Buckden.

Pen of five ewes.—First prize, £4, and second, £2, Mr. Cranfield.

Pen of five wether lambs.—First prize, £4, and second, £2, Mr. Cranfield.

Pen of five ewe lambs.—First prize, £4, and second, £2, Mr. Cranfield.

Pen of five tup lambs.—First prize, £4, and second, £2, Mr. Cranfield.

SHORT WOOLS OR MIXED BREEDS

Pen of three wethers, under two years old.—First prize £4, and second, £2, T. Topham, Staploe.

Pen of five wether lambs.—First prize, £4, J. Hall, Eynesbury; second, £2, R. Daintree, Woolley.

Pen of five ewe lambs.—First prize £4, and second, £2, F. Street, Harrowden.

PIGS.

Boar, of the large breed.—First prize, £3, J. Pashler, Great Catworth; second, £1 10s., Mr. Crawley, Waresley.

Boar of the small breed.—First prize, £3, Mr. Deacon, Oundel; second, £1 10s. to Mr. Squire.

Breeding or suckling Sow, of the large breed.—First prize, £3, Mr. Pashler; second £1 10s., Mr. Squire.

Breeding or suckling sow, of the small breed.—First prize, £3, Mr. Deacon; second, £1 10s., Mr. Squire.

Pen of three yelts.—Prize, £3, Mr. Squire.

ROOTS.

20 Swede turnips.—First prize, £1, Mr. Wood, Clapton; second, 10s., G. Day, St. Neots.

20 Green, white, or red turnips.—Prize, 15s. Mr. Squire.

20 Globe mangels.—First prize, £1, P. Brown; second, 10s., Mr. Sisman.

20 Long mangels.—First prize, £1, Mr. Sisman; second, 10s., Mr. Looker, Wyton Manor.

20 Carrots.—Prize 15s., Mr. Ekins, Wennington.

20 Kohl Rabbis.—First prize, £1, Mr. Looker; second, 10s., Mr. Sisman.

10 Cabbages.—Prize, 15s., Mr. Sisman.

20 Roots exhibited in classes 3 or 4.—Special prize, a cup value 5 gs., Mr. Sisman.

FIELDS AND FOLDS AT HOME AND ABROAD.

Rotterdam is a quaint old city, well worthy of a few hours' quiet survey; and, as there is not much to be seen, those few hours will suffice to see all. The most characteristic view of the whole is to be had from a tower of the High Church, the peculiarities of the place being at once observable from this vantage post. Of these the chief is the intersection in all possible directions of the streets by the numerous canals, or rather the twining and twistings of the great canal, the ramifications of which are so diversified as to give altogether a peculiar feature to the city: the canals take in point of fact the place of the streets of other cities, the real streets forming comparatively narrow strips on each side of the canal. The number of bridges is consequently very great; and these, when viewed from a lower level, form a feature in many cases picturesque and in all peculiar. The houses are very high as a rule, and, being nearly all built on earth which can scarcely be characterised as solid, many of them are off the "plumb," and that in some cases to a degree which is somewhat alarming to an on-looker who has been accustomed to the straight, erect structures built on more solid soils. In many cases the houses are built quite close up to the sides of the canals, and look as if they would some day inevitably topple over and splash into the waters below. In many, we may perhaps say the majority, of the streets skirting the canals, trees are planted, which give the charm to a city which they alone can give.

The view from the tower of the High Church gives on a clear day a very striking view of what may be called the exceedingly narrow limits within which are comprised the towns and districts of this little kingdom; indeed a good eye may take in the whole of it, and that by no great exertion of its seeing capabilities. To the south is seen the lower reaches of the lordly river the Rhine, about which so much has been written and said, and in praise of which the songs of Germany abound—a river at this point which, as it "drags its slow length" along in quiet and placid, or sluggish, style, is the very antipodes of that noble phase which it presents for miles away, where it dashes over the rocks of Schaffhausen, or runs swiftly through the pass of the Lurle, or washes the base of the vine-clad cliffs, the summits of which are capped by the ruins of the castles which make the upper Rhine such a charming river. But the lower Rhine, in its quiet placidity, is not a river by any means to be despised; its banks no doubt lack the features to which we have above alluded, but they possess charms to those fond of quiet rural scenery, abounding in much that is, if not picturesque, at least that is very pleasing. We are aware that it is the fashion amongst the English tourists to pooh-pooch the lower Rhine as a river all sailing upon which for sight-seeing is to be avoided, but on such fair acquaintance with it as frequent voyages upon it may reasonably be supposed to give, we can claim for it this—that it is at all events worth sailing down at least once. And if this is done by one of our readers on the strength of this statement, he will not be disposed to find fault with us for giving him the advice. All the more pleasure will it be if, to the interest which a true agriculturist will take in seeing much that is suggestive of rural life of a character somewhat diverse from that met with in our own country, he adds that interest which an artistic taste will throw around scenery which will remind him many a time in the course of a day's sail of our charming pictures of the old masters. He will see

many a production in real life of that which in their works he has long studied and admired. But to return to our view as obtained from the tower of the High Church of Rotterdam. Following the river up its banks, if banks they can be called, he will see the red piled houses and the prominent steeples of Dortrechtel (Dort), a venerable city, which with its old historical associations, and its fine buildings, and the beautiful sails which may be made on the borders of the river surrounding it, is well worthy of a visit. Turning towards the north-west he will see the railway shooting out in a straight "bee line" right off to the queer old town of Delft—once famous for its crockery—and still famous for the church in which repose the remains of some of Holland's heroes and great men. Further on the eye takes in the steeples of the still more famous town of the Hague, a charming toy town, which should be visited, not less for the art-treasures which are there to be met with, than for the pleasant trips which can be made in its vicinity. Amongst which may here be noted the watering place in the North Sea—the Baden-Baden of Holland. Further on you see the town of Leyden, famous for its university, and not less famous for its size and its heroic defence. Still further on the eye rests upon the buildings of Haarlem, famous for its huge organ, and still further on those of the regal town of Amsterdam; still sweeping round, the eye next rests upon the quaint fine old town of Utrecht, and nearer Rotterdam that of Gouda, celebrated for its cheese. Within this circle lies nearly the whole of Holland, and its principal cities.

The character of the country agriculturally may be seen at a glance, it is essentially meadow and pasture land, but such pastures! It does the heart of a staunch old farmer good to see the grass amongst which the cows luxuriate; it is suggestive of an endless flow of the finest milk, of supplies of the richest cream. But more of this and of cognate subjects as we proceed.

The chief characteristics of the towns of Holland are cleanliness and quiet, not but what we have seen dirty slums even there, and smelt scents not by any means suggestive of the "Sabean odour from the spicy shore" of which the poet sings. But cleanliness is without doubt the rule, cleanliness which does not content itself with the condition of interior but concerns itself equally with the exterior of the houses. Nothing, indeed, so clearly contrasts with the state of too many of the streets of our towns and the slovenly state of too many of the houses, especially of the lower classes, than the way in which cleanliness "inside and out" is looked after, and undoubtedly secured throughout the whole of Holland. There is certainly no stint of water, and still more certainly there is no stint in its use for cleaning purposes. The very streets are washed, and pavement scrubbed like parlour floors—the brass work is of the most brilliant, the paints of the purest. Quietness of the towns, with the exception of Rotterdam and Amsterdam, which are in many respects quite noisy and bustling enough, is another characteristic which cannot fail to strike the observant traveller. It is a "silence which may be heard," and which imparts to all around a sleepiness which is very catching, but which to one coming from the never ending push and bustle of our towns has a charm of its own. To the man who has been over-wrought, as is too often the case with many of us, a positive benefit is to be derived from the strolls through the great streets of the majority of Dutch towns—the strain is taken off the

mind, and it is allowed to go to rest as one dreamily saunters along. There is quite enough of historical interest attached to nearly all the towns to impart an intellectual rest, to keep the mind alive without taxing it in any way. But the true "draught of nepenthe" is to be drunk, so to say, when one steals through the country on board one of the canal boats or truckshuits which "run," we were going to say, borrowing a phrase from our own go-a-head vocabulary, but which we should rather say "creep" from town to town. We are quite aware that this mode of travelling is all too slow for the hurrying tourist to whom a railway is scarce quick enough, and to whom the object seems to be to get through or over a country as fast as possible, regardless of what he sees, or rather what he does not see. But to one who wishes to see the country in its true—which to our readers means its agricultural—aspect, to see the people, the houses they live in, the work they do, and what may be called the inner life of the villages, we would strongly recommend the tourist to devote at least two or three days to travel by canal boat. If the weather be fine, we know of no more delightful mode of conveyance; there is just spurt enough of motion to give the notion that progress is being made, yet not enough to dispel the dreamy drowsiness which to the overworked man is so delightful, and which is so well calculated to aid nature's recuperative powers. And as the gardens of the better class of houses almost invariably stretch down towards the canal, charming views of the inner lives of wealthy Dutchmen are often obtained. Gardens laid out with the richest profusion of shrubs, trees, and of the flowers for which the Dutch are so famous, are frequently passed; nor are views of lower life wanting, as the canals pass through the centres of the villages, forming indeed the highway, so that views of quaint old houses are often obtained. And every now and then a stage in the journey is reached at which the boat stops, and as these stoppages deserve the name they get—unlike the hurried minute or two we get at our halting places—the tourist has time enough to "liquor up" in some queer old smiddy of a drinking shop, in which more frequently than otherwise an "interior" view is obtained of house and housewife, which puts the artistically inclined traveller in mind of some rare old bits of Teniers. And last, although not least, in importance to the prudent man who wishes to get the maximum of pleasure or information at the minimum of expense, a consideration worthy to be considered, and so considered by all who are not of the class who have "more money than wit"—the cost of conveyance by truckshuit is low, almost ridiculously low. Taking everything into consideration for those who wish really to see what is worthy to be seen, we pronounce the truckshuit as the best conveyance to take in Holland. We have travelled through the country in all ways, and we maintain that those who travel only by railway, do not, and cannot, see Holland as it is, and the Dutch people as they are. Another pleasant mode of travelling to see the country is what we would call a gig: this is generally provided with a hood, by no means a convenience to be despised when the sun is pouring down its fierce rays, and not less so when a heavy shower falls. This is not the only kind of conveyance to be had; some indeed are so odd in build as to defy the powers of description of any maker of such vehicles as we have. Carriages can be hired at almost any village, and as the roads are generally good, a fair extent of road can be got over in a short time, with this great advantage, that you can pull up at any point, to examine closely what may strike you as worthy of examination, an advantage which the truckshuit does not afford you. The horses, as a rule, sent out with these conveyances are not much "crack on;" but they manage to get famously along, nevertheless, opposite as they are to the obese con-

dition which is supposed to be the characteristic of the well-built, broad-beamed Dutchman—a characteristic, by the way, we may name in passing, not so frequently met with in Holland as we would be led to infer from what has been written and said of them. In point of fact, we have seen greater numbers of "Dutch builds" in the human frame in Paris and France, than we have seen in Amsterdam and Holland, notwithstanding the popular notion of the "lean and lanky Johnny Crapaud."

From what we have already said it will have been observed that the chief towns of Holland lie in what Bob Cratchet called "a circle"; so that, setting out from Rotterdam, the traveller takes them all in, and can return to Rotterdam in the opposite direction from that in which he set out. Thus he may go from Rotterdam by way of Delft, taking thereafter the Hague, Leyden, Haarlem, and Amsterdam; thence to Utrecht and Gouda; and from Gouda back, if so he wills, to Rotterdam; or he may go first to Gouda, and thence round by way of Utrecht to Amsterdam, reversing the order in which the other towns are named.

For reasons, which may or may not be obvious, and which, after all, are of little moment, we purpose taking our readers in the last of the two named ways—namely, by Gouda—as the first point to be reached.

Nearly the whole of the land on both sides of the canal or railway from Rotterdam to Gouda is devoted to meadows and pastures, comparatively little being under cultivation, and that little devoted chiefly to rye and oats amongst the cereal crops, and colza and potatoes amongst the forage and root crops. The colza is grown chiefly for the seed, but is also used in its green state for forage purposes. It is usually sown in the month of July—if the crop is to be raised from transplanted plants—in a well-manured seed-bed. As soon as the stubbles are cleared the land is ploughed deeply, and the furrows—where the best cultivation is sought after—carefully laid up after with the spade. The plants are then transplanted from the seed-bed, in rows at distances from each other varying from twelve to sixteen inches, and at distances in the rows of twelve inches. If the season is early, and the plants have taken well, they are hoed before winter, the land being left as rough as possible; they are then left, and early in the spring again hoed, and a good feed may be sometimes obtained from it if peculiarly luxuriant and the season is early; it will after this shoot up rapidly and grow for seeding. If entirely used for forage, this will be done so early as to allow of the land being prepared for rye, oats, and potatoes. When in flower, the bright yellow appearance of the fields or patches of land—more frequently these than those—upon which it grows presents a fine contrast to the surrounding green lands, and give to the aspect of the country a cheerful look. When the crop is ready for harvesting, it is cut with the sickle, a long stubble being purposely left, upon which the cut crop is laid, and being thus well kept off the ground, it soon dries. When it is thrashed, the chaff from the seeds makes an excellent substance for mashes, and so does the straw if cut up small into chaff, although it is generally used for littering. Colza is, however, a much more important crop in the neighbouring country of Belgium, where, to be sure, the style of farming is very different, as we may hereafter see, from that carried out in Holland. There can be no doubt of this, that on light lands we could, by cultivating rape more largely than we do, add greatly to our stock of feeding or forage plants. Where good colza is grown there must also be good farming, another point in its favour. The land all the way up to Gouda is largely composed of peaty or mossy soil, as evidenced in the peats which may be seen here and there laid on land to dry, and in the dark sided pools of water; although there are parts where sandy soil is

abundant. The land is indeed, as a rule, of anything but a solid character; so far from this, that if a building or any great weight is to be erected, the first operation is that of piling. We saw a station shed in course of erection at Gouda, and the piling driven to secure the foundation showed the treacherous character of the soil, and the consequently costly character of the structure. Clover, generally the scarlet clover, is also cultivated as forage, for summer feeding. The winter forage consists almost entirely of hay, raised from the meadows. The crops are, as may be expected from what we have already said, generally heavy, as may be seen from the large and well-filled sheds or covered stacks attached to small, or what appear to be small farm-houses. The meadows are liberally top-dressed with manure, this being composed not only of farm dung, but of town refuse often carried a considerable distance in small boats, these being tracked along the water-ways or small canals, which are seen everywhere over the land. These are so numerous in the neighbourhood of Gouda, that the solid land lies between the canals in narrow patches; and it is a curiously suggestive sight to see, when one looks across the country in the direction of the water-ways, the strips of alternating green contrasting with the water-ways, and stretching far away into the distance where they seem to merge one into another. Not that the distinction between water and grass-land is always very marked, for so covered are some of the water-ways with green weeds, and that so closely, that it is difficult to see at any, even a short distance, which strip is land and which is water—only this, that the cattle grazing indicates certainly the one which is solid. These water-ways are frequently used to transport the manure to the fields; the boats are small, but their want of capacity is made up by the height to which the manure is piled up—so piled up, that many a time we looked out for a capsize. The manure for top-dressing the meadows is laid liberally on the meadow land, and with scrupulous care spread over the surface, special attention apparently being given to the breaking up of the lumps and giving as uniform a dressing as possible to the surface of the land. This care is well repaid in the magnificent crops with which, as a rule, the farmers of Holland are blessed. The distribution of the manure is aided by wheelbarrows

and sometimes by small oddly-shaped but handy four-wheeled waggons, in which the manure is taken from the boats and laid in heaps over the meadow.

The cows are kept out in the pastures night and day in the summer time, the milking being done three times a day. The "milk-maids" are a sight to see in the generally picturesque costumes in which they appear, and the scrupulous cleanliness of person and of dress; the same remark may be made of the vessels used. These are often of brass, and are polished till they reflect the rays of the sun like burnished gold; if of wood, they are bound with metal, iron or brass, hoops, which are also kept scrupulously bright, and contrast finely with the white wood, which also tells of the "elbow grease" which has been expended in cleaning it. Like the peasantry of Belgium, that of Holland take an especial pride in their utensils: they are often very costly, and are cleaned and burnished till they shine again, and are always placed in the houses in such conspicuous positions as to indicate the value placed upon them; they are the household gods and most devoutly worshipped. The milk is carried home in vessels suspended from the two ends of a pole which rests upon the shoulders of the milk-maid—a most convenient way of carrying. The cows, where supplies can be had, have distillery wash or dreg, this being given in large tubs, which are placed at convenient parts of the field. We have seen these frequently, especially on the other side of Rotterdam, in the neighbourhood of Schiedam, that place so celebrated for its fine distilleries.

The fields are by no means large, the strips of land in districts as at Gouda, where the water-ways are so numerous, indeed prevent this; in other parts, as in the polder lands, the fields are larger, and the water-ways less numerous. There are no fences, the water-ways—or dykes, as they are called—forming the divisions. To admit of access from one strip to another, and as forming in fact the roadways to the farm, bridges or boarded footways are thrown across the water-ways; and to prevent the animal crossing, when it is desired they should be confined to one strip of pasture, part of the roadway is movable or hinged, so that it can be lifted up, or one or two of the centre boards are taken out, thus preventing the animals from crossing till the hinged part—draw-bridge fashion—is let down or the planks put in place.

PENRITH AGRICULTURAL SOCIETY.

Notwithstanding the glut of local shows at this season, that at Penrith not only "held its own," but exceeded in many respects the achievements of former years. In the cattle class there were sixty entries, including some of the best breed of which these eminently breeding counties can boast. The bulls were a grand specimen of what enterprise can effect backed by capital and judgment, and no diversity of opinion existed as to the discretion of the judges in awarding the premier prizes. The aged Shorthorn bulls were a magnificent class. Mr. J. C. Bowstead, of Hackthorpe Hall, adding another to his well-earned laurels with his matchless Flag of Britain, a pure white, with splendid head, excellent fore-quarters, good gait, and elephantine but symmetrical proportions. The Emperor, for the two-year-olds, and Mr. Bowstead's British Banner and Flag of Britain had but little to contend against, excepting Mr. Hogarth's Saint Julian, promising a good future. Shorthorn cows and heifers were a very attractive show, three first prizes going to Sir G. Musgrave's celebrated herd. Mr. W. Lowth's premium of a ten-guinea cup was carried off by the first-prize bull above alluded to. Mr. Rickerby's Emperor, now for the first time shown, and for which a second prize was given in class 3, bids fair to hold a leading position at future shows. In the horse class there were 204 entries, and it was altogether a useful good show.

The agricultural geldings were not very numerous, but good of their class. Light horses were very well represented, and the hunting fillies were also much and deservedly admired. The sheep show was throughout a capital class, the Leicesters more particularly. The blackfaced sheep were also good in their class—indeed, the judges expressed an opinion that they had never seen better shown. Where there was so much excellence, it is almost invidious to particularize, but special mention should be made of the draughts from the flocks of Mr. Irving, of Shap Abbey, whose royal sheep was again successful, and had other favours showered upon him. There was, as usual several reversions of the decisions at other shows, and in no case more pointedly than in the award for the best border Leicester tup, which was given to Mr. J. C. Bowstead, of Hackthorpe Hall, whereas the same tup was only third at Templesowerby. Col. Rigg's tup in the same class was second both here and at Templesowerby. The show of pigs was not large, but it included some very good specimens of porcine excellence. Some reputable dairies were represented, the redoubtable Mrs. Dobson, of Williams town, and Mrs. Davidson, of Greengill, dividing the two honours, which included two pieces of plate presented by Mr. R. Tinkler, churn manufacturer. Messrs. Stalker, R. Tinkler, and Armstrong, of Penrith, made a large display of agricultural

implements; and Mr. Proud, of Carlisle, showed a collection of light fashionably-constructed vehicles. There was a small show of roots, by Mr. Ingledew, of Sewborrews, Mr. Wright, of Carleton, and Mr. Clark, of Penrith, but no prizes were offered. As a whole, the show was considered a complete success, notwithstanding the hesitation on the part of some to run the risk of encountering the prevalent disease which has happily not displayed itself with excessive virulence in the immediate neighbourhood of Penrith.

The following were the judges.—Shorthorn cattle, and pigs: Joseph Culshaw, Towneley Park, Burnley; Thomas Atherton; Nichol Milne, Fade side, Melrose. Leicester,

border-Leicester, and long-wool sheep: R. W. Cresswell, Ashby-de-la-Zouch, Leicestershire; Lambert, Elrington Hall, Hexham; John Wood, Stanwick Park, Darlington. Hunting and harness horses: Brumley, West Launcester; John Blackstock, Hayton Castle, Maryport. Agricultural horses: John Forster, Longtown; James Steepman, Roslin, Edinburgh. Blackfaced sheep: William Noble, Beekford, Bampton; Geo. Browne, Troutbeck. Butter: John Irving, Longmarton; John Shields, Kirkbythside. Inspectors of green crops: George Smith, Coekernouth; R. Hetherington, Park Hall, Silloth; Peter Crosthwaite, Keswick.—*Carlisle Journal*.

WIGTON AGRICULTURAL SOCIETY.

JUDGES.

HORSES.—Saddle and harness horses: Mr. Hall, Sedgfield, Durham; Mr. Fearon, Keele House. Cart horses: Mr. T. Marshall, The Howes, Annan; Mr. M. Teeuan, White Sands, Dumfries.

CATTLE.—Shorthorns: Mr. J. Unthank, Netherseales, Penrith; Mr. A. Haddon, Honeyburn, Hawick. Galloways: Mr. Kerr, Red Hall; Mr. J. Grierson, Brandedelys, by Crocketford.

SHEEP AND PIGS.—Mr. J. Belleirving, Whitehall, Lockerbie; Mr. J. Mackenzie, Burnhill, Dumfries.

P R I Z E L I S T .

CATTLE.

SHORTHORNS.

Bulls, calved previous to January 1st, 1868.—First prize, J. Todd, Mireside; second, J. Barnes, Barugh.

Bulls, calved in 1868.—First prize, J. Scott, Little Crosthwaite; second, J. P. Foster, Killhow.

Bulls, calved in 1869.—First prize, J. C. Boustead, Hackthorpe Hall; second, J. Nelson, Rash.

Bull calf, calved in 1870.—First prize, J. Lamb, Burrell Green; second, J. and J. Norman, Bridge Mill.

Cows or heifers in calf or milk, calved previous to 1868.—First prize, J. Todd; second, R. B. Hetherington, Park Head.

Heifers, calved in 1868.—First prize, T. Dalzell, Hollius; second, T. Dalzell.

Heifers, calved in 1869.—First prize, J. Gunson, Sandwith, Whitehaven; second, J. P. Foster.

Pair of heifer calves, 1870.—Prize, J. Todd.

Pair of steers, calved in 1869.—First prize, J. Cowen, Curthwaite; second, J. Clark, Wampool.

Cup, value 30 guineas, for the best Shorthorn bull of any age.—Prize, J. Lamb.

Twenty guineas for the best Shorthorn cow or heifer of any age.—Prize, R. B. Hetherington.

Shorthorn bulls above 12 months, and not exceeding 36 months old.—First prize, J. C. Boustead, Hackthorpe Hall; second, J. Scott, Little Crosthwaite; third, T. Donald, Sanden House.

Bull of any age.—Prize, J. Fisher.

GALLOWAYS.

Bulls, calved previous to January 1st, 1868.—First prize, J. Fisher, The Knells; second, J. Graham, Parcelstown.

Bulls, calved in 1868.—First prize, R. Peat, Stone House, Seaville.

Bulls, calved in 1869.—First prize, J. Johnson, The Green; second, J. Thirlwall, Whittriggles.

Bull calf, calved in 1870.—Prize, J. Fisher.

Cows or heifers in calf or milk, calved previous to 1868.—First prize, J. Graham; second, J. Graham.

Heifers, calved in 1868.—First prize, J. Graham; second, W. Harrison, Westfield House.

Heifers, calved in 1869.—Prize, J. Graham.

HORSES.

SADDLE.

Brood mares.—First prize, I. W. T. Fyler, Hefleton, Dorsetshire; second, T. Baxter, Bromfield.

One-year-old filly.—First prize, T. Baxter; second, G. Moore, Whitehall.

Two year old filly.—First prize, W. F. Wilson, The Gale; second, J. Robinson, Bowness.

Three-year-old filly.—First prize, H. Railton, Snittlegarth; second, G. Ruddick, Arkleby.

One-year-old colt.—First prize, T. C. Thompson, Kirkhouse; second, T. J. Steel, Southerfield.

Two-year-old colt.—First prize, Sir Wilfrid Lawson, Bart., Brayton Hall; second, J. S. Steel, Laythes.

Three-year-old colt.—First prize, L. Potts, Wigton; second, G. T. Carr, Silloth.

Brood mare, calculated to breed hunters, with foal at foot.—First prize, I. W. T. Fyler; second, T. Baxter.

HARNESSES.

Brood mare.—First prize, J. Jennings, Thornby; second, T. Morton, Longburgh House.

One-year-old filly.—First prize, J. Nicholson, The Bank; second, J. Jennings.

Two-year-old filly.—First prize, S. Stamper, Waverton; second, J. Bowley, Warthole Guards.

Three-year-old filly.—First prize, C. and J. Armstrong, Carlisle; second, J. Thirlwall, Whittriggles.

One-year-old colt.—First prize, G. H. Head, Rickerby; second, R. F. Irving, Torpenhow.

Two-year-old colt.—First prize, T. Baxter; second, Sir W. Lawson.

Three-year-old colt.—First prize, R. H. Watson, Bolton Park; second, T. Baxter.

CART.

Brood mares.—First prize, T. Bell, Townfoot, Brampton; second, G. Little, Heads.

One-year-old filly.—First prize, G. Little; second, W. Atkinson, Greenrigg; commended, J. Williamson, Torpenhow.

Two-year-old filly.—First prize, W. Little, Whittriggles; second, Mrs. Little, Bownes Hall.

Three-year-old filly.—Prize, Mrs. R. Carruthers, Highfield Moor, near Carlisle.

One-year-old colt.—First prize, G. H. Head, Rickerby; second, R. Barnes, Laythes.

Two-year-old colt.—First prize, W. Atkinson; second, Mrs. Little.

Three-year-old colt.—First prize, S. Stamper, Waverton; second, J. W. Black, Longburgh.

Cart horse or mare from 3 to 8 years old, *bona fide* the property of a tenant farmer.—Prize, T. Bell, Townfoot Farm.

SWEEPSTAKES.

Pair horse or mare.—Prize, R. and J. Little, Guards.

Colt or filly foal for saddle.—Prize, H. Railton, Snittlegarth.

Colt or filly foal for harness.—Prize, A. Hayton, Border Cottage.

Cart colt foal.—Prize, J. Ostle, New Cowper.

Cart filly foal.—Prize, R. Barnes, Laythes.

Pony of any age, not exceeding 13 hands 2 inches high.—Prize, R. H. Watson, Bolton Park.

Hackney, of any age.—First prize, H. Railton; second, R. Feddon, Thursby.

Hunter.—First prize, R. H. Watson; second, G. Holliday, Mawbray Hayrigg.

SHEEP.

LEICESTERS.

Tups of any age, to be approved stock getters.—First prize, J. Todd, Mireside; second, J. Todd.

Shearling tups.—First prize, J. Hetherington, Moorrow; second, J. Todd.

Three ewes that have reared lambs this season.—First prize, J. Todd; second, W. Roper, Ling.

Three gimmers.—Prize, J. Todd.

BORDER-LEICESTERS.

Border tups of any age.—First prize, T. Bell, Whitehead Hill (Town Foot, Brampton); second, J. P. Forster, Killhow.

Shearling border tups.—First prize, T. Bell; second, J. P. Foster.

Three pure border ewes.—First prize, J. P. Foster; second, G. F. Statter, Broomhill.

Three border gimmers.—First prize, J. P. Foster; second, G. F. Statter.

LONG WOOLS.

Tups of any age.—First prize, W. Norman, Hall Bank; second, W. Norman.

Shearling tups.—First prize, W. Norman; second, W. Norman.

Three ewes that have reared lambs this season.—First prize, W. Norman; second, W. Norman.

Three gimmers.—First prize, W. Norman; second, W. Norman.

MOUNTAIN.

Mountain tup.—First prize, A. Parker, Nether Row, Caldbeck; second, A. Parker.

Shearling tup.—First prize, A. Parker; second, A. Parker.

Five mountain ewes, having reared lambs this season.—

First prize, A. Parker; second, A. Parker.

SWEEPSTAKES.

Pair of gimmer lambs of any breed.—Prize, W. Roper.

Tup lamb of any breed.—Prize, W. Norman.

Ewe of any breed.—Prize, W. Norman.

PIGS.

Boar of the large breed.—First prize, J. Robinson, Wigton; second, T. Hodgson, Longnewton.

Boar of the small breed.—Prize, T. Hodgson.

Sows in pig or mild of the large breed.—Prize, J. and J. Norman, Bridge Mill.

Sow in pig or milk of the small breed.—Prize, R. B. Hetherington, Park Head.

GREASLEY AND SELSTONE AGRICULTURAL SOCIETY.

MEETING AT MOOR GREEN.

The annual exhibition of the Greasley and Selstone Agricultural Society took place at Moor Green, and though it was not quite so well attended as on many previous occasions, yet it excited considerable interest amongst the inhabitants of that locality which the Society embraces within the scope of its operations. Some very good cattle were exhibited; but, owing to the drought for which this season has been so remarkable, and also to the foot-and-mouth disease having been so prevalent, they were neither so numerous nor of so fine a quality as in years gone by. The show of roots, particularly of mangold wurtzel, was very creditable. Everything considered, though the swedes have suffered very much from the insects with which they literally swarm. The judges were S. Field, of Farnsfield, W. Machen, of Linby, R. Watson, of Scarrington, and W. Ladtkin, of Lutterworth. The following is a list of the prizes awarded:—

HORSES.

Horse adapted for hunting purposes.—First prize, — Baldwin, Bulwell Hall; second, S. T. Jackson, Watnall.

Cart mare with foal at her foot.—First prize, H. Alcock, Linby; second, — Annable, Watnall.

Cart foal.—Prize, H. Alcock.

Two-year-old cart gelding or filly.—First prize, E. Godber, Hucknall; second, Barber, Walker, and Company.

AGRICULTURAL.

Pair of horses adapted for agricultural purposes, that have ploughed at the match, to be shown in harness.—First prize, E. Godber; second, J. Winson, Watnall; third, — Braithwaite.

HACKS.

Hack or roadster.—First prize, S. T. Jackson; second, J. Widdowson, Hucknall.

BEASTS.

Cow in milk, that has had a calf since April 1st, 1870.—First prize, H. Alcock; second, J. C. Musters, Annesley.

In-calf cow, stating the time of calving.—First prize, H. Alcock; second, H. Alcock.

Heifer under three years of age, calved or in calf.—First prize, Colonel Holden, Nuttall; second, T. Edge, Strelley.

Beast under two years old.—First prize, J. C. Musters; second, T. Edge.

Beast under one year old.—First prize, T. Edge; second, J. C. Musters.

Bull two years old and upwards.—First prize, J. C. Musters; second, H. Alcock.

Bull under two years old.—First prize, J. Widdowson; second, E. Godber.

SHEEP.

Three long-wooled ewes, having reared a lamb, and having again been or intended to be put to the ram.—First prize, H. Alcock; second, H. Alcock.

Three long-wooled theaves, having reared a lamb, and having again been or intended to be put to the ram.—First prize, — Annable; second, — Annable.

Five long-wooled ewes or wether lambs.—First prize, H. Alcock; second, H. Alcock.

Long-wooled ram of any age above a shearling.—Prize, H. Alcock.

Long-wooled ram lamb.—First prize, — Evans, Moor Green; second, — Evans.

Short-wooled ram of any age.—First prize, — Mellows, Papplewick; second, — Mellows.

Three short-wooled ewes, having reared a lamb, and having again been or intended to be put to the ram.—First prize, — Mellows; second, — Mellows.

Three short-wooled theaves.—First prize, — Mellows; second, — Mellows.

Five short-wooled ewes or wether lambs.—First prize, — Mellows; second, Rev. J. L. Prior.

PIGS.

Boar.—First prize, — Mellows; second, — Musters.

Breeding sow, pigged or in pig.—First prize, — Evans; second, J. C. Musters.

Gilt, pigged or in pig.—First prize, J. Widdowson; second, J. Widdowson.

ROOTS.

Crop of Swedish turnips, four acres and upwards, contiguous.—First prize, — Annable; second, T. Day, Nuttall.

Crop of Swedish turnips, one acre and under four.—First prize, H. Alcock; second, J. Widdowson.

Crop of mangold wurtzel, three acres and upwards.—First prize, Colonel Holden; second, T. Day.

Crop of mangold wurtzel, one acre and under three.—First prize, J. Widdowson; second, H. Alcock.

THE DERBYSHIRE AGRICULTURAL SOCIETY.

MEETING AT DERBY.

The show was, on the whole, one of the best the Society has ever had. The classes were well filled, and some of the animals shown of high character. The dairy cows, shown in fours, in pairs, and in single animals, were very good, as were the Shorthorn bulls, the best of which would take a position at a Royal Show. The sheep were inferior, and Derbyshire farmers would do well to look to their short-wools. The pigs were not numerous, but with some good specimens amongst them; and the horses, as a whole, as encouraging a show as the Society has yet had. Fifteen makers of cheese entered into competition, and some five or six of the lots were excellent in quality. The whole of the competing cheese was of the flat or thin variety. The show of wheat, both white and red, was very superior; the barley very good, but the oats not of that first order of excellence, nor were the entries at all numerous. Notwithstanding the exceptional dryness of the season the exhibition of roots was remarkably good. The entry of implements was not considerable. Several makers who had intimated their intention to be present did not put in an appearance, and with very few exceptions the specimens did not display features of novelty. Mr. Murray, of Elvaston, exhibited his models of a cheese factory working plant, for which a silver medal was awarded at the Walsall meeting of the Staffordshire Society last week, and again at this meeting. J. and G. Haywood, of Derby, sent a collection of implements by leading manufacturers; W. and J. Ratcliff, of Derby, exhibited a large and varied collection of implements. Thompson and Upton, of Derby, showed, amongst other things, a new horse-gear works, in which all the wheels are enclosed in a cast-iron case, which has the advantage of keeping the works free from dirt; Mellard's Trent Foundry Co. had a stand, the most noticeable article on which was the new patent revolving mould board plough—an American invention, which the patentees and licensees predict will effect a revolution in ploughing; and Bell Brothers, of Dean-street, Oxford-street, London, exhibited their washing machines.

The judges of farms report that—"After carefully going over the several farms entered for competition, we award the first prize to Mr. Robert Sybray, of Alderwasley. His farm comprises 110 acres arable, and 113 acres of pasture, and does great credit to Mr. Sybray. The second prize we award to Mr. Matthew Walker, of Stockley Park, a farm of 110 acres arable, and 150 pasture; great credit, and if supplemented by a better class of pasture land, would make it a first-rate occupation."

PRIZE LIST.

JUDGES.

CATTLE: Mr. Murray, Elvaston; Mr. Dicken, Mansfield.
AGRICULTURAL HORSES: Mr. G. Woolhouse, Wellington; Mr. Spencer, Loughboro'.
HUNTERS AND HACKS: Mr. Corbet, Farmers' Club; Mr. Colton, Newark; Mr. Bland, Newark.
SHEEP, LONG-WOOL: Mr. T. Tomlinson, Atlow; Mr. J. Lynn, Stroxtou.
SHORT-WOOL AND PIGS: Mr. Hall, Wilne; Mr. Coxon, Freeford.
GRAIN AND ROOTS: Mr. G. Wheeldon; Mr. Sybray.
CHEESE: Mr. S. W. Cox; Mr. Etches.
BUTTER: Mr. Barber.
WOOL: Mr. T. Tomlinson; Mr. J. Lynn.
IMPLEMENTS: Mr. Bosworth; Mr. Bullock; Mr. Abel.
VETERINARY SURGEON: Mr. Cowlishaw, Derby.

CATTLE.

Four cows for dairy-purposes, belonging to members keeping more than 20 cows.—First prize, £10, and silver cup value 10 guineas, M. T. Hopkinson, Woodthorpe; second, £5, G. J. Mitchell, Newton Mount; third, £2, M. T. Hopkinson, Woodthorpe. Highly commended: J. Hodgkinson, Allestree. Commended: T. C. Smith, Birdsgrove.

Two cows for dairy-purposes, belonging to members not keeping more than 20 cows.—First prize, £5, E. Vale, Rose Hill, Litchurch; second, £3, W. Worthington, Newton Park; third, £3, E. Vale. Highly commended: Dr. Hitchman.

Shorthorn cow, having calf.—First prize, £5, J. Fox, Pleasely; second, £3, E. Vale; third, £2, R. Ratcliffe, Walton Hall. Highly commended: J. Hodgkinson. Commended: W. S. Woodroffe, Normanton-on-Soar.

Pair of heifers under three years old.—First prize, £5, R. Ratcliffe, Walton Hall; second, £3, W. T. Cox, Spondon Hall; third, G. J. Mitchell, Newton Mount. Highly commended: G. Thomas, Littleover. The class commended.

Pair of in calf heifers, belonging to a tenant-farmer dairying not less than 12 cows.—First prize, £3, M. T. Hopkinson, Woodthorpe; second, £2, G. J. Mitchell; third, £1, J. Foster, Thulston. Highly commended: W. J. Matthews, Repton.

Pair of stirks, under two years old, best adapted for dairy-purposes, belonging to a tenant-farmer.—First prize, £3, R. Ratcliffe; second, £2, G. J. Mitchell; third, £1, J. Fox. Highly commended: T. Yates, Sapperton.

Shorthorn bull, two years old and upwards.—First prize, £5, and silver cup, Mrs. Packman, Tupton Hall; second, £3, T. Robinson, Burton-on-Trent. Highly commended: G. Bryer, Markeaton Park. Commended: T. Yates, Sapperton, and W. S. Woodroffe, Normanton-on-Soar.

Yearling Shorthorn bull.—First prize, £5, and a silver cup, R. Blackwell, Tansley; second, £3, J. Rose, The Ash; third, £2, M. Walker, Stockley Park. Highly commended: J. Raynor, Markeaton.

Bull calf not exceeding twelve months old.—First prize, £3, R. Ratcliffe, Walton; second, £2, Mrs. Packman; third, £1, J. Raynor.

Four rearing calves.—First prize, £2, S. Robson, jun., Melbourne; second, £1, H. Leeke, Holbrook.

Fat ox or steer of any breed.—First prize, £5, F. Ratcliff, Cliff House, Burton Cross; second, £2, W. T. Cox. Highly commended: G. J. Mitchell. Commended: J. Evans, Alport.

Fat cow or heifer of any breed.—First prize, £6, and a silver cup value £5, W. T. Cox; second, £4, W. T. Cox; third, £2, J. Faulkner, Bretby.

HORSES.

Stallion for agricultural purposes, two years old and upwards.—First prize, £5, J. Nix, Alfreton; second, £3, J. Borrows, Stanley.

Brood mare and foal for agricultural purposes.—First prize, £5, T. Travis; second, £3, T. Orme, Ilton; third, £2, R. Marples, Kedleston.

Cart foal.—Prize, T. Orme, Ilton.

Two year old gelding or filly for agricultural purposes.—First prize, £4, A. Tomlinson, Stenson; second, £2, A. Tomlinson; third, £1, E. Thacker, Ambaston. Highly commended: T. Bullock, Egginton.

One-year-old gelding or filly for agricultural purposes.—First prize, £4, J. Vickers, Wellington; second, £2, J. E. Griffin, Thulston. Commended: J. E. Griffin; F. Tomlinson, Stuthwood; and J. Vickers, Wellington.

Pair of horses for agricultural purposes.—First prize, £5, J. Rose, The Ash; second, £3, W. Radford, Thulston; third, £2, J. Hawksworth, Barlow.

Brood mare and foal best suited for breeding hunters and hacks.—First prize, £5, W. Parker, Alvaston; second, £3, T. H. Smith, Ambaston.

Hack or harness horse above four years.—First prize, £5, T. B. Worthington, Derby; second, £2, H. Boden, Ednaston.

Highly commended: T. Ward, Dalbury Lees. Commended: H. Boden, Ednaston.

Gelding or filly, of the value of £50, not thoroughbred, above three and under four years of age.—First prize, £5, J. Pegge, Littlelover; second, £2 10s., M. Andinwood, Weston Grange.

Gelding or filly above two and under three.—First prize, £3, G. J. Mitchell; second, £2, W. W. Woodward, Stanton-bridge.

Cob not exceeding 14 hands.—First prize, £3, the Earl of Harrington; second, £2, H. Flower, Derby.

Hunter, four years old and upwards, following the hounds hunting in Derbyshire.—First prize, £5, and a silver cup value £5, S. Robson, jun., Melbourne; second, £5, G. Wheeldon, Derby; third, £2, A. Hubbersty, Brackenfield; fourth, £1, T. H. Smith, Ambaston. The class commended.

EXTRA STOCK.—Highly commended: The Midland Railway Company, for a dray horse.

SHEEP.

LONG-WOOLS.

Five breeding ewes having had lambs in 1870.—First prize, £3, F. Dean, Kirk Ireton; second, £2, S. Wade, Mickleover; third, £1, R. Johnson, Kirk Ireton.

Five theaves.—First prize, £3, A. Bryer, Quarndon; second, £2, R. Johnson, Kirk Ireton; third, £1, J. Pegge, Littlelover

Five ewe lambs.—First prize, £2, C. Mellor, Atlow; second, £1, W. Riley, Boulton.

Ram of any age above a shearing.—First prize, £4, Fred. Dean, Kirk Ireton; second, £2, R. Johnson, Kirk Ireton; third, £1, R. Johnson.

Shearling ram.—First prize, £4, R. Lee, Kniveton; second, £2, R. Lee; third, £1, R. Johnson, Kirk Ireton. Highly commended: R. Johnson. Commended: F. Dean.

SHORT-WOOLS.

Five breeding ewes having had lambs in 1869.—First prize, £3, W. Baker, Moor Barns; second, £2, W. Baker; third, £1, C. Smith, Kirk Langley. Highly commended: J. Rose, The Ash.

Five theaves.—First prize, £3, W. Baker; second, £2, J. Rose, The Ash; third, £1, C. Smith, Kirk Langley.

Five lambs.—First prize, £2, W. Baker; second, £1, J. Rose. Commended: C. Smith.

Ram of any age above a shearing.—First prize, £4, W. Baker; second, £2, W. Wood, Holly Bank; third, £1, J. Rose. Commended: C. Smith.

Shearling ram.—First prize, £4, W. Baker; second, £2, W. Baker; third, £1, T. Robinson, Burton.

Lamb.—First prize, £2, W. Baker; second, £1, C. Smith. T. Rose, The Ash, showed six rams in this class, which were highly commended.

Pen of five fat wether sheep, of any breed, not exceeding 22 months old.—First prize, £3 3s., J. Rose; second, £2, W. Sale, Smisby.

PIGS.

LARGE BREED.

Boar of any age.—First prize, £2, M. Walker, Stockley Park; second, £1, J. B. Gregory, Ashover.

Sow of any age.—First prize, £2, J. B. Gregory, Ashover; second, £1, M. Walker. Highly commended: T. Yates, Sapperton. Commended: M. Walker.

Three breeding pigs of one litter, not exceeding 7 months

old.—First prize, £2, M. Walker; second, £1, M. Walker. The class highly commended.

SMALL BREED.

Boar of any age.—First prize, £2, and second, £1, J. Poyser, Burton-on-Trent.

Sow of any age.—First and second prizes, M. Walker. Highly commended: J. Gregory, Chellaston. Commended: J. Faulkner.

Three breeding pigs of one litter, not exceeding seven months old.—First prize, 2, J. Gregory; second, £1, G. J. Mitchell.

Pig, the property of an agricultural labourer.—First prize, £2, J. Morley, Thulston; second, £1, S. Bosworth, Chaddesden; third, 10s., T. Bosworth, Brethy.

Extra.—M. Walker, highly commended.

ROOTS.

Six roots of mangold wurtzel, to be taken from a crop of not less than two acres.—First prize, £1, J. Greatorex, Sretton; second, 10s., W. Stretton, Brizlincole.

Six swedes, to be taken from a crop of not less than two acres.—First prize, £1, J. Nuttall, Chaddesden; second, 10s., W. Stretton.

Six turnips, to be taken from a crop of not less than two acres.—First prize, £1, J. Falkner; second, 10s., M. Audinwood, jun.

Six ox cabbages, to be taken from a crop of not less than one acre.—First prize, £1, J. Greatorex; second, 10s., Wm. Stretton.

CHEESE.

Cheese of not less than 1 cwt.—First prize, £5, M. Walker, Stockley; second, £3, J. Rose, The Ash; third, £2, J. Carrington, Croxden Abbey. Highly commended: C. Bosworth, Dishley; S. Burchell, Cotton; A. Bryer, Quarndon; J. Harrison, Brailsford.

BUTTER.

Milk butter (not less than 6lbs.)—First prize, £1, J. Wood, Spondon; second, 10s., A. M. Mundy, Shipley.

Milk butter (not less than 6lbs.), made by the daughter of a member.—First prize, T. Hancock, Dale Abbey; second, 10s., J. Greatorex.

WOOL.

Three fleeces of long wool.—First prize, £2, R. Johnson, Kirk Ireton; second, £1, C. Bosworth, Dishley.

Three fleeces of short wool.—First prize, £2, J. Rose; second, £1, G. J. Mitchell.

GRAIN.

Red wheat.—First prize, £1, J. Greatorex; second, 10s., J. Pegge, Littlelover.

White wheat.—First prize, £1, J. Greatorex; second, 10s., J. Greatorex.

Barley.—First prize, £1, J. Faulkner, Brethy; second, 10s., G. J. Mitchell.

Oats.—First prize, £1, and second, 10s., J. Greatorex.

IMPLEMENTS.

Selection of implements for agricultural purposes.—First prize, £3, and a silver medal, J. and G. Haywood, Derby, for Howard's new horse-rake, and Howard's improved double-furrow plough; second, £2, and a silver medal, Ratcliff, Derby; third, £1, and a silver medal, Thompson and Upton. Highly commended for portable farm boilers, Bell, Brothers.

LEDBURY AGRICULTURAL SHOW.

JUDGES.—P. Turner, The Leen, Pembroke.

J. Bennett, The Park, Ross.

W. Price, The Vern, England's Gate.

PRIZE LIST.

CATTLE.

Two-year-old heifer of any breed, in calf or with a calf.—First prize, silver cup value £5 5s., J. V. Mutlow; second, Mrs. Bishop, Pegs Farm.

Pair of two-year-old heifers.—First prize, F. Ward, Putley; second, F. Ward.

Six best yearling heifers or steers (of either sex).—First

prize, silver cup value £5 5s., J. V. Mutlow; second, J. V. Mutlow.

Best bull of any age.—Prize, £5, R. D. Cooke, Hollens.

Aged bull.—First prize, J. Sparkman, LittleMarele; second, Rev. J. Hopton, Canon Froome.

Two-year-old bull.—First prize, M. E. Hiatt, Bosbury; second, J. Sparkman.

Yearling bull.—First prize, R. D. Cooke; second, J. V. Mutlow.

Pair of two-year-old steers.—First prize, T. Edy, Frith; second, T. Edy.

Pair of yearling steers.—First prize, J. Hickman, Mainestone; second, Mrs. Bishop.

Yearling heifer.—First prize, J. Loveridge; second, F. Ward.

Fat cow, heifer, or ox.—Prize, E. Pritchett.

Cow or heifer in calf or with a calf.—First prize, R. D. Cooke; second, Mr. Drinkwater, The Farm.

Cow or heifer for dairy purposes, in calf or with calf, of any breed.—First prize, J. V. Mutlew; second, W. Hartland, Preston Court.

SHEEP.

Ram.—First prize, T. Hartland, Bromesberrow; second, J. Hickman.

Yearling ram.—First prize, J. Hickman; second, J. Hickman.

Pen of five store ewes, long wool.—First prize, C. Badham, Stonehouse; second, C. Badham.

Pen of five store ewes, short wool.—First prize, R. Mason, Hazle; second, Mrs. Bishop.

Pen of five yearling wethers.—First prize, Lady Emily Foley; second, R. Mason.

Pen of five yearling ewes.—First prize, Lady Emily Foley; second, F. Ward.

Pen of five lambs, shorn.—Prize, W. Smith (Arnolds).

Pen of five lambs, unshorn.—Prize, J. V. Mutlow.

PIGS.

Boar pig.—First prize, J. V. Mutlow; second, J. V. Mutlow.

Breeding sow.—First prize, T. Edy; second, J. V. Mutlow. Pen of five pigs under six months old.—Prize, J. Hickman.

Pig shown by a farm labourer.—First prize, T. Jones, Preston; second, T. Green.

HORSES.

Cart mare and foal.—Prize, G. Weston, Messington.

Nag mare and foal.—Prize, J. Hickman.

Three-year-old cart colt.—First prize, W. Smith (Arnolds); second, T. Hodges.

Two-year-old cart colt.—First prize, T. Haywood, Hill Top; second, Rev. J. Hopton.

Yearling cart colt.—First prize, J. V. Mutlow; second, Rev. J. Hopton.

Three-year-old hackney colt.—First prize, J. Sparkman; second, Rev. W. G. Lyall, Castle Froome.

Two-year-old hackney colt.—First prize, Major Peyton; second, C. Badham.

Yearling hackney colt.—Prize, Rev. W. G. Lyall.

EXTRA STOCK.

To be divided at the discretion of the judges, £10: To Mr. Pritchett, for four fat oxen, £2; J. Hickman, for eight heifers, £2; R. Mason, for six two-year-old steers, £1 10s.; T. Hartland, for six heifers, £1; R. Mason, for 20 store ewes, £1 R. Mason, for 20 yearling ewes, £1; T. Haywood, for two-year-old cart colt, 10s.; R. Mason, for ten yearling wethers, 10s.; and J. Sparkman, for five pigs, 10s.

CUMBERLAND AND WESTMORELAND AGRICULTURAL SOCIETY.

MEETING AT BRAMPTON.

There was a good show of agricultural horses; and the same may be said of light horses. Shorthorn cattle were not numerously represented, but Mr. Torr said the quality was good. There was a commendable entry of sheep and pigs.

JUDGES.

SADDLE AND HARNESS HORSES.—N. Miln, Foldon Side; J. Borthwick, Monkway; J. Wilson, Woodhorn Manor, Morpeth.

DRAUGHT HORSES.—B. Spraggon, Nafferton; D. Dobie, Tinwald Park.

SHORTHORNS.—W. Torr, Aylesby Manor; M. Stephenson, jun., Fourstones.

GALLOWAY CATTLE.—R. Swan, The Brae, Dumfries; R. Smith, Lady Land.

LEICESTER LONG-WOOL AND DOWN SHEEP.—Mr. Aitchison, The Rock; Mr. Borton, Barton House; Mr. Sanday, jun., Holme Pierpoint.

CHEVIOT AND BLACKFACED SHEEP.—Mr. Archibald, Stowe; Mr. Elliot, Hindhope.

BUTTER.—Mr. Wood, Carlisle; Mr. Beattie, Longtown.

PRIZE LIST.

HORSES.

Mare with foal at her foot, for breeding hunters.—First prize, — Baxter, Bromfield; second, A. Wannop, Geltside.

Mare in foal, for breeding hunters.—First prize, T. Jefferson, Hallfist, Scaleby, Cumberland; second, T. Mark, Durdar House, Carlisle.

Four-year-old gelding for hunting.—First prize, Messrs. Thompson, Kirkhouse, near Brampton; second, W. Armstrong, Kendal.

Four-year-old filly for hunting.—First prize, Messrs. Thompson; second, G. Coulthard, Lanercost.

Three-year-old gelding for hunting.—First prize, J. Brown, Howgill, near Lanercost; second, J. Bell, Halton Lea House, near Haltwhistle.

Three-year-old filly for hunting.—J. P. Law, Cross Hill, Irthington; second, R. Brough, Rye Close, Irthington.

Two-year-old gelding for hunting.—First prize, J. S. Steel, Lathes, Kirkbride; second, Messrs. Thompson.

Two-year-old filly for hunting.—First prize, J. Milburn, Wraguire House, Carlisle; second, J. Brown.

One-year-old colt for hunting.—First prize, Messrs. Thompson; second, T. Gibbons, Burnfoot.

One-year-old filly for hunting.—Prize, Mr. Baxter, Broomfield.

Mare with foal at her foot, for breeding carriage horses.—First prize, T. Morton, Longburgh House, Carlisle; second, G. Hoadley, Wetheral Abbey.

Mare in foal, for breeding carriage horses.—First prize, J. Fawcett, Scaleby Castle; second, H. N. Fraser, Hay Close, Penrith.

Three-year-old gelding suitable for harness.—First prize, R. Stockbridge, West Cliff, Carlisle; second, T. Jefferson.

Three-year-old filly suitable for harness.—First prize, T. Morton, Longburgh House, Carlisle; second, A. Harding, Kinnion Hills, Lanercost.

Two-year-old gelding suitable for harness.—First prize, Mr. Baxter; second, Rev. W. Dacre, Irthington.

Two-year-old filly suitable for harness.—First prize, R. Brough, Rye House Close, Irthington; second, J. Reay, Prior Rigg, Irthington.

One-year-old colt suitable for harness.—First prize, J. Waugh, Mosspetteril, Haltwhistle; second, W. Phillips, Smithsteads, Lanercost.

Mare with foal at her foot, suitable for breeding agricultural horses.—First prize, T. Bell, Townfoot, Brampton; second, J. Dobinson, Throp, Gilsland; third, J. Lamb, Burrell Green, Penrith.

Mare in foal, for breeding agricultural horses.—First prize, H. N. Fraser; second, J. Lancaster, Laversdale; third, J. Lamb.

Three-year-old gelding for agricultural purposes.—First prize, W. Phillips; second, T. Bell.

Three-year-old filly for agricultural purposes.—First prize, Mrs. Carruthers, High Field Moor, Irthington; second, T. & J. Hodgson, Little Strickland Hall, near Penrith.

Two-year-old gelding for agricultural purposes.—First prize, T. Milburn, Headswood, Irthington; second, Mrs. Gibbons, Rosetrees, near Longtown.

Two-year-old filly for agricultural purposes.—First prize, J. Fisher, Knells, near Carlisle; second, J. Graham, Parcelstown, near Westlinton, Carlisle.

One-year-old colt for agricultural purposes.—First prize, Mrs. Gibbons; second, G. H. Head, Rickerby, Carlisle.

One-year-old filly for agricultural purposes.—First prize, T. Gibbons; second, J. Pigg, Cocklet Hill, Kirklington.
Pony, not exceeding fourteen hands high.—First prize, J. Lamb; second, J. Little, Whitehill, Scaleby.

Pair of horses for agricultural purposes.—First prize, T. Gibbons; second, R. & J. Little, Guards, near Gretna.

Colt foal by a thoroughbred horse.—First prize, A. Wannop; second, Rev. W. Dacre.

Filly foal by a thoroughbred horse.—Second prize, T. Morton.

Foal for agricultural purposes.—Prize, J. Graham, Warwick Land, Nichol Forest.

Hackney, rising five years old and upwards, not exceeding fifteen hands, and to be brought into the ring mounted.—First prize, J. Casson, Burgh-by-Sands, Carlisle; second, B. Spraggon, William's Wyke.

CATTLE.

Shorthorn bull, three-year-old or upwards.—First prize, Messrs. Coulthard, Smith, and Bell, Brampton; second, J. C. Bowstead, Hackthorpe Hall.

Shorthorn bull, above two and under three years old.—First prize, A. Metcalfe, Ravenstonedale, Kirkby Stephen; second, J. Creighton, Scotby.

Shorthorn bull above one and under two years old.—First prize, J. C. Bowstead; second, J. Hogarth, Julian Bower, Kirkbythore.

Shorthorn bull under one year old.—First prize, J. Lamb, Burrell Green, Penrith; second, J. J. Hetherington, Middle Farm, Brampton; third, J. Lamb.

Shorthorn cow, which must have had a calf within the twelve months previous to the day of show, and must be in-calf or milk at the time of show.—First prize, R. B. Hetherington, Park Head, Silloth; second, W. Lambert, Elrington Hall, Haydon Bridge.

Shorthorn cow or heifer, under four years old, which must have had a calf within the twelve months previous to the day of show.—Prize, A. Metcalfe, Ravenstonedale, Kirkby Stephen.

Shorthorn heifer above two and under three years old.—First prize, Sir G. Musgrave, Bart., Eden Hall; second, T. Dalzell, The Hollins, Whitelaven.

Shorthorn heifer above one and under two years old.—First prize, A. Metcalfe, Ravenstonedale, Kirkby Stephen; second, Sir G. Musgrave.

Shorthorn heifer under one year old.—Prize, J. Smith, Coat Hill, Brampton.

Shorthorn bull of any age.—First prize, Messrs. Coulthard, Smith, and Bell; second, J. C. Bowstead.

Shorthorn cow or heifer above three years old, which must have had a calf within twelve months previous to the day of show, and must be in-calf or milk at the time of show.—Prize, R. B. Hetherington, Park Head, Silloth.

Shorthorn heifer above two and under three years old.—Prize, Sir G. Musgrave.

Shorthorn heifer not exceeding two years old.—Prize, A. Metcalfe.

Medal, A. Metcalfe.

Society's Challenge Cup, A Metcalfe.

GALLOWAYS.

Bull above two years old.—First prize, J. Fisher, Knells, Carlisle; second, J. Graham, Parcelstown, West Linton.

Bull under two years old.—Prize, J. Johnstone, The Green, Longtown.

Bull calf under twelve months old.—Prize, T. Watson, Burnfoot, Haltwhistle.

Cow in-calf or milk.—First prize, G. Lowes, Chesters, Haltwhistle; second, J. Graham.

Cow or heifer under four years old, which must have had a calf within twelve months previous to the day of show.—First and second prizes, G. Lowes.

Heifer above two and under three years old.—First prize, J. Graham; second, W. Armstrong, Tarn End, Milton.

Heifer above one and under two years old.—First prize, J. Mounsey, Dovecot, Walton; second, W. Armstrong.

Cow or heifer above three years old.—Prize, G. Lowes, Chesters, Haltwhistle.

CROSS-BREDS.

Polled bullock above two years old.—First and second prizes, G. Lowes.

Polled Heifer above two years old.—Prize, G. Lowes.

Polled bullock under two years old.—Prize, G. Lowes.

Polled heifer under two years old.—First prize, Messrs. Hyslop, Denton Hall, Brampton; second, G. Lowes.

SHEEP.

Aged blue-faced Leicester tup.—First prize, J. Irving, Shap Abbey; second, J. Hogarth, Julian Bower, Kirbythore.

Shearling blue-faced Leicester tup.—First prize, Mrs. Winter, Low House, Haltwhistle; second, W. Sisson, Temple-sowerby.

Three blue-faced Leicester ewes which have reared lambs this year.—First prize, W. Sisson; second, J. Todd, Mireside, Aspatria.

Three blue-faced Leicester gimmer shearlings.—First prize, J. Todd; second, T. Sisson.

Border Leicester tup.—First prize, T. Bell, Townfoot, Brampton; second, W. Lambert, Elrington Hall, Haydon Bridge.

Border Leicester shearling tup.—First prize, G. G. Lee, Land Ends, Haydon Bridge; second, T. Bell.

Border Leicester ewes which have reared lambs this year.—First prize, J. Watson, Gelt Hall, Castlecarrock; second, G. G. Lee.

Pen of Border Leicester Gimmer shearlings.—First prize, J. Watson; second, J. J. Hetherington, Middlefarm, Brampton.

Aged long-wool tup, not being a Leicester.—First prize, W. Norman, Hall Bank, Aspatria; second, J. Irving, Shap Abbey.

Shearling long-wool tup, not being a Leicester.—First and second prizes, W. Norman.

Three long-wool ewes, not being Leicesters, which have reared lambs this year.—First and second prizes, W. Norman.

Three long-wool gimmer shearlings, not being Leicesters.—First and second prizes, W. Norman.

Aged Down tup.—First prize, Capt. Thompson, Kirkhouse, Brampton; second, W. Parker, Carleton Hill, Penrith.

Shearling Down tup.—First prize, Capt. Thompson; second, W. Parker.

Pen of Down ewes which have reared lambs this season.—First prize, J. Carrick, Flosfield, Wigton; second, W. Parker.

Pen of Down gimmer shearlings.—First prize, J. Carrick, second, W. Parker.

Aged black-faced tup.—First prize, H. Thompson, Lamperts, Gilsland; second, F. Moscrop, Butterburn, Gilsland.

Shearling black-faced tup.—First prize, Messrs. Dodd, Hopehouse, Falstone; second, F. Moscrop.

Three black-faced ewes.—First prize, J. Irving, Shap Abbey; second, H. Thompson, Lamperts, Gilsland.

Three black-faced gimmers.—First prize, H. Thompson; second, J. Irving.

Aged Cheviot tup.—First prize, J. Johnstone, Capple-gill, Moffat; second, J. Johnstone, Bodesbeck, Moffat.

Shearling Cheviot tup.—First prize, J. Johnstone, Capple-gill; second, J. Johnstone, Bodesbeck.

Three Cheviot ewes.—First and second prizes, J. Graham, Wyliesyke, Gilsland.

Three Cheviot gimmer shearlings.—First prize, J. A. Johnstone, Archbank, Moffat; second, J. Graham.

PIGS.

Boar of the large breed.—Prize, J. Hetherington, Crosby, Carlisle.

Boar of the small breed.—Prize, R. and J. Little, Guards, Gretna.

Sow pigs of the large breed, of any age, in-pig or milk.—Prize, J. C. Bowstead, Hackthorpe Hall, Penrith.

Sow pig of the small breed, of any age, in-pig or milk.—First prize, G. Foster, Wetheral; second, Rev. W. Dacre, Irthington, Brampton.

Pig belonging to a cottager, labourer, or artisan.—First and second prizes, C. Bendle, Brampton; third, J. Whitfield, Lillies House, Laversdale; fourth, R. Carruthers, Laversdale, Irthington.

BUTTER.

Best basket (5lbs.)—Miss Wannop, Brunstock; second, Mrs. Wannop, Wallhead, Crosby-on-Eden; third, Miss Dobinson, Throp, Gilsland; fourth, Mrs. Storey, Wallhead, Crosby-on-Eden.

Best firkin of butter.—First prize, Mrs. Dobson, Solmaine, Walton; second, Mrs. Graham, Red Hill.

STAFFORDSHIRE AGRICULTURAL SOCIETY.

MEETING AT WALSALL.

The show of cattle was inferior to that of many former years, especially in the number of entries. The obvious reasons are—first, the exceptional dryness of the season; and, secondly, the prevalence of the foot-and-mouth disease, which has had the effect in all parts of the country of deterring owners of valuable animals from incurring the risks attending gatherings of this description. At the same time there was a good proportion of really prize animals exhibited. With regard to the dairy stock, it may be stated that, with one exception, the whole of the six bulls exhibited were good animals; but, so far as the pairs of dairy cows were concerned, it must be pointed out that only one pair were in true dairy condition, the remainder being so burdened with fat that the judges withheld the second prize. It is not at all unlikely that when exhibitors see that judges insist upon dairy cows being shown in their proper condition the competition in this class will be increased. There was not a single entry in the class of in-calf heifers in pairs not exceeding two years old, and only two in the next class of heifers under two years old, but these latter were all fine animals. In the class of fat cattle there were only five entries. The competition for the first prize was very close between the Shorthorn cow of the Marquis of Anglesey and Lord Hatherton's Hereford ox; and the latter was the favourite with the public.

In Leicester sheep only one class showed more than two entries, and therefore the competition was little more than nominal. The remaining specimens of the longwool breeds were respectable, but not remarkable in point of quality. The entries of Shropshire sheep were, as was to be expected from the greater favour with which the breed is regarded in the county, much more numerous.

The show of pigs was one of the best ever made at the meetings of the Staffordshire Society; but still Mr. T. Walker carried nearly all before him. He secured a medal and no less than five out of eight first prizes, besides one or two minor distinctions.

The show of horses for hunting and hackney purposes was not, taken as a whole, of the superior character one might have reasonably expected at a meeting of a Society which includes within its district four good packs of foxhounds, and under whose auspices such handsome prizes are offered. The classes were somewhat differently arranged to last year. For weight-carrying hunters Lord Hatherton offered a prize of £20 and the Walsall Committee one of £10, and for these prizes there were five competitors. Both prizes were awarded to Mr. A. Harrison, of Edgbaston; the first for his chestnut Rob Roy, up to most weight, and the second to his brown horse Mulatto, which showed a deal more breed, style, and action, but was not quite up to the weight. The light-weight hunters were decidedly the best of the lot, the three noticed horses especially being very superior animals. The £25 offered by the gentlemen of Mr. Meynell Ingram's Hunt only attracted a moderate class; and mares with foals at foot, suitable for breeding hunters, were below the mark with the exception of the first prize animal. There were only two entries in the class for mares in foal best suited for hackney purposes, and neither call for special remark. The hackneys, though a larger class, were not as a rule superior animals, and the same remark applies with even more force to the cobs, which were an indifferent lot. The horses for agricultural purposes were less meritorious, and only attracted an entry of 22, all told. By far the best class was that for entire horses, in which some good animals were exhibited. Mr. M'Lean's handsome prize of £25 was taken by a fine, powerful animal, Crown Prince, belonging to Mr. Enston, Warwick, who came on accredited with honours from other meetings; and Mr. J. Manning's Champion, also a very good horse, was second.

The show of thick cheese was moderately good, but the quality was not by any means equal to that of the thin cheese exhibited. In this latter class there were 15 entries as against five only in the former. There was a very fair show of butter. The roots, considering the season, were remarkably good.

There were some capital mangolds, and the quality of the swede turnips was surprising after the long drought of the past summer. The kohlrabi in Mr. Fleming's first prize collection was exceedingly fine. The potatoes also were very good. The show of grain was exceedingly good, the white wheat especially, the prizes offered for which excited the most competition, being of superior quality. Barley and oats only had three competitors each, but the prize samples were good as regards colour and size.

JUDGES.

SHORTHORNS AND FAT CATTLE.—Savidge, Sarsden, Chipping Norton; H. Lowe, Comberford, Tamworth.
 SHROPSHIRE SHEEP AND PIGS.—T. Mansell, Ercall, Wellington; J. Hardy, Kinner Hill, Stourbridge.
 DAIRY COWS AND LEICESTER SHEEP.—F. Smith, Ashborne Grange; — Stevenson, jun., Sweptstone, Ashby-de-la-Zouch.
 HORSES.—Agricultural: — Wright, Hollington, Longford; J. Ward, Kiddemore, Brewood.
 HUNTERS: W. T. Stauley, Leamington; H. Corbet, Farmers' Club, London.
 CHEESE.—S. W. Cox, Derby; H. E. Emberlin, Leicester; J. Daniel, Burton-on-Trent; T. H. Smith, Clifton, Ashborne.
 IMPLEMENTS.—J. J. Rowley, Rowthorne, Chesterfield; R. Craven, Uttoxeter; — Brewster, Bulderton, Middle Salop; W. Cover, Bryanote, Stafford.

PRIZE LIST.

CATTLE.

SHORTHORNS.

Bulls.—First prize, £10, and the Society's silver medal, Rev. W. Sneyd, Keele Hall, Newcastle (Ironmaster); second, £5, S. Burchall, Catton, Burton-on-Trent (Grand Duke of Essex). Highly commended, T. Hands, Cauley, Coventry (Lord Lavender).

Yearling bull.—First prize, £10, and silver medal, W. Bradburn, Wednesfield, Wolverhampton (White Satin); second, £5, W. Sneyd (Prince Patrick).

Bull calf.—First prize, £5, W. Sneyd (Lord of the Manor); second, £2 10s., R. Ratcliff, Walton Hall, Burton-on-Trent.

Cows.—Prize, £6, R. Ratcliff.

In-calf heifers, in pairs, not exceeding three years old.—First prize, £6, W. Sneyd; second, £4, T. Hands. Highly commended, R. Ratcliff.

Heifers, in pairs, under two years old.—First prize, £3, R. Ratcliff; second, £3, T. Hands. Highly commended, C. Stubbs, Preston Hall, Penkridge.

ANY BREED ADAPTED FOR DAIRY PURPOSES.

Bulls.—First prize, £10, and silver medal, W. Loverock, Horninglow, Burton-on-Trent (Duke of Sutherland); second, £5, T. Nash, Featherstone, Wolverhampton (Nimrod). Highly commended, T. Nash (4th Duke of Claro); commended, J. Booth, Shenstone, Lichfield (Radford).

Cows, in pairs.—Prize, £10, T. C. Smith, Birdsgrove, Ashbourne.

Heifers, in pairs, under two years old.—First prize, £4, W. Bradburn (Ammonia and Moss Rose); second, £2, J. Brawn, Bosses, Shenstone, Lichfield.

FAT CATTLE.

First prize, silver cup, £10, the Marquis of Anglesey, Beaudesert, Rugeley (Shorthorn cow); second, £5, Lord Hatherton, Teddesley Hall, Penkridge (Hereford ox).

SHEEP.

LEICESTER OR OTHER LONGWOOLS.

Ram.—First prize, £5, R. Johnson, Kirkireton, Wirksworth; second, £3, R. Johnson.

Shearling ram.—First prize, £5, and silver medal, R. Johnson; second, C. Mellor, Atlow, Ashborne. Highly commended, R. Johnson and C. Mellor.

Ram lamb.—First prize, £3, R. Johnson; second, £2, R. Johnson. Highly commended, C. Mellor.

Breeding ewes, pen of five.—First prize, £3, R. Johnson; second, A. Bryer, Quarndon, Derby.

Shearling ewes, pen of five.—First prize, £3, R. Johnson; second, A. Bryer.

Ewe lambs, pen of five.—Prize, R. Johnson.

SHROPSHIRE.

Ram.—First prize, £5, W. Baker, Moorbarns, Atherstone; second, W. Wood, Holly Bank, Burton-on-Trent. Highly commended, the Earl of Bradford, Weston, Shifnal.

Shearling ram.—First prize, £5, and silver medal, J. Coxon, Freeford, Lichfield; second, C. Stubbs. Highly commended, W. Wood; commended, W. Baker.

Ram lamb.—First prize, £3, J. Stubbs, Weston, Stafford; second, £2, W. Stubbs, Stockton, Stafford. Highly commended, Rev. E. Creswell, Seighford, Stafford.

Breeding ewes, pen of five.—First prize, £5, J. H. Bradburne, Pipe-place, Lichfield; second, £3, W. Baker. Highly commended, C. R. Keeling, Penkridge.

Ewe lambs, pen of five.—First prize, £3, W. Baker; second, £2, J. Coxon. Highly commended, C. Smith, Kirk Langley, Derby.

PIGS.

Boars of a large breed.—First prize, £3, M. Walker, Stockley, Anslow, Burton-on-Trent; second, £2, H. Tomlinson, Blithford, Rugeley. Commended, T. Bantock, Merridale, Wolverhampton.

Breeding sow of a large breed.—First prize, £3, M. Walker; second, £2, H. Tomlinson, Rugeley. Highly commended, T. Bantock, Wolverhampton. Commended, M. Walker.

Boar of a small breed.—First prize, £3 and silver medal, M. Walker; second, £2, J. T. Poyser, Burton-on-Trent.

Breeding sow of a small breed.—First prize, £3, and second, £2, M. Walker. Commended, Rev. W. Sneyd, Newcastle.

Boar of the Berkshire breed.—First prize, £3 and silver medal, R. Wyatt, Stafford; second, £2, Dr. J. D. Hewson, Stafford.

Breeding sow of the Berkshire breed.—First prize, £3, the Earl of Bradford; second, £2, Dr. J. D. Hewson. Highly commended, R. Wyatt.

Pen of not less than three pigs, same litter, of a large breed, above three and under six months old.—First prize, £3, and second, £2, M. Walker.

Pen of not less than three pigs, same litter, of the Berkshire breed, above three and under six months old.—Prize, £3, the Earl of Bradford.

HORSES.

FOR AGRICULTURAL PURPOSES.

Entire horses (open to the United Kingdom).—First prize, £25 and silver medal, W. Euston, Claverdon, Warwick (Crown Prince); second, £15, J. Manning, Orinbury, Wellingborough (Champion). Highly commended, R. Orange, Bellington, Morpeth, Clydesdale (Conqueror).

Mare and foal.—Prize, £8, R. Swale, Saredon, Wolverhampton (Madam).

Two-year-old gelding or filly.—First prize, £5, E. Tongue, Aldridge, Walsall (The Drummer); second, £3, W. Masfen, Norton Canes, Cannock, Stafford. Highly commended, W. S. Tavernor, Ubbertley, Stoke-on-Trent (Bell).

Yearling gelding or filly.—First prize, £5, J. Hawksworth, Barton Fields, Derby (Darling); second, £3, T. C. Ball, Prestwood, Ellastone, Ashborne. Highly commended, J. Hawksworth (Boss).

FOR HUNTING PURPOSES.

Hunting horse or mare, equal to 15 stone.—First prize, £20, A. Harrison, Metchley, Edgbaston (Rob Roy); second, £10, A. Harrison (Mulatto). Commended, H. Morris, St. Thomas, Stafford.

Hunting horse or mare, equal to 12 stone.—First prize, £15, T. H. Walwyn, Doveridge, Uttoxeter (Princess); second, £5, B. Gilpin, Longford, Cannock. Highly commended, A. Harrison (Sultan).

Class 39.—First prize, £15, C. A. Pratt, Shenton, Nuneaton (Flirt); second, £10, C. Stubbs, Preston Hill, Penkridge (Sandon). Commended, J. S. Clay, Branstone, Burton-on-Trent.

Mare with a foal at foot, suitable for breeding hunters.—First prize, £6, T. W. Gardom, Butterton Park, Newcastle (Brazenose); second, £4, the Stonetrough Colliery Company, Lawton, Cheshire (The Fawn).

Mare in foal or with foal at foot, best suited for hackney or

roadster purposes.—First prize, £6, Lord Hatherton (Fanny); second, £4, J. Coxon.

Hackney mare or gelding, not exceeding 15 hands 2 inches.—First prize, £6, F. James, Aldridge, Walsall (Topsy); second, £4, F. James (Punch).

EXTRA STOCK.

HORSES.—Medals to Lord Hatherton (harness horse), T. A. Negus, Lynn, Walsall (dray horse).

SHEEP.—Medals to C. Smith, Kirk Langley, Derby; J. Coxon; R. M. Wright, Coppenhall, Staffordshire.

PIGS.—Medal to M. Walker.

CHEESE.

Thick cheese.—First prize, £9, T. Woolf, Standon Hall, Eccleshall; second, £6, T. Simon, Ternhill, Market Drayton; third, £4, T. Ashcroft, Walford, Eccleshall; fourth, £2 10s., C. Byrd, Littywood, Stafford.

Thin cheese.—First prize, £9, M. Walker, Stockley, with special prize for best cheese in yard; second, £6, J. Carrington, Croxton, Uttoxeter; third, £4, J. Smith, Spon Farm, Alton, Cheadle; 4th, £2 10s., J. Hawksworth, Barton Fields, Derby. Commended, W. Smith, Rangemoor, Burton-on-Trent; H. Tomlinson, Blithford, Rugeley; Mrs. Ward, Gravely Bank, Uttoxeter.

Thin cheese.—First prize, £10, M. Walker; second, £5, S. Burchall, Catton, Burton-on-Trent. Highly commended, J. Carrington; Mrs. Ward; J. Smith. Commended, J. Hawkeswood, Barton, Derby; W. T. Carrington.

BUTTER.

First prize, £3, F. H. Yates, Great Burr, Birmingham; second, £2, W. Masfen; third, £1, Mrs. Bond, Draycott, Cheadle. Commended, J. T. Poyser, Stapenhill, Burton-on-Trent; The Stonetrough Colliery Co.; J. Booth, Shenstone; E. Rowley, Norton Canes, Stafford.

CORN.

White wheat.—First prize, £2, J. Greatorex, Stretton, Burton-on-Trent; second, £1, R. H. Masfen, Pendeford, Wolverhampton. Commended, J. Greatorex.

Red wheat.—First prize, £2, J. Greatorex; second, £1, W. T. Carrington.

Barley.—First prize, £2, J. Greatorex; second, £1, R. H. Masfen.

Oats.—First prize, £2, J. Greatorex; second, £1, R. Masfen.

AGRICULTURAL ROOTS.

Ox cabbage.—Prize, £2, J. Greatorex.

Late potatoes (any variety).—Prize, £2, W. W. Pearce, Measham, Atherstone. Highly commended, G. Fleming, Groundslow, Stone; W. T. Carrington.

Collection of roots (not less than three varieties).—Prize, £3, G. Fleming. Highly commended, J. Greatorex; T. Bantock, Merridale House, Wolverhampton.

IMPLEMENTS.

SILVER MEDALS to J. T. Mackall, Union-street, London, for general joining; J. Perkins, Yoxall, for plough with steel breast; T. Corbett, Shrewsbury, for single plough, and for double-action turnip-cutter; Richmond and Chandler, Salford, for chaff-cutter; G. Murray, Derby, for a model of working plant for cheese factory on American principle; T. Bradford and Co., London and Manchester, for "vowel A" washing machine; Southwell and Co., Rugeley, for combined sheep-rack and trough; Gower and Son, Market Drayton, for 12-foot broadcast machine for clover and ryegrass, with double box to keep the seeds separate; Ball and Son, Northampton, for plough with lever neck; Lambert Brothers, Walsall, for stand of pumps, steam and water fittings, and wrought-iron tubes; W. S. Underhill, Newport, Salop, for double plough, and for five-horse steam-engine; Robey and Co. (Limited), for eight-horse single cylinder steam-engine; S. Corbett and Son, Wellington, for root-pulper; Woods, Cocksedge, and Warner, for two-horse gear; Mellard's Trent Foundry (Limited), Rugeley, for double-roller oil-cake breaker. Money prizes (20s., unless otherwise stated): J. Barnes, Shenstone, Howard's patent iron plough, Ransome and Sims' iron plough, Ball and Son's nine-tined cultivator; J. Perkins, on expanding horse-hoe; T. Corbett, two-horse-gear and one-horse cart; J. Le Butt, Bury St. Edmunds, corn screen; G. Ball, Rugby, carts (2 prizes); Southwell and Co., improved plough, and double or Cheddar cheese-press; Gower and Son, coulters corn-bill; Ball and Son, waggon (40s.); Mellard's Trent Foundry, horse-power gear, seven-tined cultivator, and patent churn.

WEST TEVIOTDALE AGRICULTURAL SOCIETY.

The annual exhibition of this society took place in the Loch Park, Hawick. The weather was fine, but the attendance was limited. The display of stock, though including first-class animals in some departments, was on the whole very meagre. In the class of cattle, the quality was good; the prize Ayrshire being as pretty a little animal as ever graced a show. In the class of Leicester sheep, some well-known prize-takers of former years did not put in an appearance, but Mr. Wilson, who has lately turned careful attention to this department, made up for the absence of many. In the Cheviot class, always the leading feature of this show, the competition was numerically below the average, but the quality for the chief premiums was good.

JUDGES.

CHEVIOT SHEEP.—Mr. Scott, Gilmansclueich; Mr. Elliot, Hartwoodmyres; and Mr. Shortreed, Attonburn.
CATTLE, LEICESTER SHEEP, AND HORSES.—Mr. Amos, Earlside; Mr. Scott, Hawford; and Mr. Swan, Bush.

PRIZE LIST.

CATTLE.

Shorthorn bull.—First prize, Messrs. Ayres, Hallrule; second, Mr. Amos, Earlside.

Shorthorn milch cow, in regular milk at the time of the show.—First prize, Mr. Wilson, Midshields; second, Mr. Turnbull, Burnfoot.

Ayrshire cow, calved after 1st January last, and in regular milk when shown.—First prize, Mr. Hadon, Honeyburn; second, J. Henderson, hind, Honeyburn.

Shorthorn quey, two years old, calved subsequent to 1st January, 1868.—First and second prizes, Mr. Turnbull.

Shorthorn quey stirk, calved subsequent to 1st January, 1869.—First and second prizes, Mr. Turnbull.

SHEEP.

LEICESTERS.

Best tup, of any age, shearing excepted, to be used within the district for the ensuing season.—First prize, Mr. Haddon; second, Mr. Selby, Hassendenbank.

Best pen of five gimmers.—First prize, Mr. Wilson; second, Mr. Selby.

Best pen of five ewes.—First prize, Mr. Wilson; second, Mr. Selby.

HALF-BREDS.

Best pen of five ewes.—Prize, Mr. Wilson.

Best pen of five gimmers.—Prize, Mr. Wilson.

CHEVIOTS.

Tup of any age, to be used in the district for the ensuing season.—First prize, Mr. Aitchison, Linhope; second, Mr. Grieve, Skelfhill.

Two tups, two years old, to be used in district.—First prize, Mr. Grieve; second, Mr. Aitchison.

Two shearing tups, to be used in the district.—First, Mr. Oliver, Howpasley; second, Mr. Turnbull, Falmash.

Pen of five ewes, from the hill.—Prize, Mr. Paterson, Chapellhill.

Pen of five ewes, without restriction.—Prize, Mr. Grieve.

Pen of five gimmers or shearing ewes.—Prize, Mr. Oliver.

Pen of five ewe-lambs, from the hill, lambed after 11th April last, bred by competitor.—Prize, Mr. Grieve.

HORSES.

Mare for breeding draught horses, with foal at foot, bona fide the property and in the possession of any member of the Society from 1st January last.—First prize, Mr. Fenwick, Northouse; second, Mr. Paterson.

Two-year-old draught colt or filly, belonging to a member of the Society, and having been his property for six months previous to the show.—First prize, Mr. Aitchison, Winningtonrigg; second, Mr. Forsyth, Ashybank.

Draught mare or gelding, above three years old, belonging to the exhibitor.—First prize, Mr. Wilson; second, Mr. Blythe, Whitriggs.

THE FLAX EXTENSION ASSOCIATION IN IRELAND.

The bi-monthly meeting of the council of this association was held in Dublin, Mr. J. W. Mc'Master in the chair.

The Secretary, Mr. Andrews, read the following report for September. At the last meeting of the council of this association, which was held in July, a very full and satisfactory report of the Irish flax crop was presented, and which, in accordance with the resolution then passed, was printed and extensively circulated. Subsequent reports received from farmers and scutch-mill owners corroborate the favourable statement then made regarding the anticipated produce per acre; but, owing to the hot weather which occurred when a large portion of the crop was on the grass, the quality has in some instances been injured. A circular, in consequence, was issued, recommending farmers to keep their flax in stack for some time before scutching it, with the object of remedying, to some extent, the injury which had been done. Early in the month of August your secretary made a short tour through some of the flax districts in the county of Donegal. The places visited were Stranorlar, Donegal, Mount Charles, Letterkenny, Ramelton, and Lifford. Owing to the favourable season, the flax crop was exceptionally good. In some localities the culture is not done with much care, and the preparation of the fibre is indifferent; but this is likely to be remedied, as the farmers are becoming more willing to receive advice and guidance as to the management of their flax crop than formerly. On the 10th of last month the return of acreage under flax in Ireland was received from the Registrar-General, an abstract of which was promptly printed and circulated among the local, English, and Scotch trade. This return showed a decrease in the area appropriated to flax in every province except Munster, which exhibited a marked increase. The Munster flax markets, which were arranged by this association, have contributed to produce this result—having been attended during the past two seasons by buyers from northern spinning firms; and it is hoped the same support will be rendered this season at the markets already fixed, of which circulars have been issued. Delay has, in some instances, occurred in the erection of scutch mills, to which aid was given by this association, arising from the difficulty of arranging for the sites. In one instance, owing to this cause, a contemplated mill had to be abandoned for this season. New applications for assistance towards proposed scutch mills will be submitted this day for your consideration, and the necessity is pressing for scutching accommodation in the districts where these mills are projected. Scutchers have been engaged and sent to the south and west, and further applications have been made, which are being attended to. In every case the engagements have been made by the week. The introduction of skilled northern scutchers into these localities is of paramount importance to flax growers. The Belgian scutching machine, moved by hand-power, to which allusion was made in last report, has been tested, and found to clean flax admirably; and, from the lightness of the handles, the quantity of tow made is now reduced to a minimum. With the application of horse power to maintain the requisite speed, this machine would be invaluable to flax farmers. A hand-breaker has also been received from Belgium, which would be of advantage in districts where hand-scutching is practised, and would be a great improvement on the mode by which flax is at present broken in these districts. From the simplicity of its construction it is inexpensive. It is intended shortly to issue query slips, with the view of obtaining the necessary information, to arrive at an approximate of the average yield per acre, this season, of the flax crop in Ireland.

Resolutions were passed confirming the several loans to scutch-mills alluded to in the report, and a cheque was signed in payment of grants to scutch-mills, sanctioned at the present meeting, and also at the meeting held on the 21st July last.

THE NEW REGULATIONS FOR THE INSURANCE OF FARMING STOCK.

[The following is a full report of the meeting, of which we have already given the chief points.]

A meeting of the Norfolk Chamber of Agriculture was held at Norwich, Mr. C. S. Read, M.P., the President, in the chair.

The CHAIRMAN called upon Mr. T. Brown to open the discussion.

Mr. BROWN said: Doubtless many of you have received a circular from the directors of the office in which you insure your property against fire—a circular that with kind, almost paternal care, instructs you as to the amount at which you must insure your property and how you shall insure it. Perhaps I had better read one of the circulars, but before doing so, I would notice the capricious manner in which they have been issued. Say there are four farmers in a village; in one case three out of the four shall have received a circular; in another two of the four shall have received one; and in a third case but one of the four. I know an instance of three brothers, two living in one parish and the other in the parish adjoining; all insure in the same office, through the same agent; one has received a circular and the other two have not. Again, some persons received the circular quite three weeks ago, others but a day or two since, and many others have not received one at all. I will not trust myself to speak of the shortness of the notice, but will now read the precious document:

“Norwich Union Fire Insurance Society,

Surrey-street, Norwich, 15th August, 1870.

“DEAR SIR,—The continuous bad results of farming stock business have led the Fire Insurance Offices to consider how far they may be obviated by increasing the amount of the insurance to the value, and by ceasing the practice of grouping in one or two sums so many different objects of insurance. The result of the deliberation is, that the offices have all agreed only to renew their farming stock policies on the understanding that if a fire occurs, and it turns out that a farmer is not insured up to three-fourths of the then value of his *agricultural produce*, the office will be only liable to make good such proportion of the damage as the sum insured bears to the full value. In your case if the amount you now insure proves equal to three-fourths of the entire value, the condition will not apply; but if you consider the amount is below three-fourths, you will please yourself whether you increase your insurance, or prefer a settlement (in the event of loss) under the above conditions of proportion.

“In future you will find the notice duly incorporated in your receipt.

“With regard to the insurance of different items of risk in one sum, the office has decided in all new policies to divide the insurance into three heads, viz.:

“1. Agricultural produce, inclusive of growing crops, also hops, seeds, roots, fruit, wool, cheese, cider, artificial and other food for cattle, and manures, grown on, or to be used upon the farm, but not including hops and grain undergoing any process of drying.

“2. Implements and utensils of husbandry worked by hand or horse-power, only on the said farm, for which not more than £40 shall be paid for loss on any one article, unless especially mentioned.

“3. Live stock on the said farm, for which not more than £40 shall be paid for loss on any one animal, unless specially mentioned.

“No increase of rate is proposed by the offices, except under special circumstances.

“I am, dear sir, yours truly

“SAMUEL BIGNOLD, Secretary.”

Fearful that we should not quite understand the circular, they have been kind enough to explain it for us in a memorandum:

“Every policy under which agricultural produce and farmings stock are insured, will hereafter be subject to the following special condition:

“If the sum insured on agricultural produce, either separately or in one amount with other property, shall, at the breaking out of a fire, be less than three-fourths of the value

of all the property insured in that amount, then this Company shall be liable only for such a proportion of the loss sustained as the sum so insured shall bear to the total value of all the property to which such sum applies.”

Then they give us an illustration:

“A farmer insures his agricultural produce and farming stock for £300, and at the breaking out of a fire the value of the property amounts to £400, the sum insured, therefore, being three-fourths the value of the property, the whole amount of loss up to £300 will be payable.

“But if the value of the property be over £400, say £500, then the office will only pay such proportion of the loss as the sum insured bears to the value of the property, viz., three-fourths; and similarly in any other case where the sum insured is less than three-fourths the value of the property at the time of fire.”

That is to say, if a person insures for £1,000, the value of his property when a fire occurs being £3,000, should he sustain a loss of £600 the office will only pay £200. To further illustrate the matter. We will suppose that the insured occupies a farm of 1,000 acres of average land. The value of his property when he insures will probably be about £8,000. To entitle him to recover from the insurance office the full amount of loss he may sustain by fire he must insure to the amount of three-fourths of the value of such property—that is, £6,000. If he insures for £4,000, he will be entitled to but one-half his loss; if for £2,000, he will be entitled to but one-fourth. I now proceed to analyse the £8,000. I will assume the value of the corn and hay crop to be £4,000; the value of the implements and utensils of husbandry, exclusive of steam machinery, to be £600; and that of the live stock to be £3,400. Again, I will assume that the value of the sheep on such a farm amounts to £2,000. Now, the risk of loss from fire on sheep is next to nothing; therefore that item of one-fourth may be fairly struck off. The risk of loss from fire on the horses, cattle, and implements may be represented by £1,000; therefore the total risk by the office would be £5,000. Now, if such be, as I believe it to be, a fair representation, are we to be told that to entitle such an insured person to recover the full amount of loss he may sustain by fire that he must insure for £6,000? Why the idea is preposterous! I say that in the case which I have assumed an insurance of £2,000 is ample. And I will tell you why. I have shown that the risk of fire at the time of insurance only amounts to £5,000; before Christmas that risk will be reduced at least one-third—say to £3,000; by Lady-day it will be reduced three-fourths—say to £1,000; and by the 1st of June, just before the hay crop is secured, it will probably be reduced to £500. Therefore, an insurance of £2,000 would represent more than the average risk, and yet we are informed that to entitle such an insured person to recover the full amount of any loss he may sustain by fire he must insure for £6,000. Note the moderation of these directors—they don't propose any increase of the rate of insurance; they only say that in the case which I have assumed, and in which I think I have shown that an insurance of £2,000 is ample—that you must insure for £6,000, the amount of premium payable at the present rate being on £2,000, £5, and that on £6,000 being £15—an increase of only 200 per cent! I would ask who are these directors? Are they gentlemen versed in the law, are they merchants, are they manufacturers, are they brewers, are they persons conversant with agricultural affairs, or are they gods, that they thus issue their mandates? I very much mistake you, gentlemen, if you will submit to, if you will not spurn, such arrogant dictation. But I am told, and that by an intelligent and much respected agent of an insurance office in this county, that these directors do not mean what they say, that they only mean their circular to apply to agricultural produce—that is, to the hay and corn crop. I am afraid the dictum of this gentleman would not hold good in a court of law—but supposing him to be correct in his reading, all I desire to say is that it is a pity these directors did not attend school long enough to enable them to

explain their meeting. I well recollect these directors—these would-be dictators—issuing an instruction to their agents to the following effect: That steam machinery must at the time of insurance be insured to its full value, and that such insurance must be reduced yearly twenty per cent., that is, if the value of such machinery was £300, it must first be insured to that amount; the second year the insurance was to be £240, the third year £180, the fourth £120, the fifth £60, and the following year it would be uninsurable, although the machinery, if kept in good repair, might be nearly as valuable as when first insured. Now it strikes me that the instructions which many of us have received betrays the same degree of arrogance and incapacity as the circular to which I have just alluded. These directors say that the insurance on farming stock does not pay. If that statement is correct, and I will assume that it is, although a short time since they gave us a bonus on such insurance—if such statement is correct, then I say their legitimate course is either to increase the rate of such insurances generally, or, what would be a far better course, to vary the rate according to the risk. Now the risk on a farm, say in West Norfolk, where the corn is stacked in the field on which it grows, is much less than where the whole corn crop is collected in a stackyard, as it is in some of the fen districts. Therefore, I say, according to the risk so let the insurance be. In fine, I say to these directors vary your rate of insurance, increase your rate if the present rate does not pay, but don't attempt to dictate to us how much we shall insure, or how we shall insure it. Well, I have said that as this subject required but little explanation, so it appeared to me that our course of action respecting it was plain and unimpeachable. That course I take to be, in the first instance, the appointment of a committee. Should you agree with that course, and I believe you will, I presume the first step such committee would take would be to seek an interview with the directors of the Norwich Union Fire Office, they holding, I believe, the largest amount of insurances of farming stock of any office in the kingdom. If at such interview your committee should fail to convince these directors of the error of their ways, then I suppose your committee would counsel you to start an insurance company of your own. Much as I dislike companies of any kind, in such a case I shall be prepared, and I hereby pledge myself to take a full proportion of shares according to my means. Mr. Brown concluded by moving the following resolution: "That a committee of five members be appointed to take such action in the matter of the new Fire Insurance Regulations as they may deem necessary."

Mr. W. FLATT, who seconded the motion, said he considered that Mr. Brown had exhausted the subject, and expressed his concurrence in Mr. Brown's protest against the farmers being dictated to in the matter of how they should insure their produce, what amount they should put upon it, or anything of the kind. If the insurance on farming produce did not pay the offices—of course no man took business unless it paid him, though farmers unfortunately did so sometimes—let the rates be raised, for that was the fair way of proceeding. In West Norfolk, where he resided, corn was never found stacked anywhere but where it was grown, and if a man insured for three-fourths at the commencement of the harvest, or when his grain was stacked, it might be fair and proper to take an average, for the farmer would be fairly insured, and the offices ought to be satisfied. Farmers could not shut their eyes to the fact of this being a business transaction; and if the offices said: "We won't have you," then as a matter of course they must attend to their own interest, and do the best they could. Mr. Flatt trusted that the directors of the fire offices would yet see the error of their ways, retrace their steps, and so put the farmers into a fair position.

Mr. C. E. BIGNOLD said that the directors of the Norwich Union Fire Office would be the last persons to oppose Mr. Brown's resolution, because it was their wish to have an amicable understanding with the farmers, not only of Norfolk, but throughout the kingdom. While regretting that there was not one of the directors present to explain the matter, Mr. Bignold said he was certain that if the resolution were agreed to and a deputation of five gentlemen appointed to wait upon the directors of the Norwich Union Office, that that body would endeavour, as far as possible, to meet their views to the extent they were able. But it must be remembered

that the resolutions combined in the circular were not those of the Norwich Union Office alone—they were the resolutions of all the offices throughout the kingdom, founded on facts which Mr. Brown himself could not gainsay. A statement of ten years' working of all the fire offices in England showed for the first five years a bare profit, and for the last five years a positive loss, and that throughout the whole country. What course could the offices adopt except either raising the rate, and that largely, or to see that the farmers generally—he did not say those round about them—were insured more closely up to the value. It was proposed to raise the rate. That was carried with but two dissentients—two large offices—so it was felt that as the offices generally would not one and all raise the rate, that point must be dropped. The other point was then considered, and it was the most essential. Time was when farming stock was insured at 1s. 6d. per cent. The rate then went up to 2s., 3s., and 4s. Ten years ago, in 1859, the rate was raised to 5s. In each case, it would be observed, the rate was raised because the previous rate had not paid. There must be something wrong, then, in the mode of conducting the business, and, in inserting the average clause, the offices were endeavouring, if they could, to place the business on a fairer basis. Mr. Brown had said that the office asked him to insure on the supposition that his stock was worth £8,000. Now Mr. Brown had made a great mistake in his figures. If Mr. Brown's whole stock were worth £8,000, for the purpose of ascertaining 3-4ths the value on his agricultural produce, he must deduct £2,000 the value of his sheep, and £1,000 the value of his horses and implements, as on these he had the option of insuring any sum he liked, without the average clause being enforced—but with regard to the remaining £5,000 he must be covered up to 3-4th its value, unless he preferred his loss being settled under conditions of proportion. Mr. Brown himself has supplied an argument: he says, "I stack in the fields, and therefore I cannot lose more than £2,000 by any fire." But were the offices for a premium on £2,000 to undertake a risk in a half a dozen places? that would be palpably unjust.

Mr. BROWN: I did not say so.

Mr. BIGNOLD: You said it was so in West Norfolk particularly. All the offices asked was that gentlemen should insure up to such a fair value as would pay them. The directors of the Norwich Union could show them—he did not feel justified in doing it—that the farming stock business had cost the proprietors during the last ten years £4,000 a year—£4,000 a year had they paid more than they had received. It therefore stood to reason that something must be done, and what had been done he hoped was only fair and right. On reading the circular put before the Chamber he could not see how it said that farmers must insure 3-4ths on all their property, if it were divided. It said, "The result of the deliberation is, that the offices have all agreed only to renew their farming stock policies on the understanding that if a fire occurs, and it turns out that a farmer is not insured up to 3-4ths of the then value of his agricultural produce, the office will only be liable to make good such a proportion of the damage as the sum insured bears to the full value." How did Mr. Brown from that arrive at his conclusion?

Mr. BROWN: I am not bound to find the English.

Mr. BIGNOLD: But I have found the English. It does not say a word about implements and utensils in husbandry; it says especially, "agricultural produce." I trust that objection is sufficiently explained. Mr. Bignold again said that, with regard to insurance on live stock, every farmer could do as he pleased in the amount he placed upon it. Some gentlemen made a mistake in supposing that there was no risk upon live stock. This year the Norwich Union must have paid 200 different claims for losses of live stock by lightning; sometimes the amounts were £50, £60, or £70, though the majority of them were not of course more than £20. On the whole, this fact showed that there was a certain amount of risk in live stock. Mr. Bignold regretted that Mr. Brown had to complain that insurers in his district had not received their circulars; that was the fault of the agents to whom they had been sent to distribute, and then expressed his readiness to answer any questions.

Mr. R. ENGLAND: The offices do not require three-fourths of the value of the live stock to be insured?

Mr. BIGNOLD: Unless you insure it in one sum with your agricultural produce.

Mr. ENGLAND: You are at liberty to insure in any amount you please on implements and live stock?

Mr. BIGNOLD: Yes; any amount.

Mr. ENGLAND: And you only ask for three-fourths of the value of farm produce, hay and corn?

Mr. BIGNOLD: Certainly.

Mr. ENGLAND: From some conversation I have heard I was sure there was some misapprehension on this subject; and I am glad that Mr. Bignold has been able to explain the matter to us, for I think he has withdrawn a great part of the objection which farmers had to it.

Mr. R. SMITH inquired whether "agricultural produce," including growing crops, was meant to embrace roots.

Mr. BIGNOLD said most undeniably they were produce. The Norwich and Sun Offices were far more liberal than any of the others in their payments for losses on growing crops. The Norwich Union certainly would not take root crops and young wheat into consideration at the insurance on three-fourths value, and it was optional for a farmer to strike out the words so that growing crops should not be covered. He considered it was rather liberal on the part of the offices than otherwise.

Mr. SMITH said while the words remained the insurance must naturally be held in a court of justice to include roots; therefore they would come in as a proportion of the value of the produce of the farm. Unless "roots" are entirely struck out any office might say to the farmer that the insurance included the value of his roots as well as that of his corn.

Mr. BIGNOLD: Strike out the words.

Mr. BROWN: That won't bind the other offices.

Mr. BIGNOLD: But it would bind ours. There are very few offices which pay for growing crops at all.

Mr. SMITH: Is artificial food for cattle intended to be included?

Mr. BIGNOLD: I think decidedly that that is agricultural produce, and I do not see why you should not insure it up to a fair amount of value.

Mr. SMITH: I do not think you can find a single instance where danger arises upon a farm from artificial food for cattle as in the case of hay.

Mr. BIGNOLD: If you had your barns and warehouses burnt down you would find—

Mr. SMITH (interposing): But we do not keep artificial food in those places. It seems that for the sake of our corn and hay those things are to be added in. We might have £200 worth of cake, which would be no risk.

Mr. BIGNOLD: It would, if there was a fire.

Mr. SMITH: That £200 worth of cake would be added to the value, and we would have to pay a premium upon it just to make us safe with our growing crops which, perhaps, may be hay and turnips.

Mr. BIGNOLD: You have the opportunity of not being insured for it. If you wish to be covered for it it is only right you should be insured up to a fair proportionate value.

Mr. SMITH: It is very certain that as soon as harvest is over and we begin to thrash our corn we reduce the risk to the office very materially, and in the course of three months the risk is not more than one fourth of the whole.

Mr. BIGNOLD: Would you mind stating to the meeting the case you put to me outside.

Mr. SMITH: What was that?

Mr. BIGNOLD: You said supposing that you had value to the amount of £2,000 at harvest time and you did not choose to insure for three-fourths of that value; and that you insured for £1,000, and in the course of two months' time you had only £1,000 value instead of £2,000. Would you receive on the full amount? I say "Yes," because at the time the fire broke out you were fully insured—even more than three-fourths; but until the fire occurred you ran the risk to the same extent yourself. But that was optional. Mr. Bignold then remarked that farmers thought they were being treated differently to any other class. There was not an insurance on the books of any insurance office extending ever more than one place, without the average clause being inserted—what he might be allowed to call a pure and simple average clause. If the amount insured was equal to the full value the clause did not apply, but if a man insured for £19,000 what was worth £20,000 he was his own insurer for the remaining 20th as he had insured for only 19-20ths. The insurance offices gave farmers the boon of insuring up to three-fourths of the value, while everyone else must be insured up to the full value;

therefore, the farmers had an advantage of 25 per cent. granted them.

Mr. HOWARD TAYLOR said it seemed to him that the offices had been endeavouring in this circular to carry out a reform which was absolutely pecuniarily necessary to them; and there could be no doubt in the mind of any one who had at all acquainted himself with the very elements of fire insurance, that the farmers had up to the present time had exceptional advantages in insurance. But if that were so, he could not see why the offices should cause all those exceptional advantages to be transformed in future into exceptional disadvantages. It seemed to him that the offices had endeavoured to carry out an equal reform, but had not done so in a satisfactory manner. The main distinction between the insurance of house property and agricultural produce was that in the one case there was a constant value, and in the other a variable value. If a person did not insure his house up to the full value, he knew that for the difference between the insurance and the value he stood at his own risk; but when a person insured his occupation, it was for a different value every day in the year; and therefore it was impossible for him to ascertain directly what would be the value of the agricultural produce in any particular day in twelve months. In looking at the alteration suggested by the offices, it would be seen that, in order for a person to bring himself within the benefits of complete and entire insurance, he must be insured up to the value of three-fourths of the agricultural produce at a time when a fire took place. It was not three-fourths of the average value of a farm during the year, but it was three-fourths of the value when a fire occurred. Therefore, in order that the insurer should secure for himself the advantages of that insurance, he must keep his premium up to the maximum value of his property at any time in the year. There was another point in which the offices appeared to have subjected the insurers to exceptional disadvantages. They said to the farmer, "You must insure in three-fourths of your existing value"—that was what they intended—"but," they also said, "if you are not insured up to three-fourths of the value at the time a fire breaks out, the sum you shall receive shall be in proportion to the total value of the insured property." There, again, the farmers would be subjected to a disadvantage in the calculation of the amount to be paid as compensation. It therefore seemed to him that the clause in the circular had been framed without a due consideration of the variable value attending agricultural produce. If the committee proposed waited upon the directors of the Norwich Union, which course would no doubt have a commanding influence upon other offices, and pointed out this matter clearly, it would be almost impossible for them to maintain the position they had assumed. Although they were familiar with specific property, they were not so well acquainted with that which was variable.

Mr. BIGNOLD said there were three farmers on the board of directors of the Norwich Union, so the thing had not been done without the advice of practical men. He should be glad if Mr. Howard Taylor would explain how farmers had been treated in an exceptional manner. If a merchant insured bales of cotton in warehouses at Liverpool, he had to do so under the average clause; and cotton, surely, had a different value at different times in the year, just the same as corn. Many different species of merchandise varied more than corn. If a farmer insured at Michaelmas—and that was a general thing—he was almost certain to be insured for three-fourths during the whole year; and the Norwich Union Office, if it found that a farmer had endeavoured to the best of his ability to be covered up to three-fourths the value, would not take any advantage of him if he happened to be a trifle under.

Mr. J. EVERITT said that he was a shareholder in the Norwich Union Fire Office; but, at the same time, he had a large capital invested in the soil; and therefore it would be a suicidal act if he were to offer any observations which were calculated to depreciate or to do harm to the agricultural interest of the country. Taking a common sense, commercial view of this matter, it was absurd to suppose that a large office like the Norwich Union, or any other office in the kingdom, could go on *ad infinitum*, incurring considerable loss by one description of insurance. There was a considerable risk on all property; but he contended that there was greater risk upon farming produce, it being exposed to the dangers of lightning and incendiarism. There was a time when fearful losses were the result

of the latter cause. Then, again, they were exposed to the carelessness of their servants; the consumption of tobacco had increased tenfold, and almost every farm boy had now a pipe in his mouth. Further, he believed that he was stating a fact when he said that one of the greatest losses from fires arose from children innocently playing with lucifer matches. Having looked at the question carefully, as a practical man, he was of opinion that the insurance office was asking nothing unreasonable in fixing the rate of insurance for the whole produce of the farm at 5s. per cent. Perhaps three-fourths was rather above the value; but, as the directors were men of intelligence and moderation, he had no doubt a course would be suggested which would meet the views of the directors and of the agricultural body in general.

Mr. F. CLOWES wished to ask Captain Bignold whether, as the representative of the Norwich Union Office, he was able to give them any pledge as to what would be the future course with regard to the circular? He apprehended that the circular was not the dictum of the Norwich Union, but of many offices?

Mr. BIGNOLD: Precisely.

Mr. CLOWES: Therefore nothing could be come to until another meeting of that association in London, where the offices met and concocted and contrived the means of protecting the community by fixing the rates of insurances. When, a few years ago, he was the director of a fire office, he looked particularly into this matter, and the determination he came to was that insurances upon growing crops and the produce of the land of an inflammable nature would pay at 10s. per cent.; but then if the stacks were separated about the land they might be taken at another rate. Then, looking at the circular, he saw that the office had brought into three distinct classes not only the produce of the farm, but what was upon the farm. They might keep it so. In taking the produce of a farm at what was grown and harvested, there was a danger that might be taken at one rate, and the implements and live stock at other rates. For the live stock they might go down as low as 1s. 6d., and the implements they might take at something like 3s. 6d., and the other ranging at 10s., separated and divided where the stacks were set apart. Such was his proposition at the time. It was communicated to the association in London, but they ignored it; still he thought some such arrangement was desirable. Anyhow, let them get rid of the average clause, and have a rate which should be satisfactory to both parties. This great difficulty arose here, that the policy was not a floating policy; it was a fixed policy upon the farm.

Mr. BIGNOLD: It floats over the whole.

Mr. CLOWES: But still there were a variety of risks, and if they were separated in this way it was like the floating policies which were taken at a lower rate. For instance, in the insurance of cotton at Liverpool they took a floating policy over the whole.

Mr. BIGNOLD: At a shilling a month.

Mr. CLOWES: And some for a good deal less.

Mr. BIGNOLD: No, none; many higher.

Mr. CLOWES thought that if they were to devise some means of separating the produce the office might with advantage take a higher rate upon what was grown and harvested. He did not mean roots, because roots would take no mischief but what would burn. They might then cut the other rates down, and he was sure the office would be glad to insure the live stock at 1s. 6d. For his own part he would much rather do so than take the other risk at 10s. He hoped the committee would make some such suggestion as this to the office.

Mr. BIGNOLD agreed to a certain extent with what Mr. Clowes had said. It was impossible to get the other offices in London to agree to what he had stated. One of the things tried for was that if there was not a certain division between every stack a higher rate should be charged; but as two other large offices would not agree to it the thing could not be carried.

The CHAIRMAN: Would the Norwich Union Fire Office take the insurance on agricultural produce and implements without the live stock on the farm?

Mr. BIGNOLD: Certainly; but if you put the implements in the same item with the agricultural produce the implements would have to be subjected to three-fourths of the value, the same as the produce. If you look at the circular you will see it is so: "If the sum insured on agricultural produce, either

separately or in one amount with other property." You notice that the words "in one amount" show that if you insure £500 on dead farming stock that includes agricultural produce and implements.

The CHAIRMAN: I do not think Captain Bignold has answered the very forcible objection raised by Mr. Howard Taylor. Mr. Taylor did not say a word about the price of our agricultural produce, nor did he say a word about the quantity we grow. Of course we must have new policies every year, that is certain. Take a light land farmer this year; his crop of wheat is perhaps not worth £5. I hope that a kind Providence will bless him so next year that it will be worth £10. Then, Mr. Howard Taylor really put the matter in its true light. A farmer, directly after harvest, has, of course, an immense amount of inflammable stuff upon his farm, but just before the hay comes into the stackyard what has he? Hardly anything besides the straw, and perhaps a bit of old hay; nothing else in the shape of "agricultural produce." Therefore it is very difficult in properly arriving at what they are good enough to call "three-fourths" of the value. I think that the observations made by Mr. Everitt about smoking ought to receive attention in this Chamber, and that the subject is worthy of more consideration than has been given to it. The careless use of lucifer matches is no doubt the whole cause of all these disturbances between the insurance offices and the farmers. One insurance office has been good enough to send me a circular in which it says "children are permitted to play with lucifer matches in rickyards." Why, good gracious me! who permits? You know that accidents cannot be helped, but the careless use of lucifer matches are a source of more destructive fires than all other causes put together. I am quite sure that Captain Bignold will say that it is so in Norfolk; and I do think that one point which ought to be considered is whether there should not be some restriction put upon the sale of those lucifer matches which ignite upon anything. There is a safer kind of match, which ignites only on the box, and one never hears of a child taking a whole box of lucifer matches to play with—and if they were used I believe the risk would be materially diminished. I will just make one observation further—I particularly object to the way in which this circular has been put before us, and I object still further to the time. This meeting was held in London on the 10th of May. Our policies are all renewable on the 29th September. The Norwich Union Office has certainly dated their letter the 15th August, but some of us have not yet received a copy, and others only received one in the course of this week.

A MEMBER: I received mine this week.

Another MEMBER: I have not received mine yet.

The CHAIRMAN: Some of the offices in London, according to a letter which I have, say: "We are about to inform our agricultural friends of these new regulations." I may tell you this: I was a director of an Insurance Company in London; but things were managed in such a very nice manner that I knew nothing about this until I received this notice from the Norwich Union Fire Office of these new regulations. I need not say that as soon as I saw that, I resigned my seat on the Board, because I did not wish to be made a puppet of, nor did I wish to run the risk of being had up before the Lord Mayor, and committed to prison, if some discontented shareholder finds that the Society does not flourish quite so well as he expected. I should like to inquire of Captain Bignold whether it is the insurer who has to ask this long list of questions—eleven in all, but they are compound questions which would lead to about 30, more or less—the poor unfortunate agent?

Mr. BIGNOLD: The poor unfortunate agent.

The CHAIRMAN: I am very glad indeed that the farmers have not to ask them. Some of those questions are ridiculous. I have before me some put by a London Office—the Norwich Union does not go quite that length—and one is, "Is the insurer popular with his labourers?"

Mr. BIGNOLD: That is a very material point.

The CHAIRMAN: You will next have this, "If a manufacturer, what are his politics, and is he popular with the mob?" Captain Bignold has told us that fire-insurance does not pay.

Mr. BIGNOLD: Not generally, we don't say that.

The CHAIRMAN: I make this challenge to Captain Bignold—and I have pretty good authority for it—Fire insurance on farm produce in Norfolk does pay. I do not say that it does pay all over the kingdom; but I say that it does pay in Norfolk, and I challenge the directors to prove that it does not.

Why should we be made to pay for the shortcomings of other counties? There was a time when there was a vast amount of incendiarism in Norfolk. Happily that time has gone by; but incendiarism still exists to a certain extent in other portions of the kingdom. I do not say a word about that, because the poor farmers cannot help it more than we can. But in most other counties the whole of the agricultural produce is grouped in most beautiful fantastic ricks all round the premises. The "Royal Farmers" Office say, "We have just had to pay a loss in which there were 27 stacks destroyed." Now I will ask you whether such a thing as that could by any possibility happen in the largest farm in Norfolk? Of course it could not. Therefore I say that we in Norfolk have no right to bear this infliction, but that everybody should be insured according to the proportion which he takes. Let us have varying rates. For my part, I have arrived at the conclusion that nothing shall ever insure my live stock. Mr. Clowes says he would insure it for 1s. 6d. per cent. I would not insure it at 3d. per cent. What risk is there? Perhaps some stupid pig may run his nose under a rick and get smothered; or some cocks and hens, but they are not taken into account, I believe—

Mr. BIGNOLD: There would be some cackling if they were not paid for.

Mr. EVERITT: What about horses in the case of fire in a stable?

The CHAIRMAN: Well, occasionally you may have a horse destroyed. Let any practical farmer go round his premises at Michaelmas and value his live stock. I am only a small farmer, occupying 400 acres of land. I shall be sorry indeed for anyone in the month of October to come and pay me £2,500 for my stock. Do you think that there is any risk whatever upon sheep? They may occasionally be killed by lightning; and, as to bullocks, I wish we had an insurance against pleuro.

Mr. BIGNOLD: We nearly had an insurance against pleuro the other day.

The CHAIRMAN: I think the insurance companies have treated the farmers particularly bad as regards time. They have not given us time to establish a Mutual Insurance Company, which, perhaps, would be a bad thing for us; but at the same time I would rather be a shareholder in such a company than have this injustice inflicted on the agricultural interest. And I would say this: Weren't we laughed at and scoffed at in the year 1843, when we established the Hail Storm Insurance Company, and is that such an extremely bad speculation? I believe not; and I also firmly believe that if a body of farmers would undertake mutually to insure each other, they would take such legitimate precautions that a premium on fire insurances at 5s. would be a very profitable investment.

Mr. BIGNOLD remarked that he thought they could hardly complain of the office not having given them sufficient time to establish an association against them, but, nevertheless, he assured them that the desire of the directors was that they should have sufficient notice. With regard to the establishment of a Mutual Insurance Office, if they took that course, he did not think they would find the profits to be much; but, on the other hand, he believed it would share the fate of one established some time ago. Pray let them try; but, at the same time, the Norwich Union would be sorry to lose anyone who insured with them. The question as to whether a man was popular with his labourers he regarded as an important one, because no less than 25 per cent. of the losses sustained by fire arose from incendiarism, and if a man had the reputation of being harsh to his labourers and of ill-treating them, that might be an important element as tending to incendiary fires. With regard to what the chairman had said as to his not having answered Mr. Howard Taylor, the chief point in that gentleman's observations was that the farmers were being treated in an exceptional manner. He (Mr. Bignold) was at a loss to see how this was, because the office asked the farmer to insure up to three-fourths, or to have an average clause, whereas in every other case a man had to insure up to the full amount, so that the farmer had the advantage by 25 per cent.

A MEMBER asked if tramps were not the cause of most of the incendiary fires?

Mr. BIGNOLD said that most of the losses incurred through tramps came under the head of accidental fires.

The CHAIRMAN said that if they looked at the calendar of

any Norfolk assizes, they would see that almost all incendiary fires were caused either by tramps, by some one for a lark, or by some pleasant individual who wanted to get transported. As far as regarded the labourers themselves, whether a man was a hard or very generous master? was a question that ought not to be put by an insurance office.

Mr. BIGNOLD: We don't put such a question. I am only defending others who do.

In answer to Mr. BROWN, who regretted the observation of Mr. Bignold as to its not being likely the office would give them sufficient notice to enable them to form a Mutual Insurance Office,

Mr. BIGNOLD remarked that the directors never dreamed of such a thing being possible, and that they had given five weeks' notice, the non-delivery of the circulars being entirely the fault of the agents.

A MEMBER remarked that Mr. Bignold was mistaken if he supposed farmers would be put down now as they were twenty years ago.

The resolution was then adopted unanimously; and on the motion of Mr. CLOWES, seconded by Mr. J. EVERITT, the following gentlemen were appointed the committee: The President, the Vice-President, Messrs. T. Brown, B. Bond, and W. Flatt.

The CHAIRMAN said that he was sure the Chamber were much obliged to Mr. Bignold for attending there, and for the courteous explanations he had given.

On the motion of Mr. EVERITT, seconded by the Rev. J. L. BRERETON, a vote of thanks was accorded to Mr. Bignold, who, in acknowledgment, said that the Norwich Union Office insured eleven millions of farming property in the kingdom, and they would very much regret not to remain at the top of the tree.

The meeting then terminated.

An adjourned meeting of the Norfolk Chamber of Agriculture was held, Mr. C. S. Read, M.P., in the chair, to further consider the question of the terms upon which insurances of agricultural produce are required to be effected in future by the principal insurance companies.

A committee appointed to confer upon the subject with the directors of the Norwich Union Fire Insurance office reported: "Your committee are informed by the directors that the conditions requiring agricultural produce to be insured up to three-fourths of its full value apply only to all manures, food for cattle, &c., produced or used upon a farm; and that it is competent for a farmer to insure his corn and hay crops to the exclusion of roots, food, manures, and other items. In the event of a fire only the particular produce insured would be taken into account in estimating or valuing the loss. The directors declined to amend or withdraw the circular issued by them. They also informed the committee that a reasonable amount, having due regard to the total value, can be insured on implements and also on live stock, such reasonable amount being in their opinion not less than one-third of the value thereof; and that if such reasonable amount were insured, any amount, not exceeding the amount insured, would be paid in full without any limitation or restriction, beyond the usual one that not more than £40 will be paid for any article or animal unless specially mentioned. Your committee pointed out that the foregoing terms were a radical change in the system of farm insurance, that farmers were entitled to due notice thereof, and that as they had not had such due notice your committee suggested a renewal of Michaelmas policies on the old system for a reasonable time to enable a committee of farmers to meet the directors and endeavour to arrange terms which would be satisfactory to both parties. The directors, while admitting the insufficiency of notice declined to grant any extension of time, but advised that insurances should be effected on their terms, adding that there would then be a whole year for farmers to consider the matter."

Mr. GERARD DAY proposed that a fresh insurance company should be formed.

Mr. C. E. BIGNOLD, assistant secretary of the Norwich Union Office, stated that that office had insurances of agricultural produce to the amount of £2,000,000 in Norfolk. For several years the profit realised on this amount of business had been only £900 per annum, and for the last five years there had been a positive loss.

The CHAIRMAN said the directors of the Norwich Union appeared to wish Norfolk farmers to pay for the shortcomings of the insurers of other districts. Farmers ought to have a heavy policy from July to December, and a light one from December to July. They could not insure under an average clause without a great deal of trouble and an immense amount of injustice, and, therefore, he for one would not so insure.

After a good deal of conversation the proposition for the formation of a fresh insurance company was withdrawn, but the Chamber adopted a resolution to the effect that it regretted that the directors of the Norwich Union had thought fit to adhere to the average clause system which the Chamber conceived to be unfair to the agriculturists of Norfolk.

The proceedings then terminated.

ECHOES FROM THE AUTUMN MEETINGS.

WARWICKSHIRE.

At Leamington, Mr. T. HORLEY said: We must feel that we are exceedingly fortunate in having such a nobleman as Lord Leigh as lord-lieutenant of the county. He is always foremost in every charitable movement which is started, and he has always shown himself ready and willing to alleviate the sufferings and better the condition of the working classes. As a landlord he is a noble example. Since the last meeting of the society, his lordship has given his tenants the privilege of killing ground game on his estate. I am quite certain that neither his lordship nor his friends will ever find legitimate sport interfered with by reason of the concession he has made. But Lord Leigh has done yet more for his tenants; he has promised compensation for unexhausted improvements carried out on his estate; and, if that act should lead to the establishment of a good practical system of Tenant-Right in the county, it will be a great thing for Warwickshire. I must also speak of the liberality of another landed proprietor of the county—Mr. Mark Philips—who has intimated his intention to return to his tenants the whole of the rent of land upon which they had grown wheat, which would amount to about 25 per cent. of the aggregate payments. That is a noble and generous act, and one showing that Mr. Philips takes a deep interest in the welfare of his tenantry. It has been mentioned in connection with the prize offered by the High Sheriff of Oxfordshire for the best cultivated farm at the last meeting of the Royal Society, that in Lincolnshire they have a Tenant-Right, which was attended with the best effects. It has tended to create enterprise among farmers, and if the same thing were adopted throughout the country, then the whole country would participate in the good which has unmistakably resulted in Lincolnshire. It will be a red-letter day for Warwickshire when we have a practical Tenant-Right in vogue. Referring to the condition of the agricultural labourers, I must say I believe no system of education will do good unless the labouring classes have good dwellings to live in. Nothing will do more good to the farmers or their servants than providing on the farms suitable dwellings for the latter class, with good gardens, and all near to their work. I also hold that the landlords should not carry on the practice of having large preserves of game. It would be productive of much good if they would remove a large quantity of the hedgerow timber from their fields. If a few of these things were brought about, we should no longer hear of the farms in Lincolnshire and Northumberland being in a better state than those in Warwickshire and other counties, but there would be a better state of things throughout the whole country.

Mr. C. N. NEWDEGATE, M.P., said: I was glad that Mr. Horley congratulated the meeting upon the decision of the Lord-Lieutenant that he would upon his estate allow compensation for unexhausted improvements. I am a half-bred Lincolnshire man, and for more than 15 years, in all my agreements with my tenants, there has been a clause that binds my estate to give them compensation. That system of agreement has been the foundation of the success of agriculture in Lincolnshire which now surprises even Scotland itself. I will not touch on all the observations that have been made with respect to agriculture; but when Mr. Horley says "Fell more of the hedgerow timber," I must call to his attention the admitted fact that in the counties where there is the least hedgerow timber they have suffered most from the drought, and that it is an ascertained fact that in Egypt there were no showers about Cairo till they planted rows of poplars. As we have experienced a period of unexampled drought, I doubt the policy of felling the hedgerow timber round grass land. I

have in this drought watched the state of things in the park at Arbury, and I have found that where there have been trees and shelter there has been more natural pasture this season than I have seen anywhere else. I think, therefore, that what Mr. Horley recommended should be qualified to the felling of hedgerow timber where it stands between arable fields; and this even may require further qualification, for I am convinced a great mistake has been made in Leicestershire, where the hedgerow timber in the fences which separate pasture land has been cut down. I think the recommendation of Mr. Horley needs the qualification I have mentioned. I am an old member for the county, but I am a young farmer; yet this year I have tried an experiment I would like to mention. I was the first to propose and give a prize for draining, as a member of the Rugby Agricultural Society, and I do not regret it; but, happening to have a level meadow this year with a spring in it, I stopped up my drain, and I think I had more pasture there than all my neighbours. I admit that that is an experiment to be tried with caution, but if it be done wisely where there are springs you will be able to withstand the drought of such a season as this.

Mr. C. M. CALDECOTT said: If I had the fortune of our noble Lord-Lieutenant, and possessed the quantity of land which he possesses, I think I should also be inclined to give my tenants the privilege of shooting hares and rabbits on the farms they occupy. I have a small farm at home, with about 300 acres, occupied by one tenant, and on that farm I have shot eleven hares in three years. I have been out three days this year, and saw one hare on the farm. I do not take particular credit to myself for not being a strong preserver of hares against my tenants. As to Mr. Mark Philips, a better man never lived; and if I, like him, had £30,000 a year and saw my tenants in difficulties, should I not help them? Mr. Horley has lifted up these two landowners as if there were no others like them in the county. I object to this, and I will not have it. I quite agree with him that a landlord ought to think of his tenants, and what is best for them in the way of helping himself by helping them, and by giving good houses to the labourers, and all that; but it is not to be a one-sided arrangement, it must be worked all through; everybody must have the same feeling—the inferior towards the superior, and the equal towards the equal. There must not be one man set on high, and people say "There's none like him!"

Mr. SMITH, of Bibury, Oxon, said hedgerow timber was a source of great injury to tenants. At a time like the present, when such great demands were made on the land, the soil should be made the most of. One of the greatest drawbacks to the tenant was the over-preservation of ground-game. In whatever district he lived, if the farmer was much over-run by ground-game, he could not make the best of his land. He hoped to see the day when, like Lord Leigh, landlords would give up ground-game to their tenants. Landlords would then have as good sport as at present, and that without the expense of so many gamekeepers. Every tenant-farmer would be a keeper of his landlord. If, on the contrary, they had no share of the sport, when they saw men lurking about their fields they might be inclined to look another way, saying, "They are not going to rob me, but to take the robbers off my land." While, on the other hand, if they had a share in the sport, they might seek assistance and arrest the suspected characters. Rabbits were the worst of vermin, and their over-preservation was unnatural. He had had an interview with Sir Michael Beach, who asked him, "What do you require us to do?" He replied, "All we wish you to do is to set a good example. We wish

you to legislate as you please; but we are now come to ask you to allow your tenants to destroy rabbits and course hares." He had given that permission for the last two years. It was said that every pheasant cost a guinea, while its market value was only 3s. 6d.

Lord WARWICK, the President, said: I hope you will excuse me for saying one or two words with respect to the discussions which have been held during the speeches this evening. I do so in good part, and with the best feeling. It is my earnest wish to hear from all practical men their practical opinions on farming, on stock, and on what may advance the interests of agriculture. I think, as President of this Association, it becomes me to say that we have a little too much wandered into points which are likely to create differences of opinion and discussions which are hardly fitting for a meeting like the present (Hear, hear, from Lord Leigh). If there were no other places where they could be discussed, I should say let us discuss them with all that good feeling evinced by my friend Mr. Caldecott. But you must remember that there is a Chamber of Agriculture, to which these matters more especially belong. I hope you will nearly all agree with me that if we introduce these matters, which are somewhat personal, and which almost require a reply, or if we get into the discussion of such questions, there may be certain disagreements which we should wish to avoid, and which no one who looked forward for a moment would wish to encourage.

Lord LEIGH: I may be permitted to say a few words in reference to the matters alluded to by the noble President. I must say that I most entirely and completely agree with what has fallen from my noble friend. I regret that my name has been more than once mentioned by my friend Mr. Horley and others in reference to the game question. I must say that I perfectly agree with my noble friend the Earl of Warwick, that it is far better to avoid the introduction of such questions as the excessive preservation of ground game, referring them to the Chamber of Agriculture, which is the medium for their consideration. My private feelings led me to see that it would be better for me to give up ground game to my tenants, and I did so for that reason. But I never expected it would pass beyond my own tenantry. It got into the newspapers, and it has been to me a source of annoyance, as it appeared as if I wished to dictate to my neighbours. I am satisfied that the good feeling of every landlord in Warwickshire would, if he could, induce him not to have an excess of game. I am equally convinced that if my noble friend the president thought game was doing any injury to his tenants, he would use his discretion as to the manner in which it should be remedied. It is a question between landlord and tenant, and one which should not be introduced at these assemblies. If the tenant has anything of which to complain, let him state his grievances to his landlord—but do not let him come here and quote Mr. A. or Mr. B. as examples of giving up their ground game. It has been to me a source of great annoyance to hear my name frequently mentioned in connection with this subject. I hope tenants will speak out to their landlords, and not introduce such discussions at festive gatherings like the present.

NORFOLK.

At Wayland, Mr. MAYHEW said: Besides the difficulties of feeding his stock, the farmer had had other difficulties to contend with, and he was afraid there were yet more in store for him. During the last few years they had experienced very adverse seasons. There was a time when the light land farmer by well and judiciously applying his money could meet with some encouragement, but now, however much skill and energy he brought to bear in the farming of light soils the result was not that which he might reasonably expect. Possibly these adverse circumstances in the long run might be attended with benefit. It might, perhaps, put them on a sounder basis. In the first place no doubt it had a strong tendency to do away, in the successful cropping of the soil, with ground game, or, more properly speaking, vermin. He was sure they would all agree with him in thanking the noble president for having taken the initiative in destroying these pests to the farmer. It was true that in the course of time Parliament might enforce the suppression of them, but their noble president had anticipated this, and had acted wisely in taking the initiative. He thought they would also concur with him that the rents of the light lands were not exactly genuine. They had been put up to an extreme degree

by what he might term outside men, men who were not brought up in practical farming, and who imagined that if they could get hold of a light land farm it would be nice to gallop a horse across the farm, so that they had been induced to come and give more for that land than it was absolutely worth. This put a practical man in a very difficult position, especially when the seasons favoured that description of land, but he believed the last few seasons had shown that the practical men who were willing to give a fair rent, and to give no more, were the men in whom alone they could trust.

Lord WALSHINGHAM said: With respect to ground game, that was always a difficult and moot question, and he had never heard it discussed without its being qualified by the statement that it was very wrong, and people ought not to be allowed to have too much ground game. But who was to decide between too much and too little? A man when he took his farm inquired and ascertained from his neighbours what amount of ground game the landlord was in the habit of keeping, and if he was dissatisfied he need not take up the lease, and had better go to where there was no game. It was a question which rested entirely with the landlord and the tenant, and one with which the law could not deal. As to theoretical men paying more rent than practical men, the landlord tried to get as practical tenants as possible, and if men turned out not to be practical, it was no fault of the landlord. There might be non-practical men get hold of farms; but, as a rule, he believed the farmers of Norfolk were practical men, and knew the value of land just as much as the landlord, and would never give more than it was worth, unless, indeed, he happened to be a man not of strong mind and unable to judge for himself. If they had a horse to sell, they tried to make as much of him as they could; and if they asked a price they could not obtain, it was proof positive that the value put upon the horse was more than it was worth. It was a matter of agreement between landlord and tenant between buyer and seller. Referring again to the question of ground game, the noble lord said that the tenant would have a right to complain of his landlord if he kept up more game than he had been in the habit of keeping up before he let the farm; but if the conditions and circumstances under which he took it remained the same, he could not see on what ground any complaint could be made.

LINCOLNSHIRE.

At Halton Holgate, Mr. J. H. M. MUNDFY said he was nearly the oldest on the roll of the magistrates of this county. He hoped they might so adjust the justice of the country, which had been placed in the hands of the magistrates of England, that they might not be reduced to that position which prevailed in most other countries, where justice was conducted by a paid magistracy. They were, perhaps, not always quite so conversant with the intricacies of the law as paid magistrates might be, who would be selected from the legal profession; but they had their magistrates' clerks—men of uprightness and integrity—to whom they could appeal with every confidence in any legal difficulty, an advantage which assisted them to do what was just and right.

Mr. HEANLEY, in responding for "Success to Farming and Grazing," said it took a clever man to farm at a profit, much more to graze at a profit. Under the present régime, with a European war, they were not to have wheat above 47s. per quarter, and cake was costing £13 per ton. As a practical man his advice was "farm as well as you can." He recommended the use of artificial manures, the necessity of having sheep on a farm; and with a European war, wheat instead of being at four guineas had come down below 50s., which they must try to make up for by growing a greater quantity. The next thing he could recommend was consideration for the labourer, and that he should be paid in proportion to his labour. Mr. Mundy had given them a little speech on the administration of justice in the county of Lincoln. He (Mr. Heanley) contended that they had spent too much in prison building in this county, and they had got so Radical as to think we ought to have a paid magistracy. They could not take two men opposed to each other before a justice and both win the case, and when the investigation was before a clergyman what was the result? Why, the man who lost declared he would never go to church any more, and became a dissenter. There was already plenty of dissent, and he hoped we should always have an Established Church in the realm, but he did not think in

this county of Lincoln the law could be administered without going to the clergy, because there were not enough country gentlemen for the task without them. If it was an undeniable fact, then, that the man who went before a clergyman and lost his case turned dissenter, it was time we had stipendiaries.

Mr. THOS. DRING (Claxby) followed. He thought that to ensure prosperity it needed the united efforts of the owner, occupier, and labourer. There was a great deal to do which it would require those three interested to carry out to the greatest advantage, but when he looked back he admitted there had been a very great deal of prosperity in the country. Not only farms, but whole parishes now grew more than double the quantity of every description of crop that they did 40 years ago; yet, whilst there had been that prosperity in agriculture, the farmers may not have made much by it. There were three things that had been very valuable to occupiers—namely, steam thrashing machines, reaping machines, and artificial manures. All these had been productive of great benefits. Artificial manures produced great turnip crops. If it had not been for the use of reaping machines they would almost have been beaten, but with them they got in the harvest just when they ought to do. A reaping machine, in fact, was one of the best things a farmer could have. There was another thing or two that had also tended to the prosperity of agriculture. Landowners or their representatives had not only been considerate for their tenants by building them warm sheds, &c., but had built good cottages for the labourers in the neighbourhood of their work, and copied the best specimens of dwelling that could be found; but he could not see the use of allowing a tree to grow on a space worth say 2s. a year, which at the end of a century produced 30s. He thought there might be a great advantage gained by improving fences and grubbing up trees. There were also a great many other things he could name that would be a benefit to agriculture. They should have sheep from the best flocks, and cattle from the best herds, and get the most they could out of the soil by endeavouring to grow more than their neighbours. Another thing was, that on these occasions of ram shows, he should be glad if the breeder could vouch that there were no sheep amongst them fed on anything but green food for the last six months. If kept on grass food they would be leaner, fewer sheep would fall lame when they got them at work, and there would be more work in them. Mr. Vessey's sheep were this year in better condition for work than he had ever seen them. They were fat enough, but not too fat, and those who had hired them would be better satisfied than if they were so very fat.

Mr. C. M. MUNDY differed *in toto* with Mr. Heanley when he said stipendiary magistrates would be preferable to the unpaid. He had found inconsistencies in the administration of justice committed not only by stipendiaries, but by the greatest judges of the land. It had been his duty to serve on the Grand Jury at Lincoln Assizes, and he had observed that it made a great difference in the sentence passed upon a prisoner in respect to the person who represented her Majesty as the Judge of Assize. He had seen judges sitting with their backs to one another in Lincoln Castle when one had given fifteen months' imprisonment and the other fifteen years' penal servitude for the same offence. It was impossible for magistrates to make as much difference as that. Then the stipendiary magistrate would entail great expense, which would fall on the ratepayers. Take for instance this district. Suppose they had a stipendiary magistrate for Louth, Horncastle, Spilsby, and Alford; he could not do more than those four places in a week, and a man could not be found to do them under a thousand a-year. [Mr. Heanley: He could do them for a deal less.] No doubt they could get a man to do it, but not the class of man that was necessary. A man of the calibre of a County Court Judge would not take the several divisions of Louth, Horncastle, Spilsby, and Alford, under a thousand a-year. And if that would be the cost of these four petty sessional divisions it would be an expensive matter for all the divisions in the country. The justices did not get many thanks for what they did, but in ninety-nine cases out of a hundred they did their duty to God, to their fellow creatures, and to their neighbours. When the country parishes should become so affluent as to have many thousands of pounds to throw away, then it would be soon enough to discuss the question of a paid magistracy. But then they would do away with one of the objects for which country

gentlemen live here. There would be only two or three more things which induce gentlemen to reside here that they could be deprived of, and if they abolished them one by one they would find them going away to a foreign country to spend their days in a finer climate than that of Lincolnshire. He had been born here, and he hoped to live and die here amongst his friends, and to live as a country gentleman should do. But it was a great mistake on the part of those who would try to do away with those inducements which made it worth while living amongst them. If everything was made unpleasant here for the country gentlemen they would find a more pleasant place to live in.

At Aylesby, Mr. JOHN TORR said he thought that success in agriculture had been attained by the indomitable perseverance, self-denial, and pluck of the tenantry of England. He did not pretend to be well up in the statistics of Lincolnshire, but to illustrate his argument he would say that no part of the country could boast of a greater increase in the value of land or in improvement of stock than that county. He had heard that Limber Magna had once let for half a crown an acre. It was not Lord Yarborough who raised its value from 2s. 6d. to 35s. an acre, but the cultivator of the soil. He made these remarks *ad captandam*, and said that if they were to toast the landlords, let them also toast the tenants.

Mr. C. NAINBY said, with regard to the improved position of this county and other counties in agriculture, he agreed that it was the industry and intelligence of the farmers that had brought it to such a position, still it could only be arrived at by a mutual confidence and understanding between landlord and tenant. The two landlords whose names had been brought forward co-operated with their tenants, and their motto was "Live and let live." They had one great difficulty to contend with in bringing the land to a high state of cultivation, and that was the miserable return it brought them. He kept working hard, but found he could get but little together. He tried to keep his farm up to a respectable standard, and perhaps he gave what land he had of his Lordship's a better chance than his own. But if they had many more years like the last it would make a great difference. He had been unable to get anything for himself. He lived loyally, but it had not been his fortune or misfortune to take a wife, and he had no incumbrances. Yet his returns were very small. He thought therefore that those gentlemen who had the start of him, and had families to look after, must be better managers than himself.

Mr. WILLIAM TORR said: I return you my earnest thanks, not as a ram breeder, but as a friend who is glad to see you at his board. It makes little difference to me whether you come here to take my sheep or not, but I have the satisfaction—which is something at my time of life—of saying I have shown you some very good ones, and that cannot be denied. If you are satisfied, I am the more pleased. I believe this, that farmers may be thought by some to have no more intelligence than the clod they cultivate, but they have in their heads as good sense as any class in her Majesty's dominions. They have integrity of purpose, and when called upon are ready. My friend has so thoroughly enunciated the position between landlord and tenant that it leaves me nothing to say. I should hardly have expected so good and sensible a speech from him. I have had a long experience as a farmer, and have found out that if a tenant pays his landlord, and spends as much as a green-grocer in a town, he would have little left for his family. But if a farmer is not rich, it is a long time before you can break him. He will grunt long and grunt well, but he has never grunted so well as during the last three years. You have lost your money from a succession of bad seasons, during which the higher a man farms and the more land he cultivates the greater is his loss. I have no idea of a man farming and saving, and doing no good to those who may come after him. I think every man ought to live fairly and farm well; and farm so that something may come after him. From 1860 to 1861 was a disastrous year in farming, but 1868, 1869, and 1870 were the worst, and those who farmed on the Wolds must have been last year's rent out of pocket, for their farms have made them nothing. I say it guardedly. Look at last year, when wheat and barley did not exceed three quarters to the acre. Where could you get your profit after paying labour? This year things look improving, and we shall not lose so much as we have done. Yet there is

nothing to be said against the landlords. But it is a bad time for landlords to raise rents. I say that guardedly. The tenant farmers of this country form a most respectable body of men, and if they have no knowledge of chemistry to help them, they have a deal of practical knowledge, but they might learn chemistry to boot. Let us move together and stick to each other, "and let the devil take the hindmost."

BUCKINGHAMSHIRE.

At Aylesbury, Mr. DISRAELI said: I hope, although this has been a very trying year to my constituents and the agricultural world generally, I may venture to state that the termination of your labours has not been altogether so unsatisfactory as it once promised or rather menaced to be. I believe we shall all agree that the harvest is a good harvest, and even in the light lands in which I live the wheat harvest is one of which I am not ashamed; barley is not so plenteous as it might be, but it is of excellent quality. It is of that brightness which our maltster loves ("hear, hear," and a laugh), and I think we shall be able to place it in the market with confidence in those with whom we deal. No doubt we have all suffered terribly in the expectations which we entertained respecting the root crops, but the late rains have been most beneficial, and although I cannot flatter myself so far as to suppose that the bulbs will expand at this late season of the year, still there is no doubt there will be a large quantity of green stuff which will be valuable food for the winter. And on this subject, looking to the unexpected drought which has prevailed this year, I would advert to one point, and one point only, to which I wish to call your anxious attention, and that is to make provision for a better supply of water for the cultivation of the soil. Where I have lived I have never built a cottage without making tanks, and I have introduced tanks among all the old cottages as far as I could manage to do so, and during the trying times you have lately experienced it is difficult to express what a mitigation of suffering of the population generally, especially on the table lands on the top of the Chiltern Hills, has been produced by these tanks. I think it is well for the agricultural world to consider whether that principle should not be pursued still further, and for my own part I cannot see why every farm, especially in those districts where there is a want of water, should not be furnished with a reservoir. I hardly know anything more striking than the great waste of surface water, and when I remember the intense suffering, not only of the peasantry, but of the cultivators of the soil, this year from the want of water, I think the time has come when we ought to consider whether greater use might not be made of that surface water which now is entirely wasted. It seems to me that if the habit were introduced of establishing reservoirs, very great advantage might be obtained, and under the difficult circumstances of years of drought like the present very great benefit might accrue.

Mr. J. K. FOWLER said that he had just received a telegram stating that the rinderpest had broken out among the Dutch cattle. The Government, to meet the question of preventing the importation of the cattle plague into this country, had made an Order in Council, prohibiting the importation of stock from France, but France wants now every animal she could get, and it was from Holland and the other countries in the rear, not in front of the armies engaged in warfare, that the prohibition should be applied to. If the representatives present would see that this frightful scourge was not allowed to be brought into this country again they would be thankful, and the British farmer would not, in the words of Mr. Disraeli, be appalled!

CHESHIRE.

At Sandbach, Lord DE TABLEY, in giving "Success to the Cheshire Agricultural Society," said a very grave question had arisen as to the future of this Society. He thought, in short he took it for granted, that the presence of all the gentlemen he now addressed proved that they felt an interest in the Cheshire Agricultural Association. The question was, should the county association go on or not? The result that day had been promising, and he thought if they held together and increased their subscriptions, and infused a little new blood into the affair, they might continue their existence as a county association. He had alluded to a sister society—the

Manchester and Liverpool. With that association they must come to an understanding, either for friendship or perhaps the contrary. He had great confidence in the result of the meeting to-day. He hoped the county association would hold together, and it was with great satisfaction that he proposed its continued success. He could not sit down without alluding to two or three facts which Mr. Tollemache would have more ably brought under their notice had he been present. It was only right that Cheshire farmers should know the exact position in which they stood, in order not to discourage them, but to stimulate their exertions. Mr. Tollemache had sent him a statement of the importation of American cheese, which showed that from 1865 to 1869 there had been an increase in the importation of nearly a hundred million hundredweights of cheese. In 1865 the total foreign cheese imported was 853,277 cwts., and last year it was 979,189 cwts. Still he (Lord de Tabley) thought there was no cause for discouragement, for with a large increase of population in this country, there were additional ways of disposing of farm produce; while as to quality, he did not think foreign cheese would ever beat a good Cheshire. Poor cheese might find a difficulty of sale, but good Cheshire would never be beaten. Improve the make of your cheese, then, he would say, and beat the foreigner out of the field.

Mr. R. DUTTON, said: Notwithstanding the wishes of Mr. Latham, Mr. Mainwaring, and other gentlemen who wanted them to come under the shadow of a much greater body, he could not help thinking that it would not be to their credit if one of the first agricultural counties in the kingdom were not able to maintain one large county association. He was quite certain that they could maintain one, but, in order to do it they must all be prepared to allow for each other's peculiarities; must try, should he say, to make wider their sympathies, explain their opinions, and be willing to bring in from distant parts that which made the Manchester and Liverpool the commanding society it was. If his young friends would take the advice of an old man who had watched the proceedings of that society from its commencement—for he had been a member from the first, and had not been absent from one dinner, and could only say he was forcibly impressed by the absence of many of the originators of the society, but that must not divert them from the greater object they should have in view—they would all try to do what they could to make the society more efficient, and to do that they would take lessons from a somewhat more powerful rival. They must put aside self-conceit and somewhat narrow notions—for he did not pretend to say that farmers were not a little selfish, with a tendency to monopolise—and try and throw open some of the classes, for if one thing would strike them more than another in connection with the Manchester and Liverpool, it was the good stock they brought from all parts of the kingdom. They brought first-class stock from the east, the west, the north, and the south; and hence he thought one of the first things for them to do was to make their show-yard more attractive. Taking into account the area, the subscription list of the Manchester and Liverpool was not larger than theirs, and therefore what he strongly urged upon them was to offer prizes, open to the competition of the whole of the kingdom. Let them have the best bull, whether it be Lady Pigots, Mr. Brierley's, or any other; let their Cheshire farmers see them, and see if they could not take a leaf out of the books of others. Not only so, but he would have a champion prize for cheese, open to the whole of the kingdom, so that they could get makers to send from Somerset and Scotland, and let them try to find out how the cheese was made there with a view to adopting the methods. There were other points too which required a little ventilation. He would have premiums as now limited to the sphere of the Society's operations, but in addition to all-comers' prizes, he would make a distinction between those who made a living by agriculture and those who did not. He did not hardly like to see Lord Crewe competing with dairy farmers, and though his lordship was fairly beaten, and it was his (Mr. Dutton's) honest opinion that a better pair of cows was in the possession of a dairy farmer than those belonging to the Right Hon. Lord Crewe, still he thought a large landowner like his lordship should not compete with tenant farmers. However, such was the case, and he (Mr. Dutton) thought that the parties competing for a specific purpose in this direction should be those making a living mainly by farming. Then he would press it upon their

judges that in giving the prizes for the best dairy cow or best pair of dairy cows, they should not give them to those with a tendency to lay on fat. It did not follow that the cow in the best condition was the best dairy cow. It might produce excellent stock, and yet not be a good milker. Therefore he would instruct their judges to give their attention to the qualities the cow possessed for the dairy, and if they liked to give prizes to the best cow irrespective of that, they could do so. The other day a cow, which was unquestionably the best animal, was shown against other dairy cows; but after considerable hesitation the judges, he being one, decided that they could not give the prize to that cow and made a note in their book that though they considered it the best in the yard, not being the best dairy cow, they did not consider it was entitled to the premium. There was one more question which everybody seemed inclined to shirk, but upon which he had spoken out more than once, this was in regard to the stallions and brood mares. He considered that, whatever their merits in other respects, if they were not perfectly sound they should not be allowed to take prizes. They would laugh at a judge who gave a prize to an unsound cow or an unsound bull. He knew that sometimes an unsound horse came into their possession, and that they got the jeers and taunts of every horse-dealer, who would ask, "What do you want for your screw?" And he must say that to give a premium to an entire horse which was unsound—he did not say this with any specific reference to what had been done—was to do a positive injury, and to hold out an encouragement to the horse to travel throughout the length and breadth of the country, propagating unsound horses. As to mares, he knew the common notion was that when a mare was unfit for sale the best thing to do with her was to make a breeder of her; but he held that no man, be he farmer or gentleman, would act wisely in putting an unsound brood mare to the horse when the probability was that in five cases out of seven she would propagate her own unsoundness; and therefore he thought there should be a footnote inserted under the premium for horses, requesting the judges to withhold premiums from entire brood horses which in their opinion were unsound. Proceeding to the farm premiums, he told them candidly that sometimes when money was expended upon a farm it was not taken into consideration whether that money would be wisely and profitably expended. He did not think it was good policy to expend 20s. in one direction with a prospect of getting no more than 18s. back. Many a man spent money on unnecessary improvements, for unless money expended gave a return of five per cent. a man was not a good farmer, although his land might be clean, free from thistles, and nothing wrong in the fences. There was a saying that a man who caused two blades of grass to grow where only one grew before was a benefactor to his race; but a man ought not to expend capital without a fair and reasonable prospect of getting interest for it. If they would give the matter serious thought they would see there was something in what he said. There was one remark made by the Hon. Wilbraham Egerton in reference to the great education question which he (the speaker) would not like to pass over. The future of the country depended upon the success of the education movement, and he felt confident that if, with all due respect to their sectarian influences, they would sink them and combine to extend education on the basis of the Bible, it would be one of the most successful measures ever brought forward. Let them drop sectarian bitterness, because if they did not, it would be a perpetual blanch, and instead of happiness and goodwill, the existing breach caused by their differences would be widened.

Mr. JAMES DAPLIN said in breeding many farmers lost time. They were all well aware that from three to four years horses were very unsaleable, owing to casting their teeth, being bad in their coats and out of condition. Therefore this was the time he would put a young sound mare to the horse. The fourth year it would have a colt, and at the back end of the year they would have a colt worth from £10 to £12, and the mare better in appearance by £10 or £15. This plan would not preclude the young mare with a colt at her foot doing the work of an old horse. He did not think any man should put an old mare to the horse. How many times did they hear the remark when a colt happened to be awkward-looking, and not what was expected, "I will never send my mare to that horse again;" and at the same time perhaps it was not the horse's fault. If they put old mares to the horse

they need not be astonished to see colts with lop-ears, bad necks, bad hocks, their tails turned, with ring-bones, side bones, and one foot over the other! But if they would take the line he had directed they would see the advantages of it.

Mr. PEDLEY said the few observations he had to make had reference to a department which he conceived to be the most important in the show of a Cheshire Agricultural Society—that in which the cheese and butter were shown. So far as his own knowledge extended over the past history of that society he did not think there had been any cheese to equal it, and it was only justice to the society to say it far exceeded the show of cheese in connection with the Manchester and Liverpool Agricultural Society. The richness of the quality and the pureness of the flavour was as near approaching perfection as it could be, especially in those cheese taking first and second prizes. He believed they had not only done justice to his friend Mr. Aston, but that he was richly entitled to the award. It had been suggested by his (the speaker's) colleague that the person who obtained the first prize should be under the obligation of giving a detailed account of the process of making the cheese, and that every person taking a first prize should give a written account of the production of it, for the benefit of members of the society and others, with a view to improving the quality of cheese generally; and he was quite sure that if the quality of cheese was equal to the majority of that shown, they would hear nothing about American cheese. There might be, perhaps, on the part of some a feeling of jealousy, and perhaps selfishness—a fear lest their monopoly should be interfered with, but it was his conviction that if, as his coadjutor had suggested, the quality of cheese was improved the consumption would be increased; and personally he could say that, if he could obtain cheese like that made by Mr. Aston, where he sold 50 tons now he could sell 100. His own experience, and no doubt theirs was too, that when he got a good cheese on the table it disappeared very much quicker than a poor one.

Mr. J. ASTON said when he entered his cheese for exhibition he was not at all sanguine about taking a prize, still less of securing the cup, but he assured them he was very pleased he had been successful. For a number of years he had taken great interest in cheese-making, and in his humble way had put forth efforts so improve the quality of cheese generally. That their staple commodity would compare favourably with that of many other counties and surpass that of most of them no one who had given attention to the subject would deny. Still they ought not to rest satisfied because more equally fine in flavour. For the last two or three years he had been labouring to secure rich fine flavour with a small amount of labour, and the prize awarded to him that day proved that he had to some extent succeeded. But he would not rest satisfied; he sought to attain to a higher standard of perfection. As a desire had been expressed on the part of some that a short account should be furnished of how the cheese was manufactured, he would just say that their present plan was a combination of two methods—the Cheshire and the Cheddar. In the process they made use of scalded whey, and entirely dispensed with skewering. They had also dispensed with rubbing and greasing during the time the cheese were ripening for market. No pressure was applied at the time of making, or until about two days afterwards. After the curd had been broken up the heat was increased to 160, and the whey drained off; they ground the curd and vatted it. The cheese was put into a moderately heated oven, where it remained till the following morning. It was then taken out and left in a warm part of the press-house for twenty-four hours without being turned: was kept in this room for three or four days, when it was rubbed over with warm grease, put into calico caps or binders, and continued so till sent to market. He acknowledged he had not furnished the details, but only a few particulars—but he would be happy to communicate all he knew as to how rich fine flavoured cheese were made with a small amount of labour. He would just say, before sitting down, that the results of his somewhat new mode, were highly satisfactory to himself.

Mr. G. W. LATHAM said that credit was due to Mr. Aston for what he had said about the making of cheese. He believed he spoke the sense of the meeting when he said if all was put down that he had said, it would put cheese making in a new light. They would observe from his account that instead of crushing out the curd, he applied heat, having found out that the flogging and beating system was not so good as gentle pressure. As to

the method of not violating the curd, but simply applying heat to the whey that had run from it, it was one which commended itself to their good sense, and he was not in the least surprised that Mr. Aston had got a prize. If Mr. Aston published a fuller account of the process in the papers, it would be of great benefit to them all. Mr. Dutton had referred to himself and others, who were wishful that that society should come under the shadow of a larger body. Now no man in the world was more ready to assist that society than he (Mr. Latham) was. The only question he had in his own mind was whether they would not do more good by being affiliated to that larger society than they were doing at the present time. But depend upon it the Cheshire Society would do good if they could get to know the processes and experiments of the successful competitors. Still he could not help feeling that the question would arise some day, not only to them but to the newly-born society in East Cheshire, the Wirral, Altrincham, and Manchester and Liverpool, whether these should not all combine to form one great north-western agricultural society, which might include Staffordshire, Cheshire, Lancashire, and part of Yorkshire.

STAFFORDSHIRE.

At Walsall, at the Judges' dinner, Mr. J. BRAWN introduced the customary discussion on agricultural topics by adverting to the present and future supply of animal food. About 30 years since Sir Robert Peel introduced his measure for the free importation of foreign cattle, the object of that measure being to reduce the price of butchers' meat. The price of butchers' meat had, however, gone on increasing at intervals until the present day, for the simple reason that while foreign stock had been introduced free, foreign diseases, of which previously they had had no knowledge, had been introduced also. The somewhat insignificant proportion of 4½ per cent. of cattle had been introduced from foreign countries, and 5 per cent. of home products had been lost by diseases which were imported at the same time. In consequence of this the consumers of food had not in the least possible degree benefited by the importation of foreign cattle. The remedy he suggested was that all imported cattle should be slaughtered at the port of debarkation. English agriculturists did not fear the importation of animal food, cooked and encased in tallow; but they did fear the live animal, which brought disease into their herds and loss to the farmer, and deprived the consumer of a considerable portion of his food.

Mr. R. H. MASEFIELD agreed with some of Mr. Brawn's remarks, but with regard to another part would be disposed to sit on the opposition benches. If the remarks had been made seven or eight years ago, then there would have been sufficient data to show that the imported diseases had caused more loss by the destruction of the flocks and herds than had been gained by the introduction of the food; but he was disposed to think that the introduction under Sir Robert Peel's Act had been a great advantage during the past five or six years, and with proper restrictions, which they, as producers of food, had a right to expect, might continue to be of advantage. He would leave this topic, however, to refer to one or two things which he regarded as desiderata to make the position of the agriculturist what it should be. The first was a good and equitable agreement between landlord and tenant, and another was that they should not let the increase of local taxation press more heavily on them than they were given to understand would be the case at the time it was imposed. The last subject he referred to because he had more than once been told that the tenant farmer had nothing to do with paying the rates. If, however, the tenant farmer, on making his calculations, found that he had to provide from 2½ to 5 per cent. annually for what might be termed the good-will of possession, and afterwards it crept up to 7 or 8 per cent., as it frequently did, it was as much a question for the tenant as for the landlord. With regard to the burdens brought by recent legislation, they had no right to grumble at the amount they were called upon to pay. The making of the county rates was, however, mainly in the hands of those who had an interest in the soil, and as the tenant farmers had never had an opportunity of curtailing the expenditure of those rates, they had a right to complain, or, at all events, to express their opinion about it. Two of the things they had no right to complain about were, first, the abolition of the turnpike gates, and, next,

the educational rate. Nevertheless, the turnpike system, he had always contended, threw the burden upon the right shoulders. And as to the education measure, which he did not exactly like, while he was not prepared to condemn it to the extent that some had done, he contended that education was as necessary for the agricultural labourer as for the man engaged in any of the trades of the country, particularly as the introduction of costly machinery into farming operations rendered the employment of men of intelligence and skill necessary. It was, therefore, apart from any question of philanthropy, to the interest of the farmer to see that his labourers were educated. As, however, the education of a child was received for good or for no purpose, just according to the example he found set him at home, he considered that in giving education to the children before they had provided the parents with comfortable homes in which to bring them up decently, they were beginning at the wrong end. If they provided this, then they might expect a good return for the two investments—the good education and the good home. As to the game question, there was no man who had a greater horror than himself of being game-eaten; while at the same time no man had a greater horror of the question being taken up and used as political capital, as it had been by certain persons during the last twelve or eighteen months. It would be in his power to single out certain gentlemen, and he need not go many counties distant to find them, who had spoken very liberally upon this question for political purposes, but whose actions would not bear reflecting upon, their tenants suffering more from game than the tenants of any other landlords in the county. If there was one thing more than another that agriculturists had to complain of it was the introduction of a third party as a tenant of game after the landlord or his agent had selected a tenant with sufficient capital to stock the farm and farm it properly. No tenant would object to his landlord shooting over the farm, but it was not to be expected that there could be any old associations brought to bear between the tenant and the holder of the shooting—perhaps a man who had made money as a merchant—who trampled over his turpits, and almost invariably left his gates open.

At the annual dinner the Chairman, Lord HATHERTON, said, in Staffordshire they ought to have 133,000 acres under cereal crops, and if by science they so improved the implements of husbandry as to raise but one peck additional per acre, that would add 32,520 bushels to the annual food products of the country, and at 5s. per bushel that would be worth £8,312. Then with regard to pasture. They had in the county 348,000 acres of pasturage; and if they could keep but one more sheep per hundred acres than formerly—and a good farmer would not think much of that—the result would be 3,480 additional sheep, worth £6,960. Thus by a slow, yet a sure process, they would gradually develop the resources of the country. He could scarcely speak upon the subject of agriculture without alluding to the great drought which had so seriously affected the farming interest this year. Persons told them that the dryness of the late season had arisen from the system of thorough drainage. But they could not accept that explanation when they reflected how small was the area of country which was put under thorough drainage, and especially when compared with that of the ocean by which they were surrounded. They could not dive into the secrets of nature, for they were guarded by a kind Providence; but they could tell how to cultivate the ground so as to meet diverse circumstances. Now, wherever he had seen a crop of turnips this year on light land it had been the result of deep autumn cultivation. The ground in autumn was so dealt with that it received and retained the winter moisture, and when the seed was deposited in it in the spring the seed germinated without the assistance of those spring showers which never came to the relief of the farmer this year. He had seen it stated by an eminent agriculturist that barley crops were to be secured by deep autumn cultivation, and although he (the Chairman) saw many objections to such a course, he was not above trying experiments. There would be the loss of the value of the manure, which the sheep folded upon the ground would give to it. They would lose, too, the advantage of removing the sheep from pasture to fallow, which was a great advantage to their feet, and the advantage of clearing their pastures for a time of sheep so as to renew the herbage. Still, for the sake of agricultural improvement, he was willing to make the experiment; and if he was spared until their next

exhibition he would tell them the result. Before dismissing the subject of agricultural improvements, he would express his satisfaction at witnessing the revival so general throughout the country of the old custom of harvest thanksgivings. They heard and read of their being celebrated not only in rural but in town districts, showing that there was a feeling abroad that the gifts of Providence in the fruits of the soil were an advantage confined not to the agriculturists alone, but extending to the community at large. There was a question mooted at the Society's table last year which did not meet with much approval—the Irish Land Bill. If he alluded to it now at all, it was simply to express a hope that they would never in this country require any legislative interference between the English landlord and the English tenant, even upon the vexed question of game. All that was required was a simple, short, and fair agreement between landlord and tenant, with liberal covenants, and a covenant as to unexhausted improvements,—in case of outgoing tenancy. There could not be any difficulty about unexhausted improvements, because he thought that building and draining were the work of the landlord; and when he could not do it the tenant ought to be able to go to the landlord or his agent, and come to an understanding as to how he was to recoup himself for those improvements in case he became an outgoing tenant. There should be a liberal covenant with regard to unexhausted value of manure in the soil. He held that with regard to that the tenant had a Tenant Right. It had been suggested that an arbitrator should be appointed for the county between landlord and tenant. He did agree with that suggestion, because he did not think that any arbitrator could be so appointed who would have the confidence alike of landlord and tenant. The best plan he thought was the custom which obtained in this and other counties, by which each appointed his own arbitrator, and the arbitrators appointed a referee, whose decision was final. As great interest attached to the subject he might be expected to say something upon game; but it was difficult for a landowner, a sportsman, and a game-preserver, to deal with such a topic. Nevertheless, if anything he could say should add at all to the force of what others had said in other quarters upon the subject, he should not be sorry that the matter had been broached. He deprecated in the strongest terms that modern system of cramming an estate with game to the great detriment of the land. Observe, however, he did not object to a moderate quantity of game, particularly if there was not much ground game; because he was convinced that there were very few tenant-farmers who would object to see an owner of the soil enjoying at times a day's sport. It was no argument to him to say that when a farmer came upon an estate where much game was preserved that he knew what to expect before he came. When a tenant bargained to look after trees, or to find a team occasionally for his landlord, that might be so, and he could do it; but there was something indefinite in the matter of game, and the tenant very naturally found more game kept than he expected when he took to the farm. He hoped that those gentlemen who indulged in the great slaughter of game in these days, and which could not be called sport, would see the necessity of curbing their inclination to that pursuit, or public opinion would become so strong that they would be obliged to do so. Next year there would be no meeting of that society as it would be eclipsed then by the meeting of the Royal Agricultural Society at Wolverhampton. He was sorry to learn that the funds required to carry out that, seriously speaking, great undertaking were not yet equal to the requirements. He thought that the suggestion of the committee at Wolverhampton that the gentlemen composing the Boards of Guardians in the country should form local committees in aid of the Central Committee deserved every support, for though the show was to be held at Wolverhampton it was no less an honour and a utility to the whole county.

Mr. BRAWN said: Agriculture, they were told some time ago by the President of the Board of Trade, was in so robust a state of health that the old lady believed that something was going to happen to her. But the President of the Board of Trade was not an authority in agricultural matters, and if they appealed to those who were better acquainted with the old lady they would tell them that she, like many other old women of whom we heard some-times, enjoyed very bad health. She was extremely susceptible of extreme heat and excessive moisture. At the present time she was almost prostrated by

the excessive heat. A few years ago those who took upon themselves to be the instructors of agriculture—and they were not a few—called upon the British farmers to drain their land. They did drain their land, and now they were told by the members for North Warwickshire that they had committed a mistake. The senior member for North Warwickshire spoke of the advantages he had gained by choking up his drains, and the junior member had expressed his belief that they had drained the land too much. Opinions something similar to this had been expressed that evening. He would not on any account say one word that would affect the judicious draining of land, but there was one system of drainage which had proved most disastrous to agriculture, and that was that continuous and unceasing drain upon the British farmer's pockets. It was a very important fact that the population, wealth, and pauperism of this country had increased to a very considerable extent, but that neither wealth, population, nor pauperism had increased in the slightest degree in purely agricultural districts, and yet the payments which agriculturists were called upon to make in support of the poor, for the punishment of crime, and for the protection of the population, had doubled within the last ten years, and in very many instances amounted to about one-third of the farmer's income. The British farmer complained, and how was it proposed to remedy the evil? It was proposed to take one-half of the burden from the tenant-farmer, and place it upon the landlord. He would ask them, as reasonable men, what this would do for agriculture? Agriculture was properly described, a short time ago, as a great donkey, carrying two heavily-laden panniers; and it was proposed to lighten his panniers by taking part of the burthen out of one pannier and placing it in the other. What, he asked, would that do for the comfort or equilibrium of the donkey? He would respectfully impress upon their representatives in Parliament that what they required for the relief of this overburthened donkey was an increase in the number of beasts of burthen, and a decrease in the size of the panniers.

Mr. MASEN pointed out that the judges at agricultural shows discharged very onerous duties; and, as his own experience told him, the faithful discharge of their duties was often followed by unkind and unpleasant criticisms, which he strongly deprecated.

CUMBERLAND.

At Wigton the Hon. P. WYNDHAM, M.P., said he had been very much satisfied with what he had seen at the show to-day, and he thought that Wigton had kept up its character for having one of the most interesting and attractive shows in this part of the kingdom. They had seen a great number of very good horses to-day, and particularly in the younger class. Among the colts and fillies there were, he thought, some most promising animals, and that at a show of this kind was what one cared more about than the show of old horses, because it was from the young horses that those who bred horses must expect to receive that profit to which every breeder looked. There was one part and the only part of the show which did not meet his approval. He had hoped this year to have seen them go back to what he always remembered to have seen at these shows formerly in respect to the system of testing the leaping powers of a horse—a system they used always to see practised in Cumberland—namely, by flights of hurdles at proper distances from each other, properly bushed with gorse, which was all that was needed, for then they could judge how the horse measured its distance, instead of which they saw to-day what he might call sensational nonsense and danger. The first fence he could only compare to a gardener's leavings at the side of a wall when he had trimmed the evergreens. It was not like anything you ever saw in the field. The next obstacle was a lot of loose earth with a shallow ditch on the other side, and he must say he thought those horses were the most sensible who, having once found that there was very little water and a sound bottom, never took the trouble of jumping a second time. The second fence he called nothing more than a mud lark. It might be good fun to those on the stand who had paid their shillings to look on; but really as to a test of what a horse could do, it was sheer nonsense. And then came the third leap, which consisted of high rails. If they had been made stiffer, they would have been so dangerous that it would not have done to send any horse to face them in cold blood. The result was that it was found neces-

sary to make the rails so as to fall down when touched, and the natural good sense of the horse was such that when he even found he could break the leap, he never took the trouble to raise himself up a sufficient height in his jump and go over the top rail. He had attended these shows for ten years, and it was only within the last three years that this nonsense, sensation, and danger had come into vogue. They saw last year a valuable mare, Fanny Drape, which won all over England, come to an untimely end with great cruelty through this nonsensical sensational jumping. He hoped that Wigton show would continue to flourish, that it would continue to have a fine show of young horses, and that they would go back to the old rational system of testing the powers of the hunters.

The Hon. CHARLES HOWARD, M.P., said, referring to the inquiries of the Committee on Local Taxation, he had had an opportunity of seeing Mr Grey of Dilston, who recommended that the Irish system of a division of rates between owners and occupiers should be extended to England.

At Carlisle, Colonel SALKELD, the chairman, remarked: It is said that these are days of progress; and I am glad, among other improvements, to see a great improvement in the toast list. Hitherto, on these occasions, we have been accustomed to see twenty-four or twenty-five toasts on the list; but, owing to the curtailment which has been made, it is my duty to bring to your notice, at this rather early period, what may be called the toast of the evening, which is, "Success to the East Cumberland Agricultural Society" or, in other words, "Our noble selves." It would be difficult, I think, to overestimate the value of Associations like this, or the good they do in creating emulation and in bringing together practical men from various parts of the country, not only to exchange ideas among themselves, but also to impart to those of less experience the result of their experiments in their several localities on a subject of great national importance. There was a time when it was said that the owners and occupiers of the land were, in skill and enterprise, behind the age; and at that time several political economists held that the tillage of the soil in this country was a matter of very minor national importance. Even the late Joseph Hume, amongst the many foolish things which he said in the course of a useful life—and no man uttered more nonsense during a most practical career—was accustomed to declare that England would be as great and as prosperous if not even a blade of corn were grown in this country. But we have outlived that folly, and now, by the energy of our farmers, the progress which has been made in agriculture during the last twenty years has been greater than that in any other branch of national industry. We have also lived to learn that when skill and enterprise are applied to the soil, and Heaven blesses his efforts, the farmer's reward is indeed well earned; whilst his failure is not only an individual loss but a great national calamity. Since the establishment of agricultural associations—and I believe it is somewhat near forty or fifty years since they took root in this country—more has been done for the improvement of our flocks and herds than three hundred years had accomplished previous to the organization of these societies. The days for mere fat and bulk have gone by. The breeder now endeavours to produce an animal which will yield the largest amount of prime beef in a short space of time and on a small amount of food; in fact, the breeder's motto has now become, "Moderate in size, but rich in quality." We must not, however, rest upon what we have already accomplished; for we have enterprising rivals both in Holland and Denmark, and in other countries where the pastures are naturally luxuriant. The Danish farmers have more than once exhibited stock at the Smithfield Club shows side by side with our own, and their Shorthorns have been pronounced to be but very little inferior to those of our native growth. You are all aware of the fabulous prices which are given for bulls for exportation, and you may rest assured that our rivals abroad are doing their utmost to equal the stock bred in this country. We must not, therefore, assume that the arena is entirely our own, to hold without a rival. Beside cattle and sheep, this country has become extremely celebrated for its breed of horses; and those who saw the horses on the ground to-day, and at Wigton yesterday, must have been highly pleased with the progress which has been made. You can now scarcely go to a large horse show—at Islington, or Birmingham, or any other place—without finding Cumberland horses, many of whom are successful competitors. That can only arise, first, from the fact

that our farmers have good mares to breed from; but they are indebted to certain gentlemen for having introduced into this neighbourhood most superb stallions. They have spared no expense in bringing into this county the best blood which England has produced. It is now about ten years since I last had the honour to occupy the chair at the meeting of this Association; and on that occasion I ventured to suggest that advantage might arise if an agricultural college could be established in the northern districts, for the education of farmers' sons in the higher branches of their profession; for it is to the rising generation we must look for the development of that good seed which, through the medium of these associations, has been sown broadcast through the land. Now, if that subject was deserving of passing remark so long ago, surely it is of more importance now, when we consider the large quantity of manufactured manures and the large quantity of oilcake and other things which are used by farmers. To the manufacturers of those manures to which I have referred we are deeply indebted for the introduction into this country of a fertilizer which has been of inestimable benefit to the farmer. But when a new and profitable trade is established in a commercial country like this, you always find some who are ready to embark in it for the sake of immediate profit, without caring very much about the quality of the article they sell. Now, by that remark it is far from my wish to cast any unmerited or sweeping reflection either on the manufacturers or the dealers in those manures. I know many of them to be highly honourable men—men of integrity, who would scorn to be guilty of a shabby or dishonest transaction, and our daily experience proves to us that many of those fertilizers produce the very best results; but that same daily experience also proves to us that much of what is sold to our farmers is very properly called "artificial" manure, for it is often hardly worth the labour and expense of carting. The same remark applies in great measure to oilcake and other food used for stall-fed cattle. It is almost impossible to get it quite pure; therefore it would be a great advantage to have an institution such as that to which I have referred, where young men from the country could be educated upon more scientific principles—where they may learn to analyse the soil which they are to till—where they may be taught to understand the component elements of the crops they are hereafter to cultivate, and thus apply to their production the manures that best suit them—where they may learn to understand the component elements of the various kinds of food used in the rearing and fattening of cattle—and also be able to discriminate between the fat-producing, the muscle-forming, and the bone-creating substances. Surely, in these days, when we hear so much about elementary schools, we might have an Agricultural College in a large agricultural district like this; for I am one of those who feel convinced that we have yet much to learn with regard to the earth's fertility; and I believe, by the application of more scientific farming, many gentlemen in this room will live to see a much larger acreable production than has ever yet been reaped. I believe there are 400 or 500 similar associations in the kingdom; and therefore, not being selfish, let us wish success and prosperity to them all; for by co-operating for the improvement of agriculture, they are not only assisting in the development of the national resources and in reducing the national burdens, but are adding to the welfare and happiness of the whole kingdom.

At Whitehaven, Mr. BENTINCK, M.P., wished the rule that no politics must be imported into these dinner proceedings could for a year be binding in the House of Commons; what an enormous amount of useful legislation they would then be able to get through, instead of the interminable party fights which now occurred! Many important subjects awaited treatment, amongst which he prominently named Local Taxation. That had been referred to a Select Committee, which had brought in a most unsatisfactory report. What he wished them particularly to consider was whether any re-arrangement of burdens simply between occupiers and owners was anything in the world more than a mere shuffling of the cards, and whether it could be attained with any useful results—whether there were not certain burdens which were imposed by local taxation both upon agriculturists and upon inhabitants of towns, which ought to be borne, in part at least, by the State. Such, for instance, were the burdens placed upon counties in respect of the militia; then there were others in respect of lunatics, others in respect of the general police; and many burdens of the same kind, which were, in point of fact, not

only for the benefit of a particular public, but also of the public at large. Mr. Goschen had two years ago suggested the addition of a penny to the income tax in order to relieve local burdens, and he hoped the public would put pressure on their representatives in order to get something effectual done.

Mr. FLETCHER, M.P., the Chairman, was glad to hear Colonel Lowther, who is well known to be a good judge in these matters, say that the exhibition of agricultural horses and of cattle was eminently satisfactory; and I was also glad that Colonel Lowther had the courage—and I have never yet heard that he was deficient in courage—point out the very glaring defect which I think was apparent to all, however little they may know of the science of horseshoes, the great defect that was apparent in some of the other descriptions of horses which were exhibited. I myself do not pretend to be a judge of horseshoes, but I believe that Colonel Lowther is; and I remember the dietum of the celebrated Tony Weller—a gentleman that all of you have heard of, I have no doubt—who said that the man who was a good judge of a horse was a good judge of anything; and I think there is a good deal of truth in that sentiment. I remember very well, many years ago, attending one of the meetings of this society when the chair was occupied by the present patron of the society, Lord Lonsdale, who made use of an expression that I have frequently thought of since. He said that men of science might talk whatever they liked about mineralogy, and about geology, and about all sorts of "ologies," but that in his opinion the best "ology" to which any farmer could devote himself, was the science of "muckology"—and I believe that although that opinion was uttered a great many years ago, it still holds good at the present day. I think there is one subject which farmers have entirely neglected, and which, in my opinion, they might very beneficially devote their attention to. We all know that, in the present day, ample and sufficient drainage is absolutely necessary if you would have a remunerative farm, and farmers, I believe, are guided in laying down drains chiefly by the position of their land and by the nature of their soil. But there is one thing which I think they entirely overlook, and it is a matter of very great importance in a county like this, and that is the rain-fall of their locality. We live in a county where the rain-fall varies to a greater extent than in any other county either in England, Scotland, or Ireland, for we have in the same county localities where the average fall of the rain throughout the year is only some 23 or 24 or 25 inches, and we have other localities where the average rain-fall varies from 140 to 200 inches; and I do think that if farmers who devote their attention to draining, and landlords, who are also interested in this question—if they would give more attention to the rain-fall in each locality, it would prevent in many cases small and inefficient drains being made, and in other cases it would prevent unnecessary expenditure of capital upon drains which really are not at all required.

DERBYSHIRE.

At Derby, Lord EDWARD CAVENTISH, the chairman, said: We have just passed through one of the finest summers ever known in this country, but it has been accompanied by a drought of such unusual length that, pleasant as it has been to many of us, it cannot be regarded as having been a favourable season for agriculture. Should a very severe winter follow I fear that the shortness of the hay crop and the failure of the turnip crop will make the winter a very trying one. Very dry summers, like that of this year, are amongst the greatest difficulties farmers have to contend with. In the case of very wet summers, we can take what precautions are in our power; but very dry summers come at such rare intervals that we are not prepared to meet them. It seems to me well worthy the consideration of a Society like this, whether it would not be practicable to store some of the superfluous water of one part of the year for use at those times when only a very small quantity of rain falls. I cannot but think that that would be a most useful thing, and that it might be done without a very great outlay. There is one other subject on which, with your permission, I should like to say a few words. We must all regret that we are deprived to-day of the presence of two gentlemen—Mr. Coke and Mr. Crompton—who have usually attended these meetings, for the subject on which I wish to say a few words is one to which Mr. Crompton drew your attention last year. I refer to the manufacturing of cheese. I regret Mr. Crompton's absence the more because I believe it arises from

indisposition; but you will remember that this time last year he communicated the results of numerous and careful inquiries which he had made on the subject of the manufacture of American cheese. It occurred to him that a similar system might be adopted in Derbyshire, and he brought two facts prominently under your notice; one was, that the make of cheese was diminishing in this country to a considerable extent, and the other was—and it was a still more lamentable fact—that the Americans were competing with us in our own markets. The object which we ought to have in view in reference to this subject appears to me a very plain and simple one. If it is found, after a fair trial, that the general average of cheese throughout the district can be improved by the factory system, that the improvement can be effected at a diminished and not at an increased cost, and that a better price than formerly can be obtained, then Mr. Coke and Mr. Crompton might safely advocate the adoption of the system. With reference to these points I have made some inquiries, and although my remarks will not have the weight which they might have, if communicated by some one personally and practically familiar with the subject, I may tell you that Mr. Coleman, who has always taken a deep interest in this subject, has kindly placed some facts before me which I think will interest you. I infer from what he says of the results of the concentration of labour, so far as those results are at present known, that the cost of production is very considerably reduced. Mr. Coleman estimates that taking the yield of 500 cows a saving of £400 a-year is effected by turning their milk into cheese on the factory system as compared with the old farm-house system. That fact speaks for itself, and I place it before you just as it was given to me. With regard to the quality of the cheese made on the factory system, so far as I can learn the tests applied have been sound ones and the result has been satisfactory, namely, that the price obtained for the factory cheese is better than that hitherto obtained for the produce of almost any dairy in the county. It may be replied to all this that there are some very considerable objections to the factory system. I mention these alleged disadvantages with some hesitation because I have no practical knowledge on the subject, but it is said that if you take away the manufacture of cheese from the dairies you will take away the occupation of the wives and daughters of the farmers. I do not know whether that will be considered a disadvantage or not; but for my own part I have never been in the habit of looking upon the wives and daughters of farmers in other parts of England where cheese is not manufactured as an idle and unoccupied class. There is plenty of useful work in the house for them to do. The comfort of the house depends, of course, very greatly upon them, and I cannot help thinking that both wives and daughters would be a good deal happier if they were relieved from the drudgery of making cheese. I do not give you my own opinion on this subject, but I have no doubt this view will have its influence with farmers in determining whether or not they shall support the factory system. There is another objection to that system which is put in this form. The farmers say they have done very well up to the present time, and they would rather things remained as they were. That may be all very well at the present time; but I must say from my personal knowledge of many Americans that they are a stirring and active people, and if they find they can compete successfully with us they will not rest until they have driven us out of the market. It will not do for us to stand still, but we must push on and do the best that can be done. I cannot close without asking you, whether the experiments succeed or not, to give these gentlemen—Mr. Coke, Mr. Crompton, and many others—full credit for being actuated solely by a desire to benefit the farmers of the district. Look into the matter for yourselves, for it very closely affects you. Do not take my word as answering for the success of the new system, or the word of any other person as answering for its failure. You have opportunities of seeing the system at work both here and at Longford, and I ask you to see for yourselves, and form your own opinion on the subject.

Mr. NUTTALL said, referring to the cheese factory, that the price given for the milk was equivalent to 77s. 6d. per cwt., which he thought in an average season was a very fair price, and if they could get above the average price the first season he thought they might infer that they could do still better another season. There had been a considerable amount of prejudice against the cheese, and the complaint against it was

that it was not old enough. They certainly could not make old cheese, but there was no doubt that every day it was kept would improve its taste. He, however, thought that the general favour with which the cheese had been received augured well for the ultimate success of the Derby Cheese Factory, and the statement which would at a future time be laid before them would be both satisfactory to the guarantors and to the public.

Mr. HENRY CORBET for the judges said, only last week he had acted in a similar capacity in an adjoining county, where one of the management who proposed "The Judges" did so in a very feeling and almost affecting manner. That gentleman said the judges had very onerous duties to perform, but he was sorry to add from his own experience, that these duties were frequently followed by some very unkind and unpleasant criticism, which he strongly deprecated. Now, he (Mr. Corbet) could not altogether agree with this. Honest, straightforward criticism did a deal of good in many ways, as he could not help thinking that the progress of these Societies had done something to improve the breed of judges as well as the breeds of stock. Besides, the great fun of the fair after all was judging the judges; and he could imagine nothing more insipid than that when the visitor took his entrance-ticket he should be bound down as it were by a sort of moral obligation not to whisper a syllable against the correctness of the awards. Such a course would not only threaten to become insipid, but impolitic and unwholesome. "To err was human," although he had once heard a clerical-looking gentleman who had been acting as a judge of poultry declare that he had never made a mistake in his life, and never before or since had he (the speaker) looked with so much reverence at any man in a white neckcloth. But putting poultry out of the question—those elegant Cochin Chinas, those beautiful Bramah Pootras, or those still more wonderful varieties, the aim with some of which seemed to be to breed them without any tails, and with others all heads and chignons, like the devout young people they saw in church on a Sunday morning. Admitting that a parson must from some inscrutable cause be an infallible judge of cocks and hens, there were other judges, from the highest downwards, who were merely mortal. Brougham was said to be a bundle of crotchets, and Eldon full of prejudice and port wine; as he really believed half the judges of stock were full of prejudice and port wine. One hated Bates, and the other did not quite fancy Booth; but they were none the worse for a little prejudice or port either. Still, whatever the public said about the awards the less the judges themselves said the better. He did not know whether when the work was over but that an active steward should caution each of them just as a policeman was bound to do any other unfortunate man who had got himself into trouble: "Now look here, anything you say will be used against you, so perhaps you had better hold your tongue until some of your friends have been to see you." Were he discreet he (Mr. Corbet) might stop here, but he should like to say a little about his own business on the ground. He could remember, and not so many years since, when the riding horse classes were almost the laughing-stock of these meetings, such failures indeed, that the Royal Agricultural Society had occasionally struck the premiums out of the list. Since then "the nags" had become far away the most popular feature of these occasions. There was no mistake about it, although there was one element in any such a popularity with which he could not quite go. No doubt the jumping business "drew" in the way of shillings and half-crowns, but it was no test as to the actual merit of a hunter, as many of the best or best-looking horses he found declined to take part in these exhibitions, and he should prefer to judge the hunters as they did the other horses, and then let the public judge the jumping and the judges. It was difficult at these times to touch any topic that could not be brought to bear on the war, and he saw that a friend of his had been writing to the papers on the way in which our cavalry was mounted. The light troops were the most useful for modern warfare, but the men were not so well horsed as they might be, and it was proposed to remedy this in the usual way—that was by starting a company. Let them call it the Light Dragoon Horse Company (Limited), for breeding troopers, to be sold to the Government, at three or four years old, at regulation prices. Would anybody in the room like to take any shares? Or, if that would not do, the letter went on to recommend the esta-

ishment of Government studs for the purpose. But by the time they had secured an efficient manager, a staff, farm, mares, and so forth, he feared the cost of growing a troop horse would open the eyes of political economists when they came to pass the accounts. Of course he had a notion of his own on the subject, and one that would tend to thought to make these Societies still more useful, as a little countenance from Royalty or Government would not be out of place. Some three or four thousand a year was given in Queen's Plates, which had outlived their use, as they did little good now either in providing sport or improving the breed of horses. He was not going so far as to say these should be done away with; but if we could afford to spend so much in one direction, we might surely offer a few Royal Prizes at the leading agricultural shows for the best thoroughbred horses; and by such patronage or encouragement at a small outlay some benefit might follow in increasing the supply of well bred stock.

Dr. HITCHMAN said the pursuits of agriculture can never be satisfactorily and successfully carried on on a mere cold, calculating, commercial basis, on the broad principle of an abstract political economy; for they differ from ordinary trade in many essential particulars, and mainly in this, that one man is working upon another man's property, and every day of his life he is either exhausting or improving that property; and this exhaustion or improvement is such that cannot be accurately measured by a foot rule, and here moral sentiments and feelings are necessarily brought into play. Again, the nature of the farmer's pursuits is such that he cannot make the supply to be always commensurate with the demand he cannot obtain more than one crop of wheat in an entire year, and therefore the cardinal principle of energetic trade cannot be realized of "Small profits and quick returns" for, however small the "profits," the "returns" cannot be quick; and every practised farmer will bear me out in this that there are circumstances which happen to the highest skill and the most abundant capital, and that seasons influence the result of crops to a greater extent than either or both combined; and superadded to these special peculiarities is the terrible one, developed by the importation of foreign cattle, of contagious diseases by which hundreds, nay, thousands of cows are destroyed, the labours of years of breeding skill annihilated, and capital to an incredible amount, ay, to an amount exceeding the vast sums lost by the cotton famine, sacrificed and gone; and therefore, if the pursuit of agriculture as a livelihood removed wholly from the sympathy of the public, he brought in its social relations to the simple condition of an ordinary trade, and be carried on between landlord and tenant with none of the chivalrous feelings of the olden time, but solely, absolutely, and exclusively as a pound, shilling, and pence spirit; the days of English agriculture are numbered. Vast factories would crowd all our hills and all our valleys. We should become the manufacturers, the colliers, the carriers for the World! One vast canopy of cloud and smoke would hang like a bird of darkness over the land. Brightness and beauty would be gone. Flowers and grass, trees and waving corn, the sunlit landscape, and the gorgeous clouds would pass away. The bright eye, the rosy cheek, the jocund laugh of ruddy health would be displaced by sallowness and grime, and the beautiful England of our forefathers would be no more! Happily it is not so; the public honour the pursuit, and the innate love of the English for well-formed animals, and for the cultivated products of the field, will, I trust, cause them to continue to honour it for evermore. They now honour it in a manner that they honour no other, as your presence here at this moment testifies, and as other facts testify. Tens of thousands of persons from our crowded cities crowd to see the mere fat stock of the Smithfield Cattle Show; hundreds of thousands through the show yards of the Royal Agricultural Society; and even in this our Provincial Show, we have been gladdened and honoured by the visits of many thousands. It surpasses all other pursuits in its importance to mankind, and therefore I earnestly hope it may continue to receive the sympathy and respect of the public, and that English agriculture may for ever hold the first rank among the cultivators of the earth. I would say something on the Game Question. It is far, very far from faultless, is the Game Law, but it is not so debased or debasing as some of the men who have denounced it for their own sinister ends. Few large landlords at the present day withhold from their tenants the right of destroying rabbits—those foes to all pro-

fitable agriculture—and I hope the day is not distant when none will do so; and I am glad to say there are few indeed in this county who preserve an undue quantity of ground game. But in addition to this good quality I hope yet to see the landlords ignoring all mere petty politics, and aiding their tenants in the great work of regulating the local taxation of this kingdom, which is annually increasing in variety and amount, and widening the area from which it is gathered, and pressing equally, equitable on all classes the burthen of providing for such national purposes as vaccination, registration, the police forces, and the maintenance of the paupers and lunatics of this great country.

At Chesterfield, Mr. MARKHAM said, the President had justly complained of the very contemptible breed of cattle which existed in the county. He himself had seen stallions led about the country during the past season, which in his opinion ought to have been taken to a slaughter-house. He would merely throw out a suggestion with reference to improving the breed of cattle, and that was for a branch society to be formed with a capital; say, of a couple of thousand pounds, which should purchase the very best description of horses, bulls, sheep, and pigs, and if they were let out to the farmers with the distinct understanding that the charge would be no more than that at present in use, they would not be slow to avail themselves of such advantages, and the breed of cattle would be materially improved. The farmers in this district, owing to the smallness of their occupations, were not able to buy such animals for themselves, and they had no chance at present of getting a better description without paying very dearly for it. They must remember it cost just as little to breed and rear a superior animal as an inferior one, whereas the profit at the end was immeasurably greater. If the large landed proprietors, such as the Dukes of Devonshire and Portland, were to come forward in the matter, and if intelligent farmers like Mr. Crawshaw were to provide over it, he was sure such a scheme would work well.

At Alfreton Mr. C. SEELEY, M.P., the Chairman, said: In this district we have very good turnpike roads—I wish I could say the same of all the bye-roads. My impression is, that if the agriculturists would set themselves to work and would make the bye-roads better, it would have the effect of making the highway rates lower, and would save a good deal in teams. I know some bye-roads in this neighbourhood which certainly are not in a good state. There is one occupation road, so called, especially, and a pretty occupation it is to traverse it. The owner of this occupation road is a large farmer, and in taking his corn to market he has carefully to steer clear of the many ruts that abound in it. There is another matter which was alluded to at the Agricultural Society's meeting at Derby last week by Lord Edward Cavendish, which struck me as being exceedingly appropriate, and that is whether it would not be possible for the tenant farmers in this country especially to combine together to carry out a general system of irrigation. I believe that there are many places in this neighbourhood—certainly in this county—in which the system could be employed to great advantage. The quantity of grass grown on land irrigated is enormous, and anyone going to the Duke of Portland's water meadows would see what great results may thus be obtained. Very few farms are of sufficient extent for the occupiers to do this of themselves, and it is only by combination that any practical results can be arrived at. There is another matter I should like to see the tenant farmers take in hand, and that is, rates and taxes. There is no class more deeply concerned in the subject of rates and taxes than the farmers of this country. So far from growing less, rates every year become more serious. Now there is no doubt that in the long run the landlords do pay the taxes, for if there were no taxes the rents would be higher, but it is often found that the "long run" is a very long run indeed, and as farmers do not now live to the age of Methuselah, it may well happen that they may be ruined before the process of adjustment is carried out. I sat on a committee of the House of Commons last session upon this subject. We examined all sorts of people—collectors of rates, agents, landowners, owners of house property, and so on, but not one real tenant farmer came before us to give evidence. Yet we sat for months. Certainly a gentleman of great ability, who is a tenant, Mr. Sewell Read, was examined, but he could scarcely be said to be a real representative of the tenant-farmers. I think that farmers should take more part in the dis-

ussion of this subject. Another question of great importance to you is the advance of wages, which you may depend upon must go on, and which you should, as prudent men, anticipate and prepare for. The question is if we cannot meet that difficulty by reducing the rent and taxes. Some people think rates are a necessary misfortune and that "what cannot be cured must be endured;" but I cannot think it is not a state of things with which we should be content, that one person in every 20 should be receiving relief. I think it very advisable for tenant farmers to make their voices heard on this question. I heard a gentleman say the other week that in his parish, although they had no poor, they paid 3s. in the £ poor-rates, most of the poor living in a neighbouring town. It does seem to me very important that the views of agricultural occupiers on these subjects should be ventilated. Then there is that ticklish question, the game laws, and it is exceedingly desirable that in every district there should be some means by which the farmers could meet together, and discuss these subjects. In towns they have their Chambers of Commerce, in which they can discuss the questions affecting their trade; they have their Town Councils and so on, and I think some means should be afforded by which farmers could discuss questions affecting their interests.

Mr. PETER BOWNE saw no more reason why a farmer who produced milk should manufacture it into cheese than why one who grew corn should grind it into flour, and if they could get as good a price for their milk without having to make cheese many dairy farmers and their families would feel it to be a very great relief.

Mr. ROWLEY said, one fact to which he would briefly allude was the continual exodus of the labouring class. Perhaps it might be said in reply that they should advance their wages and improve their dwellings, and certainly something more might be done in respect to this; but it appeared to him that there was a growing dislike on the part of the labouring man to agricultural work. He appeared to prefer the work of the factory or the mine. It was a question of great importance; and had it not been for the introduction of the reaping and mowing machines, great difficulty would have been experienced during the late harvest in getting it in for want of hands. No one was more willing to contribute to the expenses of the State than the agriculturists; but it was monstrous that they should be called upon to pay income-tax when, during the last three years, it was patent to all they had realised no income at all ("You are na' a long way off it"). That was the result of the excessive drought, which they must look upon as a great national calamity. He hoped the Government would take into consideration this deplorable calamity, and that their chairman would do all in his power to remove an impost which was looked upon with dissatisfaction by a great part of the community.

Mr. NUTTALL said it appeared to him that his *forte* that night was the question of cheese. He happened last year to make a few observations which had resulted in what they had tasted that day. He had been asked the question, "Does it, or is it likely to pay?" In answer to that he would say that by the factory system they were able to produce more cheese from a certain quantity of milk than was made in home dairies: They produced 1 lb. of cheese from 9 lbs. of milk. A gallon of milk weighed 10 lbs. 14 oz. as a rule, but it varied a little during the season, and the average make was a pound of cheese to a gallon of milk. He left it for them, after having tasted the cheese, to say if by the factory system they could make as good a cheese as farmers could at home. At all events they could make as good a price, 83s. 6d. being the last price realized in London for the Derbyshire factory-made cheese. He believed, too, they could make it for 2s. 6d. per cwt., and he did not think farmers could make it under 7s. 6d. a cwt. (A Voice: 10s.). If a man had thirty cows, he must pay a dairy-maid £15 or £16 a-year. (Mr. Haslam: £20 if she is worth anything). Her living would be worth more, and they might put down the two at £35. From thirty cows they would not get above six tons of cheese in a good season, or 4 cwt. per cow, and therefore the dairy-maid alone would cost 5s. per cwt. Other little et ceteras would certainly amount to 2s. 6d. per cwt. There was some little difficulty about the offals, which the dairymen did not like to lose, but this would be easily remedied, and he was satisfied they would approve the change when they found their homes were made more comfortable,

and more like other homes. For his part he could not see why their wives and daughters should be greater slaves than the wives and daughters of arable farmers. If they could make as much money by the factory system as they could by making cheese at home, they would relieve themselves of the great difficulty, anxiety, and uncertainty of its manufacture. They intended to publish a balance sheet at the end of the year, and they had no reason (except from the dryness of the season) to be disappointed with the result, which in truth had exceeded their most sanguine expectations.

At the Bakewell Farmer's Club, Mr. NESFIELD felt convinced the harriers had done as much good in this country as a whole legion of parsons. He maintained that a pack of hounds brought men together, and united them, and made friends of them. Every age had its special feature, and the curse of this age was effeminacy, especially amongst the young men about London, whose moustachios were waxed until they were as sharp as a pin point, and who if they came into Derbyshire and followed his harriers, he guaranteed would be so done for as never to be heard of more. The chase was an antidote to the effeminacy of the age, believing as he did, that the talk of the hounds made a man's heart right as well as his body.

WILTSHIRE.

At Marlborough, Lord Ailsbury said: He did not think it right to give persons prizes simply for doing their duty, as it was almost invidious and excessively difficult to draw the line between what duty was or was not of advantage to agriculture. He always doubted whether there was any reason for giving a recompense to a person for being forty years in the same service. If a master had tolerated his services for forty years, it was probably rather a bore. Not but what he had men who had served his grandfather, and he always took the greatest interest in them, and every possible care of them. But he did not think it any advantage to agriculture that shepherd, or a carter, should never change his master for thirty or forty years. The prizes of this Society should be given not only to those who excelled in labour, but it should be to the advantage of agriculture to promote that particular kind of labour. For that reason he preferred to see prizes given for the best description of ploughing, in accordance with the most advanced ideas of what ploughing ought to be. Ploughing twenty years ago was vastly inferior to what it is now: they might get plenty of men to plough with three horses and a boy, but they wanted men to plough with two horses without a boy. This was the case in the north, where he obtained considerably more per acre. He was speaking to the employers of labour, and he was well aware of the difficulties they had to contend with. There was no doubt about it; their labourers were not sufficiently paid. He advocated that their labourers should be paid and treated as they were in the north, where he was ready to admit he saw much better labourers. There was no denying that if the labourer of the north earned more wages, he did more work for his master than was done in the south. He would not pretend to deny it. He often had bodies of men to work for him at draining and other matters, and he always employed north country gangmen, directing them to give men Yorkshire wages for Yorkshire work, and Wiltshire wages for Wiltshire work. He admitted that the gang diminished, and they could not keep Wiltshiresmen up to it. Wiltshiresmen did not work so hard as Yorkshiresmen. He was sorry to say it, but he had an opportunity of seeing the two systems at work; he was not a practical agriculturist, but from what was pointed out from time to time by his farmers and agents he saw a great distinction between the work of the north and that of the south. There was ample excuse for the farmers not giving the same wages as in the north, because they did not get the same amount of work done. In the first place they were better fed, because they had better wages, and it was for employers in the south to consider whether by giving them increased wages for two or three years, they would not be stronger and do more work. [Mr. Wentworth: They would be more lazy than ever.] The difficulty was to get up to Yorkshire work. Sir George Jenkinson had said it was very hard upon one class of persons to pay for the education of persons who, as soon as they became educated, would very likely leave the district. That was exactly what they wanted. They wanted to get rid of the men here, for it could be proved from blue-books (statistics of the population engaged in the cultivation of land per acre were easily obtainable) that there were three times as many agricul-

ral families in this neighbourhood as were needed. The greatest boon they could confer on the neighbourhood, far superior to building cottages or other benevolent acts, was to get rid of one-third of the labouring population. Then they would not employ so many labourers per acre, more work would be done, and they could afford to pay them higher wages, and would themselves become more prosperous, for cultivation was done cheaper wherever the wages were highest. Mr. Bolam could show it them in blue books, and it had been proved over and over again. The consequence of the superabundance of labour was that poor rates were double what they were in Yorkshire. There they had no poor men in the villages; he could never obtain one to hold his horse, for they were all at work. They never came to him to ask for work, but in Wiltshire this was the case over and over again. This was accounted for by the proximity of manufacturing towns, and it would be the greatest boon to this neighbourhood if Marlborough were to become a large manufacturing town. If Marlborough became a large manufacturing town they might have a difficulty in obtaining labour, but it would be a great deal better; labourers might not be so subservient, a little more troublesome, but the result would be that all would be better for it. In other respects the farmers of the neighbourhood had made great strides, and he must congratulate them especially on the advance they had made in steam cultivation, by which they brought, as it were, so many more hands to bear at the moment they wanted them. He was convinced the system of the north was the best, that here they were overburdened with population, which entailed heavy poor rates, and they employed three men where they wanted two, and five horses where they only wanted three. They were improving but so slowly and so gradually that their sons would get the benefit, and he hoped those who came after him. He could not help noticing that the men he saw that day were remarkably well dressed, and though he had a small frock, of which he did not see above one, he thought it of the highest importance they should have a regard for their personal appearance. This would be the case as they were more educated, and result in their being tidier and better dressed. With the subject of education he would not trouble them, except to say that he was not disposed to take such desponding views as his reverend friend (Archdeacon Stanton). He could quite understand that any member of his profession would be especially anxious when a change of this kind occurred, as to a certain extent they had the control of this important work, which was now to an extent taken out of their hands. Knowing how conscientiously and liberally they had always performed the work, he could quite understand they felt great anxiety, being afraid of seeing their flocks dropping from under them. As far as he was concerned, being a subscriber to schools in the whole neighbourhood, he would do his utmost to prevent such a misfortune here, and he asked the assistance of other gentlemen present. He was not aware what it was the intention of the Bishop of the Diocese to recommend, but he was about to have a conference, and had asked his lordship among others to attend. He was going down next week, and might learn something from the enquiries made and statistics obtained by the Bishop. Generally speaking schools had been provided for the parish through the instrumentality of the clergy, and hereafter there would be two ways of dealing with them, by keeping up their subscriptions, or by withdrawing them, allowing each to pay his proper share by way of rates, and electing a school board, and purchasing the school and master's house, which, as it happened in some cases, belonged to him. He should be benefited by the last system, as they would be supported by rates instead of subscriptions as they would, he thought, be conducted in a superior and more expensive mode, he asked them to ponder this in their minds, that those gentlemen who wished to be relieved from the necessity of paying rates might subscribe, and thus be saved from purchasing the school-house, and obtain other advantages. The schools would of course be required to be conducted in accordance with the principles laid down by the Committee of Council on Education, whenever they came out, to include of course a Conscience Clause, and in accordance with the principles of the new Act. They were not obliged to adopt the voluntary principle, but in this instance good might attend it. He did not want to benefit by the new Act, but was willing to contribute what he had contributed before. They must come up to the requirements of the Government, then it would not be

necessary to adopt school boards and the compulsory system. He anticipated, therefore, gentlemen were willing to continue the voluntary system in the modified form, and he hoped the rev. gentleman's apprehensions would not be verified. He had a high opinion of the value of education, even in a labourer's ordinary work, and thought its effect would be that those ambitious, restless spirits who now gave trouble at home would go elsewhere, and they would get rid of them altogether, although it was true the stupid fellows would remain behind. But he thought they would all be the better for it. He recommended them to put their shoulders to the wheel, and do the best they could to carry out the voluntary system, otherwise he was for compulsion. Compulsory education and compulsory military service was his view of what was right for the country.

ESSEX.

At Great Broxton Col. BRISE, M.P., said: We have not had an English Land Bill yet. We had the Irish Land Bill, as you all know, and I believe that bill to have been necessary and expedient under the present condition of that country; but whatever our political feelings may be we cannot but admit that it was subversive of the principles of the rights of property, and that it was subversive of some of our old-established notions of political economy. As a farmers' representative in the House of Commons it has been my misfortune on one or two occasions to put the government of this country in a minority when we thought the farmers' interests were at stake. The Chancellor of the Exchequer wanted to prevent the farmer from scaring or shooting rooks or crows on his own lands. We, as representing your interests, protested against this, and put the government in a minority upon that point. The Chancellor of the Exchequer refused to make any exemptions in the case of the tax on guns in the interests of the farmers, and we carried this amendment against him; but as he then threatened to throw up the bill, and as that was not quite the wish of some gentlemen—though I am not very fond of it one way or the other—but as it was not the wish of some of us to put him in a minority on that point we consented to a compromise enabling the occupier to kill rooks, rabbits, and vermin upon his own land, but not to employ anybody else so to do, unless he takes out a certificate for himself. Well that was better than not being able to do what you like with vermin and birds that depredate your crops. The Chancellor of the Exchequer then wanted to impose a tax upon your farm horses, and to make no exemption on any terms, but to tax horses employed in agriculture if they carted materials on to the highways. We thought this most unfair, and by the help of the Speaker we again put the government in a minority. Time would not allow me to go into the many measures that have come before Parliament in the interests of those before me during the past session. You know what took place on the malt-tax; you know how little has been done in reference to local taxation, and you know what discussions we have had on the corn laws. These are three questions which all want a long time for discussion, and at this hour of the evening I will not venture to trespass upon your patience by dwelling upon them. But there is one question of greater importance to the agricultural labourer than any other, upon which I must claim your indulgence for a few minutes; I mean the education of the agricultural labourer. I will not go into all the details of the Education Bill. But you will remember that in this diocese our Bishop held a Conference in July last; on the merits of that Conference I will not here dilate; sufficient to say committees were appointed by the Conference, and the Bishop did me the honour of placing me upon a committee in reference to education, so far as related to this county. We had our first committee meeting in London the other day, and after a great deal of discussion we arrived at the determination to ask the Bishop to make an appeal to the whole of his diocese for subscriptions to aid those parishes in which it was necessary either to enlarge or build fresh schools. At the present moment there are something like 50 or 60 parishes in this county where there is insufficient school accommodation, and it is most important that steps be taken immediately, for this reason, that unless you have your plans sent in to the Privy Council before the 31st of December next you will have no opportunity of getting any aid from the government, or of receiving any government grant for building or enlarging your schools. Therefore, although I confess

this rather a dry after-dinner subject, I take this opportunity of mentioning it, as time is valuable to those parishes that have not sufficient educational accommodation. No doubt the appeal that will be made for subscriptions will be met by many objections. We should hear from many, "I have my own schools in my own parish to attend to, and cannot assist in this undertaking." Others will say, "If I subscribe at all I shall not subscribe to parishes and schools in this diocese generally, I would rather subscribe to those in my own immediate neighbourhood." Others again will say, "I do not see why we should subscribe to those parishes that have neglected their own duty, after we have done ours." And further, many will say, "I don't feel so very sanguine, I don't care so very much about getting these government grants; I should not object to see school-boards established in the different parishes or education paid for out of the rates." These are all objections which we shall have to meet, and my advice to you is, whatever you do, if possible avoid an education rate—and for this reason, principally, that a rate falls exclusively on one class of property—it falls on the overburdened, overweighted land. It is true that the shopkeeper and the professional man may pay some portion of it, but they only pay on their houses; and the wealthy man will only pay on his house. Now, then, is the time to make an appeal to all those wealthy men and others who have no local obligations or local responsibilities; and they have an opportunity of aiding those parishes that are not able, perhaps, to help themselves; and I have no doubt large sums will be collected, if not from agricultural districts, at any rate from those districts in the neighbourhood of the metropolis where we know wealth and plenty abound. Some may say that the parishes ought to help themselves, therefore they will not subscribe to this fund; but it should be borne in mind that the fund will be in the hands of those in whom you can fairly place confidence, and aid will not be given to those parishes where the parishioners, or the squire, or the leading occupiers have neglected their duty, but simply to those parishes in which they have not had the means to supply their wants. Again, I say, avoid education-rates, and I hope dissenters in those parishes will come forward liberally, if they have not any government school of their own; for although these will be Church of England schools, they will be well protected by the conscience clause, and therefore there will be no religious difficulty. If possible, I should strongly advise those parishes in which they have no schools at the present, to let the dissenters have a share in the representation of these schools. I would go further even than this, and say, let a school board exist and let them have the management of the school, and let the ratepayers elect the school board. I do not say this from any desire to take the patronage out of the hands of the clergy. We know that in this matter of education we are under unbounded obligations to them; but I say so because I do not think we ought to impose too much labour on the clergy in this matter. And another reason is that I want to see all the inhabitants of the parishes take more interest in the education of their children than they have ever done before. Therefore, I say, give the people an interest in the subject by enlarging your administration. Another advantage resulting from the election of your school boards would be that you would be able to put the compulsory clauses into operation. Now do not let me be misunderstood when I advocate the compulsory clauses. When I speak of compulsion I have not in my mind any thought of the policeman, or the magistrate, or of any harsh measures at all; I speak of compulsion as I believe it could be carried out by any local board or any board in our different country parishes, by whom it would be carried out in a spirit of love, and benevolence, and kindness. And I do not think it would be at all impossible or impracticable to put the Factory Acts into operation if it should be the opinion of the local board that it was desirable to do so. I believe that if you thought it necessary to compel parents to send their children to school—though I believe you would not find it necessary in many parishes in this county—you would be able to put the Print Works Act into operation, whereby you could compel a boy to attend school for 150 hours in the six months, which would be equal to 60 days in a year, without materially affecting any of the sources of livelihood of the parents of such boy. The "religious difficulty" in the House of Commons is no difficulty in the country; the great difficulty, in my experience,

and in that of other people, is in getting the children to attend school. My friend Mr. Mechi and myself have often had amicable discussions on the agricultural topics of the day. I am sorry to say we do not always agree, and I should have preferred speaking after him rather than before him. He wishes to carry out the commercial principles of this country in regard to land to a much greater extent than I do, and I should like to ask him how it would be if we carried out this commercial principle to its furthest limits. I ask him what is the result in Scotland, where this principle has been carried out entirely? What is the consequence so far as farmers are concerned? The rents in Scotland are at the rack. There is not a farm in Scotland that is under let, and many land-owners let their farms by tender or by auction. Would you like that to be the case in this country? This year I have been working very hard, and among other duties I have been sitting on the Local Taxation Committee. I will not go into that question to-night, but merely remark that we had before that committee Mr. Caird, whom Mr. Mechi knows very well, and who has investigated the question thoroughly, and he will tell you that the rental of England is very much under its value, and he told the committee that he believed it would conduce very much to the deterioration of the happiness and welfare of the people of this country if it were raised upon the same commercial principle as they have in Scotland.

Mr. MECHE came to the important question, How could they increase their profits by farming? The interests of landlord and tenant were concomitant and concurrent; and it was to their advantage to abolish open farmyards, as being a source of loss, and to substitute covered and enclosed yards for their cattle, which would increase their profits.

Mr. W. FAIRHEAD: Decidedly not.

A VOICE: Who is going to put them up?

Mr. FAIRHEAD: I don't agree with you.

Mr. MECHE: I do not expect my friend Fairhead to agree with me. But you cannot gain say facts. When you look at it dispassionately you find that covered sheds for cattle increase your profits. They preserve your manure with all its virtues, and preserve the health of your cattle, and I would lay strength upon that point while you are complaining of disease among your cattle.

Mr. WAKELIN: If you inclose them you make them worse.

Mr. FAIRHEAD: I quite agree with you.

Mr. MECHE: We are at present in the dark as to the causes by which our cattle are affected, but how is it that they are never affected when kept under cover?

Mr. WAKELIN: Generally so, not never.

Mr. MECHE said there had been no disease in his covered yard for the last 20 years, and the same could be said of many other farms where the same plan was adopted. He had reason to believe that many of the diseases that were prevalent proceeded from the variation in the temperature, from the insects and various things found in the grass, and from the various conditions under which the food in the open field was eaten. Nobody objected to folding sheep on the land; everyone approved of it, because the land then got the benefit of all that resulted from the food, but it was not so in the open farmyard, where the virtue of the manure was all wasted. If they wanted to increase their profits by obtaining larger crops at a diminished cost, let them have covered yards for their cattle (expressions of dissent). This was a question which Essex had yet to learn, but he was certain she would learn it. If they were men of business they would study the question, and not be blinded by prejudice. Another point in which he thought Essex was rather deficient was in the unfortunate belief that those strong non-calcareous clays which were called loams were unfit lands to be drained.

Mr. GWYNNE: You have gone into that question so often, M. Mechi; don't go into it again.

Mr. MECHE: Don't you believe they ought to be drained?

Mr. GWYNNE: We had gone into the question so often that we shall be better without it to-night.

Mr. MECHE: I speak from facts, because I have had experience, and I can only say that the belief that drainage is of no use on such lands is a very fatal deduction from the profits of the farmer.

Mr. GWYNNE: In your opinion.

A scene of confusion here ensued, during which there were cries for Mr. Mechi to "go on," and counter cries of disap-

Mr. WAKELIN calling out, "We can't listen any longer, we have had enough of your 'gab' already."

The CHAIRMAN: I hope everybody will give Mr. Mechi a fair hearing.

Mr. MECHE continued: One of his neighbours, who had been his greatest opponent on this drainage question, had been converted to a different way of thinking.

Mr. WAKELIN: I should like to have his name.

Mr. MECHE: I do not wish to disclose his name, but he does not live half-a-dozen miles from here. I think this is a question which ought not to be left to after-dinner discussion, but ought to be looked into practically. If the farmer would say, "I will try a portion of a field, and experimentalize on the question," they would prove it by results.

Mr. GWYNNE: It has been done already. We have plenty of fields in this neighbourhood that we can point to.

Mr. FAIRHEAD: Cut it short, Mr. Mechi. You have got some good head-pieces here.

Mr. MECHE: If I had a jury here and they were to hear such opinions as those you now express they would say the farmers of Essex are not men of business.

Mr. GWYNNE: Perhaps not.

Mr. MECHE said he was there to speak the truth as he had proved it, and not simply to give opinions. He advocated the advantages of drainage, and urged the importance of deep tillage. He asked them to come before him with fact, but not to oppose him with anger, because he had the welfare of the agriculturists at heart in all he said.

Mr. GWYNNE said he could name two farmers who had cultivated after Mr. Mechi's system, and who were prepared to state that the results were opposite to Mr. Mechi's opinions.

Mr. GOLDEN FAIRHEAD had the highest respect for Mr. Mechi, who gave important lessons to the farmers by his experiments, but they profited more by avoiding what Mr. Mechi did than by following his example, and the more Mr. Mechi let his farming to his men the better results would he have. He (the speaker) knew there were some lands that would not stand ploughing more than three inches deep, while others could not be ploughed too deeply; and he had some fields which he would not allow Mr. Mechi to drain if he would do the work for nothing.

At Harlow Sir H. T. SELWIN-IBBETSON said: In building cottages I should like people to feel that they were not building them with the view of getting direct remuneration out of them, but that, by improving the class of labour they placed upon their land, they were really benefiting themselves in the long run. I am quite satisfied that if we could provide proper habitations for the labouring population, if—another crotchet of mine—we could scatter those houses a little more about the farms, instead of congregating them together, too often at long distances from the centre of work, we should be doing much towards solving a very difficult question. Modern days have shown us that this feeling is abroad. Attempts are being made here and there to carry out some such principle as this. The results that have attended those steps have, in every instance that I have had any experience of, been satisfactory; and I believe now, that the example is set, it will spread. When you get a really good useful servant as a labourer, living close to his work, able to give you all his energies, instead of exhausting them in coming to your service, we shall realise the motto I see on my left, that "Nothing is denied to well-directed industry."

NOTTINGHAMSHIRE.

At Greasley, Mr. FOX said it was a question whether corn rents would act well between landlord and tenant in the Midland districts. He thought it would cause more dissatisfaction than the present system of rental. His belief was that the landlord was foolish if he fixed more rent than could be paid by a reasonable tenant, and the tenant was foolish if he gave more than he thought he could afford to pay. He had always objected strongly to open valuation. If a person was sent as valuer on a farm the landlord's instruction should be, that if he found the farm above the original condition in consequence of the improvements made by the tenant, the tenant should be allowed to have the difference, and if he found the farm was not up to the mark owing to the tenant's negligence in common honesty, that farm ought to be put up to what a good farmer could make it pay under reasonable management. General valuations must be productive of evil results unless instructions of this kind were given.

LANCASHIRE.

At Ecclestone, Mr. G. A. DEAN, the chairman, said: Mr. Professor Rogers, of Oxford, at a political meeting at Birmingham, did farmers the honour of saying that their heads were as hollow as the turnips they grew. Now, I want to do my best to show Professor Rogers that he is very greatly in error in making such a statement; and for that purpose I have brought out a root, one grown on Cartford Farm, and here it is. (The chairman at this point held up a very fine and large turnip, which created much laughter amongst those present.) There's nothing hollow about that. That turnip I intend to send to Professor Rogers for him to see whether it is hollow, and also to compare it with his own head (loud laughter). I was reading some time ago of a professor—perhaps it was Professor Rogers himself—who was suffering from rheumatics, and he called in another professor—a brother professor—to try and cure him of his rheumatical complaint, and he (the brother professor) adopted the rub-and-tap system. This professor of the rubbing-and-tapping principle attended his brother professor, and rubbed him from head to foot, and then commenced tapping. A friend was standing by looking what he was doing, and when he came to his chest, and after rubbing and tapping it, the friend said, "Why, bless my soul, how hollow it sounds!" "Yes," replied the other, "it does, but wait till I get to his head, and then you will see how hollow it will sound" (renewed laughter). I should not at all wonder that the head would be found to be just as hollow as Professor Rogers's (great laughter). I can only say that, so far as this stupid remark made use of by Professor Rogers with respect to farmers' heads is concerned, it is all trash, and I much regret that such absurd statements should have been made by anybody. Whoever heard of a Lancashire farmer having a hollow head? Let any one attempt to buy a horse, or to buy grain from a farmer, and they will not see any hollowness about his head then. The farmers are a class of men of great intelligence; and if I can only induce Professor Rogers to come here next year, I am sure he will make an ample apology for the remarks he has made.

HERTFORDSHIRE.

At Hertford, the Hon. H. COWPER, M.P., said: There was one person above all whom he expected to see there, a gentleman who had been writing some letters in which the three gentlemen who had the honour to represent Mr. McGeachy, and the member for the borough of Hertford, were peremptorily summoned to meet him at that meeting and be examined by him as to their opinions on the game laws. When a man was called out he believed he had the melancholy privilege of selecting the place and time of meeting. Mr. McGeachy not only challenged them, but in the most peremptory way insisted upon that occasion and that place for their meeting. He was very sorry Mr. McGeachy had not gone there, though probably by the rules of that society they would not be allowed to gratify him in discussing to the extent he might desire, that most difficult question. Although he had adverted to that question which so closely affected the farmer he was not going to discuss it. On that question which affected the farmer and the landlord in the first instance (he did not mean to say it was to be settled by them alone, but it affected them in the first instance), Mr. McGeachy had the pull of them, for he was neither the one nor the other; and from that point of neutrality Mr. McGeachy was able to address himself to the subject in a calm and intellectual manner.

Mr. H. R. BRAND, M.P., congratulated them upon the energetic action lately shown by the Privy Council with respect to the importation of cattle; and he believed there should be a feeling of security when energetic measures were taken to show that the authorities were determined to prevent the recurrence of such a plague as the rinderpest. The mutual object of the representatives of that county was to advance the interests of the agriculturists; and that could be best done by there being a mutual understanding between all classes of the agricultural world. When there were grievances to be remedied they could not be remedied by violent means, nor by forcing humiliating concessions; nor in any case could a remedy be gained, as had lately been attempted, by bringing questions of a kind calculated to arouse differences of opinion before those meetings. Mr. McGeachy was a gentleman for whom he entertained the greatest respect, but he

hoped that gentleman would find a better opportunity of discussing the Game-laws than dinners of that kind.

Mr. FAWCETT thought it would be a great advantage if members for the county were allowed to speak on any matters they thought would be likely to interest or benefit the meeting. They had in this county the largest number of most respectable landlords, both owners and occupiers, of any county in England. And yet they had, connected with all these advantages, the most miserable county show that could be seen in all England. When he saw the names both of Lord Dacre, Mr. Ames, and hundreds of others, he was perfectly satisfied that the owners and farmers only wanted to have matters placed in a proper light before them, and they would support it, so that the Hertfordshire county show should be second to none in England. He would show them many reasons why there should be alterations. The Society was bound hand and foot with restrictions. There was scarcely a prize offered but was bound with foolish and contemptible restrictions. And the money is so divided there is no prize worth competing for. In one class there were 14 premiums; they would find nothing of the sort in any other society; they didn't give a single £20, £40, or £50 prize open to all England. They offered a prize for male animals, but put such restrictions on it that no man in his senses would think of sending good animals to the show. Look at their description of a tenant farmer! They say a man is not a tenant farmer if he does anything else; that is to say, he is not fit to be a tenant farmer if he is connected with agriculture and commerce; did they not find that some of the most honourable, honest, and straightforward men were connected with commerce? And yet, if they find one of these men taking a large farm they tell him he is not a tenant farmer. Thus they drive members away.

MIDLAND AGRICULTURAL SOCIETY.

MEETING AT ALFRETON.

This was the best exhibition the Society has ever had. The cattle were particularly good, and the milking and in-calf classes especially so. The landlords' class of milking cows and the tenants' in-calf class were, as a whole, highly commended by the judges. The bulls were few in number, and were not above an average in quality. The sheep classes were not very well filled. The rams were good, and the others about an average show. The pigs were excellent, and would have done credit to any showyard, though some of the classes contained but few entries. There was a superior show of horses; and those shown in pairs, which had ploughed in the match, were a capital lot. The three pairs in the landlords' class were fit to compete anywhere, and those of the tenants were little inferior. It is worthy of remark that the two pairs which took first and second prizes in this latter class were under three years old, and beyond their actual merit gave good promise for the future. The show of cheese was good; and the first-prize cheese was cut for dinner, where it had to compete with a cheese from the Derby factory. Both were rather new; but the better judgment gave the preference to the factory cheese, though some preferred that of Mrs. Shutes. The roots were a very good collection for the season. The swede turnips were, as a class, highly commended by the judges, and would compare with advantage with the swedes shown last week at Derby. The white turnips were very little inferior to the swedes. One of the chief attractions in the showyard was Mr. Gilbert Murray's model of the Cheese Factory Working Plant, as introduced from America by Mr. Schermerhorn, with a vat improved and a press invented by the exhibitor. The model was the object of constant examination. The funds of the Society not being sufficient to offer premiums for implements, the judges were unable to award to Mr. Murray any substantial expression of their appreciation.

The judges were—for stock, Messrs. J. J. Rowley, J. Faulkner, and J. Nuttall; for ploughing, Messrs. S. Chadwick and J. Parker; for roots, Messrs. W. Hollingsworth and T. Stendall; for cheese and butter, Messrs. T. Rodgers and T. Bland.

THE CENTRAL CHAMBER OF AGRICULTURE.

The Council resumed its monthly meetings at the Salisbury Hotel, Salisbury Square, on Tuesday, Oct. 4, under the presidency of Colonel Tomline, M.P.; but the attendance was very small, there not being in all twenty members of Council or deputed members present; the company was, indeed, mainly made up by the reporters, although, as Mr. Neild says, many of these gentlemen do not take much note of the proceedings.

The Chairman, in opening the proceedings, observed that the principal business before the Chamber was the reception of the report of the committee on local taxation. That, he remarked, was a subject of the greatest interest to them. The agitation of the question had gone on quietly and steadily, and he was glad to see in one of the newspapers the report of a speech respecting it, delivered by a borough member at Whitehaven, which was exceedingly good, altogether in the sense in which the Chamber viewed the matter, and which was received with great applause by the constituency. This showed, he thought, that the Chamber was not acting *ex parte* in what it was endeavouring to do; and he believed that if county members would only see that what was asked for was no more than just and fair, and that their constituents had a deep interest in it, a favourable conclusion would more speedily be arrived at.

The secretary read a communication from the Cirencester Chamber relating to the collection of cattle disease statistics by the addition of another column to the Board of Trade Returns. On being applied to, that department stated that it would be easy to add a column for the purpose, in case the occupiers desired it.

Mr. NEILD observed that the business committee had fully considered the matter, and had come to the conclusion, seeing the way in which agricultural statistics were being handled in certain quarters, that it would be inexpedient to take action upon it at present.

The Chamber approved of this decision.

In the absence of Sir Massey Lopes, the Chairman of the Local Taxation Committee, Captain CRAIGIE submitted the Committee's report, which, alluding to the meetings held at Taunton during the Show of the Bath and West of England Society and the Royal Agricultural Society, said that the report of the committee published in August, giving an account of its proceedings since its formation, had been sent to the various provincial Chambers of Agriculture, and a letter from Sir Massey Lopes, directing attention to the importance of the subject, and asking for contributions, had, together with a copy of the report, been sent to the landowners in most of the counties in England and Wales through the local agents of the committee; but, owing to the committee not having been able to obtain local agents in a few counties, the landowners in these had not as yet been applied to. The committee suggested that members of the Council and of provincial Chambers should send to the secretary the names of those in different counties who, in their opinion, would be willing to take an active interest in the subject. "In conclusion," said the report, "the committee cannot help feeling that the movement in favour of a reform of the existing inequalities and injustice of the present system of local taxation is spreading, and they are sanguine that an increasing interest is being felt, not only amongst those who are connected with land, but also amongst the heavily-rated inhabitants of large cities and towns; but the committee would, nevertheless, press upon the members both of the Central and provincial Chambers the great necessity that exists for keeping up this interest if any large and useful measure of reform is to be obtained."

Mr. T. WILLSON moved that the report be received and adopted; and the motion was seconded by Mr. NEILD, who remarked that there was matter in the report which came home to the heart and the judgment of every ratepayer in England, and that steps ought to be taken to give it the widest circulation. The Chamber was greatly indebted to some of the weekly papers, and especially *Bell's Weekly Messenger* and the *South Lanc. Express*, for publishing its proceedings;

but he regretted to find that the daily press of the metropolis was exceedingly remiss in this part of its duty, and seemed to stand aloof from the Chamber as if it did not wish to touch agricultural subjects. It was from London that the provinces took their cue, and the London press might be made an important instrument in disseminating information on the question of local taxation. He believed that the day was not far distant when it would be made the battle-cry of parties at every hustings, and he earnestly hoped that the farmers would refuse to vote for any candidate until they knew what were his sentiments on local taxation. Local taxation and the malt tax were the two subjects on which the opinion of the country would be pronounced at the next general election; and if the county voters did their duty, he had no doubt both questions would be settled in a satisfactory manner.

The motion was agreed to.

Mr. H. GENGE ANDREWS proposed a vote of thanks to Sir Massey Lopes, M.P., and the 89 members of the House of Commons who voted for limiting the charge on the poor-rate assessment for elementary education to one penny in the pound. The best place for agitating the subject of local taxation, he observed, was the floor of the House of Commons; for the speeches and motions made there the daily press was bound to report more or less fully. The first division in the House on the question referred to in the motion was taken on the proposition of Sir Massey Lopes to reduce the contribution of the poor-rate for elementary education to a penny in the pound. He (Mr. Andrews) did not approve of paying even so small a sum as that out of the poor rate; but he could not ignore the fact that, in the House of Commons, if the sympathy of any considerable body of members was to be enlisted in support of any object, gentlemen were obliged sometimes to propose what they did not, perhaps, entirely approve of themselves.

The motion, having been seconded by Mr. WEBB, was adopted unanimously; and the secretary was instructed to transmit a copy of it to Sir M. Lopes, and the other gentlemen who had voted for his motion.

Mr. ANDREWS wished to draw the attention of the Chamber to the fact that an important movement was on foot in the city of London for the establishment of a national poor-rate. He then read the following paragraph on the subject, which had appeared in some of the public journals: "National Association for the Equalisation of Poor-rates.—This association, the president of which is the Right Hon. the Lord Mayor (R. Besley, Esq.), held a committee meeting on Tuesday last at the Westminster Palace Hotel. A letter was read from Lord Alfred Churchill stating his consent to become one of the vice-presidents; also letters from gentlemen in various parts of the country approving the objects of the association. The meeting resolved to take vigorous action, and the secretary was directed to lose no time in lodging petitions for public signatures in the London districts as well as in the provinces, also to hold public meetings throughout the metropolis and the country, so that by that means, and the aid of the Press, the great inequalities of the poor-rate may be clearly shown, and the object of this association, a national rate, brought about." He suggested that the Secretary of the Chamber might open communication with this association for the purpose of ascertaining whether the two bodies could co-operate in the work of accomplishing the common object they had in view.

Mr. NEILD regarded any movement of that kind with favour, inasmuch as it was very much in harmony with the object which the Chamber had at heart; but at this early stage he deemed it better not to open official communication with any other society.

Mr. H. WILKS concurred with Mr. Neild in this opinion.

Mr. ANDREWS explained that he merely wished to inquire what the objects of the association exactly were, and if they were strictly in accord with those of the Chamber.

Captain CRAIGIE said that at the meeting of the local taxation committee on the previous day, the feeling was expressed

that the secretary of the committee might ascertain what the association really aimed at; and with that he thought the Chamber might rest satisfied for the present.

The matter was then dropped.

It was next agreed that the first subject for consideration at the council meeting in November should be the new regulations of the fire insurance offices for the insurance of farming stock; and that at the same council meeting the question What further regulations for the home and cattle trade are required in the interest of producers and consumers? should also be considered.

The Secretary read the report of the joint committee on weights and measures, which had been previously published.

Mr. WILES contended that, as the question at issue was a large one, its ramifications extending to every section of the population from the highest to the lowest, the richest to the poorest, and as the report proposed to wholly unsettle the existing system of weights and measures, before the Chamber sanctioned the proposal contained in the report the sense of the provincial chambers should be taken upon it. It seemed to him that the Committee had mixed up in some confusion the question of uniformity of weights and measures with that of their use, and that their recommendations were impracticable. He moved, therefore, "That the report of the Joint Committee on Weights and Measures be remitted to the Provincial Chambers, with a request that they will consider and *resolve upon* the same prior to the council meeting in February."

Mr. RELPH reminded the Chamber that at a former council meeting it adopted a resolution on the subject which did not agree with the recommendations of the report. What weight, then, could they expect the daily press or the public

to attach to their proceedings if, having come to a definite resolution on an important question, they afterwards in the same year resolved to "consider" it? The effect must be sadly to puzzle the agricultural mind.

Captain CRAIGIE concurred with Mr. Wiles in thinking that the Chamber could not then arrive at a resolution on the report, because the meeting in October was necessarily a very small one, and the subject had already been considered and a determination come to which the report certainly tended to upset. On the 2nd of November last the Chamber expressed its approval of the central. The resolutions it adopted were that in the opinion of the Council all agricultural produce should be sold by weight only, and that the central of 100 pounds should be the standard; and these resolutions were ordered to be remitted to the provincial chambers for future consideration. Therefore the decision in favour of the central was not in the nature of a final and an irrevocable one. Hence the necessity for asking the provincial chambers now to consider the matter in all its bearings, and in the light of this report. Nothing could be more inconvenient or cumbersome than the present system of weights and measures. It was universally admitted that a uniform system was desirable; and if a change was to be effected the question was, "why not let it be such as would put England on a par with other countries in all parts of the world?"

The motion was ultimately agreed to.

The Secretary laid before the Council the resolutions come to by the various provincial Chambers, with the view of obtaining greater unanimity of action between the central and provincial Chambers, but no action was taken over this matter.

EAST SUFFOLK CHAMBER OF AGRICULTURE.

A meeting was held at Ipswich, Lord Henniker in the chair, Mr. CORRANCE, M.P., moved the adoption of the report of the Local Taxation Committee of the Central Chamber, which had been circulated. It was two years since he addressed the chamber upon this question, and since that time some progress had been made, but the fact that so long a period had passed without bringing them much nearer the question was one that required some explanation on his part. It was satisfactory to know that both in and out of the House of Commons the question had not been a party question. They had never yet been fortunate enough to secure the sympathies of any Government on their behalf. He did not say so of this Government more than any other, but they had not obtained the sympathies of the gentlemen who occupied the front benches and who formed, or would form, the Government. Here and there they had had some support, but for the most part those who sat on the front benches stood to a considerable extent apart from the general interests of the country, and, perhaps, of the House—that was, they considered it necessary to be a little behind a growing opinion; for it was not until that opinion had formed itself with some distinctness that any Government whatever felt bound to give effect to it, and perhaps they were right. No doubt there might be some very good reasons for not dealing with the question of local taxation, and, perhaps, some very bad. The good reasons included the extreme difficulty and great intricacy affecting large interests, which were involved in the transfer of large burdens from one class to another, whilst a bad reason would be the necessity, even at the expense of justice, for consolidating their supporters. Those who were agitating this question had to take care they gave the Government no pretext for good reasons, and then they would be able to fight the bad ones. It was his duty to endeavour to place before them what had transpired in the interval which had elapsed since he last addressed them on this point. After two years of considerable pressure they induced Government to give them a recognition to this extent—that the question was one which it behoved Government to deal with at least. Of course it did not go the extent of meeting their views or giving what they should consider a satisfactory answer to the question, but it was a recognition of the question, and had had one practical result—the appointment of a select committee. Such

a committee ought to have had the power to inquire completely and fully into the whole question, and not merely one part of it; and it must give a semblance of insincerity when they found that out of two or three very important points that ought to have been inquired into, one which they thought the most important was left out. The reference to the committee was to inquire "Whether it would be expedient that the charges now locally imposed upon occupiers of rateable property should be divided between owners and occupiers, and what changes in the constitution of local bodies now administering the rates should follow such division." That was only part of the question, and when the committee was appointed Sir Massey Lopes and Mr. C. S. Read expressed great indignation at the terms of the reference and thought it would at once shelve the question. He did not agree with them, because he was persuaded that it would be found utterly impossible to avoid or blink the main issues at stake, and the report of the committee showed that there was some reason for the anticipations he entertained. Mr. Corrance proceeded to point out from extracts from the printed proceedings of the committee that, although unintentionally, it was impossible to prevent reference being made in the evidence to the equity of extending the area on which rates are levied and of placing national burdens now borne by local rates on the national resources. By both Sir M. Lopes and himself resolutions were proposed, expressing the opinion that great hardships were inflicted in consequence of matters for the imperial welfare being supported by local taxation, but they were defeated by the casting-vote of the chairman (Mr. Goschen) on the ground that they did not come within the scope of the reference. Mr. Goschen was, however, by the collective voice of the committee forced, in his draft-report, to propose a clause in which he said that owing to the terms of the reference the committee had been precluded from entering on the enquiry on the relations of local and imperial taxation and the nature of the property liable to the same; that the enquiry on which they had been engaged formed only one branch of the general question of local taxation, and other questions should be previously taken into account in any general measure giving effect to the recommendations of the committee. That was positively condemnatory of the terms of the reference, and of course next session the question

would be asked, why was it that the committee was limited as it had been? At any rate the anticipations he had formed as to what the committee would lead to were to a great extent carried out; and who could doubt after such a resolution that Mr. Goschen's mind itself must have been cleared of any possible objection previously entertained to enter upon the larger portion of the inquiry. The direct reference was to inquire how far it was desirable to divide the charges locally imposed on occupiers between owners and occupiers, and also whether some better constitution in the bodies who now administer the rates could be made. He did not disguise the importance of the question of the division of the rates between owners and occupiers. Sir M. Lopes opposed the division on the ground that it would weaken their forces. At present the occupiers having to pay the rates, the subject engaged their attention; but Sir Massey feared if the government divided the rate between the owners and occupiers, the interest taken by the occupiers would not be so great as at present. The result of a division would, however, be to make the owner conscious of the burden he bears, and at present they had very little support from the owners. The evidence substantiated this fact, that the larger part of this burden was borne by the owners themselves, and it was only in certain parts that it pressed on the occupiers. The division of the rates would relieve the tenant wherever the burden fell directly on him by, before the renewal of the lease, imposing half the burden on the landlord. He did not disguise that some advantages would follow to the tenant, but after all division between the parties who now paid was not the main question; it was, who should pay and what burdens should fall on the collective rate? The poor-rate amounted to half the total local taxation—seven millions out of fourteen, and he did not see how they could alter the poor-rate by division unless they entirely altered the poor-law and did away with the principle on which the poor-law is carried out. They must do away with the guardians' system and appoint a totally different class to carry out the law. This he did not think would be wise, for the occupiers were interested in keeping down the rates; and they knew that before the creation of the Boards of Guardians, through a false humanity, the rates got to be a pound in the pound, and even more (it was so in his parish), and the value of the occupations was thus swamped. Did they want to go back to that? On those grounds he had the strongest objection to any mere division of the burden of the poor-rate unless they were prepared to grapple the larger question that lay behind. In the report, the adoption of which he moved, they were invited to take some steps to carry on the agitation which had existed for two years. He knew some would say, "What action will you take? At present there has been nothing but talking." Well, no man had a greater objection to talk than he if it ended there; and he said let them go into action at once. He admitted that they had at present confined themselves very much to talk, but the ratepayers held it in their hands to promote this action. They it was who were guardians or sent guardians to represent them, and these guardians it was who, subject to Government inspection, control, and suggestion, determined on the expenditure of the poor-rates. The justices were also rating authorities, and the ratepayers had some influence with them, not, perhaps, what they would have if there existed county financial boards, but still they could exercise some considerable pressure on them. Why had not that influence been exercised? He must blame the rate-paying body for supineness on that point, and he said to them, "Don't allow a single addition to be made to the rates. Oppose them in Parliament and out. You make the members of Parliament; if they increase your rates don't give them your votes." He invited them to join in this agitation. It was not a sham agitation. If the object were merely to put money into the pockets of secretaries and officers, or to return members to Parliament, he would have nothing to do with it. He was convinced it was founded upon a sound basis, and he felt he could ask them in all honest sincerity to take part in the task (applause).

Mr. R. L. EVERETT seconded the motion, which was carried.

Lord MAHON, M.P., moved the adoption of the following resolutions recommended by the committee of the Central Chamber:

1. That this meeting protests against the present unjust

exemption of income derived from personal property from contributing towards the various objects for which funds are now raised by local rates, and is of opinion that this grievance affects owners and occupiers of house property in towns quite as much as the landed interest, and therefore that both descriptions of property are equally interested in the removal of this anomaly.

2. That the proposal to divide the payment of rates between owners and occupiers does not afford any efficient relief or remedy for the grievance complained of in the unequal incidence of local taxation; and that no settlement of the question can be accepted as final or satisfactory which is not preceded by a thorough inquiry to determine whether the objects now locally provided for are of local or national obligation.

3. That until the question of local taxation reform has been satisfactorily dealt with this meeting pledges itself to oppose most strenuously the imposition of any fresh rates on the present unjust basis, for such purposes as national elementary education, expenses of election, turnpike roads, emigration, &c.

Mr. CHARLES HAWARD turned the resolutions, which were carried.

The PRESIDENT said he was in favour of local government, for he had seen that when the interest in local management was removed the rates increased. This was the case under the Union Chargeability Act, for he had been told that in some instances the rates had almost doubled, and that showed that centralization of management even to that extent caused a great increase of expenditure. Nevertheless, they might buy their local government at too great a price, and they must not stick to it at any expense. The select committee of last Session were very useful, but to his mind their proceedings had been rather like hunting without the fox. They had a very good pack of hounds with huntsman and horses, but they had not the essential part. In this matter the essential part was to be found in the question "What part of these charges ought to come upon us as purely local burdens, and ought we to bear all these other burdens?" When that question had been settled it would be well to go into details, and settle whether the rates should be consolidated, whether a new system of assessment should be adopted, and many other questions. He was quite ready to admit the advantages of a division of the rates between owner and occupier, but in this instance it seemed to him rather robbing Peter to pay Paul. The extra burden the tenant had to bear was the rates imposed during his tenancy, but on the other hand the burden came on the landlord too. Some time ago a farm in Essex was sold and was valued at £199 ls. a-year, and the rates then amounted to £47 Os. 6d., leaving the rent £152 Os. 6d. Ten years after the farm was again sold, and then the rates had increased, so that the farm was not worth so much. Increase in rates, therefore, cut both ways. Another reason against division was that there was a great advantage in the occupiers managing the expenditure, for they were generally resident and were more intimately acquainted with the wants of the parish than the owner, who could not live in every parish. He had tried to get a return showing the comparative amount of rates in 1843 and in 1868 in his own neighbourhood, to see whether, as was sometimes said, the value of the land had increased in the same ratio as the rates. He had been unable to obtain a complete return, but would quote the parish of Thwaite. It contained 832 acres. In 1843 the property taxed was £1,361, and in 1868 it was £1,457—an increase of 7 per cent. In 1843 the gross estimated value was £1,343, and in 1868 it was £1,468. The poor rate levied in 1843 was £102, and in 1868 it was £159, so that whilst the value of the property had increased 7 per cent. the rates had risen nearly 60 per cent. In the parish of Eye it was different, the rates having decreased somewhat, that being a large parish and the Union Chargeability Act having relieved the rates very much. On the whole, he believed the rates to have increased from 35 to 40 per cent., whilst the value of property had increased from 8 to 10 per cent. They must not forget that by the Turnpikes Act of last year £182,000 was thrown on the rates, and though that might seem a small item compared with the whole amount of local taxation, these additional burdens in the aggregate amounted to a serious sum, and the more there was added to the rates the more difficult it would be to get their claims acknowledged. Therefore they should act promptly, and with that view he moved that a committee be appointed to be called the District

Local Taxation Committee, by whom all special business connected with the question shall be transacted, subscriptions collected and applied to local and general purposes connected with the agitation, and that the council be such committee. Before he sat down he could not but thank Mr. Everett for the handsome terms in which he had spoken of him and the kind manner in which those remarks had been received. He regretted much that the tie which existed between him and the eastern division of the county as their representative had been severed, but un-

happily it was so. All he could say was that his home was in Suffolk, his interests were Suffolk, his best friends lived in Suffolk, and every tie that could connect a man with any particular locality bound him to that county, and he need hardly tell them that he would always be ready to advance the interests of the county though he was no longer their member.

Mr. CORRANCE seconded the motion, and added an instruction to the committee to memorialize and communicate with bodies having the management of local taxation.

FARM INSURANCE.

In July last a correspondent of *The Mark Lane Express* "thought it right that the attention of farmers should be called to the sudden changes made by the Insurance Offices on the mode of insuring farming stock and produce." H. C. C. in his letter went on to say that the "average clause policy" principle was about to be introduced, which was thus explained in the circular he had received: "If the sum insured on agricultural produce and farming stock be (say) £600, and the value of the property at the breaking out of the fire be not more than £800, the whole amount of any loss up to £600 will, as heretofore, be payable. But, if the value of the property be more than £800, then only such a proportion of any loss will be paid by the office as the sum insured bears to the value of the property, *i. e.*, if the property be worth £1,000, then only 600-1000, or three-fifths of any loss will be paid: if the value of the property be £1,200, then only 600-1200, or one-half any loss will be paid, and similarly in any other case where the sum insured is less than three-fourths of the value of the property." Our correspondent asked, upon this, whether it would be fair to apply such a system for mercantile insurances to farming stock, as the changeable value of the stock must require a constant alteration of the policies, of which he proceeded to give certain illustrations in the different prices of hay and corn at different periods, while he added, as "a well-known fact, that for eight or nine months of the year the farmer rather over-insures than not." He argued further that the offices should not have combined as they had done "without consulting their customers or obtaining any information or suggestions from them."

If H. C. C. might be assumed to speak on behalf of the farmers, CORRECTOR, who answered him through our columns in the course of the next number or so, should as certainly be representing the offices. This gentleman maintained how that, "After all there is little new in the regulation complained of, but it clearly shows the insured what he has to depend on. For many years the first question put to a farmer has been whether the sum he proposes to insure is at least equal to two-thirds of the value of all the property immediately after harvest, and if he has not distinctly answered in the affirmative his proposal has been declined. Now, the law is that any contract founded on a misstatement is invalid, and if the Insurance Companies had been strict they would have disappointed many who have made claims upon them; but more than this, as a caution to the insured, a clause to that effect appears on every policy." The concluding paragraph of this second letter on the subject was still more emphatic in its tone, as foreshadowing some still further consequences: "For years farming stock insurances have been so unprofitable that offices have declined to accept proposals from those who have not insured other property with them. It is hoped that the rule now to be enforced will render an increase of rate unnecessary; but if the farmers will not exercise more care when thrashing by steam, will put their ricks so close to each other that, as in a recent

case, twenty-seven can be destroyed by a single fire, and do not check the use of tobacco and lucifer matches, an increase of rate will be unavoidable."

We have quoted thus much from our own columns of some three months since, because this embodies the points of the very useful inquiry which has just taken place in Norfolk. On the face of it the offices have clearly something of a case. Mr. Bignold says at Norwich, as CORRECTOR said in his letter, that farming stock does not pay, and that on such insurance "there had for the last five years been a positive loss throughout the whole country." Now as a matter of business, as a commercial transaction, it is very evident that such a state of things could not go on. The more custom the agents obtained in this way the more certainly would the Companies go to the bad. The very natural solution of the difficulty would seem to be that the rates should be raised, though on closer examination any such step is scarcely required, at least for the present. As a rule it is maintained that the farmers do not insure their property to a sufficient extent; in a word, as a class they under-insure, whereas the effect of this new regulation would be that they must as habitually *over-insure*. The produce that they care chiefly to guard against risk is for often a comparatively brief period in their yards and barns, and then carried on to their credit in the bankers' book. And yet, according to the action of the average clause a man should be insuring his hay-ricks and wheat-stacks all the year round. Does a merchant pay the full premium on a vessel lying idle in dock precisely in the same degree as if she had her cargo aboard and were outward bound? And yet in the case before us it looks very much like ordering a man to pay a full premium on empty bays and skeleton saddles. If this principle is to prevail it would be rather only fair that the farmer should be continually striking his average, or, if that would be vexatious and impractical, that he should make an estimate on the whole year's risk and not on the actual risk of property at one particular period. As Mr. Brown, of Marham, so well put it in his speech at Norwich: "I say that in the case which I have assumed an insurance of £2,000 is ample. And I will tell you why. I have shown that the risk of fire at the time of insurance only amounts to £5,000; before Christmas that risk will be reduced at least one-third, say to £3,000; by Lady-day it will be reduced three-fourths, say to £1,000; and by the 1st of June, just before the hay crop is secured, it will probably be reduced to £500. Therefore, an insurance of £2,000 would represent more than the average risk, and yet we are informed that to entitle such an insured person to recover the full amount of any loss he may sustain by fire he must insure for £6,000." Still, against all this there is the ugly fact that the insurance of farm stock does not pay, though it may be as well to keep as closely as we can to the case before us. Mr. Sewell Read then says on the contrary that it does pay. "I make this challenge to Captain Bignold—and I have

pretty good authority for it—*fire insurance on farm produce in Norfolk does pay.*” And Captain Bignold comes to admit as much, while it appears that his Company has been drawn into the new regulation by the other offices; and H. C. C. in another letter, which we give in to-day's paper, “fears that the united and combined insurance offices will care but little for reasons or arguments. They have the power, and will use it.”

The farmers then will simply have to grin and bear it. They can only, as they said at Norwich on Saturday week, “regret that the Norwich Union Office directors, after consideration of the question and conference with the committee, have determined to adhere to the average clause, which this Chamber considers unfair to the agriculturists of Norfolk.” But this is not altogether the impotent conclusion arrived at. The story does not after all end here. In a letter which Mr. Brown has addressed to his brother-farmers—that we give amongst other correspondence on the subject—he says an extraordinary general meeting of the King's Lynn Insurance Society is about to be called with the object of changing the name and character of the Company, and that he himself and Mr. Sewell Read have already effected insurances in that office *without the average clause*. Surely this is a very legitimate and encouraging proceeding. Where the insurance of farm produce does not pay, the farmers may have to submit, willy nilly, to these new regulations; but where it is admitted that it does, they should surely have been consulted rather than have been handed over so cavalierly at the bidding of those with whom they have no concern.

INSURANCES ON FARMING STOCK.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—I was pleased to read the report of the meeting of the Norwich Chamber of Agriculture, in your Paper of the 3rd, on the Insurances of Farming Stock and Produce. The opinions I ventured to offer in your Journal in July last were at Norwich more forcibly and clearly expressed, and I for one am thankful to the chairman and his fellow members for their exertions to obtain redress; but I fear that the united and combined Insurance Offices will care but little for reasons or arguments: they have power, and will use it.

Allow me to give another instance of the working of their tariffs: We all know that a travelling steam thrashing machine may work in a rick-yard filled with stacks of all kind, for days together, and no extra rate or premium is required; but if that same engine be taken *outside* a massive stone-built *water mill*, and be used by means of a band to assist in grinding, in time of drought, the rate of premium will be at once raised from 4s. or 5s. per cent. to 18s. or 20s. per cent. I am aware that in large towns and ports the mills are chiefly worked by steam power, and that some of the operations, such as shelling, &c., are hazardous, and need a high premium to protect the offices from the increased risk; but I really cannot see the justice of charging the poor little country water mill, occasionally using a travelling steam engine, at the same rate as the extensive building where steam is constantly employed and hazardous processes carried on. Perhaps your correspondent “Corrector,” will kindly explain this for our benefit. I am, sir, yours very obediently,
H. C. C.

[The following letter has been forwarded to us by Mr. Brown.]

BROTHER FARMERS,—At the meeting of the Norfolk Chamber of Agriculture, on Saturday last, I should much

have liked to have proposed a resolution to the following effect: “That this Chamber recommends the formation of a new Insurance Company.” I was prevented doing so, because I had been informed that it would take at least six months to establish a company. As time would not permit of such a course being taken, Mr. C. S. Read and I decided to effect an insurance with the King's Lynn Insurance Society; without the average clause. We have done so—he at the rate of 5s. per cent., in four separate amounts—I, at 6s. per cent., in one amount.

I am authorized to state that an extraordinary general meeting of the shareholders of the King's Lynn Insurance Society will be at once called for the purpose of changing the name of the Company to a more general name, to open an office in Norwich, largely to increase the capital, that a fair proportion of practical farmers shall form part of the Board of Directors, and that the rates of premium will vary according to the risk; in fine I am justified in believing that such alterations will be made in the constitution of the Company that it will command the confidence of farmers as well as of the public generally.

I can only plead the urgency of the case as my excuse for thus addressing you. I do not presume to counsel you; but, as I was unable to propose the formation of a new Insurance Company, I thought it right to inform you of the course which Mr. C. S. Read, I, and others have adopted. With the utmost respect,

I am, Brother Farmers,

Faithfully yours,

Marham, Downham Market,
5th Oct., 1870.

T. BROWN.

TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—About five years since, nearly all the principal offices in London, and country too, bound themselves to charge for all insurances at one uniform rate of premium, without noticing any special hazard or risk or the absence of it. These offices fixed a “tariff” or scale of charges, and they are called “tariff offices.” By this the risk on *farm buildings*, even when of brick, tiled, stone, or slated, *i. e.*, “*common risk*,” was raised from a premium of 1s. 6d. per cent. to 3s., thatch buildings remaining, as before, at 4s. 6d. No reason was given for the change except that farm insurances *did not pay*. It may fairly be asked how it is that such splendid dividends are paid by these offices, and why it is so difficult to buy shares in any of the old offices, but that they are monopolies, and the directors dislike to be disturbed? I think it is not fair in farming stock policies to make those in quiet districts pay so much as those where discontent exists so strongly, and *stack firing* is so prevalent. I have been an agent for twenty-five years, and have often tried to reason with the officers on these things, but without avail: they have the power, and will use it. Mr. C. S. Read's remarks were very sound and practical. I enclose you a copy of the new rules, and also of the list of questions to be answered by the “Unfortunate Agent” as to character, &c.

Yours truly,

Oct. 7.

A COUNTRY AGENT.

THE TRIALS OF DOUBLE-FURROW PLOUGHS AT PETERBOROUGH.

The question of double-furrow ploughs is just now attracting a large share of the attention of the agricultural world, and several Societies are instituting trials, and offering prizes, to encourage manufacturers in their efforts to work out the problem. The subjects is not a new one, as the idea is at least fifty years old. We may therefore be asked, What has now given the matter such an impetus? The answer will be found in the great improvements lately made in these ploughs; and in the fact that merit is sure in the present day to be recognised and brought under public notice, through the instrumentality of our numerous agricultural Societies. The fact that such firms as Messrs. Ransomes of Ipswich, Howard of Bedford, Fowler of Leeds, and other leading engineers have taken up the question, is a sufficient guarantee of its practical value; but there are certain obvious advantages in the system of double-furrow ploughs which at once strike the most casual observer. In the first place there is clearly a saving in manual labour: one man alone required to work a double-furrow plough is doing twice the work he would be able to do with a single plough. With regard to horse-power the saving is not so striking; some makers state that there is a saving of 25 per cent. in draught; others, that there is none at all: the truth probably lies between these two statements; but it is important to remember that, where a single-furrow plough would only require, say, one-and-a-half horse-power, as frequently happens, two horses must be used; while a double-furrow plough would be worked with three horses and doing twice the work.

The system which appears to have made the most way is that known as "Pirie's" patent, taken out about four years since, in which a frame, carrying two plough bodies, is suspended on three wheels, two of which run in the furrow, thus dispensing with both soles and land sides, friction being diminished by substituting a rolling for a sliding motion. It has no handles, but relies only on the steerage arrangement of the front wheel to guide it both in work and when turning at the ends. Some of the more recently-designed ploughs have somewhat similar modes of effecting these objects, while retaining the old-fashioned handles; as, for instance, Messrs. Howard, which has the power of steering with both front wheels, and Messrs. Ransomes, that has a very clever plan for turning at the ends, and raising the plough clear of the ground by the same action.

A very interesting trial of double-furrow and turn-wrest ploughs took place on Tuesday and Wednesday last, on the estate of the Duke of Bedford at Thorney, under the auspices of the Peterborough Agricultural Society. The judges were Mr. J. Hemsley, of Shelton, Newark, Notts; Major Grantham, of East Keal Hall, Spilsby; and Mr. Joseph Martin, of Littleport, Ely—eminently practical men; and the dynamometer tests were conducted by Mr. Amos, consulting engineer to the Royal Agricultural Society, every care being taken to arrive at reliable data.

The prizes to be competed for were divided into two classes. Class I. "For the plough which shall produce the best and most highly finished work; due regard being had to lightness of draught, strength, and simplicity of construction."

Class II. "For the best general purpose plough; due regard being had to lightness of draught, ease, and economy of management, strength, and simplicity of construction,

£20 was placed at the disposal of the judges, to be awarded at their discretion, in the two classes. The sum of £5 was also placed at the disposal of the judges for the class of turn-wrest ploughs.

The following makers competed—viz., G. W. Murray and Co., Bauff, N.B.; W. P. Underhill, Newport, Salop; John Cooke and Co., Lincoln; Vickers, Snowden, and Morris, Doncaster; John Fowler and Co., Leeds; J. and F. Howard, Bedford; Thomas Corbett, Shrewsbury; Ransomes, Sims, and Head, Ipswich; Hunt and Pickering, Leicester.

Messrs. G. W. Murray and Co.—The double-furrow plough of this firm is on the "Pirie" system, with various improvements of their own. It consists of a frame having two parallel sides, each carrying a plough-body. To alter the width of furrow the frame is expanded or contracted in a ready manner, without affecting its rigidity. The steering is done by means of a lever from the front-wheel, while a supplementary lever, peculiar to this implement, gives the ploughman the power of regulating with precision the depth of the furrows, and of lifting the plough over obstructions. The depth of furrow can be changed while the plough is in motion, by means of a lever, on which the land-wheel is fixed. Wedges have been substituted for screws in the adjustment. Price £11 11s. This implement appeared well constructed and simple. It did very good work, and was worked by an ordinary farm-labourer. This firm also exhibited, at work, a combination of a super and subsoil plough, the peculiarity of which consists of the front mould-board being removable, and a subsoil body fastened in its place. The change can be made in a few minutes. It worked very satisfactorily, subsoiling to a depth of 12 inches, and turning a furrow 6 inches deep, drawn by four horses. There was no prize offered for this class of implement, but its merits were evidently recognized by large numbers of the agriculturists present.

W. P. Underhill.—This double-furrow plough is of a simple construction, in which no special arrangement is made for steering. Price £5 10s.

Messrs. J. Cooke and Co. competed with a double-furrow plough of the simplest possible construction, having a beam and handles of wood, and using soles and land sides; the work done by this plough was very good. Price £7 10s.

Messrs. Vickers, Snowden, and Morris.—This plough is also of simple construction: it has a wheel quite in front worked by a lever, conveniently placed to enable the ploughman to raise the plough out of work. Price £8 10s.

Messrs. John Fowler and Co.—This plough is on the "Pirie" system, the frame is triangular, and the alteration of the width of furrow is made by sliding the hinder plough body backwards or forwards. Mr. T. Perkins, of Hitchin, has made considerable improvements in this plough, greatly adding to the convenience of its management, the value of which was recognized by the judges, who awarded a Fowler plough, improved by Mr. Perkins, the second prize in Class II. These improvements consist firstly, in so coupling the front and hinder wheels that, when steering, they turn in opposite directions, and so that the two ends of the plough swing round as on a centre; secondly, in a plan for locking and unlocking the land wheel, so that when at work it remains rigidly fixed to the plough, and when out

of work it is free to turn as a castor, and lastly, by merely pulling down a lever, both sides of the plough are raised clear of the ground, while the advantage of raising and lowering the land-wheel during the progress of the plough is still retained. This implement did excellent work, and the facility with which it was managed was remarkable. Price, with all improvements, £11.

Messrs. J. and F. Howard.—The double-furrow plough by this firm is an exceedingly well-made implement. Besides the ordinary plough-handles, it steers by the turning of the two front wheels; the land-wheel can be raised and lowered to change the depth of furrow, or lift the implement out of work at the ends, while the plough is in motion. The beams which carry the plough bodies are bound together by riveted cross-stays, and they expand, to change the width of furrow, by means of two slides which pass through them; the cross-stays are fastened by clasps, thus the bodies must always keep their relative positions. We understand that this mode of expanding the frame has been patented by Messrs. Howard. The standards of the wheels are short, and, therefore, not liable to be strained. The friction or hinder-wheel runs close in behind the rear plough, thus shortening the distance between the back and front wheels, and allowing the plough to get into its full depth immediately it is set in. This plough made first-rate work, and received the first prize in class II. Price £10.

Mr. Thomas Corbett.—A simple double-furrow plough, having a means of depressing the hind (or friction) wheel so as to facilitate turning. Price £6 17s. 6d.

Messrs. Ransomes, Sims, and Head.—The plough competed with by this firm is clever, and at the same time simple in its construction. The plough bodies are fixed on two parallel beams, which expand to adjust the size of furrow, by means of screws in channel iron guides; it is fitted with a new patent lifting apparatus which throws the plough out of work instantly, and a wheel in the centre enables the plough to be turned in its own length, which is only 10 feet, as on a pivot, with very little help from the ploughman; it is furnished with handles like an ordinary plough, and is very easy of

management. The work done by this plough was all that could be desired; it was awarded the first prize in class I. Price £9 15s.

Messrs. Hunt and Pickering.—This was a well-made ordinary double-furrow plough with a wooden beam. Price £6 10s.

After a severe trial, lasting two days, partly on clover ley, medium soil, and partly oat stubble, light soil, the prizes were awarded as follows:

Class I.—£6 to Messrs. Ransomes, Sims, and Head; £3 to Messrs. J. and F. Howard.

Class II.—£6 to Messrs. J. and F. Howard; £3 to Messrs. John Fowler and Co., for their plough with Perkin's improvements; £2 to Messrs. Ransomes, Sims, and Head.

Messrs. Howard had intended to compete in both classes with the same plough, but this the committee would not permit, and consequently a smaller plough was put on for the highly finished work. Mr. Amos recorded the results by the dynamometer tests, and an attempt was made to compare the draught of a single with that of a double furrow plough, but we doubt whether the comparison can be considered entirely satisfactory, inasmuch as the single plough was not worked with a friction wheel, but with sole and land side. There was nothing calling for special remark in the turn-wrest ploughs, in which class there were only two competitors, viz., Messrs. Howard and Ransomes—£3 being awarded to Messrs. Howard, and £2 to Messrs. Ransomes.

Besides the competition between makers, there were going on at the same time various competitions between ploughmen, including a prize for "the man who shall plough with a double-furrow plough and three horses abreast one acre of land not less than five inches deep setting out two ridges and finishing off one furrow." The work was in most cases admirably done, but as all the ploughs in this competition were by the same maker Messrs. John Fowler and Co., the interest was purely local.

TESTIMONIAL TO MR. ALLEN RANSOME.

Mr. James Allen Ransome, the senior partner of the Orwell Works, having this summer completed his fiftieth year of connexion with the works, the wish was expressed by some of the old hands that it would be a graceful tribute to one who has, by his uniform kindness to those in his employ, won their respect and esteem, if a suitable testimonial could be presented to him in this his year of jubilee, as the expression of affectionate regard in which he is held by all. Accordingly a meeting of foremen and representatives from the offices was held, and it was determined that a voluntary subscription should be raised for the purpose indicated. That the contributions should be spontaneous and free: a box, on the principle of the ballot, was placed in every shop, and into these the men could put whatever contributions they pleased. The result was that 707. was thus contributed, and with this sum has been purchased a testimonial, which took the shape of a very handsome timepiece and set of bronzes. On a gold plate, let into the base, is the inscription:

Presented to

JAMES ALLEN RANSOME, ESQ.,

By the officers and workmen of the Orwell Works and Waterside Works, on the completion of his fiftieth year of business connexion with these establishments, as a voluntary tribute of the esteem in which he is held by the subscribers,

Ipswich, September, 1870.

The following letter accompanied the presentation:

Orwell Works, September 24th, 1870.

J. Allen Ransome, Esq.

Dear Sir,—On behalf of all those employed at the Orwell and Waterside Iron Works, we have the pleasure to request your acceptance of the accompanying timepiece and bronzes, as a mark of esteem and also a memento of the completion of your fifty years' connexion with the works. Believing that the value of the gift will be enhanced in your estimation by a knowledge of the mode in which it has been provided, we enclose a copy of the only notice that was issued on the subject, and which will sufficiently explain itself. Doubtless, had we adopted any means of soliciting subscriptions, or even of making the matter more generally known, the offering would have been of greater intrinsic value, but the object was not so much a costly gift as one which in its execution might be pleasing to your taste, and as a purely freewill expression of our feelings towards you. In thus conveying to you our most hearty congratulations for the past, we desire to express our hope that by the Divine blessing you may be spared for many years to enjoy your important position of senior partner in the two establishments, the blessings of your extended family circle, the respect and esteem of you fellow-townsmen, and the lasting regard of all the officers and workmen of the two firms.

On behalf of the committee and subscribers,
I am, dear sir, yours very respectfully,
(Signed) ARTHUR T. COLE,
Secretary to the Testimonial Committee,

Mr. Ransome returned the following reply:

The Old House, Carr-street, Ipswich,
Sept. 27, 1870.

Dear Arthur Cole,—On my return from the sea-side I find your kind address, accompanied by the magnificent testimonial, with which the officers and workmen have been pleased to present me on the occasion of my having completed the fiftieth year in connection with our establishment. I am deeply touched by this manifestation of the kindly feelings of those who have been associated with you in arranging this welcome and altogether unanticipated surprise, and greatly does it add to my estimate of its value to feel the thoughtful and kindly consideration that has dictated the mode and manner in which your munificent gift should reach my hands, and I trust to you to convey to your associates in this matter my appreciative acknowledgment. Much as I have reason to

value this testimonial for its intrinsic beauty and value, you who have so long known me will scarcely need the assurance that in the affectionate regard of which your testimonial is the outward symbol, I have a deeper and far higher gratification in the recognition it conveys to me of the harmony that has hallowed our mutual relations for so many years, and which during half-a-century has never been broken, nor, I believe, even disturbed. I am sensible that this acknowledgment is but a very feeble expression of my grateful feeling or of my personal gratification, but I trust to its acceptance by you in the fulness of the spirit of mutual regard.

I remain, dear Arthur, yours very sincerely,

J. ALLEN RANSOME,

To A. T. Cole, for the Officers and Workmen of
the Old Foundry and Water-side Iron Works,

BAKEWELL FARMERS' CLUB.

At the twenty-second annual exhibition of this well known Club the entries were more numerous than in previous years, and the monetary value of the prizes having been increased this season was doubtless in some measure the cause of the increased competition, and of a better quality of animals being exhibited. The cattle were remarkably good, especially the milking cows. The bull exhibited by Mr. Kirkham, of Stanedge Grange, and which took the prize for the best animal in the show, was a very fine one. The sheep were scarcely up to last year's show, either in number or quality, with the exception of the rams. The pigs were exceedingly good, especially the two prize pigs. The sow belonging to Mr. Gregory, of Ashover, which carried off the first prize at Derby last week, failed to obtain a prize, and was only highly commended by the judges. The show of horses was excellent, and as is usual at all agricultural gatherings drew a large share of attention. The show of cheese, wool, roots, and poultry was held in the Town Hall. The show of implements was small, there being only a few chaff-cutters, knife-cleaners, and wringing and mangling machines.

PRIZE LIST.

JUDGES.—CATTLE AND SHEEP: Messrs. Frank Smith and Maskery. HORSES: Messrs. Johnson and J. Bland. PIGS, POULTRY, AND ROOTS: Mr. Faulkner. CHEESE: Mr. S. W. COX. BUTTER: Mr. J. Bramwell. WOOL: Messrs. J. H. Willey and Addy. GENERAL REFEREE: Mr. Faulkner.

SHORTHORN CATTLE.

Bull, two years old and upwards.—First prize, £4, J. Kirkham, Stanedge Grange; second, £2, T. Roe, New Inns; third, £1, B. Buxton, Aldwark.

Yearling bull.—First prize, £4, R. Blackwell, Tansley; second, £2, J. Brown, Shatton; third, £1, H. Harrison, Edensor.

Cow, combining in the greatest degree milking and grazing properties.—First prize, £2, J. Kirkham, Stanedge Grange; second, £1, R. Blackwell, Tansley; third, 10s., Robt. Orme, Bakewell.

Pair of cows (of any breed) for dairy purposes, each having had a calf in 1870, and in milk.—First prize, £3, T. Wild, Cold Eaton; second, £2, J. Kirkham; third, £1, G. Gould, Pilsbury.

Shorthorned heifer, three years old and under four, in milk or in calf.—First prize, £2, J. Brown, Shatton; second, £1, T. Wilton, Heathcote; third, 10s., T. Wilton.

Pair of Shorthorn heifers, two years old and under three, in milk or in calf.—First prize, £2, F. Parker, Middleton; second, £1, F. Parker; third, 10s., F. Bramwell, Windmill.

Pair of Shorthorn stirks, one year old and under two.—First prize, £1 10s., L. and G. Furniss, Birchill; second, £1, J. Anthony, Bakewell; third, 10s., B. Buxton, Aldwark.

Pair of store bullocks, one year old and under two.—Disqualified.

Shorthorn bull-calf.—Prize, £1, T. Swann, Hargate Wall.

Pair of Shorthorn cow calves.—First prize, £1, P. Furniss, Ashford; second, 10s., L. and G. Furniss,

Best animal in the yard.—Prize, £3, Mr. Kirkham, Stanedge Grange (for bull).

Milk cow, shown by a cottager holding not more than six acres of land.—First prize, £1 10s., J. Mellor, Bakewell; second, 10s., W. Hallows, Ashford.

Four milk cows out of one dairy exceeding ten cows.—First prize, £3, J. Kirkham; second, £2, R. Gould, Bank Top, Hartington; third, £1, H. Harrison, Edensor.

Two milk cows out of one dairy not exceeding ten cows.—First prize, £3, W. Hodkin, Beeley; second, £2, G. Haddock, Bakewell; third, £1, W. Hodkin.

Fat beast.—First prize, £2, J. Evans, Alport; second, £1, S. Grindey, Friden Farm.

SHEEP.

Long-wooled ram of any age.—First prize, £3, R. Johnson, Kirk Ireton; second, £2, R. Johnson; third, £1, R. Thornhill, Longstone.

Shearling long-wooled ram.—First prize, £3, R. Lee, Kniveton; second, £2, R. Lee; third, £1, C. Mellor, Atlow.

Pen of five long-wooled ewes, which have reared lambs in the spring of 1870.—First prize, £2, L. and G. Furniss; second, £1, R. Johnson; third, 10s., W. Greaves, Bakewell.

Pen of five long-wooled theaves.—First prize, £3, R. Johnson; second, £1, L. and G. Furniss; third, 10s., W. Greaves.

Pen of five fat shearling wethers.—Prize, £2, W. Greaves.

Pen of five long-wooled ewe lambs.—First prize, £1, L. and G. Furniss; second, 10s., W. Buxton, Bakewell; third, W. Greaves.

Pen of five long-wooled wether lambs.—Prize, £1, W. Greaves.

PIGS.

Boar of any age.—First prize, £1 10s., C. B. Speight, Milhouses; second, £1, J. B. Gregory, Ashover. Commended: E. Frith, Calton House.

Sow of any age, in milk or in pig.—First prize, £1 10s., B. Hardy, Ashborne; second, £1, R. W. M. Nesfield; third, 10s., F. Potter, Harthill Moor. Highly commended: J. B. Gregory; M. Walker, Anslow.

Pig, shown by a cottager holding not more than six acres of land.—First prize, £1 10s., T. Noton, Bakewell; second, 10s., L. Mountney, Bakewell. Extra pig.—Highly commended, —Tomlinson, Baslow.

HORSES.

Brood mare and foal of the draught kind.—First prize, £3, T. Travis, Postern Lodge; second, £2, B. Swaffield, Pilsbury Grange.

Two-year-old gelding or filly of the draught kind.—Prize, £2, G. Fearn Baslow.

Yearling colt or filly of the draught kind.—First prize, £2, S. Wilcockson, Brampton; second, G. Gould, Pilsbury.

Brood mare and foal, best fitted for breeding hunters and hacks, but not thoroughbred.—First prize, £2, B. Swaffield; second, £1, R. Cook, Hathersage.

Two-year-old colt or filly not thoroughbred.—First prize, £2, W. Hodkin, Beeley; second, £1, T. Higgott.

Yearling colt or filly not thoroughbred.—First prize, £2,

S. Wilcockson, Brampton; second, £1, T. W. Wager, Glutton Grange.

Pony or cob not exceeding 15 hands.—First prize, £2, J. Swaine, Bakewell; second, £1, B. Buxton, Aldwark. Highly commended: J. O. Openshaw, Bakewell.

Pony not exceeding 13 hands.—First prize, £2, T. B. Trigg, Parwich; second, £1, J. Potter, Middleton. Highly commended: J. Gibbs, Middleton.

Pair of plough horses or mares.—First prize, £1 10s., E. Garton, Lumsdale; second, 15s., J. Archer, Meadow-place. Highly commended: F. Potter, Harthill Moor; commended, E. Garton.

Hunter, to be tested by leaping over hurdles.—First prize, £3, A. C. Hubbersty, Brackenfield; second, £2, F. Gisborne, Bakewell; third, £1 and commended, W. Greaves, Bakewell.

Hunting colt or filly, four years old.—Prize, £2, W. Greaves.

CHEESE AND BUTTER.

Six cheeses, the produce of the farm of the exhibitor, not to be tested in any way previous to the exhibition.—First

prize, £3 3s., M. Nall, Flagg; second, £2 2s., F. Potts, Harthill Moor; third, £1 1s., L. and G. Furniss, Birch Farm. Highly commended: G. Banks, Hartington. Commended: J. Melland, Snitterton Hall.

Sample of uncoloured butter.—First prize, £1, R. Lee, second, J. Hodgkinson, Haddon Grove; third, F. Potts, Harthill Moor; fourth, and extra prize, W. Hodkin, Beele.

TURNIPS.

Eight swede turnips.—First prize, 10s., M. Nall, Flagg second, 5s., J. Archer, Meadow-place.

Eight common turnips.—First prize, 10s., Large Mountney, Bakewell; second, 5s., and highly commended: J. Archer, Meadow-place.

Six cow cabbages.—First prize, 10s., F. Potter, Harthill Moor; second, 5s., W. Gurdon, Bakewell.

WOOL.

Five fleeces of hogg wool.—First prize, £1 1s., L. and G. Furniss, Birchill; second, 10s. 6d., W. Greaves, Bakewell.

Five fleeces of ewe wool.—First prize, £1 1s., L. and G. Furniss, Birchill; second, 10s. 6d., W. Greaves, Bakewell.

BEDFORDSHIRE AGRICULTURAL SOCIETY.

MEETING AT BIGGLESWADE.

The old Bedfordshire Society has seldom enjoyed a more hearty welcome than that it received at Biggleswade. What with bands playing, flags flying, ever-green arches, special trains and hospitable offers, the occasion was kept as high holiday. Still the foot-and-mouth disease interfered somewhat with the show of cattle and pigs, which was rather meagre, although Royal winners put in an appearance amongst the Shorthorns; and noticeably Mr. Mumford's Camilla, pronounced to be the best heifer at Oxford, although only here second to Mr. Howe's Windsor Butterfly, which was merely commended in the same class, at the Royal meeting. As we said, however, at the time "the decision in Camilla's favour was altogether about the greatest fluke of the day, for we most assuredly never expect to see her do so well in anything like the same class of company." Mr. Pawlett being so handy home showed strongly in the first and second classes, although, as Baron Killerby was no longer eligible to compete, he could only obtain a second prize; Prince Alfred being beaten by Captain Oliver's white bull, Lad of the Forest, and Mr. Inskip's Ravensden, of May Duke descent. Amongst the yearling bulls Mr. Mumford took the lead with his Editor, with Mr. Pawlett's Royal Booth second; while Mr. Pawlett won easily in the calf class with his promising Majestic. The sheep show was considered excellent; indeed, it would have been almost impossible at any county meeting to have brought together a better collection of animals than were exhibited in the Down or cross-bred shearling wether class, and it was a matter of general regret that the funds of the Society would not admit of more than one prize being awarded. Mr. Newman's pen, by a Biddenham ram, were of great size and really good looks, and these with several other entries will be heard of again. Colonel Lindsell presided at the dinner, and a very good chairman the new M. F. H. proved himself, as the speaking generally was above the average, or the terribly long toast-list would have worn out the company.

PRIZE LIST.

HORSES.

Best yearling colt.—Prize, Mr. Purser, Willington.
Yearling filly.—Prize, J. Walker, Goldington.
Two-year-old cart filly.—First prize, H. Purser, Willington; second, J. Dudley, Kempston.

Pair of cart horses for agricultural purposes.—Prize, F. Allwood, Walsworth.

Mare and foal for agricultural purposes.—First prize, G. Street, Maulden; second, Mrs. Brimley, Cople.

Four-year-old horse or mare for hunting purposes.—Prize, C. S. Lindsell, Holme.

Hackney of any age, for general purposes.—Prize, W. Whitehead, Wollaston.

Pony.—Prize, H. V. Gostling, Oakley.

The open hunter class.—Prize, the town silver cup, C. S. Lindsell (Croquet).

Mare and foal for hunting purposes.—Prize, J. Henman, Stagden.

Cob.—Prize, J. E. Parsons, Charwelton, Daventry.

SHORTHORNS.

Bull, above two and under six years old.—First prize, R. E. Oliver, Sholebroke Lodge, Towcester; second, W. Inskip, Shefford, Hardwicke.

Bull, above one and under two years old.—First prize, J. A. Mumford, Chilton Park Farm, Thame; second, T. E. Pawlett, Beeston.

Bull calf, under twelve months.—First prize, T. E. Pawlett; second, T. Cranfield, Standford, Bury.

Cow, any age.—First prize, T. E. Pawlett; second, T. Kingsley, Boarscroft, Tring.

Cow, any age, adapted for dairy purposes.—First prize, J. A. Mumford; second, T. Kingsley.

Heifer, in calf or in milk, under three years.—First prize, J. How, Broughton; second, J. A. Mumford.

Heifer, under two years.—First prize, J. How; second, R. Marsh, Little Offley House.

Heifer calf, above six and under twelve months.—First prize, T. E. Pawlett.

Fat ox.—First and second prizes, F. Fowler, Henlow.

Fat cow or heifer.—Prize, F. Fowler.

Pair of heifers, under two years.—First prize, J. Pawlett; second, T. Kingsley.

SHEEP.

Ten long-woolled shearling ewes.—First prize, T. W. D. Harris, Wootton Norths.

Ten Down or cross-bred shearling ewes.—First prize, C. Howard, Biddenham.

Ten breeding ewes, any age.—First prize, G. Street, Maulden.

Three fat long-woolled shearling wethers.—First prize, T. W. D. Harris.

Three fat Down or cross-bred shearling wethers.—First prize, J. Newman, Harrowden. The class highly commended.

Ten long-woolled ewe lambs.—First prize, T. W. D. Harris.

Ten Down or cross-bred ewe lambs.—First prize, F. Street.

Ten long-woolled wether lambs.—First prize, C. Barnett, Stratton Park.

Ten Down or cross-bred wether lambs.—First prize, C. S. Lindsell, Holme, Biggleswade.

Twenty ewes of any breed or age.—First prize, G. Street.

PIGS.

Boar, intended for use.—First prize, S. Deacon, jun., Polebrook Hall, Oundle; second, F. Wythes, Ravensden.

In-pig sow.—First prize, W. Burton, Northill.

Three fat hogs, under six mouths.—First prize, J. W. Tebutt, Biggleswade.

JUDGES.—For cattle, sheep, and pigs—Messrs. J. Robinson, Clifton Pastures, Newport Pagnel; J. Clayden, Littlebury, Saffron Walden; J. Lynn, Church Farm, Stroxtan, Grantham. For horses—J. H. Plowright, Mauca, Isle of Ely; J. M. K. Elliott, Heathencote, Towcester.

THE LUDLOW AGRICULTURAL SOCIETY.

At the twenty-second annual exhibition of this Society the entries were scarcely so numerous as usual, but in several of the classes animals were exhibited that it would be difficult to equal in any part of the county. Mr. Thomas Rogers' stock bull, which won the sweepstakes, and has been successful at several other shows; and both the other bulls in competition were from the same herd. It will be observed that in the sweepstakes Mr. Rogers' took all the prizes offered, and several in other classes besides. The best show was undoubtedly in cattle; but of sheep there was also an excellent assortment. Mr. James Hand's wethers, which carried off a first prize, drew forth much commendation from the judges and the visitors. Of pigs there was a capital show, Mr. Jas. Lockhart being the principal prizetaker. Of horses there was not a good show. Mr. Richard Coston exhibited a cart stallion, and Mr. James Lockhart a nag stallion, but these being the only animals of the sort exhibited, the prizes were withheld in accordance with the rules of the Society. Vince, of Ludlow, took the first prize for implements; and among his collection were ploughs by Kells, Ransome, and Howard, several chaff-cutters by noted makers, turnip-cutters by Samnelson, rootpulpers, oilcake mills, corn crushers, Howard's prize harrows, Gower's seed drills, the Cambridge roller, sheep racks, winnowing machines, and numbers of other articles and machines. Corbett, of Shrewsbury, did not exhibit very largely, but his display comprehended several of the recent improved machines turned out from his works. E. E. Edwards exhibited a new plough, which attracted attention. The mould-board was circular, and turned upon an axle as the earth pressed against it, the result being the better breaking up of the soil. It is said to be an American invention.

PRIZE LIST.

JUDGES.—HORSES: Mr. Hawkins, Weston, Herefordshire. SHEEP AND CATTLE: Messrs. Mansell, Ercall; Hughes, Lady Court; and Wigmore, Weston. ROOTS: Mr. E. H. Davies, Patton; and Mr. Wadlow, Stone Acton.

CATTLE.

A sweepstakes of 2 sovs. each, with 20 sovs. added, for the best stock bull, of any breed, open to all England.—First prize T. Rogers (Battenhall); second, 4 sovs. (Sir Oliver) T. Rogers; third, 2 sovs., T. Rogers (Long Horns).

Bull of any age, and four of his offspring under twelve months old.—First prize, £5, T. Rogers (Sir Oliver). Commended: C. H. Hincksman (Sir John).

Yearling bull.—First prize, £5, T. Rogers; second, £2 10s., P. Turner; third, £1, P. Turner.

Four two years old steers.—First prize, £5, T. Griffiths; second, £2 10s., H. Lippett.

Four two years old heifers.—First prize, £5, T. Fenn; second, £2 10s., T. Rogers.

Pair of two years old heifers.—First prize, £5, P. Turner. Commended: A. Rogers and R. Tanner.

Four yearling heifers.—First prize, £5, P. Turner; second, £2 10s., W. Tudge. Commended: T. Fenn.

Breeding cows or heifers, with calves, or to be certified to calve.—First prize, £5, T. Rogers; second, £2 10s., J. Williams.

Fat cow or fat heifer.—First prize, £5, H. Ridgley; second, £2 10s., T. Farmer.

SHEEP.

Yearling ram, open to all England.—First prize, £5, T.

Fenn; second, £2 10s., J. Hand. Highly commended: T. Fenn.

Ram more than two years old.—First prize, £5, W. Baker; second, £2 10s., J. Hand.

Ram lamb.—First prize, £5, R. Tanner. Commended: R. Tanner.

Pen of ten breeding ewes, two years old and upwards.—First prize, £5, W. Baker; second, £2 10s., R. Tanner. Commended: J. Hand.

Pen of ten yearling ewes.—First prize, £5, R. S. Edwards; second, £2 10s., J. Hand.

Pen of six fat yearling wethers.—First prize, £5, J. Hand; second, £2 10s., F. Bach.

Pen of ten wether lambs.—First prize, £5, R. S. Edwards; second, £2 10s., J. E. Farmer.

Pen of ten ewe lambs.—First prize, £5, W. Baker; second, £2 10s., R. S. Edwards.

PIGS.

Boar under two years old.—First prize, £2, J. Lockhart; second, £1, J. Lockhart.

Breeding sow.—First prize, £2, J. Lockhart; second, £1, J. Lockhart.

Cottager's pig.—First prize, £3, J. Poole; second, £2, C. Smout; third, £1, R. Price. Highly commended: J. Price and R. Smith.

HORSES.

Nag mare and foal at foot.—First prize, £5, M. Evans; second, £2 10s., M. Evans.

Cart mare and foal at foot.—First prize, £5, F. Coston; second, £2 10s., R. Hill.

Nag gelding or mare under five years old.—First prize, £5, H. Lippett; second, £2 10s., R. Coston. Commended: J. Hotchkiss.

Two-year old cart gelding or filly.—First prize, £5, H. Lippett, Priors Alton; second, £2 10s., H. Lippett.

A sum of £5 to be divided amongst the owners of animals exhibited as extra stock.—First prize, 50s., R. S. Edwards; second, 20s., J. Towers; third, 10s., J. M. Brandford.

IMPLEMENTS.

£5 for the best assortment of agricultural implements, J. S. Vince.

LABOURERS.

To the man who, by his daily labour, has reared the greatest number of children without parochial aid.—First prize, £4, A. Banks, workman to Mr. R. Bach, at Elsieh, from 25th March, 1869; had 11 children, 7 living. Second, £2, J. Hughes, workman to Mr. C. Blakeway, from May, 1841; had 9 children. Four competitors.

To the labourer who has lived the greatest number of years in one service, under the same master.—First prize, £4, B. Pearce, workman on Oakly Park Estate, from 17th November, 1826; second, £2, J. Cadwallader, in the employ of Mr. E. Sheppard, his father, grandfather, and Mr. Broxton, on Wettleton Farm, from July, 1827. Fifteen competitors.

To the farming in-door man-servant, who has continued the same service the greatest number of years, not less than five, having a good character from his master.—Prize, £4, J. Edmunds, groom to Mr. Evans, from 2nd May, 1863.

To the female servant who has lived the greatest number of years, not less than five, in one service, having a good character from her master or mistress.—First prize, £4, Alice Roberts, housemaid to Mr. W. Greame, from 19th May, 1851;

second, £2, M. A. Botfield, servant to Mr. C. Blakeway, from June, 1865.

To the female servant who has lived the greatest number of years, not less than five, in one service in the Borough of Ludlow, having a good character from her master or mistress.—Prize, £4, E. Dade, cook to Mr. F. R. Southern, from 16th October, 1861. Three competitors.

To the in or out-door man-servant or labourer who has lived the greatest number of years, not less than five, in one service in the Borough of Ludlow, having a good character from his master.—First prize, £4, R. Smith, in the service of Mr. Hand, from 1st May, 1853; second, £2, S. Cooke, printer for Mr. Partridge, from January, 1854. Seven competitors.

To the labourer or servant who has subscribed the greatest number of years to a benefit or friendly society.—Prize, £2, J. Postans, member of Elephant and Castle Friendly Society from April, 1834, in the employ of Mrs. Cooper, from November, 1853. Two competitors.

To the labourer or servant who has been a depositor in a savings' bank the greatest number of years.—Prize, £2, E. Marston, depositor in Ludlow Savings' Bank from 14th October, 1848, and in employ of Mr. F. Coston, from May, 1863. Two competitors.

To the man who makes not less than four corn ricks, and thrashes at least the same number, in the most workman-like manner.—Prize, £2, G. Morris, servant to Mr. T. Rogers, Coxall.

To the ploughman who, with a single plough, shall plough half an acre of ground in the most workman-like manner, not

less than five inches deep, under three hours and a-half, open to all England; non-subscribers to pay 10s. entrance.—First prize, £3, S. Hoare, in employ of Mr. T. Corbett, Salop; second, £1 10s., J. Rickards, waggoner to Mr. T. Lowe, Bromfield. Four competitors.

To the ploughman who, with a double plough, four horses, and a driver, shall plough an acre of ground, in the most workman-like manner, not less than five inches deep, under three hours and a-half.—Prize, £3, and to the driver 10s., T. Fletcher, waggoner to Mr. John E. Farmer, Felton. Four competitors.

To the ploughman who, with three horses and a driver, shall plough half an acre of ground in the most workman-like manner, not less than five inches deep, under three hours and a-half.—First prize, £3, and to the driver under fifteen years of age 10s., C. Probert, waggoner to S. Amies; second, £1 10s., and to the driver under fifteen years of age 5s., J. Buckley, waggoner to J. E. Farmer. Three competitors.

To the ploughman who, with two horses abreast, shall plough half an acre of ground in the most workman-like manner, not less than five inches deep, under three hours and a-half.—First prize, £3, W. Price, workman to Mr. F. Bach; second, £1 10s., H. Highway, waggoner to Mr. J. S. Edwards. Eleven competitors.

To the ploughman under twenty years of age, who, with two horses abreast, shall plough half an acre of ground in the most workman-like manner, not less than five inches deep, under three hours and a-half.—Prize, £1 10s., M. Bedford, waggoner to Mr. R. Coston. Two competitors.

HEXHAM FARMERS' CLUB.

Mr. W. F. Catcheside, F.C.S., analytical and consulting chemist to the club, has inaugurated the autumn series of meetings by reading a paper on lime. There was a good attendance, with Mr. C. G. Grey, president of the Club, in the chair.

Mr. CATCHESIDE read as follows: I have the honour of commencing the course of papers to be read this season before you, and in doing my best justice to the occasion, I may express my delight in again resuming the discussions of the various interesting topics that can ever be associated with agriculture. You will agree with me when I say that nothing tends so surely to enlighten a dark question than its open discussion. In learning the power of others' minds we often disclose the weakness of our own. In the course of a debate several aspects of the point discussed arise that by sanguine parties are never thought of, and a seemingly sure victory is turned into a stubborn acknowledgment of defeat; therefore I think that the best method of learning the character and properties of lime will be to make that substance and its uses the subject of a discussion. To me is allotted the task of concentrating facts in the first place, and in my humble way offering suggestions, the value of which you will estimate according to personal experience and knowledge. That various opinions are held by you, gentlemen, as to the qualities of, and the occasion for, using lime, I cannot doubt after hearing the discussion on the last paper read in this room. To my mind considerable difficulties arose that checked progress, and I consider it my pleasure and duty, as your chemist, to try and make all plain that I can. With this introduction I will at once proceed to my subject. I think that we shall consider it at the best advantage in the following way: Firstly, the chemistry of lime, including its manufacture and properties; secondly, its uses, physically and chemically; and, lastly, a few remarks deduced from the foregoing data. Lime, chemically speaking, is an oxide of a metal called calcium. You know what iron rust is, and lime may be called calcium rust; it is the combination of calcium with oxygen gas. In this condition lime is very caustic, or has properties of burning up organic and vegetable matter. This may be proved by moistening a little between the fingers, when a soapy and slimy sensation is apparent, owing to the partial destruction or solution of the skin. But to its manufacture. It is prepared from limestone rocks, by submitting them to fire. Limestone we will consider as carbonate of lime, or lime united in a state

of combination with carbonic acid gas, the gas known as "choke damp," and that which effervesces from ginger beer, lemonade, &c. The power which holds the union of this gas with the lime is sufficient to withstand most physical forces. We may crush or beat limestone to a fine powder, and it still remains carbonate of lime; but if we subject it to heat, the union is broken, and the gas is liberated and goes away into the atmosphere. Limekilns are convenient furnaces for the purpose, and as you all know their construction I need not explain them. The residue from the limestone is lime, properly speaking. I may mention that chalk and marble are of precisely the same composition as limestone, being carbonate of lime. Lime has several very important and interesting properties. It has a powerful attraction for water and for carbonic acid gas. You all know the consequence of pouring water upon lime. The lump of lime begins to steam, crack, and swell out, generating strong heat. After a short time it crumbles down to a very fine, and mark, dry powder. This is the operation called slaking. Lime also sucks up any carbonic acid gas it meets with, and for this reason may be used with advantage to clear out this noxious gas from the atmosphere or places where it abounds. If lime freshly burned is spread out to the atmosphere, it soon becomes converted back again into the original carbonate of lime. You may then inquire, why burn the carbonate of lime when we use that substance after all the trouble to drive off the carbonic acid gas? The limestone, you must remember, although chemically identical with chalk, and the carbonate of lime of conversion, is physically very different. Instead of the hard lumps of rock, we have powder to deal with. It would be almost useless to add to soil carbonate of lime in the shape of lumps of rock. We secure the fullest benefit by adding the same material in such a state that it may ultimately mix with the soil, and in its finely divided condition, effect those changes which we endeavour to procure. I may here state to you how important it is for this fact to be fully borne in mind when any manures are added to the land. They should be in as fine a state as possible. Just as animals can digest food and assimilate it to the good of the system the easier when that food is finely prepared for them, so the soil can appropriate to itself any beneficial agent the more readily, when the presentation is in a fine state of division. Lime is also an alkali, or a substance which neutralises acids. Its caustic properties I have alluded to, and they must be well remembered, as the applica-

tion of this knowledge is very important in practical farming. The effect of the stronger alkalies is to destroy organic matter, so that lime, if in contact with ammoniacal substances under certain conditions, will expel that gas. Therefore, it would be exceedingly unwise to put lime with guano, for instance, or sulphate of ammonia, because the ammonia gas would be lost, and the value of manure gone! Lime occurs in almost every plant as a constituent of the ash. Hence it is positively necessary that lime should exist in every soil. No cultivated soil is thoroughly destitute of lime, although the proportion of it may not be large enough for a healthy growth of plants; consequently the addition of lime to land produces, in these cases, an increase of produce. The commonest form of lime as found in soils is the carbonate of lime or chalk. Other states of lime occur, such as capulites or phosphate of lime, gypsum or sulphate of lime, silicate of lime—the substance that gives the firm and glistening characters to straw, nitrate of lime, &c. Sulphate of lime, gypsum, or plaster of Paris, is especially found in the ashes of clover, beans, &c. It is a useful manure, since in addition to supplying lime to plants that require it, gypsum converts the volatile combinations of ammonia into more stable ones, thus preserving the latter very valuable material for further use. Phosphate of lime is usually found in certain rocks and strata. This substance, containing a large quantity of phosphoric acid, is largely used in manufacturing manure, and is of no moment now to us. The properties of lime being considered, we will try how to apply them practically for our own benefit. The uses of lime may be considered to be valuable physically and chemically. Let us first look at the physical effect of using lime. Lime is used as a top dressing to destroy weeds, mosses, and other caucous growths on grass lands. A mixture of lime and earth, couch, &c., known as com-post is preferable for dressing grass. The proportions of the constituents range from one of lime to two of earthy matter or equal parts, according to the result of experience. Books give the former ratio, and farmers the latter. In Hampshire and Berkshire, and indeed in all the southern counties, farmers very often spread chalk over their grass lands, and derive very beneficial results. It is put in before winter, and the frost acting upon it splits it up to powder. It is then spread over the land as a top-dressing. The chalk is merely dug out of the various pits, always abundant in material, and convenient for casting. In one instance, to prove how valuable this process is, I knew of a field the half of which was top-dressed in the above-mentioned manner—twenty cart-loads per acre—and there was a distinct mark down the whole field after a space of ten years, distinctly showing the boundary of the chalk, and simultaneously its benefit. Lime is also used simultaneously to kill insects, worms, grubs, and other living destroyers. I knew a case where a Yorkshire farmer employed lime to top-dress his turnips. He found a worm or caterpillar ate the tops, and, moreover, that these insects only made their appearance at night. He had men out by torch-light to sow lime broadcast over the turnips, and he found that the disease was effectually stopped. Of course in many cases the fearful operation of sowing lime would be too much for the delicate mind of the poor sower, so that we might almost consider this an exceptional use of lime. Now, this farmer was acquainted with a fact—namely, that lime was a powerful caustic, killing insects with ease. He applied his knowledge, and reaped his reward. When we kill the mosses and weeds we apply the same property—the caustic property of lime. Speaking of turnips and lime, I may state that the latter substance is of great use to the former under certain conditions. It has been frequently found in England that turnips when grown at too short intervals on the same field become subject to a peculiar disease, which manifests itself in an unusual development of the roots. Instead of a round fleshy head weighing several pounds, from which filamentous roots spread out into the ground, the top roots splits into a great number of hard woody stem-like roots, of the thickness of the finger (finger-and-toe disease). This disease, which is owing to the peculiar character of the ground, is removed by a large dose of quicklime. It is certain, however, that the lime does not act in this case, because there was previously a deficiency of it in the soil, for a supply of it to the field at seed-time like other manures produces no effect, for the latter is apparent only after one or two years. Baron Liebig is responsible for this opinion. When lime is laid on insects in

the shape of carbonate of lime these effects are not observed, as the caustic properties belong chiefly to lime chemically speaking. Again, we find a soil too peaty or more organic in its character than we would wish. We dose it with lime, and its caustic properties are again displayed in splitting up the soil, and evolving ammonia gradually, and generally effecting a change by imparting a more mineral nature to the land. Another physical effect is that when lime is applied to clay land it opens and loosens the dense masses of clay, and imparts a certain amount of porosity and mellowness, and by so doing opens the road to further improvement, by exposing a larger extent of surface to the action of the air. The chemical properties of lime are just as important. We have noticed its alkaline character or its tendency to combine with acids. Now we know that clay contains silicic acid, insoluble in water, but rendered soluble if neutralised by an alkali. So that if lime be added to silicic acid, soluble silicate of lime is formed. Soluble silicate is required to impart strength to straw in crops of wheat, barley, and oats. Now, gentlemen, supposing you had a field of a clayey nature, and you wanted to have a cereal crop from it, or suppose that in a field of corn, grown in a clay soil, you notice the straw feeble and too weak to support the head, you would then think of the alkaline property of lime and say, "I know how to utilize that clay if I want a good crop. I will dress the land with lime, and then the silicic acid will be made soluble, and I shall not have my corn broken down through the straw being weak." We all notice that all crops take more or less lime from the soil to form their mineral structure. We must see that lime is always there to be taken. Gentlemen, herein lies the whole secret of real tillage farming—the restoration to the land of those materials that each successive crop withdraws. We can then understand the necessity for always having lime in the land, and so periodically the land is dosed with lime. Great difference of opinion exists as to the quantity, but I should say from 5 to 6 tons per acre every eight years would be a fair quantity to lay on. This operation is not so necessary on farms situated on limestone obviously. But there is something far deeper to be considered than this. The idea of putting lime regularly into soil is a plain one, but the development of that idea in all its beauty consists in making even extra use of the operation of liming, by performing it at times suitable for growing suitable crops after lime, that they may profit by the introduction of the same. Farmers should know as a body—not only a few—that lime exists in larger quantities in some plants and crops than others. They should study the amount required by each respective crop. Peas, beans, clover, &c., are fond of lime; or, in other words, their ashes contain a large quantity, proving beyond doubt that more lime is taken out by any of these crops than, for instance, a crop of turnips. If a farmer, then, puts lime upon land and ploughs it in, he makes a full use of it by growing peas on a light soil and beans on a heavy. The putting of lime into land full of manure should be avoided, on account of its alkaline properties. When lime bursts by reason of its affinity for water it is then spread out, and finding carbonic acid gas becomes converted into carbonate of lime, which is not nearly so active as caustic lime. Therefore manure should be used as long after lime as possible. But a great many people fancy that if they lime their land no manure is wanted at all. The stimulus of the new lime causes, no doubt, considerable increase at first, but unless the supply of other material is kept up how can crops grow? When lime is being replaced in the soil, care must be taken that too large a quantity is not used; otherwise the caustic effects will become apparent, and prove fatal to growth. Some farmers suggest, instead of a large dose at once, repeated small doses. I don't know which is the better plan, and it must, I think, develop matters to a question of labour in leading repeated doses, whilst one operation concludes the process in the plan of one large dose. Everybody should apply the position of his farm to the ease, and if convenient, one way in preference to the other he chooses accordingly. Mr. Burn says: "On very stiff soils, or on peaty land a large dose, no doubt, can be used with advantage, but on light soils it is advisable to use it in smaller doses. Some farmers prefer using large doses at once, whilst others maintain that repeated dressings with smaller doses are attended with the greatest amount of practical benefit. There can be little doubt that in soils abounding in vegetable matter, or wholly destitute of lime, a large quantity will be required at once to

change their mechanical and chemical constitution, and the propriety of liming the land heavily at first is thereby indicated. But when the land has been brought by cultivation into good condition the safest plan to maintain it in fertility will be to supply lime at shorter intervals, with smaller doses, at the rate of about 8 cwt. a-year. Repeated liming, with small doses at longer or shorter intervals, is indeed necessary to keep the land in its maximum state of productiveness. The reasons for the practice are obvious. In the first place, the well-known tendency of lime to sink deeper and deeper into the soil from year to year removes the lime from the surface into the subsoil and thus takes it out of the reach of the plants. This tendency to sink is greater in light and porous soils than in heavy but even in very stiff land lime gradually sinks and passes into the subsoil; hence the necessity of applying it as near as possible to the surface. Secondly, heavy rains wash it down into the lower strata, and dissolve also considerable portions of it. It is on account of this dissolving action that badly drained soils require to be more frequently limed than those which are well drained. In the third place, it will be remembered that all our cultivated crops remove a certain proportion of lime from the soil, and as some crops take up a much larger quantity than others, the course of cropping must necessarily influence the period at which liming ought to be repeated. Heavy doses are of extreme utility on poor land, or that which has been long pastured, as much as $7\frac{1}{2}$ to 15 tons per acre may be applied." Mr. Henry Stevens, in his excellent book of the farm, says: "The practice hitherto has been to apply a large dose of lime at once, and not to repeat it during the lease. The motive of this practice I would look for more to the circumstance in which the farmer is placed in regard to the tenure of his farm, than to any reasonable expectation entertained by him of the action of the lime upon the soil in large quantity. It is felt with the application of lime, as with the draining of the farm, the sooner it is done, and the seldom done, the greater profit to him who does it. The opinion is gaining ground, however, that it is better for the tenants' interest to lime in less quantity at a time, and more frequently. It would appear, taking the average of the quantities of lime applied in different districts of the country, that about 8 or 10 cwt. per acre per annum are applied to supply the supposed requirements of the land. It might, therefore, be better for the crops, and more prudent for the purse of the tenant, to apply 8 or 10 cwt. of lime per acre on the fallow every year during the lease, than 8 or 10 tons per acre at one time at its commencement. Over liming was an evil which the land suffered in a former generation more than in this, and when it occurred was confined to poor weak soil that was soon rendered too loose by the use of the plough." It is, therefore, quite correct what Professor Johnstone says, "That the evil called over-liming is a mechanical, not a chemical one. The extreme openness of the soil has been brought on by prolonged ploughing, and too frequently cropping of corn. An opposite procedure must be adopted and mechanical means employed by which a gradual solidification may be effected, among which none is more effective than the eating of turnips by sheep on the land." Several farmers have expressed to me the impossibility of spreading a half ton of lime annually per acre to their advantage. This statement is contradictory to the above authorities, and I leave the two views of the question to your consideration. My opinion is that practically, however, advantageous it may be, the smaller dosing is of no value. I may mention that there are several kinds of lime, according to the quality of limestone employed in the manufacture. The magnesian limestone produces lime of course containing certain amounts of magnesia. The Cornbrash stone contains nearly 3 per cent. of oxide of iron. The lime used in retaining the sulphuretted hydrogen in gas at the gasworks has been sold for agricultural purposes. I cannot advise this article to be used in preference to the ordinary lime. In fact, I have been told by more than one farmer who has used it, that it has very prejudicial effects, killing all vegetable growth completely. It may be that the sulphuretted hydrogen escaping from it as it lies in the ground is in sufficient quantity to exert its noxious effects on vegetable growth. In conclusion, I would like to make a few remarks connected with our subject, which I sincerely trust may be of practical value to you all. I consider it were folly to come here and read a paper, devoid of practical import and a mere exposition of literary ability. It would be wasting your very valuable time. I shall, there-

fore, be perfectly plain in my conclusions, and at the same time I am equally sanguine of their meeting your approval. There can be no doubt of the value to be derived from periodically liming land. A farmer, who has farmed now during a period of 50 years, and whose words must therefore be highly valuable, told us that "The great beauty of lime was to set free some hidden or inactive good already existing in the soil." When peat is split up, this operation proves the truth of the remark. The constituents of peat, when acted on by lime, are rendered useful, inasmuch as the hitherto inactive organic matter is decomposed, producing ammonia, and is also rendered more soluble in water. By these changes lime is made the agent of improving the land, whilst supplying plants with food from the products of its action. Lime kills grubs and worms, weeds and fungi, breaks up too rich soils, supplies food for plants, and cleans the land. But I protest against the promiscuous use of lime to land. I am sorry to acknowledge the acquaintance of some farmers who, immediately they find a decrease of produce, lime their land! Where is their reason for so doing? We ought never to do anything without a reason for it! A hundred reasons may exist to account for the inefficient crop, but only a few can be traced to want of lime. There must be a logical course of treatment followed. I would like farming conducted on a more scientific principle than it is. There is too much haphazard about it. Farmers put all kinds of material in their land without ever so much as thinking whether the land requires them. One may lime when ammonia is wanted; another may put in ammonia manure when lime is required, and so on. There should be no confusion. Old usage, I am sorry to say, has a great deal to do with this evil. A man's grandfather did so, and so therefore he must do the same. Farming is changed now, land is dearer, living is more expensive; consequently larger crops must be made to grow. At the same time, to help farmers, science has done much of late years. Much more is known now of nature than a century ago. Then let us advance too! We surely cannot be content to just farm on as of old, whilst others enjoy a closer glimpse into the wonders of nature, as exemplified in agriculture. We have certain facts before us to-day. They are the basis of calculations. We argue from facts, and in practice as we watch the development of our projects shall we not feel infinitely prouder of our success than if we had not reasoued with nature at all? A man who farms thus can pity his neighbour who looks with anxious eye and uneasy pocket at his crops, afraid that he has put the wrong manure on his land! Now that I hope you know something about lime gentlemen, let us reason together, and I imagine we learn the following lessons: We must use lime upon newly broken land. It kills superfluous decay and hinders nefarious putrefaction. We must also remember the lesson about the land being drained. We must use lime upon clay soils to render the silicic acid, or more properly speaking, the insoluble silicates *soluble*. Then our corn crops will stand the normal effects of the wind and rain, and our straw will stem the noble heads of the grain in the place of asking for strength to enable it to bear its burden. Then we may lime the land when we think that lime is required for general purposes, and let us grow a crop of peas after the process on a light soil, and beans on a heavy one, thus helping nature and filling our own pockets. Again when we see weeds, mosses, lichens, or any living worms, grubs, or any other injurious vegetable or animal causes, let us destroy the effects by lime, using it as a top dressing. If we possess a soil full of unutilized organic matter of the character of a vegetable mould, let us lime at once, thereby splitting up useful matter, converting it into substances that will feed plants, and produce food in turn. Then, gentlemen, there are occasions when we must avoid using lime. We must not use it in quantity upon ammoniacal manures, or in other words, we must not waste such a valuable feeding material for plants as ammonia. Also allow fresh lime some time to attract water, and then the advantages consequent on the proper use of lime will be surer. It is of no use applying lime on farms situate on limestone rock, yet I am sorry to say such an absurd action is really done. Lime can be of no service upon sandy soils unless in very small quantities. As a general rule soils containing more than 4 per cent. of lime should not have lime applied to them. Such is the opinion of Dr. Voelcker, who gives the following means to ascertain the soils likely or not likely to be benefited by lime: "Put a small

quantity of soil in a tumbler, and pour upon it first a little water, and then a good deal of spirits of salts or muriatic acid. If this addition produces a strong effervescence there is no need of applying lime to the land; if no effervescence is produced, in all probability liming or marling will be useful. However, this simple test cannot always be depended on, and it is therefore much safer to have the proportion of lime determined in the soil, which at no great expense can be done by an analytical chemist." In conclusion I will merely mention that I am aware of the poor justice I have done to my subject, but if I had more time at my disposal I should never tire of discussing this question as long as my audience would derive the least benefit therefrom.

The CHAIRMAN asked if Mr. Cateheside could explain how it was that lime destroyed everything bad, but nothing that was good? He had once in Ireland tried separately on grass land fresh lime, and lime which had been mixed with soil, and the superiority of the latter was remarkable.

Mr. DRYDON demurred to the employment of lime upon wet, peaty land where, though it might do a little good, it soon disappeared. He had observed that lime always acted better upon land which had never been ploughed than upon that which had been broken up. In the latter case it certainly might benefit the soil, but not to such an extent as in the former instance. There must be, he believed, vegetable matter in the land for the lime to act upon, or it would do no good. Compost might, however, be used with an advantage in such a position. These remarks were applicable to land which was situated as high as four or five hundred feet above the level of the sea, and he did not know whether they would fit the case of low-lying farms. He had seen land doubled, if not trebled, in value by simply draining and liming it. This land was of a marshy nature, and had on its surface a good deal of vegetable matter. He had remarked before, and it could be borne out by facts, that there were hundreds and thousands of acres of land which could be equally well improved by the same process, and thus rendered a great deal more useful to everybody than they were at present. There were a great many objections to improving this land, some of which would not bear the light of argument; but he would not at present enter into them. In passing down the railway, he saw at a considerably greater elevation than even that of which he had been speaking, fine bullocks for the fat market grazing on excellent grass on land where before had grown nothing but the coarsest vegetation, which was known as a place where the sheep had got the rot, and which was not worth more than five or six shillings an acre. All these results were due to draining and liming. In making these observations he was only adding his testimony to the value of that description of land when improvements were properly entered into; when the landlord gave an encouragement on the one hand by a lease, and the tenant on the other by his industry. For this kind of land draining was the proper treatment, but when lime was easily available it should be also used; for the land from this double application benefited much more than from the draining alone. In some wet lands it might be well to drain alone; but in general money expended in draining, without a corresponding application of lime, was money expended uselessly. To improve, however, required lime; and before engaging in it, a lease should be obtained of twenty-one years, and some little encouragement should be given by the landlord, because, to carry it out, capital was required, and where the lime was not easily obtained, the process was very expensive.

Mr. HARLE, in answer to the Chairman's question, proceeded to explain the action of lime upon vegetation. He said that Baron Liebig had given a chemical explanation of the matter with great clearness. It was that the growth of sedges and marshy plants was caused by siliceous or sandy matter in the soil, and that the application of lime to it neutralized as an alkali this acid, and formed silicate of lime, which promoted the growth only of the finer grasses. This was the reason why, when lime was applied to sandy land, fine grasses always supplanted the sedges and rushes. He must say he thought Mr. Cateheside was mistaken when he stated gas lime was not useful. It must be better than common lime, because sulphuretted hydrogen being added to it sulphate of lime was formed. If this lime was, however, applied hot from the gas-works it might indeed be injurious, because requiring oxygen it abstracted that gas from the manure with which it came into contact, and thereby caused

a diminution in the crop. It should not therefore be put into the soil at once, but should be allowed to lie for some weeks exposed to the air, under the influence of which it turned into gypsum, a very valuable application.

Mr. J. LEE said his own first experience of lime was upon grass land, peaty on the top, such as that which Mr. Drydon was referring to. The fact that land of this kind could be doubled in value by proper treatment should be very greatly considered by landlords, and he thought with Mr. Drydon that they should give encouragement to tenants to apply large quantities of lime to the land; of course it must first be drained. He quite agreed with Mr. Drydon that many of the rough, peaty soils would not pay for draining without liming afterwards, and it ought to be one of the stipulations of the landlords that if he agreed to drain the land the tenant should, with some help, or by other agreements, lay the lime upon it. With respect to the liming of tillage land, he said that every twelve years liming he found to be profitable. It had been said—he did not know whether there was any truth in it or not—that lime bound light land and loosened heavy land. He was not aware whether Mr. Cateheside or any other person could bring proof that such was really the case. He could not himself bring any proof of its truth, but it used to be an old saying in the country. When he was first a farmer there were no superphosphates to apply to land, and he should very much like Mr. Cateheside to explain whether, if a large quantity of superphosphate, say ten cwt., were put on tillage land during four years, it was necessary that so much carbonate of lime should be expended upon it also. As for the lime destroying moss and coarse grass, he thought lime always had a destructive effect upon coarse grass and caused the growth of finer grasses. He had seen ground limestone, or at least limestone from the roads, laid in early days down upon the heather for convenience in carting to the kiln, and whenever it had thus lain for two or three years, and the ground had got some little dust from it, white clover invariably grew ever after. How to account for this he did not know. The clover was not growing previously among the heather or it would have been seen, but he supposed the seeds of the grass must have been lying there undeveloped till the arrival of the lime had assisted them to germinate.

The CHAIRMAN: I have heard the farmers say the seeds were in the limestone, and burning in the kiln brought it out (laughter).

Mr. M. SMITH said gas lime was a substance which he had used for many years, and he had no doubt that it was a valuable manure if properly applied. It was sometimes, however, not properly applied; and he recollected many years ago the secretary of a gas company, who, thinking that if the lime was beneficial to another it might be beneficial to him as well, laid it down on his field in small heaps before spreading it, and then found that where the heaps had lain years elapsed before even the grass grew at all. He concurred with Mr. Dryden that lime was very beneficial to newly-broken soils, for wherever organic matter had lain for centuries undisturbed it required lime to bring it to life. It was not, however, until it came in contact with water or dew, and was dissolved, that plants were enabled to take it up. When lime was laid on to land which had been ploughed for forty or fifty years, and from which, therefore, all the organic matter had disappeared, the application of lime only made the soil poorer than before. For such land as that, bones, phosphate, or manure were necessary, and would do much more benefit, at much less expense. Lime, as Mr. Dryden had remarked, was a proper top-dressing to follow draining, but it ought not to be immediately used, because, if it were, a heavy rain would wash it into the drains, and perhaps choke them up. He gave instances of the value of lime as a dressing, and said, in conclusion, that it was merely a matter of opinion whether compost or hot lime should have the preference. If they would take a ton or half a ton of gas-lime and sow it on the land, it would destroy far more insects and do as much good as five or six tons of lime applied in the same way.

The CHAIRMAN said what Mr. Cateheside had told them, nobody could, he thought, contradict. The information to be derived from the experience of people in liming was of very great value, and the example mentioned by Mr. Drydon it would be well if people in this country would follow. In this country thousands of acres of land had been improved by

draining and liming to an extent almost incredible by people who had not had experience of it. He did not quite see the point in the discussion which Mr. Dryden alluded to. He did not think any of the land which they wanted to drain had any grouse upon it. Liming was, in his opinion, quite useless on wet land; but he could not agree with Mr. Smith, to leave the land four years without liming after draining. He had always been in a hurry to lime it immediately, and in his experience that system always did the greatest possible good to land. The drains must be very shallow where the lime would wash away by being put on as soon as the draining was completed. He had no experience of gas lime, and had never tried it, but it might be that the smell of the sulphuretted hydrogen acted like the muck which a friend, who sent him some splendid violets, told him to use freely, saying the worse the smell which went into the ground the better the odour which came out. Mr. Catchside's paper would, he was sure, not only do others good when they heard it read, but would be even of more advantage afterwards, when they had it printed in their hands, and took it, as they should do, home to read. He should advise all the members of the club to read it carefully at home, by which they might learn both the chemical and mechanical uses of it, with hints how to employ it to the best advantage, a very important knowledge when the great expenditure for lime was taken into consideration. If half the money spent on lime would do as well as the whole sum, it was much better to spend the smaller amount and keep the remainder in their pockets. While thus speaking of the benefits which could be obtained from the use of lime, he must say that in his own experience land had often been overlimed. He had seen this done by farmers who had not much capital and did not wish to employ what they had, and who thought that by liming they might screw a little more out of the land than they could get before, whereas the application of good manure would have produced much better results.

Mr. SMITH, in refuting the objections of the Chairman to his views upon the time which should elapse between draining and liming, said, that if they would lay lime upon land newly furnished with drains four feet deep, it would be found that the water came out quite white, and if they dug down lime would be found at the bottom of the drain.

The CHAIRMAN said he understood that this might be the case where lime was put on immediately, but where the land was worked and fallowed, and the lime spread on the fallow, he did not see why it would be any more likely to wash away in the first year than in any other.

Mr. CATCHSIDE: He was afraid he should call forth the indignation and scorn of the various gas companies in the neighbourhood for obstructing the sale of their gas lime. He knew he would not have a wheelbarrowful on any land he had, from the effects he had seen it produce on other land. With respect to sowing it on the surface, he could not believe, in fact he was positively certain, that sowing ten hundred weight of gas lime or manure of any description, would have no effect compared with six tons of lime. There might be as much soluble matter taken into the land for the first year, but in after years it would not be seen. A good deal of sulphide of lime existed in gas lime, and he had frequently noticed the sulphur smell rising from it miles away. But the question of the application of lime after draining seemed to be the main point in the discussion. If Mr. Smith's argument was true that it was no use applying lime until four years had passed away, the land did not, he thought, require it at all. If four years' crops could be got out of it, draining, not lime, was the proper remedy for it, and the one which ought to have been employed, and it would have grown just as well without lime if it had not been drained. The best method of proceeding was to drain the land, work it, and then apply the lime on the fallow as Mr. Grey had said. He thought it would be discovered that loose soils, only once limed, would receive permanent benefit. The lime would not be washed into the drains if it was properly spread over the surface, for the amount of space occupied by the drains was a mere minimum compared with the area of the surface between them. The water might come out white—indeed he had seen water thus come out himself, but he did not think that if lime was properly laid on it would ever block up the drain. He was very glad that Mr. Harle had saved him trouble of explaining the destruction of the moss. It was the accepted view that the mosses derived the chief source of their

strength from the sand, and by its neutralization the silicate was carried away and divided among other plants, and the soluble silicate entered into the structure of the grasses. With respect to the white clover, he was told only that morning of a case at Allendale, where land situated near the common, which had been accustomed to grow nothing but heather, on being drained and limed, had yielded a first-rate crop of white clover. He remembered a case at a farm at which he was living where a similar instance occurred, the white clover having grown wherever the heaps of lime had been deposited on the field. The encouragement by landlords of liming had been abused, and had led to the expenditure of thousands of pounds in providing lime where it was not required. He could himself point out farms where this had been done. Mr. Catchside then advocated the employment of small doses at short intervals, rather than of large ones at long distances of time. The authorities he had quoted were Mr. Scott Burn and Mr. Stevens, but every farmer would find out the best mode himself to suit his own particular farm. They were getting a little off the line into the artificial manure department, but he would say that it was his firm conviction that the effect of artificial manures lasted only one year. If the land was dosed with superphosphates on a wet year the manure would all be taken away, while, if the soil received it in a dry year, it would do harm to the land, because the manures were to be used at a certain time. Mr. Catchside concluded with some observations upon artificial manures.

Mr. TROTTER said that his brother's turnips had suffered much from the attacks of grubs, until, acting upon his advice, he put a little lime round each plant on the third time of sowing, and the result was that, though two previous lots had been destroyed of this one, not a single turnip went wrong. Having himself taken some of these grubs home and kept them, they turned into black "clocks."

Votes of thanks to Mr. Catchside and the Chairman were then passed, and the proceedings came to an end.

THE USE OF THE CENTRAL CHAMBER OF AGRICULTURE.

At a meeting of the West Riding Chamber of Agriculture, held at Wakefield. Mr. J. B. Charlesworth, of Hatfield Hall, presiding, a conversation took place upon the determination of the insurance companies to compel all the live and dead stock and produce of a farm to be insured to the extent of three-fourths of its value, or only to pay for losses by fire in proportion the amount of insurance bears to the value of the stock. Hitherto, where a farmer insured for £300, no matter what the value of the stock, he received the full amount of insurance in the event of suffering loss to that extent; but now if he insures for £300, and his farm is worth £500, the insurance companies will only recompense him to the extent of three-fifths of the damage. No resolution was submitted upon the subject. Mr. T. C. Johnson proposed that Mr. Morrison be the Chamber's representative at the meeting of the Central Chamber, to be held in London on the 4th October next. Mr. Morrison said he should not have the slightest objection to being sent to London, but he confessed he objected to the Central Chamber, because he did not think it had expressed the opinions of farmers during the last twelve months. The chairman said that was probably the fault of the Chambers themselves in not sending delegates to the meeting. Mr. Morrison said the Central Chamber was not composed of delegates from the various Chambers throughout the kingdom, but was a separate and distinct body which permitted delegates to attend its meetings. The secretary was glad that Mr. Morrison had consented to attend the Central Chamber, because he thought he would find gentlemen present who were fully alive to the interests of farmers. Mr. Morrison said no doubt some of the members individually were, but as a body, he did not think that the Chamber had had much influence upon legislation. The alterations which had been made, instead of benefiting the farmer, had only been the means of making fresh imposts. The secretary said those imposts would have been much heavier had it not been for the action of the Central Chamber; and Mr. Wordsworth said farmers would never exert proper influence until they pulled better together. Mr. Morrison having consented to introduce the subject of the position of the farmer at the next meeting, the proceedings ended.

THE BLANDFORD FARMERS' CLUB.

At the first meeting for the season of this club, Mr. SPOONER, of Ealing, Southampton, delivered an address on "the Principles involved in the Breeding of Stock." There was a very good attendance; the chair being taken by the president for the year, Mr. Scutt, of Bere Regis.

Mr. Spooner said: Throughout the whole range of creation there is nothing perhaps which strikes the mind of the student of Nature with greater force than the wonderful provision made for the preservation and sustentation of animal life. There is no spot so barren but what some vegetation appears, and wherever this is the case animal life in some form corresponds with the supply of food. Provision is made for maintaining and augmenting the species far beyond the supply of food, and thus the struggle of life goes on; the weakest goes to the wall, and the strongest propagate their kind. This phenomenon has been termed by Mr. Darwin "natural selection," which term, however, does not carry with it its own solution, but demands some little explanation. Not only is the surface of the earth instinct with animal existence, but even the very air we breathe is full of the germs of animal or vegetable life ever ready and ever seeking the proper niches to enable it to increase and multiply. The theory of spontaneous generation which has been so long and so vigorously maintained, and which from time to time appeared to be supported by phenomena which could scarcely be disputed, and could not well be otherwise explained, has at length received its quietus, and has yielded to the facts developed by modern research, and the old doctrine, "Omne ex ovo," has been proved to be sound. Decaying substances are soon peopled with animal life, but this does not take place provided all contact with external air is prevented; nor does it result if the air to which it is exposed has been first deprived of all its germs by means of fire. It would appear as if the same scientific truths which modern discoveries had brought to light were believed in with such absolute proof years ago; for Huddibras wrote:

"Great fleas have little fleas
Upon their backs to bite them;
And little fleas have lesser ones,
So on, 'ad infinitum."

"Like begets like" is an axiom that cannot be disputed, and examples are continually met with, showing how types are handed down from father to son, and from generation to generation; and yet, as propagation is effected by parents very dissimilar from each other, there are causes in operation which result quite as much in diversifying the race as in handing down the types from one age to another; so that we may be probably correct in saying that no single individual is the precise counterpart of one gone before. What then is this vital union, or rather what is it not? It is not then a merely mechanical union like the combination of spirit and water, or the composition of the atmospheric air. It is not chemical union which, by the combination of two substances, produces a body totally different from either of the elementary bodies, such for example as water—the product of the combination of two gases, oxygen and hydrogen. Vital union is probably partly mechanical and slightly analogous to chemical union, but, differing materially from either, undoubtedly *sui generis*. Each parent possesses certain peculiarities, but by no means in equal proportions, and there are no fixed rules enabling us to judge precisely what the effect will be of certain combinations, but yet there are certain truths, or rules, although abounding with exceptions, which careful observation has detected and recorded. Of these the first in importance is the influence exercised by either parent on the offspring. When the influence of one is greater than the other, the term prepotency is used to denote the superior influence. And although this prepotency may belong to either parent, yet in the majority of instances, so far as external form goes, it belongs to the male. This is partly owing to the fact that the vital functions, the internal frame, and the central and nervous systems, which are unseen, more frequently follow the female, whilst the more visible features, such as the external form, the skin,

the back, and hind quarters, the size and general shape is generally influenced by the male parent. Sometimes the very opposite is the case, and then the female is said to be prepotent. [Illustrations of the truth of the above remarks were then given by the lecturer, in cases where the male animal was superior in size and weight to the female, in horses and sheep of different breeds, in cattle, and the Manx cat.] In the human race a tall family was often the progeny of a tall husband and short wife. Sometimes the opposite alliance produced the same result, and sometimes part of the family were tall and the other part short; but it is scarcely ever the case that a mean or average size resulted from the union of parents of opposite statures. That the constitution, temper, and mental condition more frequently follows the female parent, is generally acknowledged; and it is considered as essential to the production of a clever family that the mother should be distinguished by mental gifts. It is well worthy of notice, the astonishing manner in which peculiarities and predispositions to disease is propagated, although such predisposition may not manifest itself till a good portion of a life-time is passed away. An hereditary disease or peculiarity appears perhaps at about the age of 50, and not before, and yet the germ of predisposition inherited from the parent must have existed all this period. [The lecturer then proceeded to speak on Reversion, a term which, he remarked, was given to that well-known phenomena of certain peculiarities disappearing in one generation and re-appearing in the next, or subsequently.] It was this fact that, with animals when the first cross had proved eminently successful, a continuation of the cross-bred animals has by means of reversion caused all sorts of incongruous results to crop out, so as greatly to disgust the would-be improver. So strongly has this been felt by many breeders, that they have condemned crossing altogether except for purposes of the butcher, or confined to the first cross. Indeed, at one time this was the leading doctrine of the most prominent men belonging to our agricultural societies, who clung with superstitious tenacity to the doctrine of purity of blood, believing it to be the ark in which alone true safety was to be found. Time was when prizes were only given to three breeds of sheep supposed to be pure. Now what do we see? Improved Hampshire Downs, Shropshires, New Oxfordshires, and others, all from cross-bred parentage, but non-recognised as distinct breeds, and all considered worthy of prizes and of encouragement. These breeds may be considered as the successful results of crossing, scientifically and practically carried out, and although, no doubt, contemporaneously with these successful examples, many others have been made which have ended in failure, yet we cannot shut our eyes to the fact that new and distinct breeds have been thus created, and have been so perfected by rigorous weeding that they require no further crossing, but only careful selection, and may now justly take rank as distinct breeds. Although there was no reason to doubt but that the Southdown is a pure breed, greatly improved by selection, yet the Leicester breed was raised by crossing in the first place. It was as essential to have the best and purest parentage on the one side as the other. The Hampshire and Wiltshire Downs originally were large, bony, uneouth sheep, with horns, which latter were got rid of by means of Sussex rams, but still remained a very useful though coarse sheep, till Mr. Humphrey commenced his improvement some thirty years ago by means of two of Mr. Jonas Webb's prize Southdown rams, from which were descended all the rams he afterwards used or let, although he replenished his flock and maintained his size by occasional purchases of ewes. This improvement has been carried out with the greatest success by Mr. James Rawlence and others. The Oxfordshire breed is the result of the cross of the Cotswold ram with the Hampshire Down ewe. The Shropshire is indebted to both South Down and Leicester for the improved breed of sheep recognized under this name. Thus, without disparaging the effects of those who have devoted their attention to the improvement of pure breeds, some of whom he was glad to see present this evening, whose exertions were

worthy of the highest praise, yet all must acknowledge the great success that has attended the establishment of the breeds he had mentioned. Indeed, he considered that more skill and more science had been shown by the breeders of sheep than by the breeders of any other kind of animals. A certain want had been felt, and breeders set about to supply the want, whether it was greater size, earlier maturity, or larger or finer wool; and when the want was supplied and the breed established, further crossing had, for the most part, been discontinued. The Royal Agricultural Society, not leading, but falling in with the improvement, greatly aided and extended the movement. But whilst this was the case with sheep, it was far otherwise with horses. With the exception of cart horses, the breed of which had certainly been greatly improved by the encouragement given by the Royal and other Societies, he considered that other useful breeds would have been better if these Societies had never existed; but to this he would refer again before he concluded. Crossing had been adopted with great success with pigs, for, although certain distinct breeds had long been known, such as the Berkshire, Yorkshire, and Sussex, yet it would be somewhat difficult to give a correct nomenclature to all the different breeds. The Royal Society have long since fallen back on the distinction of "large and small," "white and black" pigs. It would almost appear that the rule with regard to pigs must have been derived from Shakespeare, who in "Macbeth," in the incantation of the witches, says:

"Bubble, bubble, toil and trouble;
Fire burn and cauldron bubble.
Black spirits and white,
Blue spirits and grey,
Mingle, mingle, mingle,
Ye that mingle may."

So with pigs it may be said to have been—

Black pigs and white,
Blue pigs and grey,
Mingle, mingle, mingle,
Ye that mingle may.

In-and-in breeding had been more successful with horned cattle than with any other animals, and with the Shorthorns it appeared to have been followed out without those objectionable results which were often considered to attend the practice. These objections were a disposition to barrenness, a want of vigour, and the increase of those diseases to which the parents are most liable. In the human subject it was considered—and with good reason—that the alliance of near relations was conducive to scrofula, insanity, and barrenness. The truth appeared to be that certain diseases and peculiarities were hereditary in particular families, which by alliance with relations became two-fold increased, whilst by alliance with other families not liable to such diseases there was a fair chance of the defects in question being crossed out. With cattle, and with Shorthorn cattle more particularly, by employing healthy parents, possessing great excellency and few if any defects, the benefits of the latter have been kept up without the evils which have so frequently followed the practice, and thus we have the celebrated Duchess and other families handed down in unrivalled perfection. In no breed of animals have the females been so highly estimated, which is shown by the remarkable sums given for the best cows at the leading sales. One interesting fact is well illustrated in the breeding of cattle—viz., the power of transmitting the milking, or female qualities, by means of the male, which must therefore have possessed the germs of those qualities belonging to the opposite sex. This was well shown by the Alderney bull, which was as important as the cow in transmitting rich milking qualities. Mr. Spooner thought, however, it was rather to be regretted that in giving premiums for cattle more attention had not been paid to the milking qualifications, but the purposes of the butcher had alone been regarded. Thus while some of the old milking breeds have almost died out, their places have been supplied by cross-bred and mongrel animals to a very large extent, it being considered in many instances that for dairy purposes pure-bred animals were not so profitable, more particularly on moderate pastures. With regard to horses, all must agree that the difficulty of suitably mounting a welter weight is greater than ever, and it is also an acknowledged fact that it is more difficult than ever to provide remounts

for the cavalry and artillery. Why should this be the case, when it is well known that a good animal costs no more to keep or to rear than a bad one, and that such vast sums have been expended in breeding from thorough-bred horses? He well remembered the horses that used to be cast and sold out of the cavalry and artillery some thirty years ago, and how immeasurably inferior were the cast horses of the present day. He had occasion to look over a lot of horses thus cast a very few years since, and there was not one in twenty but what was faulty in structure, or had some hereditary defects. Why was this the case, but because it had become at first the convenience, and then the custom, to use broken-down race horses alone for stallions for getting saddle horses, which fashion the Royal and other Agricultural Societies, instead of opposing had done their utmost to encourage. A certain few had set themselves up as law makers in this respect, and in total abnegation of the principles of science and physiology except such as were derived from the training stable, and they have ventured to proclaim certain dogmas which others have been weak enough to regard like the laws of the Medes and Persians. These dogmas were that pure blood must be had on one side, and that side the male, and that thorough-bred horses alone possessed it. But to this he replied, 1st, That by using thorough-bred horses for successive years, in the course of ten generations they would have only about one thousandth part of the original breed left, from which they derived their bone and substance, their constitution and digestive organs. 2nd, That the female was as important as the male in breeding. 3rd, That principles that had proved so successful with sheep and other animals would prove equally successful with horses. Thus after trying to get superior horses, in a few generations the animals became weedy and degenerated, and we were obliged to begin again, starting, perhaps, from the plough tail. He had no wish to underrate the good qualities of blood horses, but freely acknowledged that no other in the universe possessed so much speed and endurance, or could make such extraordinary muscular efforts, or whose nervous and vital systems were more wonderfully developed, or could better transmit their good qualities; but at the same time they were bad doers, were narrow and small in the carcase, and deficient in bone, requiring large quantities of the most nutritious food, and were, from their thin skin, very susceptible of cold, and incapable of standing the rough treatment and rigours of a campaign. The original parents, Barbs and Arabs, first introduced in the reigns of James and Charles, were small animals, about 14 hands, and the size of their descendants has been obtained by high feeding from their earliest. There is thus a perpetual tendency to reversion, particularly when excessive feeding is not adopted. He would, therefore, in conclusion, with a view to remedy these evils, suggest the following plans: As in consequence of the discouragement hitherto given by the leading Societies, it would not pay private individuals or companies to establish any scheme for the improvement of ordinary saddle horses; it must be done by the Government, or the aid of the State; and first he recommended the doing away with Queen's plates, which, however useful in past days for improving the breed of horses, were no longer of any utility. The Turf, he thought, could take care of itself, and the money might be devoted to a national purpose, viz., the encouragement of the breeding of cavalry and other useful horses. Secondly, Government stud farms should be established, not so much for the breeding of weight-carrying hunters and cavalry horses as for the breeding of horses and mares calculated to produce them. Hampton Court might well lead the way in this respect. It would be far better than keeping it up to play second fiddle to Mr. Blenkiron. There might also be half-a-dozen other Government studs in suitable parts, and the loss on these farms would be but little, and would soon be repaid by the better supply and cheaper cost of good, sound, and valuable horses, many of which would make first-class hunters, and others valuable horses for cavalry, artillery, and harness purposes. All faulty animals should of course be weeded out annually. The greater part of the mares might be sold in foal, and the best of the young horses as stallions. He verily believed that if some such plan were adopted, in a few years they would be able to mount the cavalry as they ought to be mounted, and supply the country with valuable horses for all purposes, in place of the worthless weeds that now abounded. The stud farms in different parts of the coun-

try, to accomplish the ends in view, should be furnished with at least:

1st. One thoroughbred stallion, the most calculated to get weight-carrying hunters and saddle horses, with suitable mares.

2nd. One seven-eighth-bred stallion ditto.

3rd. One or more three-fourths-bred stallion.

4th. One or more half-bred ditto.

These stallions to be available for the neighbouring farmers as well as for the stud farm.

5th. Mares, young and fresh, with size, substance, shape, and action (a few of which can still be obtained), but without pedigree, for alliance with stallions Nos. 1 and 2.

6th. Mares with the above qualities, but possessing one-fourth blood, that is, descended from a thoroughbred sire, and fit for alliance with stallions of Class 1, 2, and 3.

7th. Mares with above qualities, and possessing one-half blood, suited for stallions 1, 2, and 3.

8th. Mares possessing three-fourths and seven-eighths blood, of proved excellence, and suited for stallions 3 and 4.

Mr. H. FOKES said as regarded sheep he had more practice than many present. There were many breeds of sheep which always did best in certain localities that suited the particular breed. Mr. Spooner had alluded more particularly to the Hampshire Down. There was no breed of sheep that had exhibited more improvement than they had during the last twenty years, especially in the Salisbury district. The late Mr. Humphreys told him at the cattle show at Islington some few years since, that all his best shearlings were descended from one of his ewes. The late Mr. Roper, of Clenston, bought a ram at Wilton fair some years ago. Mr. Rawleuce, of Bulbridge, and himself sent 10 ewes each to him; when the produce were shearlings. Mr. Rawleuce exhibited Down ewes at the Bury St. Edmunds meeting of the Royal, and he, Mr. Fokes, exhibited shearlings for the cup at Dorchester, as southdowns. They both took the prizes, and in each pen of ewes were descendants from Mr. Roper's sheep. This proves what may and can be done by judicious crossing. As regards

the Shropshire, every breeder has a peculiar breed of his own, and if they would only look at the report of judges at the late Oxford meeting they would find in the conclusion of their report that they laid down stringent rules to guide the Shropshire breeders as to what a Shropshire sheep ought to be. He had acted as a judge of Shropshires at the Royal on two occasions. At the Battersea meeting there was a wonderful show, and at the present time he believed Lord Chesham's were as good as any. Everyone must be very careful how they begin crossing; the first cross invariably did well, but he should advise all parties to keep the animals that were most suitable to his farm and his district. He had always stood by the Southdowns, and tried to keep them as well as he could, combining size, quality, and plenty of good wool.

Mr. J. FORD quite agreed if regard to Southdowns being the purest breed of sheep, but it was impossible to maintain a pure breed in Dorset without occasionally going into Sussex, and getting some from there. He had done so for 30 years. The late Mr. Jonas Webb had, he believed, some of the best Southdowns possibly to be obtained, but he could not get on without occasionally obtaining some of the original breed. He (Mr. Ford) was also a believer in pure breeds of cattle, but as with sheep so with Herefords or Devons. To keep up the purity of the breed, and prevent deterioration of stock, it was necessary to go into North Devon or Herefordshire. People could not be too careful in crossing, but certainly great improvement in herds had arisen by judicious crossing. He also quite agreed with Mr. Spooner in his remarks about the old Hampshire Downs, as being the most ugly sheep ever bred, but the improved Hampshires were very different. As regarded the Shropshire he was of opinion that they were almost all cross-bred. Mr. Newman, who had some of the best, had a Southdown ram from Mr. Webb's flock, and he noticed in Lord Chesham's show of them that there was more of the Southdown than anything—some of them were very fine wool, and others had wool as coarse as hair. He (Mr. Ford) said that a farmer should study to get such animals as were suitable for his farm, and having procured a good and suitable breed not to chop and change about too much.

ATHENRY FARMERS' CLUB.

AGRICULTURE AND SCIENCE.

At the monthly meeting of this club, the Rev. M. Perriu in the chair, the following paper was read by Mr. N. G. RICHARDSON:

The subject I have chosen to-night is the connexion between agriculture and science. In the course of a few years I venture to anticipate it will be impossible for such a subject to be discussed at Farmers' Clubs, as by that time agriculture will be looked upon as a science in itself; but for the present we can only speak of the advantages science has conferred on agriculture, and even in the present backward state of agriculture they are numerous and important. Before commencing my subject, I think I should make some general remarks on the word science, to explain in what sense I use it. Upwards of two hundred years ago men contented themselves with arguing about what they wished to find out, and their researches after nature were confined to words; but Lord Bacon about that time published his famous works, proving uncontestedly that before we can be certain of knowledge we must make numerous experiments, and that before commencing to argue we must have facts to argue on. Experimental science may date her birth from then, and has been increasing in importance ever since; but Lord Bacon's writings are not yet sufficiently known, and, from not attending to his directions, various blunders have been and are still being made in all directions. One of the most amusing on record is the following: Charles II. proposed this question to the London Society—a society composed of the most distinguished scientific and literary men of that period—"Why was it that if you weighed a bowl containing water, and then put a live fish into it, the weight remained the same; but if you put a dead fish into it the weight was increased to the extent of the weight of the dead fish?" After a lengthened debate they

discovered a satisfactory reason for this curious fact. When some one suggested that they should make the experiment, it was discovered that no such difference existed, and that the king had merely played a practical joke on this distinguished society; but though we may laugh at the blunders committed by the savants of that age, do we not act in the same way? For instance, take solid ploughing and crested ploughing; the former is generally believed to be the better plan, as it is supposed to give a better seed-bed and to be less strain upon the horses. Granting that these are true, has any one ever started two ploughs in the same field the same day, the one ploughing solid, the other crested, and treating the fields in precisely the same manner; weighed the crops after harvest, noting all particulars, such as which ripened first, which had the best grain, as well as heavier crop, also particulars of soil and weather? Another instance is in the case of sheep dips, artificial manures, and feeding stuffs; we use them, either because we believe what the vendor chooses to tell us of them, or on the faith of an analysis, or because we have tried them and found them to succeed; but when we find them succeed, we take for granted they will succeed in every case, neglecting the conditions under which they were tried, and also neglecting to find out why they succeeded or why they failed. Thus, though in some instances we partly act on a scientific plan, yet we never make sufficient experiments, nor when we do make a few experiments do we sufficiently follow up the clue so obtained. From these instances you will perceive that what I consider scientific treatment of a subject is to make numerous experiments, taking note of each particular, and then, proceeding to argue on the cause of the result, finally lay down a general law for our future guidance. That this is not the general notion on the subject is evident from the constant use of the

expressions "Practice *versus* science," "An ounce of practice is worth a pound of theory;" and in an article on this very subject in a weekly paper, it was stated, "Let theory and science say what they will, without practical experience we are left still in the dark." These are sufficient to prove that at least some people, if not the majority, imagine that theory and practice can be separated, as if a theory or science would deserve the name that was not founded on facts discovered by experiment—in other words, practice. If not so founded, when brought in contact with practice it entirely fails to account for the facts so discovered, and so proves itself a false theory, and therefore unworthy of the name of science. But to return to our subject. The advantages science has conferred on agriculture may be divided into two heads; first, the benefit derived from the study of the various sciences; second, that derived from a scientific treatment of agriculture itself. Botany I begin with first, dealing as it does with the structure and habit of plants, which are the only products of agriculture. As far as the grain crops are concerned, we have not improved on the knowledge of the ancients, as we still continue to grow the same plants as were grown thousands of years ago, and I am not sure whether we have improved the quality of the grain, at least if we take the average of that grown through the country. Of course, if we take that grown by the best farmers, we might find an improvement, not only in the quantity per acre, which is undoubted, but also in the quality; but unfortunately skilful farmers are not sufficiently numerous to raise the standard much, but we may hope that by careful selection of the seed sown and proper tillage, inferior grain will gradually disappear. But in green crops botany has been of signal service. Take, for example, the potato, a vegetable which, even the most bigoted disciple of Malthus must admit has been of some service; but in Ireland it is needless to say anything in its praise, as here there is more danger in over than under valuing it. I pass from it to a root which is not valued so highly, but which has been of great service to the meat consumer, the farmer, and the labourer—I mean the turnip. In former times grain crops were grown repeatedly, the principal way of keeping the land in fertility being the custom of fallowing the land. But the introduction of the turnip is gradually abolishing this custom, to the great benefit of the meat consumer, as he is able to get fresh meat all the year round, instead of only during the summer and autumn months, as formerly; to the farmer, as, instead of allowing his fields to be idle, he is able to crop them every season, and, besides, to improve his fields by so doing; but to the labourer it has been the greatest service, as the turnip crop is one which requires a vast amount of labour in all stages of its culture. These are the most remarkable cases; but when we remember that to botanists we are indebted for cabbages, mangels, &c., not to mention the greater number of our garden vegetables and fruits, I think it is evident agriculture owes a great deal to botany. To show the advantages that may accrue from a study of this science, I will mention the following cases, though they are neither of them directly concerned with farming. When Linnæus, the famous botanist, was an under gardener, a plant which he was told was very precious was left in his charge; and directed to place it in a hothouse. The head gardener was horrified to find one morning his precious plant left out in the frost, and accused Linnæus of wilful neglect; but he accounted satisfactorily for the change, as he was able to tell from the structure of the plant that it must live in a cold climate. The result proved he was right, as the plant gradually improved. Another instance is in the case of the *Aurancaria imbricata*, an ornamental tree. The elder McNab, of the Botanical Gardens, Edinburgh, knowing that in their native country their roots were saturated with wet during the spring of the year, owing to the melting of the snow on the tops of the mountains on whose sides they grew, thought they should receive similar treatment here, and ordered barrels of water to be poured on their roots during the spring. Whether due to this treatment or not, it is certain they thrive very well, and are about the best specimens of this tree in the United Kingdom. A few years ago farmers in England, but more particularly in France, took it into their heads that they were serious losers by the small birds eating a large quantity of their grain. It was immediately decided to destroy them, which was done, at least in France, so successfully that all the birds disappeared. The result was that the farmers discovered that their crops were unable to grow, owing

to the ravages of insects, which were now able to increase unchecked. They thus learned by sad experience what they might have learned from ornithology, that birds are the natural enemies of insects, and feed on them to a very great extent, some of the small birds living on them altogether, and others living on them for about nine months in the year, not to speak of the advantages derived from birds eating largely of the seeds of weeds. Electricity might become of the greatest service, if we can rely on the accounts of some experiments which have been made. Poles were set up in the ground, and wires fastened across the tops, and then brought down the poles and connected under ground. The results, in some cases, were eminently successful, oats so treated being ten inches taller than the rest of the field, but in other cases there was no perceptible difference. Surely this is a way of manuring land that should not be neglected, or, at least, if useless, this should be proved, and the reasons stated. Mechanics is a science that has been of great service, and never more so than during the season just past. How the harvest could have been secured this year without the use of reaping machines is a puzzle to me, and it is a curious fact that in England and even in Scotland, it required a year like this to convince farmers of the absolute necessity there existed for such machines. The whole harvest came in together, men could not be obtained to secure it at once, and so farmers were driven to use them. I have seen it stated that the principal machine makers had to work night and day, and were unable to supply the demand. Now, this raises a question at once—the result of this influx of machinery on the labour market. We may leave the general question of the change of farm labourers into skilled artisans to make the machinery and the proper dispersion of labourers to the social science philosopher. These are questions not likely to be considered by the labouring class at present, but there is one question they will seriously consider, and that is, these machines do more work than we can do, and at a cheaper rate—the result will be that they will be employed, and we will not. But the labourers may remember two considerations: the first is, that the greater number of machines are designed to save the heavier sort of labour, such as mowing and thrashing; the second is, that as farmers find their haymaking and harvesting bills decrease, independently of being got over more satisfactorily, they will turn their attention to the many improvements that are required on their farms and so the labour that was spent on harvesting, &c., will be spent on draining and fencing. When all these improvements have been effected, the labourer may perhaps find it difficult to get employment, but in this county at least there is no apparent danger of such a terrible catastrophe. This year is the first year I have used machinery for making hay, and, in consequence, I have been able to commence clearing out a lake, a thing I should never have thought of attempting in other years. But mowing and reaping machines are but a fraction of the implements we are indebted to mechanics for. Why, if we read the price lists of some of the leading agricultural machine makers, we get bewildered among ploughs, harrows, turnip-cutters, pulpers, thrashing and mowing machines, flax-scutchers, chaff-cutters, furze-bruizers, not to speak of all the improved steam machinery that, I suppose, will be gradually introduced. The next science I shall refer to is chemistry. The services it has rendered are immense; but when chemistry is better understood, and the chemist becomes a farmer, and the farmer a chemist, we may expect a splendid result. One of the present advantages is the analysis of soils; here a great deal of good has been done by letting us know what manures are required, owing to a deficiency of any particular element in the soil, and which the manure will supply, hence preventing waste of manure, and consequent loss to the farmer. Another is the manufacture of feeding stuffs and artificial manures. These are obtaining a greater share of attention than formerly, and deservedly so, since it is impossible to grow good crops without the one or the other. The latter has a more immediate effect; but the former, till experience shall have proved the opposite, I must consider the best means of manuring land, as there is no way of improving the quality of the manure equal to using cake, grain, and other concentrated food; and farmyard manure must be considered the mainstay of the farm, owing to the beneficial effects, both immediately and for a series of years to follow. I met a farmer in London who told me the system he adopted was to use all his turnips with sheep. He fed, besides, sixty fat cattle in the

stall, feeding them entirely on chopped hay or straw and feeding stuffs (what the exact system was I did not inquire, as at that time I did not take as much interest in farming as now); the result was the carting of his turnips was reduced immensely, which was a considerable saving. He was able to turn out his cattle in splendid condition in a much shorter time than his neighbours, and, though his manure heap was diminished in quantity, he was able to grow better crops than his neighbours, owing to the improved quality, whilst the cartage was greatly lessened. But the chemical manufacture of feeding stuffs and manures has forced farmers to the study of chemistry, to enable them to decide their respective values and to protect themselves from the disgraceful frauds that were sought to be practised on them. This brings us to the custom of getting samples of all the artificial manures in a district analysed by a competent chemist, such as has been adopted in some counties in Ireland, and also by the Athenry Farmers' Club. There are two reasons why such should be done. The first is artificial manures are sold by agents scattered over the face of the country, who naturally do their best to sell their own commodity, and the farmer is naturally puzzled to know which to select and where to lay out his money to the best advantage. This he cannot tell, and, therefore, buys from the seller who gives him the greatest amount of credit, or who happens to be the most plausible. Chemistry now steps in, and by analysis is able to tell which contains the most valuable ingredients, and taking also into account the selling price, decides which is the best value. This way is not, however, accepted by all, and on the publication of the report of your club a discussion was carried on in the pages of the *Farmers' Gazette* and the *Irish Sportsman* relative to this system. Mr. Woufor, a manufacturer of one of the manures analysed, complained that, owing to a false system of valuation adopted by chemists, the returns were not to be depended on; also, that an erroneous estimate was taken of some of the chemical ingredients. These were replied to by the *Farmers' Gazette*, and I should be inclined to think that paper was probably right, though, of course, I could not venture to give an opinion on the subject, from my almost total ignorance of it; but that such a question should arise is conclusive proof that we have not yet attained to a proper knowledge of chemistry, and, further, that before we can absolutely decide on the cheapest and best manure, varied and extensive field experiments must be made with the different manures, under the guidance of experienced farmers and chemists. There is one point in Mr. Woufor's letter, however, where I think he goes wide of the mark, and that is where he states that his manures consist of the most expensive materials, and are, therefore, most valuable. He says in one of his letters "For your readers' information I will analyse them by the commercial test of the price of each article in the market. To do so, I will place side by side the cost of the materials in each of the manures, and then analyse the result of the figures, by which we will come at the actual cost of each manure." I maintain that the cost of the materials of a manure to the manufacturer are of very second-rate importance to the farmer, whilst the price and quality of the manufactured article are of the greatest importance, and must be discovered either by experiment or chemistry, or, best still, a combination of both. Up to this we have been dealing with honest men, who wish to drive an honest trade, and to confer a benefit on the farmer as well as themselves; but all men are not honest, and this brings us to the second reason why manures should be analysed. The spurious manures are constantly sold through the country, and, therefore, farmers, particularly the poorer class of them, plundered of their money, is evident from the exposures which have frequently taken place from the reports of the analysis of the different farmers' clubs, and from Mr. Woufor's letter, where he speaks of "those ingeniously conglomerated compounds, known in the market as Liverpool mixtures," and which are to be found from Galway to Ballina, and from Ballina to Athlone. That we should do what we can to effectually put a stop to such practices is, I think, our duty, and chemical analysis offers a certain means of doing so. Finally, gentlemen, there is the question of climate. First, with reference to the general climate, depending upon the latitude and longitude of the country; and secondly, the yearly variations of the climate in each particular place. The first is, I think, a question that is sufficiently understood for all practical purposes, at least it may be safely left for future generations, as we have so much more to learn that has

a direct influence on our agriculture. People living in their own country, of course, understand their climate, and those who migrate mix with the people of the country they migrate to, and soon learn the peculiarities of the climate of that country. I may merely add that I lately saw it stated that about six hundred years ago grapes were grown freely in the open air in England, but that about that time their cultivation had to be given up, owing to the seasons becoming unfavourable to their ripening. This, if true, would prove that great changes may take place in climate, even in the same place; but, as I said before, I think we may safely postpone discussion on this subject. The yearly variations of climate are of much greater importance to the farmer, some crops preferring a wet season; others a dry season; and it is needless to mention the many advantages that would accrue to the farmer if he could foretell the general character of the seasons for a year or two in advance; and I do not see why we should despair of such being the case, when we know more of the general laws of nature; but before this can be attained, we must accumulate a vast amount of data. Observations must be accurately taken in different parts of the world, and for a considerable number of years, before anything approaching a theory that will even approximate to the truth can be built up. The difficulties that must be surmounted ere this result can be attained are exceedingly great, but can, and, I am convinced, will be overcome. In fact, observations have been taken, and are still being taken, in numerous places, but not on a sufficiently extensive scale; nor are they part of a comprehensive scheme; but, with the exception of those taken at observatories, they are the work of individuals, and necessarily isolated and unclassified. The great danger to be avoided is hasty conclusions drawn from insufficient data. A memorable instance of this is, that a few years ago, when the late Earl of Carlisle was Lord Lieutenant here, because a series of wet years happened to come in succession, he recommended grain crops to be sown but sparingly, and the greater part of this island to be laid down to permanent pasture. This advice, if followed, would mean death to all scientific farming in Ireland, and, I may say also, to all improvement; and yet the earl was a most highly educated and gifted man, and one who, we may take for granted, had an earnest desire for Ireland's welfare. If such men as he commit errors like this, what danger are we in! I believe I may apply to all the matters I have touched on to-night a remark which I read, as applied to climate alone: "These are questions of which we shall have to leave the scientific investigation to those who may come after us; for the present we seem likely to content ourselves with deductions from very narrow experience, with very large conjecture and very confident assertion." I now come to the second division of the subject—the advantages derived from a scientific treatment of agriculture itself. One of the most remarkable instances of this is the origin of Shorthorn cattle. Mr. Bakewell, the founder of this breed, was a close observer of nature, and he noticed that the cattle which fattened easiest and came soonest to maturity, however much they differed in some points, all agreed in one, and that is, they had short horns. He consequently adopted that as his standard, and the result is the splendid breed of Shorthorns. Other instances are the growing of turnips and potatoes in drills in preference to large beds, as they produce a better crop, can be kept cleaner, and are much cheaper to put in and take out; for I hold that good farming consists not merely in growing the largest and best crops, but in doing so at the least expenditure of time and money, as that means so much gained to the wealth of the country. Unremunerative labour is held by political economists to be labour wasted, and, therefore, should be avoided. Another is that of laying down to permanent pasture with natural grasses. The old method was to allow the ground to come to the natural grasses through lapse of time. In this country they previously prepared the ground by taking as many successive crops of oats as the land would give without manure. But now the improved system is to manure the land highly, then to lay down with the natural grasses, which are obtained by noticing the sorts that grow in the best grass lands in Meath and about Dublin. These are some of the instances where scientific treatment has conferred great benefits on agriculture, but up to this scientific performers have had but slight encouragement from the great number of farmers, and besides they have been few. We may certainly expect a great advance in the future, as education is extended,

and the many advantages of a proper system of farming become more and more evident. Besides, there is an influence at work now that was absent in bygone days. I refer to Farmers' Clubs. If they do not make themselves felt at first, it is partly owing to the novelty of the thing, but still more to the enormous amount of inertia they have to overcome; and I think no sane man will but admit that they will, in time, in connexion with the press, exercise a great amount of influence for good, for this one reason alone, leaving all others aside—they make men think; they hear of new plans of growing crops, and brilliant results stated, and when they compare these with their own slovenly work, they come away, not, perhaps, convinced, but still inclined to try the new system on a small scale. Once the wish for improvement is generated, it will steadily, though perhaps very slowly, increase. Still it is there, and as years go by it will gradually spread over the whole country. This it is we are aiming at, and I feel convinced that future generations, if not the present, will say the Athenry Farmers' Club has deserved well of its country.

SALE OF MESSRS. GARNE'S SHORTHORNS,

AT CHURCHILL HEATH, CHIPPING NORTON.
ON TUESDAY, OCT. 4TH, BY MR. H. STRAFFORD.

"Mr. George Garne's luck this season has been something extraordinary, while it should serve as a capital advertisement to the Churchill Heath sale." It was thus that we wrote in our report of the Royal Society's Show at Oxford, in July, and certainly the Heath herd has been coming to the front with immense force during the past summer. At the Taunton meeting of the West of England Society, the only two entries made by Mr. Garne took the first prize for bulls and the first prize for cows, as another cow was best of all at Oxford, with a reserve number, and sundry commendations also falling to the share of Mr. Garne, senior, and his two sons. The sale on Tuesday was made up, in fact, from the Broadmoor and Churchill Heath herds, the foundation of which, according to the customary prologue, "was laid nearly forty years ago by Mr. Garne, who was one of the earliest introducers of Shorthorns into the county of Gloucester, and the origin of his herd was from stock then held in high repute, such as that of Messrs. Champion of Blyth, Mason of Chilton, and Whitaker, of Burley." The advertisement runs on to say that "first-class bulls have since been used from Farnley, Brandsby, Ley Fields, Tortworth Court, and other famed herds; latterly, sires have been bought and hired at high figures from Colonel Towneley, Messrs. Booth and Peel; and on comparing their pedigrees carefully with the *Herd Book*, the animals will be found to combine alliances with the best and most fashionable families of the day." Still the blood was scarcely "pronounced" enough to make much sensation, as it read rather like judicious crossing than anything very remarkable in any direct line. In the way of good looks, however, there was much to like; and there were a number of lengthy, handsome roomy cows, such as Pride of the Heath, Precedent, Paradox, and Garland, which would show well in any company. Of a very different style is the Royal first Lady Lavinia, a short podgy patchy butcher's kind of beast, with a broad back, and plenty of good flesh, but a bad mover, and utterly devoid of anything like elegance or fine character. Nevertheless the picked lot of all would seem to have been Royal Butterfly 20th, "on which Mr. Garne retains the right to make one bid," Mr. Strafford's instructions being, by the catalogue, to sell all the others without reserve. At Taunton, as we contended, Butterfly 20th, beat a better bull than himself, in Lord Sudeley's white Mandarin;

but at Oxford, the judges commended Butterfly, and took no notice of Mandarin, and in the West of England Society's own report, Mr. Savidge, the Shorthorn judge, spoke of Butterfly as "the grand roan," who "quite surpassed" the white, and "won point after point." Nevertheless since the Oxford Meeting Mandarin at Kidderminster took the first prize, and Butterfly 20th the second; and again at Stroud Mandarin was first and Butterfly second. There is some interest in such competition, as more handy home Mr. Garne has won plenty of prizes during the last two or three seasons. Mr. Hall, of the Heythrop, who presided at the Luncheon, felt he could accordingly offer his congratulations on the goodly company he saw assembled, but Mr. Strafford rather shook his head at this, and when examined it certainly did not look much like business. Beyond "old" Mr. Bowley as he was called, Mr. Mace, Mr. Gibson, Mr. Culshaw, Mr. Thornton, Mr. Sheldon, and the next door neighbour Mr. Savidge, there was nobody of much note in the Shorthorn world, and it was tolerably clear thus early that high prices would not prevail. Still there was a deal of hurrying, and one or two relays of visitors to be accommodated, but the spirit of the thing evaporated at this point, and the sale was a very dull one. The very shortness of keep deterred some, no doubt, from securing the bargains they might continually have had, and the crack lots hung almost as heavily as the less famous animals. Pride of the Heath, the first cow at Taunton, and the reserve at Oxford, was knocked down to Mr. Savidge for 77 gs., so that, as was remarked, "she will not have far to go," while Lady Lavinia, the best cow at Oxford, realized 75 gs., also booked to Mr. Savidge, and Duchess of Towneley, a merely commended cow at Oxford, still to Mr. Savidge, at 85 gs. It was our impression at the time that both the cow and the two-year-old heifer classes of this year's Royal Show were but indifferently appraised, and the result of this sale tends to strengthen such an opinion, as the best of the three by the judges' books was the worst of the three by the auctioneer's return. With the competition, however, so slack and so few really good buyers present, we are not inclined to give too much weight to these figures, and there seemed to be an impression abroad that some of the best animals were not sold. At any rate it is clear enough that neither at Churchill Heath nor at Broadmoor will the Shorthorn be henceforth quite banished, for there was our view during the day a good, lengthy, high-quality bull, from Warlabey, called Royal Benedict, that the father and his two sons have hired amongst them of Mr. Booth for a couple of seasons. So that even if Butterfly 20th were gone there is something to fall back on; but no one ever came near the 150 gs. reserve, so that "the grand roan" and the white may fight their battles o'er again.

Mr. Strafford said he was not bordering on the grounds of romance, and the Heath and its surroundings would certainly promise a deal more in the way of feeding rabbits and finding foxes than in rearing or maintaining a herd of highly-bred cattle. But Mr. Garne has done great things with the material he has at his command, and it is to be regretted that he had not a better sale. Still, both the times and the seasons were against him, as even the railways did not serve as well as they should do. There was virtually no up train after four o'clock in the afternoon, and the business announced for one did not commence until past two o'clock. In our correspondent's report of the Butley Abbey sale there is a bit of wholesome advice—a kind of commercial ethic that cannot be too often or too forcibly impressed: "Mr. Robert Bond put up the first lot at the time advertised—a practice we earnestly commend to the notice of all auctioneers at all sales; why it should ever be departed from, or for whose benefit the clauses 'to a

minute, 'ten o'clock punctually,' 'one for half-past,' are inserted in farm sale advertisements we have yet to learn. The common result of all such useless notice is that the sale commences anything but punctually, and the business part of the company is kept waiting for the auctioneer in the morning, while people leave before the sale is concluded at the end of the day."

COWS AND HEIFERS.

Ruby, red and white, calved November 17, 1859.—Mr. Parker, 27 gs.
 Panacea, roan, calved in April, 1860.—Mr. Penson, 25 gs.

SALE OF MR. CALESS' SHORTHORNS,
AT BODICOTE, BANBURY.

By Mr. H. STRAFFORD, ON WEDNESDAY, OCT. 12TH.

The weather was exceedingly unfavourable, there being a continued rainfall up till twelve o'clock, which no doubt kept numbers away. Mr. Cales has been known as a Shorthorn breeder for upwards of sixteen years, and in this locality has done much to improve the breed of cattle. Fifty years ago, the stock in this neighbourhood was principally bred from Heretords, Welsh, and other older breeds, but Shorthorns have gradually taken the place of the less improved breeds; so that now in Banbury market nine-tenths of the cattle are Shorthorns or at least Shorthorn crosses. Mr. Cales' stock was shown in useful store condition; the older cows seemed to be in good breeding order, and a number of them showed capital milking properties. Most of the younger animals were got by Huntsman, who has distinguished himself in various show-yards, and they showed a good deal of style, substance, and nice hair. Amongst the cows and heifers Autumn Queen, red, calved October 12, 1866, got by 3rd Grand Duke, made 60 gs., sold to Mr. H. J. Sheldon, of Brailes, and Kathleen, red and white, calved March 18, 1868, got by Wellington, 52 gs., to Mr. Brown, Hull; while none of the other 32 lots reached as high as 30 gs. Of the bulls, Huntsman, roan, calved November 29, 1863, got by Dusty Miller, made 42 gs., for Mr. Bygrave, Aynhoe; Best Boy, roan, calved November 26, 1865, got by White Chief, 37 gs., to Mr. H. J. Sheldon; and Gladstone, red and white, calved May 9, 1867, got by Huntsman, 70 gs., to Mr. Hall, Barford; none of the other bulls reached to 30 gs. The 34 cows and heifers made in all 792½ gs., at an average of about £24; and the 17 bulls 357½ gs., at an average of £21.

THE RANBY SHORTHORN SALE.—By Mr. JOHN THORNTON.—The late Mr. D. Prime Walesby's stock of Shorthorns and sheep were brought to the hammer on Tuesday, the 27th of September. Although a man of good judgment and a practical farmer, he never went much out of his way to obtain first-class stock. His cattle were, with one exception, raised during a lifetime of fifty years, with the use of good bulls, and out of the 70 head only one family, the Junos, had been bought in. Bulls from various breeders and of every variety of blood were purchased as required; consequently the stock were not of that fineness and quality that is often seen, nor did they command much attention out of their own district. They were brought out, considering the season, in very fair condition, and were large, useful, rather coarse cattle, many of them of the old yellow tinge. Each cow had a calf at foot, and the calves often excited more competition than the dams; for instance Red Juno, sold for 27 gs., and her nine-months roan bull-calf, made the same price. The highest-priced cows made 35 to 40 gs., and some of the two-year-old heifers reached also to fair figures; while the yearlings sold pretty well, and Woodman, a two-year-old bull of Messrs. Dudding's breeding realized 44 gs. The seventy head of cows, heifers, calves, and bulls averaged £25 8s. A pair of young horses fetched 80 gs.; and a flock of Lincoln sheep, which were somewhat low, fetched a few shillings over market value. The district for miles round had experienced two bad seasons, so that there was not that demand there otherwise might have been.

SALES OF SHORTHORNS,

BY MR. JOHN THORNTON.

MR. W. BUTLER'S HERD, AT BADMINTON, OCT. 5.

Badminton was wrapped as it were in a winding-sheet of mist as we entered the "pretty village, dotted with neat cottages and gay flower gardens." Mr. Butler's farm, under the Duke, and adjoining the park, lying in the centre of it. The cattle were grazing in the small fields at the back of the house and immense farmyard, the scanty bite was helped out with here and there a small bundle of hay. The cows, however, showed the effects of good management and careful treatment from calfhood, and might be called a useful though somewhat uneven lot. Old Darlington 10th, a 45 gs. calf, purchased at Mr. Sainsbury's sale in 1856, and own sister to the celebrated 300 gs. Darlington 6th, was conspicuous among them by her fine character and great size; with crumpled horns, huge cushioned rumps, and a fine quality of flesh and hair, she was as good a specimen of a Shorthorn as one often meets. Oxford Bride was also a pretty cow, and evidently of great profit, or Mr. Butler described her when in the ring "a real good 'un." The three-year-old heifers were admirable, but neither the two-year-olds nor the yearlings, save three or four, showed to very great advantage. By far the best portion of the stock were the heifer calves; placed in a comfortable straw-yard they were certainly not only one of the prettiest but one of the best lots we ever saw, and were brought out in the height of bloom and beauty. They were mostly rich roans, full of long hair, even in character, and the very pink of condition. Promiscuous as the original selection of cows might have been, a master mind and fine management had evidently been at work, and the young stock gave promise of what might have been a very first-class stock of cows in a few years. The mist hung so thick that the Duke's circular tent was scarcely visible 30 yards off, but a tingling bell told luncheon was ready, though we were sorry to see a magnificent spread for three hundred, with scarcely two hundred to enjoy it. Tethbury mop and three local sales attracted part of what would have been a very large company, but soon after two the ring was encircled with evidently half a thousand people. Col. Kingscote presided, and, after the loyal toasts, proposed Mr. Butler's health, and alluded in touching terms to the death of his eldest son, "Tom Butler," a young man, who was not alone esteemed by his associates, but who had given evidence of great promise. A drag, with the young Marquis of Worcester, Col. Kingscote, and some of the company, was drawn to the ring side, when the proceedings then commenced.

Old Darlington the first lot was put in at thirty and went away quickly to fifty, then Mr. John Thompson, the Duke's agent, bid against Col. Kingscote's steward Burnett to 65 gs., and the glass ran to the astonishment of the company at an old fourteen-year-old cow selling so high. Mr. Burnett, however, got her, and several of the best lots for, as it afterwards turned out, for Mr. Pavin Davies, who has removed from Wales and taken a farm a few miles off Badminton. Some of the other cows were doubtful, and much satisfaction was expressed by the company at the straightforward manner in which these particulars were announced. Oxford Bride drew bids from several quarters, and at last Mr. Lord got her for the Marquis of Lansdowne. Badminton Girl, a large fine cow with evidently a couple of quarters gone, went, as a local expressed it, to "some one who didn't want milk," but she had bred well, and Mr. Gibbon secured both her progeny at cheap prices; they go to Westmoreland. Mr. H. Mousell bought a good cow in Unity 2nd, descended from Mr. Cottrell's stock, and the entrance of Ursula 16th and her roan bull calf made a little talk. She was a purchase at Didmorton, and many bid for her; at last Mr. Long (for Lord Fitzhardinge) got in and bought the cow at 45 gs.; the calf was put up at 5 gs., but some of the farmers in the neighbourhood wanted the breed, so Mr. Long was run up to 17 gs. for it. Lavender 8th was a particularly nice-formed cow with arched ribs, and closely resembled her sister Lavender 9th. They were both bought for Mr. Cruikshank, as well as their two heifer calves, and go to swell the great Sittington herd. Darlington 13th, a level true-made animal, rather plain in colour, was the best milker in the herd. The biddings went on languidly between Mr. Burnett, Mr. Thompson, and Mr. Piere (who was buying for his estate in California) up to a hundred,

and the company cheered: "Go on again," said Mr. Piere, "one" other which meant "five," and the glass ran; so she leaves the country in December. He got a good companion for her in Oxford Rose, ten months younger and at half the money. The next, Darlington the 14th, a thick compact red heifer, had the cross of the Marquis of Oxford, and as the company wanted the next lot, which was out of lot one, she went cheap to Mr. Turner, of Lincolnshire. The 15th had plenty of hair and a very pretty calf, and in calf again, so she went merrily along to a hundred, and more cheering when Mr. Burnett got her. A white Darlington 16th, sister to the 14th, was of very elegant form, and dam of a nice bull calf. She was a cheap lot to Mr. Thompson at 85 gs. But Darlington 17th was the lot of the sale; of beautiful form, and full of rich roan hair, she might have been a trifle fuller in girth and a little more feminine in the head, a fault pertaining to the tribe. Mr. Burnett and Mr. Piere, after bids for Mr. Cochrane, fought it out to 155 gs., at which price she joined her dam; Mr. Piere taking the next Darlington out of the 13, and a thick red heifer, destined for Col. Kingscote's Third Duke of Clarence, at 125 gs. One of the best calves out of lot 6 was fit to enter a show-yard, and Mr. Pybus takes her into Monmouthshire cheap enough at 54 gs. Her companion, Miss Minnie 7th, goes to Canada, but Darlington 19th, a five months' calf, nearly doubled the price her grandmother made at the same age fourteen years before. Capt. Blathway's Lord Collingham, a pure Bates bull of the Fidget tribe, was in great demand, and bids went well along up to 115 gs., when Mr. Sharp took him for Lord Aylesford's herd at Packington. Count Bickerstaffe 2nd, although a nice bull, was not a promising sire, and went the way of all flesh at 40 gs. The Darlington bull sold well at 51 gs., but for the others the competition was very dull; two steers made 38 gs., and the *Herd Book*, handsomely bound, 20 gs. The proceedings closed soon after four o'clock. Total, £2,531 17s. Average of 74 head, £38 5s.

THE LATE MR. WILLIAM HEWERS HERD.

AT SEVENHAMPTON, WILTS, OCT. 6TH.

The white mist never cleared off, and hung thick all through Gloucestershire, and in the "happy valley" of Sevenhampton, as the strangers drove up the day after the Badminton sale from Swindon Station. Early visitors, however, dropped in to look well over the pigs; for the late Mr. Hewer had founded his stock reputation more by them than Shorthorns and sheep, though he had years ago shown both with success. The Berkshires, however, had carried all before them, and won about 116 prizes, including several firsts at the Royal. He had always been very careful to select the best-looking, and to use the best blood. Sir W. Throckmorton's, Mr. Edmonds', Mr. Smith's, and Mr. Withers' had all been dipped into, but lately he rarely went much from home. Although he exhibited at Oxford, the pigs were evidently not got up, and indeed many might have been fresher, but they had all fine form, good heads and backs, and were well on their legs; a few, however, fancied they might have been longer. But they sold amazingly. The first sow, Jessie, four years old, with ten suckers at her side, went cheapest at only 16 gs. for Mr. Beattie. Witch, eighteen months old and in pig, fetched 19 gs. (Hon. C. W. Fitzwilliam), and her own sister, Waif, 17 gs. (Mr. Beattie). Four young sows, farrowed in January, out of Sister to Jessie, fetched 52 gs., and seven, five months old, out of Witch, 79½ gs. The Earl of Lisburne (2) a sow and a boar, Mr. Chas. Leney, Kent (3), Mr. J. W. Larking, Sussex (4), Mr. W. Watts (4), Lord Chesham (2), J. Beattie, Annan (6), Mr. H. C. Pole Gell (2), Mr. T. Arkell (2), and Mr. H. Humfray (2) were the principal buyers. A nine-months boar fetched 21 gs. (Mr. J. W. Clark). Mr. W. Looker got one at 16 gs., seven months old, and the Rev. W. Bailey, one four months old at six guineas. The forty pigs realized £459 18s., or an average of £11 10s., which is probably the highest price that has ever yet been realized for a similar lot of Berkshires.

The Shorthorns were as devoid of fashionable element as they were full of useful qualities. Bred for thirty years with the greatest care towards quality and milk, the best of bulls, generally with Booth blood, had been used. The season was much against their appearance, as it was against people buying and the sellers' interests as well, although the cows made

fair prices, from 20 to 38 gs. Two very fine roams were bought to go to Scotland, and five useful cows to Surrey. The two-year-olds went up to 28 gs., and the yearlings, low in condition, sold better; but for the calves—a very hairy, pretty lot—the demand was good, and three Epitaph calves, two, five, and six months old, made 13, 17½, and 15 gs. Three aged bulls went at butchers' value, but Bothwell, a two-year-old, and a purchase from Aylesby, fetched 71 gs. (Mr. S. Beattie). The competition for the bull calves was equal to the demand for the pigs, as they sold remarkably well, up to 25 and 25 gs., and the last of all the three-months-old fetched 32 gs. from Mr. H. Dunn, who bought several lots. Considering the state of condition, the bad season, and scarcity of grass, not to mention the three bad years farmers have had in the district, the sale must be taken as a good one, the eighty head making nearly £2,000, or an average of £22 6s.

THIRTY DRAFTS FROM LADY PIGOT'S HERD. AT BRANCHES PARK, OCT. 7TH.

This sale took place on account of two of the farms being given up at Branches, and Messrs. Newson and Stanley, of Bury, sold off first the implements and afterwards the Suffolk horses, Shropshire sheep, and pigs. The cattle could be called scarcely anything but drafts, though there were a few desirable lots in the catalogue, five of which belonged to Mr. J. Burgess. Old Polyxena never came in, being too lame, and Princess Patrick was the first to make anything over market price; she went to 55 gs. La Belle Helene, own sister to Lady Anne, and the winner of several premiums, was in show-yard condition, but scarcely what might be called a first-class animal. Mr. Gibson who buys for America, and Mr. Howsat beside each other but neither of them bid, so the fight was between Mr. Martin, of Littleport, and Mr. Angerstein, M.P., who got her at a 100 for his Norfolk estate. Lady of Branches, a very handsome two-year-old, with a beautiful bosom, made 80 gs. (Mr. Angerstein, jun.) and was the only one of Mr. Bruere's stock that went to anything like an extra price. Mantalini 2nd, with a good thick body but a plain head and horn, the prize calf of last year, and a 70gs. purchase at the Rugby Sale 1868, was put up at 100 gs., and after some few bids fell to Mr. Angerstein, jun., at 160 gs. for his Ashby St. Leger's estate, Rugby. Mr. Angerstein, jun., also took Pele at 75 gs., and Imperial Rose 3rd, a handsome rich roan hairy calf, was bought for Mr. H. F. Smith, of Hull, for 56 gs. The bulls must be called only a second rate lot, and two out of the dam of Lady Anne fetched respectively 27 and 31 gs. None of the bulls put up for hire were let, and the thirty sold averaged nearly £10. The horses sold fairly, and some of the sheep and pigs well. A very large company witnessed the proceedings, which were over in good time. Total, £1,173 18s.; average of 30 head, £39 2s. 7d.

THE BUTLEY ABBEY SALE.

BY MR. R. BOND.

Mr. Crisp died in February, 1869. In the following July some of the choicest of his breeding animals were sold by auction, the executors retaining a portion for the final sale when the farm was to be given up. This took place in the last week in September, and the 1,280 lots in the catalogue give some idea of the extent of the occupation the late proprietor had in hand at the time of his death. No little credit is due to the auctioneer for getting through his labours in three days. On this occasion Mr. Robert Bond put up the first lot at the time advertised—a practice we earnestly commend to the notice of all auctioneers at all sales; why it should ever be departed from, or for whose benefit the clauses "to a minute," "ten o'clock punctually," "one for half past," are inserted in farm sale advertisements we have yet to learn. The common result of all such useless notice is that the sale commences anything but punctually, and the business part of the company is kept waiting for the auctioneer in the morning, while people

leave before the sale is concluded at the end of the day. The catalogue embraced nearly 100 horses, more than 100 head of cattle, 150 breeding pigs, and 2,000 sheep, besides the usual effects in dead stock, in addition to which there was an infinity of articles of machinery, scientific and practical, the like of which few have seen collected in one man's lifetime. Such a sale was pretty sure to attract a large attendance, and on Wednesday the company must have numbered thousands—a vast portion of which were more likely to try the temper of the auctioneer than to inspire hopes of spirited competition. The agents of Lord Derby, Lieut.-Colonel Wilson, and a few others were there, however, to give hopes of better things, and most of the Suffolk breeders were personally represented; but the knowledge that the best of the horses and cattle had been already disposed of kept many away, and hence the average prices made by the horses were nothing extraordinary. The highest priced mare was bought by Mr. Garrett—a thick-set short-legged animal, well worth what she made—66 gs. Diamond, a four years old, said to be in foal, a daughter of Wolton's Warrior, as fine a stamp of a cart mare as one wants to see, was bought by Mr. Toller for 55 gs. Mr. Loft, who bought freely at the Newbourn Hall sale, secured Depper at 40 and Doughty at 46gs., both in foal, as well as the seven-year-old Diamond for 56gs. This was the second-prize mare at Sudbury, and the dam of the first-prize foal at the same show, sold at this sale to Col. Wilson for 51gs. He is by the noted Cupbearer, and is likely to be seen at many a show in future, where, in the hands of his new owner, he should be a winner. Mr. Wilson, of Bayham Hall, and Mr. M. Sexton, of Wherstead, were the other principal bidders. The ten best mares made an average of about £45 each. The old Cretingham Rookery mare (13 years old), a three-years-old winner at Framlingham, and a 70gs. purchase at Mr. Barthropp's sale, made only 24gs., and her yearling filly was bought by Mr. M. Biddell for 29gs., both likely bargains. One great drawback to the sale of the mares was their being in foal to a very ordinary horse, a son of old May Duke; for although the foals and yearlings were by Mr. Garrett's celebrated horse Cupbearer, none of the mares were covered by him. The highest priced stallion was the three-year-old Captain, knocked down to Mr. Packard at 90 gs. A yearling Cupbearer made 44 gs., and a two-year-old something less.

The Shorthorns made no more than dairy or grazing prices, but the pigs seemed in greater force than ever, especially the blacks. The highest priced white Norfolk sow fetched 20½ gs., and was bought by Mr. Packard, Mr. Copeman giving 15½ gs. for another, and Mr. Long bought one lot for 10½ gs., nine of the best of these averaging about £10 each. Mr. Packard gave 18 guineas for the best small breed white boar, and Lord Rendlesham bought one at 8 gs., and another at a less figure. Perfection, the 18-guinea purchase, was a very good animal, though with hardly width enough about the jawl. The black sows were, if anything, better than those sold last year. The prices for them on Thursday were 31, 21, 19½, 17, 15½, 15, 14, &c.; the ten best averaging something like £17 each, the whole lot offered, 24 in all, making just upon £10 each. The highest priced sow was bought by Mr. Barthropp (a commission), at 31 gs. Mr. Harding (Kent), gave 21 gs. for a 10 months sow, perhaps about the best animal offered that day, and Mr. Herman Biddell secured the fellow to her at 15½ guineas. Mr. Sexton, always ready to add a real good thing to the Wherstead herd, bought one of the best at 17 guineas, as well as the dam of Mr. Harding's, Mr. Barthropp's, and Mr. Biddell's purchases, a grand 2½ years old sow, likely enough with a Wher-

stead boar to breed a similar lot. The other purchasers were Messrs. Prout, Cordy, Coleman, Westhorpe, &c. The black boars ranged from 17 gs. downwards—the highest price being given by Mr. Barthropp for Mr. Johnson; the same buyer for some one else, another at 14½ gs.; then follow Mr. Herman Biddell at 11½ gs., Mr. Cornish at 11 gs., and others at a shade less. The other buyers were Messrs. Copeman, Claxton, Duckering, Wolton, Pettitt, &c. Neither Mr. Stearn nor Mr. Manfred Biddell seemed very much inclined for the Butley cross, although the former ran close up for the 18 gs. Perfection and the latter for one or two young pigs of the black breed. The ten best averaged £11 each. A herd like this is not easily bred, bought, or collected together by any means, but the large number of good animals, boars and breeding sows, scattered broadcast over the country, must soon make their mark in the general character of the swine of the district to which they are sent. We were glad to observe that many of 7, 8, and 10 guinea boars were bought by tenant farmers; not breeders for the showyard, but by those who begin to see the value of the showyard pig for practical purposes—that is, for crossing and improving the farmer's stock who breeds for profit as well as for competition.

The sheep were sold on Friday. Many years ago Mr. Crisp stood high in Southdowns. At the early meetings of the Royal Agricultural Society he took first for old and shearing rams. Since then he kept a very pure Sussex-like flock, but had not exhibited for many years previous to his death. The ewes were of a very nice character, but fetched little more than market prices.

SALE OF SHORTHORNS AT KEITH-MORE, N. B.

Mr. Cantlie's second annual sale of Shorthorn bull-calves and surplus cows and heifers took place at Keithmore, Dufftown, in the uplands of Banffshire.

BULL CALVES.

- McMahon, red and white, calved March 10, 1870.—Mr. Thomson, Tynett, Fochabers, 23 gs.
- Norwood, roan, calved March 27, 1870.—Mr. McLennan, Meikle Urchany, Nairnshire, 26 gs.
- Crown Prince, red, calved January 24, 1870.—Mr. Edwards, Birchfield, 24 gs.
- Bazaine, roan, calved March 16, 1870.—Mr. McLennan, 20 gs.
- Bismarck, roan, calved February 23, 1870.—Mr. Bruce, Burnside, 24 gs.

ONE-YEAR-OLD HEIFERS.

- Prize Rose II., calved July 5, 1869.—Mr. Simpson, Clunymore, 18 gs.
- Rosebud, red, calved June 5, 1869.—Mr. Garland, Cowbythe, Fortsoy, 17 gs.

TWO-YEAR-OLD HEIFERS.

- Rosie, roan, calved April 4, 1868.—Mr. McLennan, 30 gs.
- Clara, red, calved April 26, 1868.—Mr. Wilson, Auchindachy, Keith, 26 gs.
- Dowry III., red, calved March 16, 1868.—Mr. Allan, Grummondlach, Ross-shire, 26 gs.

COWS.

- Tibby, roan, calved January 13, 1866.—Mr. Allan, 21 gs.
- Daisy, red and white, calved March 21, 1866.—Mr. Allan, 26 gs.
- Premium V., calved April 28, 1861.—Mr. Grant, Pans, Elgin, 22 gs.
- Jessie, red and white, calved March 1, 1861.—Mr. Dawson, Cairnie, 20 gs.

HEIFER CALVES.

- Jeanie Deans, roan, calved March 22, 1870.—Mr. Gordon, Tullochallum, 17½ gs.

- Eugenie, roan, calved January 12, 1870.—Mr. Allan, 22 gs.
- Mavis, roan, calved February 26, 1870.—Mr. Bruce, 21 gs.
- Dolly, red, calved April 20, 1870.—Mr. McWilliam, Stonyton, 16½ gs.
- Premium IV., roan, calved April 28, 1870.—Mr. Stewart, Newton, Rothes, 12½ gs.

POLLED BULL.

- Tommy Dodd, calved May 6, 1870.—Mr. McDonald, Shenvil, Cabrach, 15 gs.

SHEEP SALES AND LETTINGS

KILHAM ANNUAL SALE OF SHEEP.—The stock brought forward consisted of about 2,200 ewes, gimmers, and dimmots from the farms of Kilham, Mindrum, West Newton, and Yeavinger. The sale commenced shortly after two o'clock with the Kilham half-bred ewes. The following were the averages:

	1870.	1869.
Kilham half-bred ewes	45s. 0d.	38s. 8½d.
Mindrum Leicester ewes	46s. 10d.	41s. 9½d.
Yeavinger half-bred ewes	44s. 0d.	38s. 7½d.
West Newton half-bred ewes.....	44s. 6d.	—
Yeavinger Cheviot ewes.....	27s. 10d.	25s. 2½d.
Kilham half-bred gimmers.....	38s. 11d.	36s. 0d.
Mindrum three-parts-bred gimmers	47s. 7½d.	41s. 5d.
Mindrum Leicester gimmers.....	45s. 0d.	42s. 6d.
Yeavinger & West Newton h.-b. gimmers	37s. 10d.	—
Kilham half-bred dimmots	48s. 4d.	57s. 0d.
Yeavinger & West Newton h.b. dimmots	43s. 3d.	42s. 0d.

The ewes sold at about 6s. 6d. a head above the prices obtained last year, and the other kinds from 2s. 6d. to 3s. above last year. The total sum realised was £5,100 6s. 6d.

THE WESTDEAN SOUTH-DOWNS.—This flock, the property of Mr. C. Waters, who is about to quit Westdean Farm, was sold by auction by Mr. S. Southerden. The flock was bred from ewes selected from the flocks of J. Fitcher, R. Woodman, T. Saxby, T. Cooper, J. S. Turner, and W. P. Ashby; or crossed by rams bred by the late J. Webb, and have since been crossed by rams from the flocks of W. Rigden, Messrs. Ilesman, R. Boys, and the late J. Waters. The severity of the summer had not been without its effect upon the condition of the sheep, especially the older classes. Full-mouthed ewes: Four lots of five were severally sold to Mr. P. H. Ellis, Clayton Court, at 45s., and to Mr. Tickner, Boreham-street, at 43s. (three lots). Thirteen lots of ten were sold to Mr. R. Brown, Allington, at 42s. 6d. and 39s.; Mr. Paige, Ringmer, 36s. to 38s. 6d.; Mr. Faxton, Willington, 37s. to 40s.; Mr. P. H. Ellis, 38s. 6d.; Mr. Caffyn, Cuckfield, 37s.; Mr. T. Baumister, Hayward's Heath, 37s. 6d.; and Mr. Hobbs, Newhaven, 37s. Two lots of twenty were bought by Mr. Matthews, Ranscombe, at 37s., and Mr. W. Bannister, Lindfield, at 35s. 6d. Six-tooth ewes: Four lots of five were severally sold to Mr. Heasman, Angmering, at 45s. (two lots); to Mr. Ticker, at 43s.; and Mr. W. Bannister at 42s. Seventeen lots of ten were sold to Mr. W. Bannister at 37s. to 40s.; to Mr. R. Brown, Allington, at 37s. to 44s.; Mr. R. Breton, Westham, at 39s.; Mr. Hobbs, Newhaven, 37s. and 39s.; Mr. J. Homewood 36s.; and Mr. Faxton 35s. 6d. Four-tooth ewes: The four lots of five were sold to Mr. E. Cane, Berwick, at 60s.; to Mr. W. Rigden, Hlove (who bought for Mr. Perkins, of Thripton, Cambridgeshire), at 45s. and 48s.; and to Mr. Groom at 46s. Seventeen lots of ten were severally sold to Mr. Humphrey, Ashington, at 52s.; Mr. Rigden (for Mr. Perkins), at 41s.; Mr. J. Homewood at 40s. and 45s.; Mr. G. Hudson at 43s. to 45s.; Mr. W. Bannister at 42s. 6d. to 45s.; Mr. T. Cooper, Norton, 46s.; Mr. J. Kent, Southeaste, 46s.; Mr. Brown, Allington, 43s.; and Mr. Hobbs 40s. Two-tooth ewes: The four lots of five were sold to Mr. J. Saxby, Northeast, at 66s. (two lots); Mr. E. Cane, Berwick, at 65s.; and Mr. T. Saxby, Firlie, at 63s. Twenty lots of ten were purchased by Mr. R. Evans at 43s. and 54s.; Mr. Brown, Allington, at 47s. to 59s.; Mr. W. P. Ashby, Eastdean, 52s. 6d. to 65s.; Mr. J. Filder, Jevington, 48s. and 50s.; Mr. W. Bannister, 48s. to 51s.; Mr. J. Saxby 53s.; Mr. Rigden (for Mr. Perkins) 52s.; Mr. Graysmark (for Mrs. M. Marshall, Godalming) 51s.; and Mr. Groom, Folkington, 47s. Stock

ewe lambs: Four lots of five to Mr. E. Cane at 10s.; Mr. J. Saxby 30s. and 32s.; and Mr. J. Filder 31s. Ten lots of ten to Mr. Cooper, Eastbourne, at 25s. to 27s.; Mr. H. Waters, Essex, 26s. and 30s.; Mr. W. Saxby, Rottingdean, 27s.; Mr. F. Noakes, Rodmell, 32s.; and Mr. R. Woodman 28s. Five lots of twenty were sold to Mr. R. Brown at 26s. and 27s.; Mr. Cooper 26s.; and Mr. G. Hodson 25s. Rams: Six-tooth ram, sire bred by Mr. Heasman, 7 gs., Mr. B. Waters, Moteombe; ditto, 5½ gs., Mr. Hodson; ditto, 30 gs., Mr. Waters; ditto, sire Mr. J. Waters's ram, h. c. at Plymouth, 11 gs., Mr. Hodson; ditto, £6, Mr. Cooper; ditto, 5 gs., Mr. Cooper. Four-tooth ram, bred by Mr. Ashby, 4½ gs., Mr. Hodson. Two-tooth ram, sire a Boy's ram, £4 10s., the Earl of Haddington; ditto, £4 14s. 6d., Mr. Hobbs, Newhaven; ditto, £7, the Earl of Haddington. Ram lambs: These possess blood from the flock of J. Webb, W. P. Ashby, and J. Waters, and were sold at the following prices—Mr. G. Hodson 4½ gs. to 17 gs.; Mrs. Marshall, Godalming, 6 gs. and 7 gs.; Mr. J. Gorrage, Eastbourne, 15 gs. for eight; Mr. Mockett, Crowlink, two at 5 gs. each; Mr. J. Filder 5 gs. and 6 gs.; and Mr. H. Waters 1½ gs.

THE LATE MR. LONG'S HAMPSHIRE DOWN FLOCK, at Overton, Marlborough, by Mr. Marsh. The flock consisted of 2,000 ewes and chilver lambs. The two-teeth ewes were sold in lots of twenty, and the highest price obtained was 41s. a head, the lowest 27s. Several lots made 40s., 36s., 35s. 6d., 35s., and 34s. a head. The four-teeth ewes ranged from 43s. (at which two lots were sold) to 31s. Some of the intermediate lots realized 42s., 41s. 6d., 40s., and 38s. 6d. a head. The highest price for six-teeth ewes was 50s., the lowest 28s.; other lots were knocked down at 45s., 43s., 42s. 6d., 41s., 40s. 6d., 39s., and 37s. 6d. a head. The chilver lambs, which were small, ranged from 29s. to 15s. 6d. a head. The dead stock, oxen, horses, and hay were sold on Wednesday. The cart-horses particularly fetched good prices, realising respectively 42gs., 40gs., 39gs., 38gs., 37gs., the average being just upon 30gs. The working oxen averaged £41 10s. per pair, the highest price being £48.

SALE OF HAMPSHIRE DOWNS.—Messrs. Ewer and Winstanley sold by auction, on the premises at Bishopsdown Farm, 700 ewes and lambs, and seven rams, the property of Messrs. Holloway, who are quitting the farm. The whole of the sheep were of the Improved Hampshire Down breed, and were descended from the stock of Mr. Rawlence, Mr. Dibben, the late Mr. Waters, of Stratford, and other eminent breeders. The sale was attended by a very large number of the agriculturists of the district. 177 chilver lambs realized prices varying from 27s. per head down to 20s. The four-teeth ewes were sold at prices ranging from 38s. 6d. to 29s. 6d.; the six-teeth ewes sold at 37s. 6d. to 32s.; the full-mouth ewes ranged from 33s. 6d. to 27s.; the two-teeth rams at from 50s. to 42s.

THE CORSKIE LEICESTERS.—A displesh sale of the whole flock of sheep, the property of Mr. John Hannay, Corskie Bank, Banff, took place on the farm at Corskie. The stock included 70 ewes, 55 ewe lambs, 37 gimmers, 32 shearing tups, 2 two-year-old tups, and 45 tup lambs. The average price of 34 shearing rams was £43s. 6d., the highest price being £11. The tup lambs averaged £2 3s. 4d., the highest price being £6. The ewes averaged £3 5s. 9d., the highest price was £7 10s. The ewe lambs averaged £2 9s. 2d., the highest price was £3 17s. 6d.

MESSRS. SYMES' HAMPSHIRE DOWN FLOCK.—This flock, the property of Messrs. J. and G. Symes, who are about to leave St. Giles' Farm, Cranborne, was sold on Oct. 8th. It comprised about 1,800 ewes and lambs. Mr. J. Waters, of Salisbury, was entrusted with the sale. The first of 28 lots of chilver lambs were turned into the ring. The highest price realized was 36s.; the lowest 16s. a-head, the average being about 26s. The wether lambs averaged 21s., and the two-teeth ewes about 33s. a-head. The highest price was 48s., and the lowest 29s. The four-teeth ewes ranged from 42s. to 34s., the average being about 38s. a-head. Six-teeth ewes sold at from 44s. to 39s. a-head, and made an average of about 40s. 6d. One lot of full-mouthed ewes sold at 45s.; the others realized 40s. and 39s. a-head, the average being 40s. Cull ewes and wethers averaged 40s. Average of all the ewes, 38s. One lot of dry cull ewes made 46s. a-head; others 41s. and 40s. The ram lambs fetched about 3 guineas a pair; and one ram made £5 10s.

RAM SALES AT BARTON FAIR.—A large number of rams were offered for sale by auction. Messrs. Moore and Hill, of Cirencester, sold nine shearlings, bred by Mr. Fowler, of Aston Farm, at an average of £7 1s. 5d., and some bred by Mr. T. Clarke at an average of £5 15s. 6d. Mr. J. Villar sold Cotswold rams from the flocks of the following breeders and at the subjoined average prices: Mr. E. Handy, Sierford, £7 9s.; Mr. G. Fletcher, Shipton, £7; Mr. W. H. Fletcher, Shipton, £6 12s.; Mr. T. B. Browne, Salperton, £7 1s.; Mr. W. Smith, Bibury, £7 10s.; Mr. W. Jones, Pegglesworth, £6 8s. 6d.; Mr. J. Humphris, Hawling, £4 14s. 6d.; and Mr. H. Cole, Ashbrook, £6 6s.; also Oxford Downs from the flock of Mr. C. Hobbs, Maiseyhampton, £6 10s., and from Mr. G. Wallis, Bampton, £9 2s.; and Shropshire Downs from the flock of Lord Sudeley, £5 15s. 6d.

PERTH ANNUAL SALE AND SHOW OF RAMS took place on Wednesday, Sept. 28. The stock comprised 360 Leicester shearling rams, 15 Cotswold and Shropshire down rams, 40 Leicester tup lambs, 40 blackfaced rams and tup lambs, and 270 Leicester ewes, gimmers, and ewe lambs. The Leicesters were from the principal breeders in the counties of Perth, Forfar, Kincardine, and Kinross. The following are the average prices made for the principal lots, viz.:—Mr. Taylor, Redcastle, £5 0s. 6d.; Mr. Halley, Dornock, £2 19s.; Earl of Dalhousie, £6 15s.; Mr. Rae, Haddo, £4 11s. 3d.; Mr. Cowie, Balhousie, £6 19s. 4d.; Mr. Johnston, Cairnpeg, £5 5s. 10d.; Mr. Fenwick, Leadkeltie, £3 1s. 2d.; Mr. J. Maxton Grahame, of Redgorton, £5 1s. 5d.; Mr. Muirhead, Durdie, £3 16s. 1d.; Mr. Flockhart, Annocroich, £3 8s. 6d.; Mr. Lyall, Old Montrose, £5 12s.; Messrs. M'Glashan, Cleavage, £2 11s. 3d.; Mr. Hart, Kirklands, £3 7s. 7d.; Mr. Ruxton, Farnell, £6 14s.; Mr. Wedderspoon, Masterfield, £6 12s. 6d.; Mr. Goodlet, Bolsham, £5 13s.; Mr. Smith, Balmain, £3 10s.; Mr. Baptie, Hardwoodburn, £3 8s.; Mr. Fergusson, Kinnochey, £5 10s. 5d.; Mr. Gold, Marthly Home Farm, £4 3s. 7d.; Mr. Somerville, Carey, £3 17s.; Mr. Bell, Glentarkie, £3 3s. 6d.; Mr. Gardiner, Chapelbank, £4; Mr. Whyte, Muirhead, £3 17s. 6d. Leicester ewes and gimmers—Mr. Whyte, Muirhead, £3 0s. 4d.; Mr. Rae, Haddo, £2 4s.; Mr. Gorrie, Inverdunning, £2 1s. 2d.; Mr. Lyall, Old Montrose, £2 7s.; Mr. Gold, Murthly, £2 10s. 9d.; Mr. Taylor, Redcastle, £2 4s. 6d.; Mr. J. M. Grahame, Redgorton, £2 4s. 10s.; Mr. Buist, 'Ormiston, £2 8s.; Mr. Gardiner, Chapelbank, £2 2s. 3d.; Mr. Fenwick, Leadkeltie, £1 18s. 6d. Blackfaced rams—Mr. Archibald, Overshiels, £3 2s. 1d.; Mr. Williamson, Lawers, £4 2s. 6d.

SALE OF FAT STOCK.—The cattle fed in the Home Park, Hampton Court, the property of her Majesty the Queen, were sold by auction by Mr. Cowles, acting under the instructions of Colonel Maude. There were 81 beasts, polled and horned Scots. They realised £1,829, an average of £22 11s. each.

LAUDERDALE AGRICULTURAL SOCIETY.—The annual show of rams in connection with the above society was held at Lauder. A large show of ewes and rams, all of which were bred upon farms in the county of Berwick. The judges were Mr. Todd, Cardona; Mr. Stephenson, Mid-Lothian; and Mr. White, Hutton Knowe. The following were the awards: Leicester ram above one shear, G. Wight, Carfrae; Leicester shearing ram, J. Runciman, Wantonwallis; two Leicester ewes, T. Simson, Blainslie; two Leicester ewe lambs, T. Simson; five half-bred ewes, G. J. Renwick, Corsbie; five half-bred ewe lambs, H. Hogg, Symington; two Cheviot rams above one shear, R. Durie, Broadshawrig; two Cheviot shearing rams, — Archibald, Glengalt; five Cheviot ewes — Archibald; five Cheviot ewe lambs, H. Hogg; two blackfaced rams above one shear, J. Graham, Chints; two blackfaced shearlings, J. Graham; five blackfaced ewes, — Archibald, Overshiels; five blackfaced ewe lambs, G. M'Dougall, Blythe. The usual sale of rams took place, Mr. Davidson, Melrose, acting as auctioneer. The following is a list of the sales: Mr. Simson, Blainslie, eleven, highest £7 2s. 6d., average £5 19s.; Mr. Bertram, Addenstone, seven, highest £5 17s. 6d., average £5 2s.; Mr. Smith, Leaderfoot, four, highest £4 15s., average £4 11s. 6d.; Mr. Dickieson, Maidenhall, sixteen, highest £7 2s. 6d., average £5 13s. 9d.

SALE OF MR. FAWCETT'S SHORTHORNS, AT SCALEBY CASTLE, ON OCTOBER 20TH.

BY MR. JOHN THORNTON.

This sale of about fifty head, from Mr. Fawcett's herd, was to have taken place two days before Mr. Saunders' sale at Nunwich, last month, but an outbreak of foot-and-mouth disease caused the sale to be postponed. This not only reduced the card item of the stock, but also deterred many from buying. A certificate of health was given by the local veterinary inspector; but a wet day kept many away, still the ring was well filled, and Col. Graham was very happy in the chair at the lunch, which took place in the large nursery of the old castle. Mr. T. Gibbons was judge of the sale. Most of the cows ranged from 20 gs. to 30 gs.; some of the animals had, however, not held, and others were slightly doubtful, so that there was a general combination of mishaps. Balcony, a six-year-old cow of the Certainty tribe, went cheap to Mr. J. Thom at 32 gs., and her bull calf, a fine hairy roan, was bought for Mr. Williamson at 30 gs. Elvira 12th, five years old, fetched 41 gs. (Dalton), and Archduchess 3rd, four years old, not yet calved, made but 34 gs. Mr. Fair bought a very cheap cow in Paulina at 29 gs., and her heifer, a roan yearling, 46 gs., by Royal Duke, went to Mr. Gray for Mr. Brocklebank, who bought several; Col. Graham and Mr. Binning Horne were also buyers. Royal Duke (25015) was reserved at 100 gs., and the fine bull Emperor Maximilian, exhibited unsuccessfully at the Royal, made only 47 gs. (Mr. Bardon). The bulls, rather low in condition, went very cheap, and altogether the 48 head averaged nearly £25. Five bulls, bred by Lord Kenlys, were included in the sale: these sold better, averaging £37 7s. 6d., the highest price being 65 gs. (Fair) for Valiant Oxford, a young bull of much promise; and Oxford Lad, from Mr. Maynard's stock, went for 36 gs. to Mr. J. Mattinson. The proceedings were over early in the afternoon.

MR. SHELDON'S SHORTHORN BULLS,

AT WESTON, ON OCTOBER 18TH.

BY MR. STRAFFORD.

Wharfedale Darlington, white, calved September 6, 1869; by 3rd Duke of Wharfedale (21619), out of Darlington 12th by Duke of Geneva (19614).—J. J. Stone, 27l. 6s.
Puck, red and white, calved September 13, 1869; by Duke of Brailes (23724), out of Harebell by 4th Duke of Thorndale (17750).—Benson, Foxcote, 42l.
Sabinus, red, calved October 7, 1869; by Earl of Warwickshire (26079), out of Giulita by Duke of Darlington (21586).—Bliss, Edgcombe, 47l. 5s.
Earl of Warwickshire 3rd, roan, calved November 4, 1869; by Duke of Brailes (23724), out of Lady Emily 2nd by 7th Duke of York (17754).—G. Garne, Churchill Heath, 70l. 7s.
Lord Hastings, red, calved November 17, 1869; by Earl of Warwickshire (26079), out of Lady Elizabeth by Duke of Darlington (21586).—C. Hobbs, 50l. 8s.
Bismarck, red, calved January 3, 1870; by Earl of Warwickshire (26079), out of Woman in Red by Duke of Darlington (21586).—Lathern, 27l. 6s.
The six bulls made £264 12s., at an average of £44 2s.

SALE OF BULL-CALVES FROM THE BALLYWALTER HERD.

Messrs. Marsh, of Cork, offered for sale, at Ballywalter, Ireland, fourteen bull-calves of the herd of Mr. Richard Welsted, at Ballywalter, when the following excellent prices were realised.

Golden Prince, roan, calved Jan. 2, 1870, by Prince Christian (22581).—Mr. Newman, Grouse Lodge, Co. Limerick, 45 gs.
Prince Leopold, white, calved Jan. 9, 1870, by Prince Christian (22581).—Lord Carbery, Castle Freke, 35 gs.
Prince Charlie, white, calved Jan. 13, 1870, by Prince Christian (22581).—Mr. Gash, Bandon, 25 gs.
Prince of the Realm, red and white, calved Feb. 12, 1870, by

Prince Christian (22581).—Mr. David Taylor, Portanan, Co. Limerick, 45 gs.
Prince George, roan, calved Feb. 14, 1870, by Prince Christian (22581).—Mr. Ahern, Blarney, 41 gs.
Prince Royal, red and white, calved Feb. 24, 1870, by Prince Christian (22581).—Mr. Meade, Ardagh, Co. Limerick, 30 gs.
Lord of the Manor, red, calved March 5, 1870, by Uncle Ned (19026).—Mr. Cooke, Ballyneal, Co. Kilkenny, 54 gs.
Uncle Sam, red and white, calved March 15, 1870, by Uncle Ned (19026).—Mr. Lloyd, Strancally Castle, Co. Waterford, 20 gs.
Fosco, red, calved March 21, 1870, by Uncle Ned (19026).—Mr. Murray, Ballystin, Co. Limerick, 38 gs.
Falstaff, red and white, calved March 27, 1870, by Sir Egbert (27468).—Mr. Leahy, 17 gs.
Protector, red and white, calved April 10, 1870, by Sir Egbert (27468).—Mr. Gash, Bandon, 29 gs.
Symmetry, red, calved April 19, 1870, by Sir Egbert (27468).—Mr. T. Sullivan, 33 gs.
Defender, red and white, calved April 21, 1870, by Sir Egbert (27468).—Mr. D. Driscoll, Clogheen, Cork, 21 gs.
Lord Spencer, red, calved April 30, 1870, by Sir Egbert (27468).—Capt. Bowen, Bownscourt, 21 gs.

GREAT CHEESE SHOW AT KILMAR- NOCK.

The sixteenth annual exhibition held under the auspices of the Ayrshire Agricultural Association, took place last month.

Sweet milk cheese, made according to any method (the weight of each lot not being under 1 cwt.).—First prize, John Gardiner, Baldoon, Wigtownshire; second, the Duke of Buccleuch; third, R. Stevenson, Hillhouse, Riccarton; fourth, A. Mitchell, Moorhouse, Loudoun; fifth, G. Mackerrow, Airliland, Castle-Douglas; sixth, R. Drummond, Pocknave, Craigie; seventh, J. Drummond, Camiscean, Craigie; eighth, W. Lindsay, Killoch, Mauchline; ninth, J. Galloway, dairyman, Cleudrie Inch, by Stranraer; tenth, J. Gibson, Stoneykirk, by Stranraer; eleventh, J. Lindsay, Lane, Stair; twelfth, W. Harcomb, High Ardwell, Stoneykirk.

Sweet milk cheese made according to the Cheddar method (the weight of each lot not being under 1 cwt.).—First prize, J. Clark, Killylan, Old Luce, by Glenlue; second, W. Harcomb, High Ardwell, Stoneykirk, by Stranraer.

Two cheese, each cheese not being less than 30lbs. in weight, made strictly according to the Dunlop method.—First prize, H. Wilson, Auchengelsie, Cunnock; second, J. Henderson, Kellose, Kirkeconnell; third, W. Sharp, Dallannah, New Cunnock; fourth, G. Dunlop, Warwickland, Fenwick; fifth, S. Wallace, Auchenbrack, Thornhill.

Loaf cheese (Cheddar or any other imitation English)—each lot not being under one-half cwt., and each cheese not exceeding 12lbs.—First prize, R. Drummond, Pocknave, Craigie; second, J. McCamen, Barnhill, Kirkecoln, by Stranraer; third, Nisbet, Gameshill, Dunlop.

Uncoloured cheese, made according to any method (the weight of each lot not being under 1 cwt.).—First prize, D. Blackburn, Calscadden, by Garlieston; second, D. Sayers, Old Luce; third, J. Drummond, Camiscean, Craigie.

Uncoloured loaf cheese, made according to the Cheddar method (each lot not being under 1 half-cwt., and each cheese not exceeding 12lb.).—First prize, D. Blackburn; second, W. Harcomb, High Ardwell, Stoneykirk, by Stranraer; third, D. G. Williamson, Bomby, Kirkeudbright; fourth, J. Nisbet, Gameshill, Dunlop.

Lot of cheese (not under 1 cwt.), made according to the Cheddar method.—First prize, G. M'Kerrow, Airliland, Castle-Douglas; second, J. Hannah, Inshanks, Kirkeconnell, by Stranraer; third, J. Drummond; fourth, J. Currie, Borland, Borgue, Kirkeudbright.

Sweet milk cheese, made according to any method (the weight of each lot not being under 1 cwt.).—First prize, R. Drummond, Pocknave, Craigie; second, A. Allan, Munnoch, Dalry; third, A. Dunlop, North Turnberry, Kirkeoswald; fourth, R. Stevenson, Gillmill, Stewarton; fifth, R. Stevenson, Hillhouse, Riccarton; sixth, J. Nisbet; seventh, W. Lindsay, Killoch, Mauchline; eighth, R. Torrance, Burnfoot, Loudoun; ninth, R. Dunlop, Alton, Kilmours; tenth, J. Howie, Boghead, Tarbolton.

AGRICULTURAL REPORTS.

GENERAL AGRICULTURAL REVIEW FOR OCTOBER.

Although the transactions in the wheat trade at the opening of the market were on a limited scale, considerable firmness has been apparent in prices, and, as we write, a decided tendency in the upward direction prevails. Very exceptional circumstances have influenced the trade, which have prevented the ordinary run of supply and demand from altogether controlling the market. The condition of France, and the probability of an extensive demand on French account as soon as the war is brought to a close has induced factors, to hold with firmness, and has caused millers to somewhat hastily replenish their stocks, which have, for a long time past, stood at a low ebb. The present agricultural condition of the north and north-east of France is something appalling. Not only have the crops been consumed, and the stock carried off, but the implements have been destroyed, and there is not enough grain left for seed for the present sowing. The only way to remedy the waste and destruction which have accompanied the war, will be by extensive shipments from this side, and factors have accordingly been amply justified in demanding advanced prices. The improvement which has taken place in values is about 4s. per qr. on the month, and at this enhancement a steady business has been concluded.

The weather has been somewhat variable. At the commencement of the month rain was much wanted to loosen the stiff clays, which refused to answer to the ordinary action of the plough. Recently, however, much moisture has fallen, and the ponds and streams which had become dried up in consequence of the droughty nature of the past season, again present their usual appearance. Autumnal preparations have made rapid progress, and potato-lifting is now almost completed. Farmers have thrashed out wheat liberally, and their deliveries have been large; but recently more attention has been given to barley, which has paid better than wheat in consequence of its being relatively higher in value. Many circumstances have conspired to induce the belief that we shall see high prices for wheat for some time to come. The winter season is now near at hand when there is an increased consumption of breadstuffs, particularly when the price of meat promises to rule high, while the close of the navigation both in the Baltic and Black Seas will prevent any considerable additions to the quantity of produce afloat. This, however, is still large for the time of year, and the report of advanced prices here will have the effect of stimulating shipments from America before the canals are closed. These facts, coupled with the certain demand we shall soon experience from France, amply justify the somewhat unexpected movement which has taken place in prices, considerable as it is.

Barley was in scanty supply early in the month, but latterly has come forward freely; the quality of the samples has been inferior. There is little good malting barley to be had, and the value of most samples shows a decline of 1s. per qr. on the month. Grinding and distilling samples, however, have maintained late rates. Malt has ruled dull at nominally unaltered currencies. There have been large arrivals of maize, but owing to the increasing demand values have been sustained. It is estimated that there are about half a million quarters of maize afloat from the South of Europe; but a firm trade is anticipated, as it is believed that the scarcity of cattle food will cause a steady demand throughout the winter. The price of oats has fluctuated considerably, but the quotations show no material change at the close as compared with those current at the opening of the month. Beans and peas have been scarce, and have commanded very full prices.

The worst feature in the agricultural world is the condition of the root crops. Turnips especially are very bad, being much blighted. Potatoes are not good, while the absence of rain has materially affected most other crops. As the grass has failed this year, this is a consideration of vital importance to our graziers, the prospect before whom is far from

encouraging. Fortunately, the season has so far been a mild one, and the cattle have been well able to keep out in the fields up to this time.

New hops have come forwards freely, and the condition of the samples has been very excellent. As much as 17 cwt. per acre has been secured on favoured lands, while the return generally is far above the average. A good trade has been passing in home-growths, while foreign produce has been quite neglected.

The wool trade has ruled quiet but firm. Choice English lustras have commanded steady prices, but common descriptions have been neglected. Large public sales of colonial produce commenced on the 27th October.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

The feature of the cattle trade has been the stoppage of the French and German beasts at the waterside, owing to the prevalence of disease amongst the arrivals from those countries, and only Spanish and Dutch beasts are now allowed to pass the barriers. Owing to this circumstance, the actual supplies exhibited at the Metropolitan market have shown a marked falling-off. The arrivals from our own grazing districts have been about an average, and they have included some prime animals, whilst the Scotch beasts have come to hand in excellent condition. It must be remembered that even throughout the severe drought pasturage was plentiful in the north, and therefore Scotch graziers suffered less from the deterioration of their stock. The late rains have also considerably improved the appearance of the meadow lands in the southern part of the kingdom, and cattle can now obtain a fair feed. As regards trade, there has been a continuance of firmness. Prime breeds have been in request, and have commanded full quotations, viz., 6s. per 8lbs.; other qualities, however, have been quiet.

With sheep the market has been moderately supplied, and the quality has been rather improved. On the whole, the trade has been steady, and the value of the best Downs and half-breeds has risen to 5s. 10d. to 6s. per 8lbs.

Calves have been scarce and dearer; but pigs have changed hands slowly.

The total imports of foreign stock into London during the past month have been as follows:

	Head.
Beasts	16,598
Sheep	42,584
Calves	3,035
Pigs	3,370

COMPARISON OF IMPORTS.

Oct.	Beasts.	Sheep.	Calves.	Pigs.
1869	11,496	28,252	2,365	1,902
1868	12,744	17,891	962	1,943
1867	13,061	29,265	957	2,911
1866	15,876	30,108	1,373	4,859
1865	15,344	69,611	1,952	9,135
1864	16,074	38,715	3,339	5,537
1863	11,560	37,521	1,129	2,965
1862	7,906	28,109	1,327	1,600
1861	5,577	42,538	1,207	5,315
1860	6,750	24,980	1,662	2,074
1859	6,026	24,323	784	875
1858	4,600	24,145	1,581	553
1857	5,819	24,102	1,998	1,233
1856	8,871	10,502	1,980	895

The arrivals of bullocks from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years:

From—	Oct., 1870.	Oct., 1869.	Oct., 1868.	Oct., 1867.
Lincolnshire, Leicestershire, and Northamptonshire	8,690	9,250	11,160	7,340
Other parts of England.....	2,200	1,637	1,790	2,500
Scotland	625	32	267	7
Ireland	1,300	1,400	1,110	1,820

The total supplies of stock exhibited and disposed of during the month, have been as under: Head.

Beasts	23,290
Sheep	130,820
Calves	2,955
Pigs	1,995

COMPARISON OF SUPPLIES.

Oct.	Beasts.	Sheep	Calves.	Pigs.
1869	23,840	86,930	2,375	830
1868	26,562	109,160	1,446	1,380
1867	28,340	103,870	1,129	2,865
1866	27,600	99,200	1,666	4,340
1865	30,210	157,840	2,932	2,478
1864	33,840	137,424	2,671	3,520
1863	30,512	110,800	2,029	3,439
1862	28,975	118,780	1,855	3,286
1861	28,220	121,390	1,626	3,650
1860	26,240	128,250	2,289	2,620

Beasts have sold at from 3s. 8d. to 6s., sheep 3s. 6d. to 6s., calves 3s. 6d. to 5s. 10d., and pigs 4s. 4d. to 6s. 2d. per 8lbs. to sink the offal.

COMPARISON OF PRICES.

	Oct., 1869.				Oct., 1868.			
	s.	d.	s.	d.	s.	d.	s.	d.
Beef from	3	2	5	8	3	2	5	4
Mutton	3	4	5	10	3	2	5	4
Veal	4	0	6	0	3	6	5	4
Pork	4	4	6	2	3	4	4	4

	Oct., 1867.				Oct., 1866.			
	s.	d.	s.	d.	s.	d.	s.	d.
Beef from	3	2	5	0	3	6	5	4
Mutton	3	2	4	10	3	8	6	4
Veal	4	2	5	4	4	2	5	6
Pork	3	4	4	2	4	0	5	2

The dead meat markets have been well supplied. The business doing has not been extensive; but prices have ruled firm. Beef from 3s. 4d. to 5s. 2d., mutton 3s. 4d. to 5s. 4d., veal 4s. 8d. to 5s., and pork 3s. 8d. to 5s. 8d. per 8lbs. by the carcass.

ISLE OF ELY.

The early harvest and the subsequent fine weather have enabled farmers to accomplish their autumn tillages most satisfactorily, and very seldom has there been so much of this sort of work done as this year. Autumn cleaning becomes year by year increasingly essential, in consequence of the much larger acreage of crops sown in the early spring. But this work has now given place to wheat-seeding. The long continuance of dry weather kept the land in an unfit state to receive the seed, and it is only during the last ten days, since rains have fallen, that we have had a good seed-bed. Sowing is being rapidly proceeded with now, and in a very short time the bulk of the crop will be in the ground. The harvest is proving very much what we represented it in our report in July. Where there was a full plant of wheat the yield is good, above an average; but where the plant was thin and irregular it is affording a deficient yield; and we still question whether the whole Fen country will much exceed an average crop. We are inclined, from the information and knowledge we have acquired, to place it at just about an average, or 4½ qrs. per acre. Potatoes are a heavy crop, but have lately shown symptoms of disease to a considerable extent on many lands, especially where the subsoil is of a wet nature. Mangels are a good crop, are ripe and being taken up, and will be found very valuable during the winter months. Coleseeds are generally not good, having suffered from mildew, fly, and drought. Meat continues dear, and without any appearance of an early change to lower prices. The corn trade is slightly improving, and we shall not be surprised if the low range of prices experienced since harvest should be shortly followed by one higher and more remunerative.—Oct. 20.

THE NORTH RIDING OF YORKSHIRE.

A change of weather took place here on the 8th inst., since when we have had a rainfall of upwards of five inches, accompanied with a low range of temperature. Very little wheat is yet sown, but the rain will greatly facilitate the preparation of the seed bed, and a fortnight's dry weather would enable much to be sown in beautiful order. Our pastures are very bare, and fogs are little better, and the removal of cattle to their quarters in the folds cannot now be long delayed. Owing to the almost universal failure of the turnip crops and the short crops of hay much artificial food will be required to enable anything like an average head of stock to be wintered, and the usual spring supplies of beef and mutton will from this district be very short. Our cattle on many farms have been suffering from foot-and-mouth disease, but we hope it is now on the decline; but where so many centres of disease exist it is very difficult to prevent its spreading. Fat cattle and sheep are well sold up, while anything in store condition, especially sheep, is quite a drug in the market. Thrashing, to any extent, has not taken place; but, referring more especially to that grown on clay soils, where any wheat has been thrashed, the yield is tolerably satisfactory. Our greatest deficiency will be found on the light thin soils, where the grain did not properly fill. The potato crop is spoken of as a light one, but little disease exists. Mutton in our markets is now making from 7½d. to 8½d. per lb., beef from 5s. to 9s. 6d. per imperial stone.—Oct. 21.

W E A L D O F K E N T.

After a summer of unusual drought we have a return of wet, which may prove itself another extreme. The weather was all that could be desired for preparing the land for the reception of the seed. The wheat crop of the past season was, on the whole, quite up to expectation as regards quantity, but we scarcely remember a year when black was so general in these parts, it being difficult to find a growth quite free: farmers need not be troubled with black wheat if they would take more pains and resort to the old-fashioned practice of lime and brine, which system has of late years gone almost out of doors; those of the old school who have not been led away by new fanciful ideas have grown their wheats entirely free, not only from black, but prevented the sowing of that which causes more additional labour in the spring of the year than the time occupied in more carefully preparing the seed before sowing. The price of wheat since harvest has gradually declined, but now appears to have reached its lowest; and it is very doubtful if prices do not range higher by several shillings ere another harvest arrives than we have seen for some time past. The stock on hand in this district is by no means large farmers having sold pretty freely before the hop-picking season to meet their requirements. The crops of Lent corn were in nearly all cases under an average, oats more particularly; the quality being very indifferent parcels weighing forty pounds the bushel are very few: there are more under thirty-two pounds than over, so that good corn must range at higher rates. The heaviest crop of hops on record was grown this year on most grounds, nearly two years' consumption, showing clearly the plantation to be large; they are selling now at a price which cannot be remunerative to the grower; and if they wish for better prices, which cannot be expected with such a growth as the present, the plantation must be reduced and attention paid to the cultivation of the better sorts, and grown on soils particularly adapted for the production of fine samples. The late rains have improved the appearance of the pastures. Sheep are doing better, and are, at present, free from disease. Beef and mutton realize high figures. Wool sells slowly at £13 to £13 10s. per pack. We have but few labourers but what are fully employed.—October 22nd.

AGRICULTURAL INTELLIGENCE, FAIRS, &c.

BANBURY FAIR.—The sheep and cattle trade was very good, and a large number of animals were shown. Beef brought from 5s. 4d. to 5s. 8d., and mutton 5s. 4d. to 5s. 6d. There was a large number of sheep and cattle in the market, but as the prospects of keep are very indifferent, the trade in this department was flat.

BOSTON FAT SHEEP MARKET.—An average supply Prices about the same as this day week.

CAISTOR FAIR.—Of Sheep there was fully one-third less penned than at the last fair, and business was well over before noon. About 1,000 head of cattle were brought to market, and mostly offered at prices which meant a clearance: best kinds were in good demand. A decided leanness was the characteristic, to which practical objection was taken by buyers in sorting and bidding for the best only in almost every lot. Good useful steers sold readily at £16 and upwards; a lot of eight bullocks in fine condition were sold at £22 10s. a-head, inferior sorts were bad to sell, at from £10 to £12. Of cows there was a good supply and a brisk demand, at £12 and upwards. Of horses there was an average show: a few good working animals for agricultural purposes, but the bulk composed of old and inferior kinds.

CARLISLE FAIR.—Well-conditioned stock was good to sell, and previous rates were easily obtained. Sales throughout the forenoon and early part of the afternoon progressed very steadily, the better class of Galloways and Shorthorns bringing pretty high rates. Galloways £6 10s. to £13 10s., Shorthorns £7 to £12 10s., Irish £4 15s. to £11 10s., milch cows £15 to £17 a head. There was a fine show of lambs and sheep. Some 300 head were on offer, including many very nice-looking flocks of half-breeds, Cheviots, and crosses. Though buyers were present in pretty large numbers trade only progressed slowly, and at the close of the market several lots remained unsold. The rates paid for good lambs were similar to those current recently, cost of keep in the interval taken into account. Half-bred lambs 16s. to 30s., cross-bred 11s. to 18s., Cheviot 12s. to 15s., Cheviot ewes 24s. to 30s. each.

CERES CATTLE AND HORSE MARKET.—There was a large show, and much business was transacted. The top price of fat was 9s. 6d. per imperial stone; and midding and inferior, 9s. and 8s. 6d. Wintering stock was in demand, and many lots of Irish cattle were shown. Two-year-olds sold at from £9 to £12 10s. a-head. Milch cows were keenly sought after, and realized from £10 to £21 a-head. The horse market was well supplied, but many of the animals were inferior. Good-looking horses sold at from £18 to £40 each.

COLCHESTER FAIR.—A large number of horses and beasts were shown, but no sheep. The prices ranged from £5 to £20 for useful ponies and cobs; cart horses averaged from £25 to £40. The demand for store beasts was not good, and prices are hardly quotable.

DALKEITH FAIR.—The number of cattle on offer exceeded 5,000; last year the number was 3,500. The increase is chiefly to be attributed to the large show of Irish stock, while that from England was also above an average. Generally, the English cattle were inferior in regard to quality, and there was a great scarcity of animals in forward condition; indeed, so few have not been seen at this market for some years. The falling-off in this respect is the result of the long drought experienced in the end of the summer, and the prevalence of murrain in the country. The lots from Ireland were moderately fair as to condition, and embraced all ages. A few polled Galloways from the south were exhibited, and one or two lots of crosses. Trade opened with English Shorthorns, and a good demand was experienced throughout. For the best class of stirks—of which, however, the number was smaller than usual—there was an excellent sale at high prices: indeed, higher than those current at East Linton and Falkirk. A complete clearance of this class was effected by mid-day. For Irish cattle the demand was not so quick, but on the whole they enjoyed a good fair trade, and the prices of recent markets were maintained. Stirks suitable for feeding were in chief request; those for wintering were slower, but ultimately they were all cleared off. In the afternoon, a number of lots of the rougher descriptions of Irish cattle were unsold, and at the extreme close of the market a clearance of these had not been made. The following sales were reported: Three-year-old Shorthorns at from £14 10s. to £16 10s., two-year-olds from £12 10s. to £14 10s., stirks at from £9 to £10 7s. 6d., Irish three-year-olds at from £14 to £15 10s., two-year-olds at from £11 to £13, and stirks at from £9 to £9 15s. The show of horses was not so large as usual, nor was the quality an average. For the best class of draught animals there was a fair sale at high prices. Cart horses sold at from £28 to £57, and a harness horse at 30 guineas. M. Leggat, Glasgow,

bought several draught horses, at prices ranging from £30 to £10. Mr. Hamilton, Haddington, held a good stud, and sold at from £30 to £50. Mr. Archibald Yuille, Glasgow, bought several at £35 to £50. Mr. R. Allan, Glasgow, sold cart horses at from £20 to £35; and purchased ponies at from £12 to £18.

DEVIZES FAIR was held on the green. There was a larger supply of sheep than on the last occasion, but mostly of inferior quality, lambs and culls being the rule, and good ewes and wethers the exception. Although trade must be quoted dull, there was no lack of buyers, and sales were by no means difficult to make, at about the prices of Castle Fair (Oct. 4), the advance of 1s. to 2s. per head which took place at Weyhill being now lost. Lambs made 15s. to 30s. per head, ewes 23s. to 40s., and wethers 30s. to 54s. The cattle fair was one of the smallest we have ever seen here since the cessation of the cattle plague, but the great prevalence of disease, especially that of "foot-and-mouth" among the horned beasts of the district, is quite sufficient to account for the small supply. The fair was a very quiet matter, and prices the turn lower. The beasts present were, moreover, as a rule, of very inferior quality.

DOLLAR ANNUAL MARKET.—The show of cattle was good, and the prices for winter cattle were considered high. Stirks sold at from £10 to £12, and two years old grazing cattle from £15 to £17.

DUMFRIES FAIR.—The supply of cattle was fully 1,000 head, and comprised a number of lots of very superior three years old Galloway bullocks, a large number of Highlanders, including superior two years old grazed in the district, and a number of lots of stirks from Falkirk. In the morning there was a good demand for the best Galloway bullocks, and a number of lots were sold early at high figures. By eleven o'clock the market grew duller, and the weather becoming unfavourable, had a rather depressing effect. During the afternoon the market continued slow and stiff for all descriptions, the unprecedentedly high prices asked deterring customers from purchasing. Prices for three years old Galloway bullocks ranged from £13 to £15 10s., two years old £10 to £12 10s., one year olds £6 to £8 10s., three years old Highlanders £13 to £14 10s., two years old ditto £8 to £10 10s., one year old ditto £5 to £6 15s., Irish two years old £9 to £11, one year olds £5 10s. to £7. Mr. Henderson, Garroch, sold 4 four years old Highland bullocks at £20. Mr. Robson of Barneuch sold a small lot of Galloways at £20. A lot of 40 three years old Galloway bullocks sold for £15, a lot of 30 made about the same figure, a lot of 32 three years old Galloways sold at £15 10s., a score of two years old Highland bullocks sold for £10 15s. The supply of sheep was small, and consisted principally of second and third half-bred and cross-lambs. The quality was scarcely up to the wishes of purchasers, and the market was rather slow. Prices for half-bred lambs 18s. to 24s., cross lambs 14s. to 18s., Cheviot lambs 10s. to 14s.

DUNFERMLINE MONTHLY MARKET.—Milk cows were very scarce, but anything good brought high prices, and several sold from £10 to £20 each. Fat cattle were a short supply, but what were sold brought good returns. In the afternoon the horse market took place at the same stance, but the animals shown were very deficient in quality, and consequently few sales were effected.

EARLTON FAIR.—There was a large show of cattle, and a steady good demand at high figures, the recent rains improving the turnip crop considerably, and thus enhancing the value of feeding stock. There was a large attendance of farmers and dealers. Two-year-olds were selling at from £13 to £15 10s., and stirks from £7 10s. to £12 15s. Mr. Eskdale sold a lot at £12, and bought a good lot at £12 15s. In the horse market there was a fair show, and for good draught animals there was an active demand.

ELGIN MONTHLY MARKET.—The market throughout was characterised by briskness and an advance of prices. The following are a few of the sales: A lot of six stots and queys at £14; a lot of five two-year-old heifers at £17; a lot of three two-year-olds for £70; a lot of two-year-old stots at £17 10s.; seven six-quarter-olds at £11; a lot of four two-year-old stots at £15 15s.; also two stots for £28 10s., two one-year-old stots for £16; also two queys for £16; a lot of five one-year-olds at £10, a lot of eight one-year-olds at £8 10s.; and a lot of seven two-year-olds at £15 10s.

GLOUCESTER FORTNIGHTLY MARKET.—There was a good supply of stock of all descriptions, and buyers from long distances attended in great number. Trade was good. Beef made from 8d. to 8½d. per lb., and was in favour of the seller at these prices. Mutton sold well at 8d. to 9d. per lb. Bacon pigs made 10s. 6d. to 11s. and porkers 12s. to 12s. 6d. per score, and the demand was good.

HAWICK TRYST.—The attendance was below the average, and the same may be said of the number of horses. They consisted principally of young long-tails for farming purposes, in the hands of dealers from Cumberland. Mr. John Foster, Nook, Nichol Forest, showed a good string, and sold two-year-olds at from £28 to £40. He had a few yearlings, which brought from £15 to £20. Mr. Foster, Rocliffe, sold two-year-olds at from 23 to 40 guineas, with a luckepenny in the highest quotation. Mr. Mitchell, Harperhill, Brampton, showed 36 two-year-olds, and got similar prices. Mr. John Mitchell sold a fine two-year-old at £38. There is a scarcity of young horses this year in the Cumberland breeding districts. Mr. Ogilvie, Chester, bought one of the finest horses on the ground for £40; Mr. Pringle paid £39 for another; and Mr. Welsh, Kirkton, got a fair good animal for £29. There were few ponies for sale, but high prices were asked for the best presented—as much as 20 guineas in some cases. Sales were in a few instances effected at £10 to £14. Some hacks and old horses were on the ground; they brought £10 to £20, according to quality and condition. One three-year-old horse shown by a farmer brought £32 10s.

HEREFORD OCTOBER FAIR.—This fair was one of the old-fashioned type as to weather, which was for some hours wet and windy to a degree that we have not often seen paralleled, and which much interfered with the convenient transaction of business. The supply, though very small for this great and well-known fair, one of the first of its class in the kingdom, was fully as large as had been anticipated. It was chiefly confined to store stock, which, although hanging heavily on hand, realized much the same values that have ruled here for the last few weeks—prices which we scarcely need say leave the balance on the wrong side of the ledger in the cases of too many of the vendors. Fat beef was scarce and was readily disposed of at from 7½d. to 8d. per lb. Speaking generally as to the quantity of stock which exchanged hands, and as to the prices which were realized, the fair was considered to be a bad one in the interest of farmers. There was a moderate supply of sheep—indeed we never look for a large supply at the October fair. Trade in stores dull. Prime fat wethers realized 3½d., inferior qualities of mutton 7½d. per lb. Bacon pigs were sold at 6s. 9d. per stone, porkers 7½d. per lb. Stores in demand, with an upward tendency.

LINCOLN FAT STOCK MARKET.—A small show of both beasts and sheep, and prices unaltered, viz., beef 9s. to 10s. per stone. Mutton 9d. per lb.

LOCKERBIE FAIR.—There was the largest show of sheep and lambs that has been known at any October market, the number being about 22,000, or nearly three times as many as at the corresponding market of last year. A large proportion of the stock was Cheviot ewes. The turnip crop in Dumfriesshire is in general good, and an active demand was anticipated. Buyers were pretty numerous, although few Galloway customers were present. The large supply caused the market not to be so quick as expected. For the best animals in all classes of stock there were customers, but inferior were slow to sell. The few lots of the better class of half-breds were early picked up. For the top lots of Cheviot ewes there was steady demand, although not very quick; but by one o'clock the crack lot had mostly been sold. The market on the whole may be considered a dear, slow selling market. Prices were not what buyers quite expected, although very high. Lambs would in most cases be paying their keep, but there would be no profit on purchases in September. Cheviot ewes would be 1s. to 1s. 6d. lower than last year. Prices for half-bred lambs ranged from 22s. to 28s. 6d. for the best, and 15s. to 20s. for the other descriptions. Cross lambs 14s. to 22s. 6d. Cheviot wether lambs from 8s. to 14s. Cheviot ewe lambs 7s. 6d. to 14s. 5d. Cheviot cast ewes 24s. to 32s.

MAIDSTONE FAIR.—There was a tolerably good show of horses. First-class animals fetched from 40 to 45 guineas; second-class 30 to 35 guineas; good prices being also obtained for roadsters and ponies, but the trade was somewhat slow. Between 5,000 and 6,000 sheep were penned. Twin-mark

ewes sold for 34s., lambs from 10s. to 30s. The supply of store beasts was short, there not being more than from 200 to 300 in the field, and these at from £10 to £12 per head.

MARKET HARBOROUGH FAIR.—There was a number of good horses. The trade was very slack, the buyers not being in proportion to the number on sale.

MELTON BULLOCK FAIR was by no means large. There were, however, several sales effected, the prices in all cases being high. 80 Welsh beast were sold at £9 a head, and 80 shorthorns from £8 to £16; Mr. McCauley, from Ireland, had 46 shorthorns, for which he asked £17 a piece; Mr. Rose, of Boxead, 45 North Wales runts, £7 10s. to £9; Mr. W. Fenner, of Colchester, 120 shorthorns, prices £6 10s. to £12 12s.; Mr. John Fenner, of Dedham, 124 shorthorns, £10 to £18 18s., and 100 Welsh beasts, £7 to £10; Mr. Amass, of California, 86 shorthorns, from £9 to £11. The largest exhibitor was Mr. Makin, of Ringshall, who had 400 shorthorns, at prices varying from £10 to £20 each. Mr. Walter Bond sold six three-year-old shorthorn steers from Lord Rendlesham's, at £16 5s. each, and two Brittany cows at £9 5s. a piece; also a three-year-old Brittany bull, quite fat, for £14; a two-year-old Alderney heifer for £12 10s., and two two-year-old Alderney heifers at £10 15s. each. An Alderney cow in milk was sold for £8 5s. A fat Suffolk bull, estimated to weigh 70 stones, £27. A Chesnut brood cart mare, the property of Mr. C. Barnes, of Kettleburgh, was bought for £47 15s. 6d.

RUGELY HORSE FAIR was very thinly supplied with good horses. Few only of the London or other dealers were present. One valuable hunter sold for £100. Of good cart colts and horses the supply was very limited, although the demand was brisk; whilst inferior animals and Welsh ponies were numerous, with few buyers. The supply of young stock was very scanty, and ready sales were effected.

ST. COLUMB MONTHLY MARKET was held on Tuesday last, and was well supplied with fat and store cattle and sheep. Fat cattle fetched from £3 5s. to £3 10s. per cwt.; sheep 7d. to 7½d. per lb. The attendance of buyers was not very large, but a fair amount of business was transacted.

SALISBURY FORTNIGHTLY MARKET.—The number of beasts was small, and good qualities scarce. The latter, therefore, met with a quick sale, at full rates. In the sheep department the supply was good, upwards of 3,000 being penned. A fair demand prevailed, and a clearance was generally effected, best wether mutton realizing from 8½d. to 9d. per lb., and ewe ditto from 7½d. to 8d. Oxen realized 14s. to 15s. per score for the best, and heifers from 12s. 6d. to 13s. 6d.

SHERBORNE FAIR.—Trade was satisfactory, at the full currencies of Weyhill, and a good many lots were moved off early. The great difference, not only in the quality but the condition of the lots, gave prices a rather wide range, and ewes may be quoted from 28s. to 40s., several lots fetching the top price. Lambs ranged from 18s. to 30s.; wethers brought from 37s. to 47s. In the beast fair there was a thin and indifferent lot of stock, for the best of which 13s. was asked, and asked often before a sale was effected.

SLEAFORD FAT-STOCK MARKET.—Large show of sheep, which met with a brisk trade. Good show of really prime fat bullocks, which sold at extreme rates. Small show of pigs. Mutton realized 8½d. to 9½d. per lb., beef from 10s. to 10s. 6d., and pigs 8s. 6d. per stone.

STRATHAVEN FAIR.—The turn-out of cattle was a fair average, but generally the quality was inferior. There was a good number of Ayrshire milch cows on the ground, and prices for the best sorts were higher than those of recent fairs. Irish winter stock were well represented, but at the close a number were left unsold.

WHITCHURCH FAIR.—There was an enormous supply of pigs, chiefly stores, which were sold at much reduced prices. Fat pigs realized from 11s. to 11s. 6d. per score.

GLOUCESTER CHEESE MARKET was the smallest ever known for this time of the year, only 32 tons having been pitched. The cheese met a ready sale at 70s. to 72s. for best quality, seconds 60s. to 65s. A clearance was quickly made.

GLASGOW CHEESE MARKET, (Wednesday last.)—We have still a plentiful supply of cheese, which meets with a very slow sale, and prices continue easier, especially for medium qualities.

CALENDAR OF AGRICULTURE.

Finish the sowing of wheat on clay fallows, leys, and clovers, if any was deferred from last month. Later sowings than in last month do not prosper in South Britain; the bulk may be equal into February, but the ripening is later with an inferior quality of grains. Spring wheats are not very prosperous in the same localities, while over the north of England and the south of Scotland Lammas wheat is well sown in March, and spring wheats at the same time. In such cases, some unknown causes prevail, and may be chiefly in the climate.

In favourable weather raise from the ground the crops of Swedish turnips. Store the bulbs dressed by hand-sickle from fibres and tops, which last are given to store cattle in the yards and to sheep in the fields. The store heap of roots at the homestead must have dry bottom in seven to ten feet in width, and a central height of the heap of about four feet, with a sloping ridge of about six feet, covered with a thin straw thatch, to defend from rains and at the same time admit a free circulation of air. A permanent covering for the heaps of root crops being always made of the same extent, may be formed of two sloping sides of laths nailed together at the top, with side-rails, on which a thin layer of straw is tied by strong twine. This structure will last for years; and, being joined in separate pieces, will be very conveniently placed and replaced, while the height being one foot above the heap of roots, will permit the transmission of air to maintain a dry and cool position for the preservation of the vegetable juices which being volatile are dissipated by exposure. Hence the great advantage of vegetables passing from the earth into the stomach in the least possible time, and hence the weighty objections that can be urged against the exposure of roots or bulbs by cutting, slicing, or any mode of use that deteriorates the quality by the loss of the inherent qualities, not properties, which are strictly permanent and obvious to the exterior senses. A vegetable cannot be severed from the ground for many minutes without loss, and hence the superior benefit that is derived from the roots being eaten by the mouth of the animal over the cutting and slicing of the bulbs. The tender mouths of young sheep and cattle, in a short time of weakness, are easily assisted by older animals breaking the bulbs in a cheaper way than by machines. Slicing and cutting encourages swallowing of the pieces, which lessens mastication and the production of saliva, which is of vast consequence to the purposes of assimilation and digestion.

Thrash grains regularly once or twice in a week, to supply fresh provender for the cattle and litter for the yards. Cut chaffs for the horses, of hay and straws mixed, for the bullocks that are tied up and for the milch cows, to be used raw or steamed with roots. Sell and deliver all grains as thrashed; the keeping of stores in granary does not produce any benefit as a system, which reduces the use of a granary on any farm to the convenience of a quantity of oats to supply the work-horses, which must not be long kept to contract a musty smell. The other use of a granary is for stowing and packing wool on the extensive growing of that article.

Begin to plough stubble lands for the fallows of next year, and prepare by following the best soils to be planted with the early spring crops as potatoes, beet, and Swedish turnips. Even the half-execution of the necessary fallowing of the spring will very much advance and facilitate

the planting of the crop, with the advantage of better retaining moisture than when exposed by the spring workings. Though the autumn fallowing of lands can only be done on dry soils under benign climates, and consequently restricted in the application, yet it forms at least a partial benefit, and hence it deserves a notice on the list of agricultural operations. Subsoil ploughing should follow the winter furrow; but general opinion does not allow the benefit of that operation, though it may be useful in particular cases, as by a furrow across thorough draining, to open the descent of water into the cavities. But such a partial use might not justify the cost of the implement and of its performances.

Lime in the condition of heat is spread over the stubble grounds during this month, and covered into the land by the winter furrows of ploughing. The cinders will be partly dissolved by the moisture in the land and by any air that reaches the lime, and the remaining parts will be brought into action by the spring ploughing to emit caloric and to form a mucilage, both which operations are very highly conducive to vegetable growth by warming the ground and producing an earthy residuum. This mode has in its favour the very great recommendation of the least possible expense; but it must obviously be successful only on the best loams and the least tenacious of clay soils, as the most vicious will repel caloric almost at any time and in any condition, and may be supposed to do so very strongly during the winter's cold, while the loams, with the exuvial remains of animals and vegetables, will imbibe caloric almost under any circumstances. It must be a vast benefit in the application of lime that the cinders dissolve in the ground for the reasons that have been stated.

Supply to the cattle in the yards by break of day an ample feed of turnips, rooted and topped for the fattening animals, and with the tops attached for other sorts of cattle. Wooden cribs, with latticed bottoms, suit best in letting the rain and fith escape freely downwards. The turnips should be all eaten by night, to prevent accidents from choking happening unseen. Give milch cows cabbages and beetroot, and one feed daily of steamed meats.

Continue the feeding of sheep as directed for last month. The animals may be folded over-night on the bared ground in mild climates, but more generally a liberty is given to run back for shelter.

Feed pigs, as directed last month, in roots and meals steamed together, or in a raw condition. The fine intestines of the pig derive the most benefit from cooked food of all the animals of the farm. Feed poultry with light grains and with steamed potatoes with meals mixed, and given in troughs placed in a shelter-shed in the poultry-yard.

Attend to the feeding of young horses in the yards. Provide a regular supply of fresh water in a trough, and a convenient and dry shelter-shed; give as food straws and hay chaffs, bran and oats, and a feed on each day of steamed roots. The first winter's keep has a very large share in making good animals of all kinds.

Flood watered meadows, clean out and put into proper order for use the main channels, conveying gutters, and the sluices of flood-gates.

Begin to cut underwoods, dividing the growths into the necessary articles of hop-poles, fencing-stakes, and

hurdle-stakes, cooper's-hoops, weaving-rods, and withies, ending with fine faggots for the lime-kiln. Open, drain plantations, by making a cut in the hollows, which are strictly followed at the courses of the drains; repair old fences, and make the new ones; cast open ditches, and repair roads.

Plant all kinds of forest trees, in clumps or in circles in

knolls, in a few together as in corners, or in single standards. Choice trees for ornament will be much forwarded in the growth by a quantity of mixed guano and earth, in four or five to one being placed under and around the roots, pruned to the stem according to the quantity of fibrous protrusions. The growth will be rapid and strong, and lasting for several years.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

Try again for early peas and beans. Dig roots for temporary supply of the so-called Jerusalem artichoke. Store all the potatoes, carefully observing the condition as to soundness or decay. Keep the store very dry. Dig carrots, parsnips, and beet, and secure them in dry sand.

Transplant more spring cabbage, and fill up blanks with cauliflowers of August-sown on warm borders, where they could be occasionally protected. Cover sea-kale for forcing, and prepare more asparagus plants, placing them in pits, with a bed of tree-leaves under the earth.

Protect the plant of artichokes by mulch or masses of leaves, after removing all the old stalks and decayed foliage.

Broccoli and cauliflower in the open ground should be laid down, and be guarded with a covering of dry earth laid close over the stems.

Finish earthing of celery if frost threatens; cover the ridges and tops with dry haulm.

Tie up some plants of endive, and remove others to dry frames for blanching.

Give air occasionally to lettuces under frames, and also to radish and salad, when that mode is adopted of procuring early crops of those most agreeable esculents.

Dig the grounds from which root crops have been removed, in order to expose the soil to the alternate vicissitudes of the wintry climates, to be thereby broken and dissolved in the bulk. A digging in the spring receives the seeds of creeping-rooted plants, as peas and fibres; when the ground is firm and tenacious, on the lighter soils, the spring digging may be sufficient, and the autumn preparation omitted.

Dig into the grounds to be planted with roots in the spring, a covering of the richest dung from the urine pit, short in the composition, and impregnated with liquids to dropping, but not in waste, semiprutescent and slimy in appearance. Opinions differ on autumn or the spring application of manure, no doubt arising from the different circumstances of application in the soil and climate. A general experience values highly the production of the black humified condition of the land, seen when the ground is moved in the spring, that arises from the combination of the elements in the dung and in the land in effort to form a new substance that is most beneficial to the growth of vegetation, and which produces a yield of seed-fruit, whereas the fresh dung tends to yield a profusion of leaves and fibres rather than sound fruit in seeds.

The present time is also very fitting to place in the digging of root-crop soils, once in every four or five years, a quantity of hot lime cinders of small size as a goose egg, in separate positions in the land, with a covering up of the half-depth of the spit. The moisture will partly dissolve the cinders, and the spring of the land, with the movement of the cinders, will induce a further dissolution of the incinerated earthy base, supposed to be formed from the roe of fishes, evolving much caloric to penetrate

the entire body of the soil, spreading into every corner and atom, and raising by its presence, as a quality, the temperature of the ground, producing a condition that is highly favourable to vegetable life. This warming of the ground may continue in the average of four or five years, and then renewed, always with an application of a dung of animal and vegetable matters, in order that accumulation of elements may be joined to produce from the action of caloric the benefit of damp warm exhalations that are a chief element of the ceriform food of plants. The action of caloric on soils will depend on the conducting power of the constituent parts which are favourable to that power in the ratio contained of exuvial vegetable and animal matters. Clay is a very low conductor of caloric, and hence the failures of lime as a manure on purely clay soils, owing to the small quantity applied. All clay land of any denomination may be reduced into fine soils, broken and sundered in the viscous adhesion by the intimately penetrating action of caloric from cinders placed in the ground, and dissolving in that position. For after all that has been spoken and written on the subject of lime as a manure, a very tenable opinion may be hazarded, that a chief benefit is derived from the action of caloric from the incinerated body in warming the ground, and in stimulating the dung and the soil, along with a basic residuum, in a mucilaginous condition, which adds to the early constituents. The land of the kitchen garden being treated mostly with vegetable matters, will derive much benefit from a gentle warming application to stimulate the action of inert bodies of several compositions.

FRUIT DEPARTMENT.

Wall trees and berry-bearing shrubs may be pruned at this time, although nothing is gained over the spring pruning in February, which is best preferred. But if espalier trees are not already finished, the process may now be ended, every regular spur-pruning being done in dry weather.

The mistriven growth of trees will be much assisted and forwarded into a thriving condition by pruning the roots at a distance from the stem, according to the numbers of fibres that are protruded, forming a circular branch of the ring that will be cut, and filling the cavity with a mixture of guano, with four or five times its bulk of fine earth. The trench must be carefully covered and well watered. A rapid growth will ensue to last for several years.

Leave strawberries for the winter, protected by their own foliage.

Raspberries may be tied by cord neatly to stakes, six roots to each, stopping at an angle towards the north, on to a neat open trellis. It suits well to secure by this means the full exposure of next year's growing canes to the sun; the plants are too crowded by the perpendicular confined tying to stakes.

FLOWER GARDEN.

Plant in rich beds of fine earths, sands and loams, the

bulbs of tulips, crocus, hyacinth, narcissus, jonquils, &c., &c.; open the holes neatly, place the bulb an inch or two deep, and cover it all round with fine soil. Bulbs grown in pots must be sunk deeply in sands or warm earth to remain till the early growth of spring. Cover beds of choice flowers, as azalias, rhododendron, &c., with a two or three-inch coating of leaf-mould, sand, or sandy loam, mixed together. Move a few herbaceous plants, roughly

fork the surface of beds, and scatter old rotten dung over it. Observe neatness and order everywhere.

Where any semi-hardy plants or any other kinds are kept in pits, frames or similar erections, the situation should be as dry as possible, and be aired at every convenient opportunity. Dry sawpit dust is a good material for the pots to be plunged in, as it guards from the mould effectually.

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

Though September did little to make up for the drought of the summer, after the first fortnight in October the needed supplies of rain came freely, so that the ponds have again filled and the earth has become saturated enough for all agricultural purposes. This, with the generally mild weather prevailing, has recovered the green of the meadows and greatly helped the turnips and other esculents which were threatened with an almost total extinction. Farmers will be exceedingly glad of this timely help before winter, as it will assist them to get their stock through the severe weather. The war, which has continued raging, and all in favour of the Prussians, has at last reached a height justifying the intervention of neutrals to obtain a peaceful settlement, and our own country, after a noble display of concern for the wounded of both nations, had certainly a right to take the lead in this moral effort which our latest information gives us to hope will be eventually welcome to both nations. In the mean time our anticipations of an advance on wheat has become partially realised, and from 3s. to 4s. per qr. has been gained upon the lowest point. This may be traced to the derangement of commerce caused by the war. Belgium and Holland having been cut off from Baltic supplies by the late blockade, have naturally turned attention to our low quotations, and all along our eastern coast purchases have been freely making for those countries at better rates than would have been procured in London. This lessened the supplies to the metropolis, but little resulted at first, the London trade being well furnished by shipments from America and Russia; but now some of these have been wanted on foreign account, the case has altered, and English millers found themselves outbid by the foreign shippers. The advance, therefore, though reluctantly, was paid, and as not only Belgium has been taking English wheat freely, but orders have come from that great shipping port, Hambro', and have begun to be executed, a light has been let in upon the short supplies yet received in Germany, as also upon the poor condition in which those supplies have come to hand. America too, which was the only country much moved by our dull and declining markets, shows an advance of about 4s. per qr. on her recent rates, for at New York both depression as well as excitement are very soon felt, and we really think that the waste of this European war will yet further enhance prices. Even should peace be eventually agreed on, much of the damage done is irreparable, and must certainly be severely felt through the coming season. The following rates have recently been quoted at the places named: red wheat in Belgium 55s. to 58s., white Zealand at Rotterdam 46s. to 54s., wheat at Hambro' 50s. to 56s., red at Stettin 48s. to 50s., fine high-mixed at Danzig, 61 lbs. per. bus., 50s. 6d., red at Petersburg 41s., red at Milan 48s., white at Valladolid 52s., Saide at Alexandria 41s., at Berdianski 49s. 6d., freight

included, Milwaukee and Chicago, cost, freight, and insurance included, 46s. 9d. per 480 lbs.

The first Monday in Mark Lane commenced on fair arrivals of wheat, both English and foreign. The show of fresh samples from Essex and Kent during the morning being short, factors commenced by asking 1s. advance, but millers resisting it, sales were eventually made at the previous currency. The foreign inquiry was very limited, though no improvement on the previous rates was required. There was a quiet trade in floating cargoes at unaltered prices. The upward movement in the country not being responded to in London, but few places noted any improvement in prices; Sheffield, Hull, and Ipswich were occasionally 1s. per qr. higher for fine qualities, and Barnsley was about 1s. to 2s. per qr. dearer. These instances and a few others were the only exceptions to a generally quiet and unaltered range of prices. The change during the week at Liverpool was a rise of 2d. per cental on Friday. The Scotch markets were of the same tenor, Glasgow being inactive and unaltered as well as Edinburgh. The only difference noted at Dublin was that wheat and flour went of with greater readiness at fully as much money.

The second Monday had about an average supply of English wheat, and a good increase of foreign, with only a moderate exhibition of fresh samples on the Essex and Kentish stands. Factors once more tried for improved rates, but again failed, though fully the previous prices were paid. Though no difference of value was noted in foreign, there was a better demand than of late. With fair arrivals off the coast, the business transacted was at unaltered quotations. The country wheat trade this week again outwent the advices of London, there being in most instances a rise of 1s. per qr., as at Bristol, Gloucester, Birmingham, Gainsboro', Hungerford, Manchester, Newark, Sheffield, Newcastle, Boston, Sleaford, &c.; and a few, as Market Harbo' and Melton Mowbray, were up to 1s. to 2s. The only gain of Liverpool was 3d. to 4d. on Tuesday. The Scotch markets tended upwards: fine wheat at Glasgow being up 3d. to 6d. per boll, and Leith was rather dearer, as well as Kirkcaldy. Perth was 1s. per qr. higher. Wheat at Dublin underwent little change; at Drogheda there was an improvement of 6d. per bri.

On the third Monday there was a great falling off in the English supply, and a large increase in the foreign. But few fresh samples appeared this morning on the Kentish and Essex stands, as sales had been making at a relatively higher value in the country. Factors now saw their opportunity and insisted on millers paying fully 1s. per qr. more, and indeed, in some instances, on fine parcels the rise was about 2s. per qr. Some holders of foreign were also lucky enough to obtain 1s. per qr. advance, but generally the trade found the large arrivals against them. The sales of floating cargoes were free.

HOP MARKET.

BOROUGH, MONDAY, Oct. 24.—Since our last report our market has assumed a firmer tone, especially for choice Hops, in which considerable business has been transacted at slightly advanced rates. Quantities of medium grades are still pressed

on the boards for sale, and barely realize recent quotations. The trade for foreign Hops rules dull, the imports up to the present time amounting to 3,226 bales. Latest advices from New York report the growth nearly equal to last year's quantity, but inferior in quality, only a small portion being really fine. The market is inactive, with low figures.

Mid and East Kents	£2 10	£4 4	£7 0

POTATO MARKETS.

BOROUGH AND SPITALFIELDS.

LONDON, MONDAY, Oct. 24.—Fair supplies of potatoes have been on sale. There has been a moderate demand at about late rates. The import into London last week consisted of 3 casks 3 bags from Hamburg, 14 barrel Bremen, and 3 hampers 19 packages Rotterdam.

English Regents	45s. to 80s. per ton.
Scotch Regents	50s. to 80s. „
Rocks	40s. to 55s. „

COUNTRY POTATO MARKETS.—DONCASTER (Saturday):

A fair supply of potatoes this morning, and a good average business doing, prices remaining unaltered, namely, regents 7s. 6d. to 8s., and rocks 6s. 6d. to 7s. per load.—MALTON (Saturday): Potatoes, as frost keeps off, are freely offered. Dealers buy wholesale at £2 15s. to £3 5s. per ton, and retail rates are variable, the best sorts being 6d. to 8d. per stone, but some are at 4d. per stone.—YORK (Saturday): The weather being very wet, there was only a limited supply of potatoes, and little business doing, the price being from 7s. to 8s. per tub of 280 lbs. wholesale, and 5d. per stone of 14 lbs. retail.

PRICES OF BUTTER, CHEESE, HAMS, &c.

POULTRY, &c., MARKETS.—Turkeys, 5s. to 10s.; ditto

hens, 3s. to 4s. 6d.; Geese, 5s. to 8s.; Ducks, 1s. to 3s.; ditto wild, 2s.; Surrey Fowls, 3s. to 6s.; Sussex ditto, 2s. to 3s.; Boston and Essex, 1s. 9d. to 2s. 6d.; Irish, 1s. to 1s. 6d.; Rabbits, tame 1s. to 2s.; Pigeons, 6d. to 9d.; Pheasants, 3s. to 4s.; Partridges, 1s. to 2s.; Hares, 2s. to 4s.; white Scotch, 1s. 9d.; Widgeon, 1s.; Teal, 1s.; Woodcocks, 3s.; Snipes, 9d.; Gold Plover, 9d.; Black ditto, 6d.; Larks, 1s. per dozen. Eggs, best 12s. per 120.

LONDON CHEESE MARKET, Oct. 20.—We have very

little alteration to notice in the cheese trade during the past week. The supply of English cheese is quite equal to the demand, and in fact the stock of inferior and ill-flavoured cheese is large, and sells very tardily even at reduced prices. We have a fair inquiry for very prime meaty lump Cheshire cheese, also for really fine cheese in good condition, from 50 to 80 lbs. average. Fine Scotch and Swedish Cheddar cheese sell readily. American cheese is at present plentiful; the bulk of it is too full-flavoured to command attention, but recent arrivals being milder and purer in flavour sell rather quickly. A large business has been done in Liverpool in the best descriptions, at from 65s. to 68s. Trade generally is rather dull here. The arrivals of American cheese reported since our last are 36,607 boxes.—CORDEROY & Co., Mill-lane, Tooley-street.

MANSFIELD CHEESE FAIR.—Doubtless owing to the very wet state of the weather there was little cheese pitched. Prices ranged from 60s. to 80s. per cwt., at which prices a general clearance was effected.

CHICORY.

The market has been quiet at our quotations.

LEEDS (ENGLISH AND FOREIGN) WOOL MARKET.

(Friday last.)—There is no increased demand for English wool, and prices for some sorts are not easily maintained. The public sales at Bradford have not remunerated the holders of wool, the prices of hogs, which have been usually well supported, having ranged at comparatively low figures. The approaching sales of colonial wool are anticipated with much interest. German and French buyers are not likely to be numerous. At some Continental public sales of South American wool they abstained from buying, though prices were lower by 1½d. per lb.

HARDING'S FLEXIBLE ROOFING.

REDUCED TO ONE PENNY PER SQUARE FOOT.

BEST and CHEAPEST COVERING for HOUSES, SHEDS, FARM and other BUILDINGS, &c.

Suitable for all Climates, and adopted by the English and Foreign Governments, Railway Companies, Metropolitan Board of Works, &c. Awarded the Silver Medal, Amsterdam Exhibition, 1869, for its Cheapness and Superiority to Felt, although the price was then 50 per cent. higher than at present, and is proved to be a much more Durable, Efficient, and Weather-tight Roofing than Corrugated Iron, at One-third the cost, and can be most easily fixed by any unpractised person. Please send for samples of present make.

PRICE ONE PENNY per Square Foot, or 23s. per Roll of 25 yards by 4 1/2 inches wide.

DRESSING, 2s. 6d. per gal.; ZINC NAILS, 5d. per lb.

SAMPLES AND TRADE TERMS FREE.

HARDING'S COMPOUND GLYCERINE DIP. CONTAINS NO POISON, AND IS DESTRUCTIVE TO INSECT LIFE ONLY.

A certain cure for Scab in Sheep, who thrive and increase in weight after the use of this Dip. It also preserves the wool of all animals belonging to the homestead. It cleanses it of all offensive accumulations which always cause functional derangement, being a well known fact that acrid and corrupt humours allowed to remain on the surface are the cause of a great many diseases which afflict animal life. The preparation is most easily applied, perfectly harmless in use, and most deadly to Ticks, Lice, Maggots, and a sure cure for Foot Rot. It also prevents the Fly striking; avoiding the Animal being troubled with Maggots, and heals all Sores, &c.

Sold in Tins of 5lbs. and 10lbs., at 6d. per lb.; and in Drums of 50lbs., 50lbs. and upwards, at 5d. per lb.; by all Chemists, Seedsmen, Ironmongers, and others throughout the Kingdom.

A 5lb. TIN IS SUFFICIENT FOR TWENTY-FIVE SHEEP. Spraying Apparatus necessary, common Tubs being all required. (See the simple Directions for Use on each Tin.)

THE LONDON AND COUNTY BANK opens—

DRAWING ACCOUNTS with Commercial Houses and Private Individuals, either upon the plan usually adopted by Bankers, or by charging a small Commission to those persons to whom it may not be convenient to sustain an agreed permanent Balance.

DEPOSIT ACCOUNTS.—Deposit Receipts are issued for sums of Money placed upon these Accounts, and Interest is allowed for such periods and at such rates as may be agreed upon, reference being had to the state of the Money Market.

CIRCULAR NOTES and LETTERS of CREDIT are issued, payable in the principal Cities and Towns of the Continent, in Australia, Canada, India, and China, the United States, and elsewhere.

The Agency of Foreign and Country Banks is undertaken.

The PURCHASE and SALE of Government and other Stocks, of English or Foreign Shares effected, and DIVIDENDS, ANNUITIES, &c., received for Customers of the Bank.

Great facilities are also afforded to the Customers of the Bank for the receipt of Money from the Towns where the Commercial Branches.

The Officers of the Bank are bound not to disclose the transactions of any of its Customers.

By Order of the Directors, WM. MCKEWAN, General Manager.

FARMING STOCK.—5s. per cent., with liberty to use a Steam Threshing Machine without extra charge. Nearly FIVE MILLIONS Insured in this Office.

SEVEN YEARS' INSURANCES may be effected on payment of Six Years' Premium only.

LIGHTNING and GAS.—Losses by Fire occasioned by Lightning, and Losses by Explosion of Gas when used for Lighting Buildings will be allowed for.

RENT.—The Loss on Rent while Buildings remain untenanted through fire may be provided against.

HAIL DEPARTMENT.—(CROPS AND GLASS.)

Policies to protect parties from Loss by the destruction of Growing Crops or Glass, by Hail, are granted on Moderate Terms.

LOSSES.—Prompt and liberal settlement.

AGENTS WANTED.

THE FARMER'S MAGAZINE.

DECEMBER, 1870.

PLATE I.

TROJAN; A PRIZE HEREFORD BULL.

BRED BY MR. PHILIP TURNER, OF THE LEEN, PEMBRIDGE.

Trojan (3554), a red with a white face, calved August 5th, 1868, is by Franky (1243) out of Nonpariel, by Bertram (1513), her dam Exquisite, by Sir David (349) — Nell Gwynne, by The Knight (185)—Belle, by Sir Walter (352)—Myrtle, by Commerce (354).

Franky, a red with a white face, bred by Mr. T. L. Meire, in Shropshire, and calved in 1856, was by Walford (871), out of Old Perfect by Speculation (387), her dam Patience by Young Waxy (451). Franky has been a very successful bull, and especially famous for his prize steers.

Nonpariel, a red with a white face, bred by Mr. Turner, and calved on March 11th, 1860, has been a very profitable cow in the Leen herd, throwing her first calf in the summer of 1862, and breeding pretty regularly ever since, having up to Trojan's time only missed in 1863.

Trojan was first shown at the Herefordshire Agricul-

tural Society's meeting in Hereford, in the October of 1869, when he took the second prize in a very good class of yearling bulls, being beaten for first by Mr. H. R. Evans' famous Prince of Wales, when we spoke of Trojan as a "nice thick, high quality young bull." In 1870, at the Taunton meeting of the Bath and West of England Society, Trojan took the first prize for bulls not exceeding two years old, where "barring being a little narrow behind he promised to be the best of his year." And this proved to be the case, as at the grand show of Herefords at the Oxford meeting of the Royal Agricultural Society of England, Trojan again took the first prize for bulls above one and not exceeding two years old; when he was sold through the agency of Mr. Strafford, the Shorthorn auctioneer, for 90 gs. with Sidney as his destination. These were consequently the only three occasions in which Trojan was exhibited in England.

PLATE II.

PERFECTION; A PRIZE PONY.

THE PROPERTY OF MR. ALLEN RANSOME.

Perfection, bred by Major Barlow, at Hasketon, in Suffolk, in 1867, is by Confidence, out of a good old-fashioned sort of a galloway mare, just under fourteen hands high, once the property of Mr. Brewster.

Confidence, a roadster stallion, standing fourteen hands three inches high, was bred by Mr. Hughes in Lincolnshire in 1858. He was by Fireaway, dam by Johnny Boy, her dam by Flying Buck—Old Marshland Shales. Fireaway was by Fog, out of a mare by Teesdale's Fireaway, by Pagan. Major Barlow brought Confidence out of the Fens into the Eastern Counties, where, however, he only stood one season, when he was shipped for the King of Sardinia. During his sojourn at Hasketon, Confidence was shown at Islington, where he took the second prize in the Hack, Cob, or Pony Stallion Class; and again at the Bury St. Edmund's meeting of the Suffolk Agricultural Society, where he also took a second prize. We ourselves had the honour of acting as one of the judges at this show, when we said: "The two prize roadster stallions were both of a very superior sample. Confidence, the second here, was also the second at Islington, where it was the pretty general opinion that he should have been first. And, to stand alongside of, he is almost a model of the sort; but he was not so good-

going—a strong point for a roadster in which he was beat out of sight by Sir Edward Kerrison's Fireaway, one of the grandest movers ever seen." In Lincolnshire, Confidence has even the further credit of being the sire of some capital little hunting horses; and Major Barlow has a promising three-year-old by him out of his famous old Silverlocks, the best hunting brood mare at the Royal Bury St. Edmund's Meeting; although the mare was also covered by Surplice and Ace of Clubs, a certain sort of saving clause against breeding a hunter in so heterodox a fashion. Still the produce takes all after the trotter.

The dam of Perfection was sold, with the foal at foot, by auction to Mr. Nathaniel Catchpole, of Whitton, near Ipswich, and in turn the pony was transferred to Mr. Allen Ransome, the head of the well-known implement firm at Ipswich, who, in his own words, "much as he likes a steam-engine, loves a horse still more," and who has always a neat nag or two in his stable. At the Ipswich meeting of the Suffolk Agricultural Society, in 1869, Perfection, then only two years old, took the prize of £5 as the best pony between twelve and thirteen hands high. At the Islington show, in the summer of 1870, he took the prize and medal as the best pony stallion not exceeding thirteen hands three inches high, when we reported

him as "one of the handsomest things we saw out." At the Sudbury meeting of the Suffolk Agricultural Society he again took the prize in the twelve-to-thirteen hands pony class; and at the Oxford meeting of the Royal Agricultural Society the second prize in a class of pony stallions up to fourteen hands two inches high; when we said, "as a pony, Perfection answered the description best, and ought to have won." In fact, the conditions admitted animals just two hands higher than Mr. Ransome's pony; and at the November Meeting of the Council of the Royal Agricultural Society it was resolved, on the motion of Mr. Milward, that the height in this class be altered from fourteen-two to fourteen hands. Perfection thus looks like becoming a strong favourite for Wolverhampton in 1871.

Perfection is a dark brown pony, standing twelve hands two inches high. He is very handsome, bloodlike, and symmetrical, light and corky in his carriage, with excellent temper and fine action. "Had I not believed,"

said Mr. Ransome, "that for shape, style, and movement he was not easily to be surpassed, I dare not have given him so arrogant a name." Noticeably enough, neither in size nor character does Perfection bear the slightest resemblance to either his sire or dam. The mare has since had two more foals, both of which promise to reach to her own height; and the few things by Confidence left about the Eastern Counties are not only good in themselves, but much after the horse.

In their report to the *Journal* of the Royal Agricultural Society, the three Oxford "nag" judges thus speak of the pony class: "The two placed are very good"—Mr. Calder. "Two very handsome ponies, with perfect trotting action, such as are rarely to be met with"—Mr. Robson. "The second (Perfection) a remarkably nice pony; really more of a pony than the other, and a very good mover"—Mr. Jacob Smith. It will be thus gathered that, on all sorts of authority, Perfection is worthy of his title.

THE AYRSHIRE COW.

BY THE NORTHERN FARMER.

While on a visit to the West of Scotland recently, in the very home of the Ayrshire, I happened to spend a few days with the owner of one of the nicest and most even stocks of this breed which I have ever met. From end to end of both byres, each member of the herd looked as if it had been cast in one mould, so nearly were they alike in size, colour, set of horn, form of milk-vessel, and general configuration. Amongst them were several which had distinguished themselves as prize-takers at the county agricultural show, four cows having taken eight prizes. Looking carefully at these animals, one cannot help being struck with the perfection of form which they display, and the surprising appearance of milk, in comparison with the size of the cattle. Indeed, a prize animal is faultless in form, her small size being the only objection which those accustomed to the Short-horn or its crosses can bring against her. The true Ayrshire is decidedly small; but she is none the worse for being so, as her light carcase is easily kept up; and this feature of her character renders her all the more suited to the light and in too many instances inferior pastures of her native and surrounding counties. That the Ayrshire cow is not by nature suited to rich and succulent pastures, we have often had abundant proof, her distinguishing characteristics being speedily lost. On such land she grows to a much larger size, her beef-producing capabilities becoming largely increased; but while this change is taking place, the milking qualities for which she was originally famous decrease in a corresponding ratio. With a first-prize cow before us, her owner at our elbow to suggest the points which might escape our own observation, I jot down her description for the reader. The horn slightly upstanding, wide, clean, and somewhat thin. It may be well to remark that the enthusiastic prize-taker can shape the horn to the most approved show-form by beginning his manipulations not later than the age of two years. After that age the horn has got a decided set; and to effect any perceptible change, such a degree of force is necessary as to cause the animal considerable pain, and render the owner liable to a charge of cruelty. The forehead broad between the eyes, and nose not too long; on the contrary, rather conveying the idea of shortness. Neck thin and lengthy, a cow with a short, thick neck, of whatever breed, being apt to dry off soon, however well she may milk when newly calved. Shoulder sharp, and not too thick or fleshy. Rib well

rounded, and thickish round the heart. Short in the couplings, broad over the loin, and square to and over the rump. The tail neatly set on, and tapering to a fine point. It is desirable to have a wide calving-bone, danger from injury or death being in animals possessing this formation greatly lessened at the period of parturition. The udder in the Ayrshire is for the most part well set on; but in the prize-taker it must be absolutely faultless, as no beauty of form or regularity of contour will secure a place for an animal which has the misfortune to possess a badly-formed milk-vessel. Indeed, if the latter should happen to be perfection, other minor differences can afford to be overlooked. Viewing a well-formed vessel from behind, the thighs are completely filled, no hollow either at the top or sides of the udder being perceptible. This, when joined to thighs of considerable breadth, also another distinguishing feature of a well-formed cow, forms a point the beauty of which catches the eye even of the uninitiated. Looking at either side of the udder, no hollow or indentation should be discernible between the teats, its under surface perfectly level and solid, and the teats set at equal distances rather disposed to point inwards when the udder is empty, so that when newly calved the pressure of the milk will bring them perfectly straight. The teat itself is small and round, or what is locally termed thimble-shaped, so exceedingly small are some teats that hut for the exceeding softness and elasticity of the udder, and the freeness with which most cows of this breed give their milk, the process of milking would be both tedious and difficult. Lastly, in connection with the udder, the skin must be soft and capable of considerable distension, and should extend well forward under the belly. The legs should be short and the bone clean and fine, conveying an idea of careful breeding, of which fineness of bone is almost in every instance a sure indication. Taking a final look at the cow, of which the above is an exact description, we notice that her back is as straight as a gun-barrel, and her skin, without being ridiculously thin, is yet as soft and silky as the most ardent enthusiast could wish for, rising off the rib and filling the hand at the slightest touch. She calved on the 18th October, and three weeks after, on the day this was written, viz., 8th November, her measured produce was 14 Scotch pints, which sold on the spot at 4d. per pint, making the sum of 4s. 8d. as the amount realized by this cow's milk in one day. As a remarkable

instance of the influence of descent or pedigree on the milking properties of a cow, the owner of this one traced her back to several generations, not only her dam and grand-dam having been famed as large milkers, but every cow which possessed a portion of the same blood as well as her own immediate progeny. Visiting the owners of several stocks famed both for neatness of contour and excellent milking qualities, I found in every instance much stress laid on procuring bulls of the most approved blood, from herds the cows composing which were large milkers, and the success which each had attained in forming his herd and bringing it to the perfection in which we found it was mainly attributed to the influence of sires with a milking pedigree. The food given to dairy stock during the winter months is mostly cooked, and given moderately warm, this induces a copious flow of milk, the more especially as it is given sloppy, and with a considerable mixture of milk-producing material. Boiled turnips and corn-chaff forms the bulky portion of the food, and when a portion of beammeal, fine-thirds, and meal seeds is mixed with it, the whole forms a most appetizing mess, and keeps up a full flow of milk for a long period, from four to six months elapsing before they begin to draw in to any perceptible degree, and this more particularly if they have not been bulled. About the fourth week after being bulled the flow of milk begins to decrease whatever the feeding, so that when milk is scarce and high in price the cows are not permitted to have access to the bull.

A careful feeder attaches much importance to the feeding of his beasts, both as to being regular and punctual to the hours, and to the proper preparation of the food. If not properly timed the animals become restless and uneasy, soon losing condition, and falling off in their produce if irregularity is persisted in for any length of time. Nearly an hour previous to mixing the meals with the boiled food they are placed in a separate tub and scalded with boiling water. This swells the meal, and in

a manner cooks it, making it easier of digestion, and the animals can extract more nourishment from it than they could possibly do if hastily stirred in a moment or two previous to placing it before them. When this is done it enters the stomach in a raw state, and, swelling there, gas or wind is frequently engendered, and the health of the animal and even sometimes its life becomes endangered. It is evident that the animal cannot derive as much benefit from the raw or simply wetted meal as it would from that which has been thoroughly soaked in boiling water, and it therefore follows as a natural consequence that expense is gone to from which no adequate return is ever received. In the vicinity of large towns brewers' and distillers' grains are largely used to mix with the boiled food and form a welcome addition, as the flow of milk increases whenever they are used, however liberally the animals had been fed previously. The man entrusted with the feeding of the cattle must possess judgment and knowledge of his business, as a good deal of discretionary power must of necessity be accorded him. Should it happen that a man is placed in such an important position who lacks judgment, or who perhaps although fairly qualified in other respects is of a careless or easy disposition, considerable loss is almost unavoidable. If not fed with the utmost promptitude as to time and the quantities regulated with the greatest exactness it is vain to expect regularity of produce. Nay, a stinted feed at one time and an over-dose at another of such rich meal is almost sure to cause one or more of the animals to refuse their food, probably not taking to it kindly again for a week: should this happen the cow goes back in her milk, scarcely recovering herself for the remainder of the season. A newly calved Ayrshire cow is worth at present from 18 to 20 guineas, a great price when the small carcass is taken into consideration. However, any article is worth just as much as it will bring, irrespective of all other considerations, and a man wanting an animal of this class must give the market value or go without.

THE AGRICULTURAL LABOURER.

BY CUTHBERT W. JOHNSON, F.R.S.

The condition and the improvement of the state of our farm labourers can hardly be too often re-considered. In such inquiries we may be cheered by remembering that time has gradually and steadily improved the position of our peasantry. It is indeed pretty certain that down to the days of the Tudors the plight of the English country-labourer was about the same as in some portions of Russia in our own days—that is, little better than slaves or serfs, who, until the times of the present enlightened Russian Emperor, were sold with the estate to which they belonged. We have ever and anon notices in old English authors of the farm labourer which indicate the poorness of their condition, and the low estimation in which they were then held—and we can readily imagine this when we find how miserable was the work assigned in those days even to an English farmer's wife. Thus the earliest English writer upon agriculture, Judge Fitzherbert, in his *Boke of Husbandrye*, published in the year 1531, gravely tells us that amongst other refined duties, it was the business of the farmer's wife to help her husband to fill the dung-wain!

The class that we are striving to render more comfortable are much greater in number than is commonly understood. According to the census of 1861, the number of out-door labourers in agriculture were in England:

Males	914,301
Females	43,964

In Wales:

Males	128,874
Females	58,738

Now let us refresh our memories by referring to the cost of the bare necessities of life which each labourer requires for his subsistence, and to what extent his wages suffice to meet the demand upon them. It was at a meeting in October last of the Athy Farmers' Club that Mr. C. W. Hamilton addressed its members on behalf of the poor Irish labourer; and I need hardly attempt to give in any other language the facts which he then produced as reported in the *Irish Farmers' Gazette*. As he remarked, it appears from the sixth report of the medical officer of the Privy Council, that in England the average consumption of a labouring man is weekly:

Farinaceous dry food, reckoned as if all were	
bread	12½ lb.
Sugar, or treacle	7½ oz.
Butter, dripping, or suet	5½ oz.
Bacon, or meat	1 lb.
Milk	32 oz.
Cheese	5½ oz.
Tea	½ oz.

which he will probably procure for about 3s. 6d. per week; as for an average family, 10s. or 11s.

Dr. Smith in his dietary gives the example of a family living at Oakhampton, in Devonshire, consisting of hus-

band, wife, and three children under ten years of age:—Flour, 35lbs.; peas, 4lbs.; rice, 2lbs.; treacle, 1lb.; butter, 1lb.; bacon, 3lbs.; cheap pieces of meat, 4lbs.; skimmed milk, 10½ pints; tea, 1 oz., which cost 10s. 7d. They raised some potatoes besides in their garden. Now, this man's wages were only 10s. per week, so that the rent of his house and garden and clothing, &c., must have been dependent on the wife's industry. And as the Editor of the same valuable Paper lately observed: Dr.

Edward Smith, Poor-law Inspector in England, has published statistics of the diets in use amongst the working classes in Great Britain. From the following Table, which gives the diet of various labourers, it appears rather strange that the least potato-fed agricultural labourers in the United Kingdom are the Irish! They also, according to Dr. Smith, receive the greatest amount of actual nutriment (not merely bulk of food), and at the least expenditure of money.

When addressing himself to the condition of the Irish labourer, Mr. Hamilton added: "As to the amount of food which will support a labourer and his family comfortably, it is very hard to form an estimate generally applicable, and it is clear that even allowing the same work to be equally paid for, the labourer cannot be as comfortable during the eight or ten years while he is rearing his family as he will be when some are old enough to assist him; but these are vicissitudes to which all families are liable. About 3s. per week is the average cost of food, necessaries, and clothing in the workhouses. This may be taken as the minimum for a labouring man, and if we add to it one-third we get 4s., leaving only 3s., besides what the wife and family can earn towards the weekly expense of an average family, out of what I may assume as the most usual sum paid in cash, viz., 7s. weekly. I know that 7s. weekly, along with house, garden, 2 cwt. of coal, and two quarts of milk, does enable a labourer to live comfortably, but that is quite equivalent to 10s. per week. In the county of Meath, generally speaking, the servant boys who are lodged and fed by their employers get from £8 to £10 annual wages, but this is probably equivalent to about £22 per annum, or 9s. per week; and as their expenses are only clothes and perhaps 6d. per week for tobacco, and an odd shilling for whisky, they are enabled to lay by their money, which among the best of them is too often applied to emigrating to America. The married labourer finds it harder to make both ends meet, for formerly he and his family lived on potatoes and buttermilk, and then the old wages of 8d. and 10d. were equivalent to a much larger wage than at present. Now, since they have risen to much more civilized ideas as to comfort in food and dress, oatmeal stirabout, at first regarded as a luxury, has gradually been displacing the potatoes: at the same time, though more slowly, tea and bakers' bread have taken the place of stirabout at the morning and frequently at the other meals. This is a change of more doubtful benefit; it is expensive, and frequently leads to the family going

in rags, and the labourer being deprived of the more nutritious food which would enable him to work with energy. In addition to his weekly wages of from 6s. to 7s., his wife usually makes something, say 1s. per week by poultry and 1s. by the pig, and if he gets a turf bank or some allowance of fuel, he is not much to be pitied. The weekly outlay of a labourer and his wife, with no family, may be about—

	s.	d.
1½ stone of Indian and oaten meal ...	2	0
Potatoes ...	0	9
Milk ...	0	8
Soup and candles ...	0	7
Rent ...	0	9
Clothes and tobacco ...	1	6
Fuel ...	0	9
	7	0

If there is an average family, the labourer cannot do with much less than the following:

	s.	d.
2½ stone mixed meal ...	3	4
6 stones potatoes ...	1	6
Milk ...	1	2
Candles, soap, &c. ...	1	0
Fuel ...	0	9
Rent ...	0	9
Clothes ...	2	0
Tobacco ...	0	6

11 0

I have alluded to the condition of the Russian peasant. Now, in a late Parliamentary paper, which contains returns from our ambassadors and consuls in foreign countries, we find that, on rising, the Russian peasant will eat a hunch of black rye-bread and a bowl of milk or curds; but his principal meal, at noon, consists generally of cabbage, of mushroom soup, of which meat is seldom the basis; of baked buckwheat, eaten with milk,

oil, or butter, according to the means of the family; and of an unlimited quantity of bread. Potatoes are not a staple of food, except in the vicinity of capitals, or in the neighbourhood of German colonists, who have taught the Russian peasantry around them to overcome their prejudices against the cultivation of "the devil's apple," the introduction of which, at the commencement of the present century, led to so serious agrarian riots in the provinces of the Volga basin. The drink is mostly water; a liquor made of fermented rye, called kvas, and small table beer, being only found on holidays in the houses of the richer peasantry, and that principally in the northern and industrial provinces. Spirits are not consumed at meals, but only on occasions when the peasant's object is to get merry and drunk. These occasions present themselves on holidays, of which there are many during the year. The bowl of soup, the pot of buckwheat, and the loaf of rye-bread are again placed on the table for supper. It is not, perhaps, so much poverty as the discipline of the Russo-Greek Church that compels the Russian peasant to take but little nourishing food. On about 210 days in a year he is not allowed to eat meat; and although sick persons, and women for a short time after childbirth, can obtain dispensations, they seldom avail themselves of the power, clinging superstitiously to the severest forms of fasting, and that in a climate which requires a more than average consumption of animal food. The loaf of rye-bread, it is true, but seldom fails the Russian peasant family, except in years of famine or exceptional distress; but at least half of the infant mortality in the agricultural districts is referable to the inability of the mothers (fed on sour rye-bread and cabbage or mushroom-water—worn out with excess of fasts and defect of sleep) to nourish their infants. The following table, compiled from actual account books, gives, in English quantities and value, a tariff and estimate of the diet of Russian agricultural labourers, on a large scale and under liberal management, and therefore under the most favourable circumstances:

ANNUAL CONSUMPTION PER MAN.

Description of Victual.	English Weight.	Value in English Money.
Flour—rye	451 lbs.	£0 19 0
Flour—wheat	421 lbs.	1 6 7
Grits—buckwheat, &c. ...	5½ bush.	0 4 9½
Peas	30½ lbs.	0 1 1¾
Oil and butter	17½ lbs.	0 4 6
Salt	32½ lbs.	0 1 4¾
Meat	117 lbs.	0 13 2
Fish and cabbage	1¼ lbs.	0 0 9½
		£3 11 4½

Thus, a Russian peasant, when most favourably situated, will get 12 ounces of meat, principally in soup, on 155 days in the year, and 2lbs. 6oz. of bread and flour, besides buckwheat, peas, &c., at a cost of 2½ per diem; while the quantity of flour consumed by these agricultural labourers may be taken as the average consumption of corn per head in the villages, with, however, the difference that the relative proportion of wheat will be smaller by two-thirds. Taking all the provinces together, the quantity of meat will average in the same districts only one-half the quantity shown in the estimate. In the capitals the cost of feeding servants is reckoned at about 20 kopecks (6d.) per head per diem.

The Russian peasants, it appears, erect the huts in which they dwell, for as the report of 1870 adds (p. 303): "The agricultural labourers live almost entirely in houses of their own, which are throughout the empire constructed in the following simple fashion:—Logs of the red pine are cut into the required lengths, 3, 4, or 5 fathoms, according to the proposed size of the house.

The lengths are placed one above the other, the ends being dovetailed together, thus forming as it were a huge box of logs. The doors and windows are then cut out, and the pieces carefully numbered by notches, the box is now taken to pieces, and the actual building commences; this is done by placing the lowest tier on boulder stones (and wooden posts for foundations, then each succeeding tier is added, moss or hemp and tow being used between each layer to fill up all interstices. The walls thus completed, floors and ceilings of red or white pine boards are added, both ceiling and flooring generally being double, with a layer of earth between, the whole is crossed over with boards. The roofing generally consists of wooden tiles. In one corner of the room a large brick stove, similar to an English baking-oven, is built, a chimney, either of bricks (put loosely together without mortar) or of wood, is carried through the roof, and the house or hut is complete. Here the whole family lives. Generally the house contains but a single room, but sometimes a well-to-do peasant has a house of three or four rooms, and even uses plaster and paper-hangings for the walls of his hut; this is especially the case in the grain-growing Governments, such as Tamboff, Voronje, Penso, Saratoff, Samara, &c., where the peasantry are more industrious, better fed, housed, and clothed, than in the Northern Governments."

In travelling from Russia towards our own country we arrive at the territories of the King of Prussia. Here the reporters give us a more full and a more favourable account of the condition of the agricultural labourer. From a paper by Mr. Petre forwarded by Lord A. Loftus, we learn (report, p. 49) that the labouring classes in that country, agricultural and industrial, may be ranged under the following heads:—

1. Agricultural labourers, male and female, who have a permanent engagement, and who live with their employer (farm servants);
2. Agricultural labourers ("Tagelöhner") who generally contract to work for a considerable period of time for the landed proprietors, but very often leave their employment at the end of a year;
3. Domestic servants of all kinds;
4. Small tradesmen or artisans ("Handwerker") who either work on their account, single handed, or with slight assistance, or who work by contract for others;
6. Assistant workmen of tradesmen or artisans (journeymen and apprentices);
7. Ordinary factory operatives, who have not devoted any length of time as apprentices to learning a particular trade;
8. Porters and carriers of all descriptions employed for commercial or industrial purposes;
9. Workmen or day labourers ("Tagelöhner") without any regular or permanent engagement;
10. Workwomen.

Although, adds Mr. Petre, my report professes to deal more exclusively with the purely industrial population, I have included the agricultural section of the labouring classes in the preceding category, for the reason that the wages of agricultural labour in this country influence to a considerable extent the condition of the working classes generally, and it is exceedingly common for them to exchange one branch of labour for another.

Of the agricultural labourers or farm servants mentioned under No. 1, more than half are men and boys. Girls of this class are not so numerous as the women who work as "Tagelöhner," or day labourers (No. 2). The chief duties of the farm servants in general consist in tending the cattle and flocks, in keeping the buildings and yards clean, sowing the seed, and dairy work. They have to work also in the distilleries and breweries which are com-

monly attached to large farming establishments, and they are employed generally in the more responsible and important duties of the farm.

At the manor-houses or gentlemen's seats ("Edelhöfe") it is usual to employ a large number of these farm servants. The peasant proprietors content themselves generally with one man and a boy, and several maid servants. Formerly, when labour was more abundant than it is now, the landowners and farmers used to set their faces against their farm servants marrying, but their anxiety now is to induce them not to leave their employment, and with this object they encourage them to marry. The married farm servants are called "Deputaten," or persons receiving an allowance in kind, to distinguish them from the other farm servants, who all take their meals together at the farm. The "Deputaten" receive, in addition to their wages, a certain allowance of corn, potatoes, &c. This primitive practice is, however, gradually giving way to the system of paying full wages in money. Payment in kind, as a rule, is now only made when the farm servants themselves choose to be paid in this manner, as they very often do when the price of corn is sufficiently high to enable them to make a profit out of it.

The want of trusty farm-servants is beginning to be universally felt by the landowners and farmers. The causes of this growing change are easily traced. A larger and more varied field of employment has been occupied by the development of industry and by increased facilities of locomotion. A yearning for independence, and for the possession of a home of their own, prevails even among the poorest of these farm servants. The doctrines of socialism too, which have penetrated, though not to any very great extent to this class, may have contributed in some degree to alienate them from their employment. The result, however, is, that they receive now higher wages and better food than formerly, and their condition is altogether different from what it was. Improvements have been introduced on most of the well-managed properties as regards the way in which the farm servants are lodged, but much still remains to be done in this respect. They generally sleep in the hayloft or in a garret in the cow-house. In all other respects, however, the treatment of farm servants is more considerate than it used to be, and the consciousness of their increased importance, to which this improved treatment may partially be attributed, renders them at the same time far less docile and obedient to their employers than formerly. Those who are in the service of the peasant proprietors, with whom they are more or less on a level in point of culture, are in the habit of taking their meals at the same table with their employers, and differ little from them in their social habits.

It has been observed that, after a series of good harvests, the farm servants, male and female, frequently give notice to quit, in order to work instead for daily wages as "Tagelöhner," which gives them more ready money.

Bad harvests and high prices, on the other hand, have the effect of inducing them to resume permanent employment as farm servants in preference to gaining a more precarious livelihood as independent labourers.

The second class of agricultural labourers, or "Tage-löhner," as they are termed, as distinguished from farm servants, may be divided into two categories: those who contract to work for the landowner or farmer for a certain definite period, ranging from one to three years, and those who have no fixed engagement, but who work for different employers as opportunity offers.

The former class of labourers is very general throughout the Eastern Provinces of Prussia, but rare in the manufacturing districts. They are usually married, and are bound by their contract to provide, in addition to their own labour, from two to four persons, called

"Schaarwerker," to assist them. The system, in short, is a modified form of gangwork. The labourers themselves are bound to work upon the estate from 280 to 300 days, and the "Schaarwerker" (generally the family of the labourer), on the average, 250 days in the year. They are lodged gratis, or at a low rent, in the "Innsthauser," or farm lodging-houses belonging to the estate, and have a certain portion of land (from $\frac{1}{4}$ to $1\frac{1}{2}$ acres) allowed them, which is manured and cultivated by the proprietor, a shed for goats or pigs, and some small allowances in kind. The wages and conditions of labour for this class of workmen vary too much according to circumstances, even on the same estate, to admit of generalisation.

On the whole, their condition is less favourable than that of the farm servants. The class is recruited mostly from amongst those who have made improvident marriages, and are forced by the pressure of narrowed means and increasing families to sell their labour at a low rate. Those amongst them who have small families to provide for, or whose children are of an age or condition to contribute to the support of the family, are however decidedly better off than the farm servants, and generally enabled, in the course of a few years, to save a tolerable competency. This is more especially true of those who abstain from the immoderate use of spirits.

The prevailing system of contract work gives the industrious agricultural labourer a fair chance of earning very adequate wages, which he generally supplements by threshing-work during the winter months.

The house accommodation provided for the "Innstleute," or labourers who are lodged by the landed proprietor, is very inferior on most properties, both from a sanitary point of view and also on the score of comfort. Little attention has been paid to it, and the normal standard of comfort and of the sanitary conditions of rural dwellings in general is low. Very little has been done of late years in this direction by the landowners, owing to the heavy charges on estates and to the scarcity of money.

Agricultural labourers who work independently, and are not lodged, like the "Innstleute," by their employers, receive at least 20 per cent. higher wages in money than the latter; and they have this advantage over them, that in harvest-time they can get almost any wages they choose to ask from the landowners and farmers who are short of farm servants and "Innstleute." This is counterbalanced on the other hand by their forced idleness during the winter months, which generally swallows up all their savings, and has altogether a bad influence over their moral conduct. They usually marry in order to have a home of their own, and buy a bit of land on borrowed money to supply them with potatoes and vegetables. Some of them lodge with the peasant-proprietors for whom they work, and several families are often crowded together in the same house.

One peculiar feature of agricultural labour in this country is the custom which prevails in several provinces of large bodies of labourers associating together and migrating during the summer months. The system followed is this. An experienced man is deputed to select and report upon some district suitable for the purpose. He then makes a contract for the work which is to be done, and twenty or more labourers, male and female, associate together and undertake harvest or other work for one or more of the large landed proprietors, whose estates are situated sometimes more than 200 miles away from the home of the labourers. When they have finished their work, and received the money which they contracted for, and which is equally divided amongst them, they return home for the winter. Labouring gangs of this kind migrate annually from the highlands, east of the Vistula, which afford but a scanty

subsistence to the population, to the fertile lowlands across that river.

From the few districts along the Warta, an affluent of the Oder, formerly colonised by Frederick the Great, and now over-populated, similar bands of labourers travel every summer to the neighbouring provinces. The beetroot sugar manufactories in the neighbourhood of Magdeburg are supplied in this way from the Eichfeld, a sterile district of the Southern Hartz, with the additional labour which they require at a certain period of the year. Similar bodies, called "Hollandsgänger," crop over from Westphalia into the Netherlands; some as agricultural labourers, others as tile-makers; and hundreds of masons migrate annually from Silesia to the North Eastern Provinces of Prussia during the summer, to earn money for their support during the winter months.

As we continue our tour from Russia, and through Prussia, towards our own country, we arrive in the Netherlands, and here we find a superior condition of the tillers of the soil. Mr. Sydney Loch, on the authority of Mr. Nicholls, in his account of the labourers of Holland (*Report*, p. 16) observes: "Nothing can exceed the cleanliness, the personal propriety, and the apparent comfort of the people of Holland. I did not see a house or a fence out of repair, or a garden that was not carefully cultivated." But he does not stop here, for while apparently intending merely to continue the description, he gives, perhaps unconsciously, the secret of such unwonted happiness. "The Dutch people," he continues, "appear to be strongly attached to their Government, and few countries possess a population in which the domestic and social duties are discharged with such constancy; a scrupulous economy and cautious foresight seem to be the characteristic virtues of every class; to spend their full annual income is accounted a species of crime."

There can be little doubt that if the labouring classes in Holland are prosperous and happy, they owe it to their own patient industry, their provident habits, and their natural contented disposition. Living in a land which owes its very existence to the ingenuity and labour of man, at any moment liable to be called out to work again for their lives and homesteads, they owe little to nature, much to themselves. What they acquire with pain they guard with care. The Dutch labourer, whether in field or town, reflects on the value of his earnings; the energies which a warmer blood and a more impetuous temperament would expend in political excitement, he consecrates to the improvement of his own individual lot; the question of the hour, the news of the day, possess little interest for him; he prefers his Bible to his newspaper, and his family fireside to the public, the reading-room, or the political meeting. Jealous to a degree over the liberty he already possesses, he does not sigh for more, and prefers enjoying in peace the advantages already secured to him, to agitating for others which his fathers did without.

The Dutch artisan can live comfortably and contentedly on what would ill suffice to satisfy the wants of an English labourer. He gets lower wages, he lives in a country where protection is still professed and duties are still high, where the necessities of life are about as dear as in England and the luxuries dearer, and yet his home is happier, and his family healthier than many which could be found elsewhere. Spending less on himself, he has more left for his children, and what he saves in beer he spends in bread.

In taking the retrospect we have thus done of the condition of the English farm labourer of the olden time, and of his plight in Northern Europe, in Germany, and in the Netherlands, we may well be encouraged to rejoice at the progress we have made in our own island, and be prompted to still further efforts in so good a direction.

Without attempting to exhaust the subject, let us glance at one or two only of the improvements which in some portions of our island are yet to be made for the comfort of the labourer; and can we have this better done than in the language of Canon Girdlestone, who, on a recent occasion, when addressing a body of the fine agriculturists of Devonshire remarked, very truly: "First, as regards the home of the labourer. We have most of us, more or less, some good horses of our own, and we are, no doubt, anxious that they should do a good day's work, and do it well and cheerfully. In order to do this, one of the first things to do is to secure a good stable. A cold, draughty stable, or a stable low, small, badly ventilated, and badly drained, or one in which, without any separation of stalls, all our horses would be huddled together, is there any one of us but, putting all views of humanity out of the question, and merely with reference to our own advantage, would at once say, 'With such a stable, my horses are more likely to be in the hands of the farrier than of the ploughman: with such a state of things I shall get no work done?' It is exactly the same with the human animal. Laying aside both Christian and moral considerations, a healthy and comfortable home is essential to the efficiency of the working man, and is, consequently, of as much importance to the employer as to the employed. The following is my idea of the sort of home a labourer ought to have if he is to be able to do a really good day's work. A house well roofed, drained and ventilated, and floored, with a fireplace in every room, and every window made to open, with downstairs a good family room, with handy grate, oven and boiler, and a scullery at the back, with door to the garden, with upstairs never less than three, and if possible four, bedrooms, with a good garden round it, a pigsty, and other conveniences so constructed and screened as to be decent in appearance as well as in reality. The labourer's home should be on the farm if possible, or, at any rate, as near as can be to his work. A long walk to and from his work is most exhausting to the labourer, and very unnecessarily so, and of course, at the same time, most damaging to the farmer, who wants the whole strength of those who work for him, and to whom it is of great importance that they should be fresh when they come upon the farm. A moderately-sized potato ground, in addition to the garden, is a great advantage to the labourer; whereas, if too large, it is apt to embarrass and over-fatigue him. If to some one or two cottages on each farm there were also added a cowshed, with facility of pasturage for a cow, and these cottages were reserved as prizes for the most skilled, industrious, and thrifty labourers, the employer would reap as much advantage as the labourer himself from the improved character of both workmen and work, to which such sort of emulation, wherever scope has been given for it, has always led, and is sure to lead. This, then, is my idea of an agricultural labourer's home. As far as providing such a home is concerned, it is, of course, almost entirely a landlord's question; but I have no hesitation in saying, nevertheless, that if I were a farmer, laying aside all regard for the labourer, and with a view to my own advantage alone, I should no more think of taking a farm without stipulating for proper and healthy labourers' homes upon it than I should of being content with stables and cowhouses of such a sort as would be sure to make my horses and cattle unhealthy and unprofitable.

"I pass on from the home of the labourer to his work. This ought, as far as possible, to consist of piece-work. I say as far as possible, because I am well aware of the difficulty there is in bringing many agricultural operations under the denomination of piece-work. Nevertheless, many of those difficulties may, by perseverance and good management, be overcome, and, for his own sake as

well as in the interest of those who work for him, it is well worth the farmer's while to overcome them; for until human nature is very much changed from what it is now, labourers will be found, even without reference to age, to differ very widely from each other. Physical strength and power of endurance, skill, industry, a desire to do a honest day's work, and many other particulars, are points in which there is sure to be an immense amount of difference. Yet, unless the amount of a man's earnings depends upon the amount of work done, it is difficult to see how to avoid paying all these various characters of labourers exactly the same amount of wages, and so inflicting on the farmer both a present and a prospective loss, by getting now a less amount of work than he ought for his money, and discouraging improvement in the class for the time to come. It is very important also for all parties that in every case in which a system of day-work is adopted the number of hours constituting a day's work should be definitely settled and understood, and that an account of all aftertime employment should be accurately kept and paid for, not by beer or cider, or other refreshment, except perhaps in time of harvest, but in money, and in the proportion it bears to a day's work.

Now that thrashing is almost entirely done by machinery, it is very difficult to provide wet-weather work for agricultural labourers. Yet when the immense loss of income which in the changeable climate of Great Britain and specially in the western counties accrues to the labourer from bad weather, unless paid by the week, with no deduction for wet days, and the difficulty in which the loss involves him are considered, it will be obvious that a farmer who wishes his labourers to have well-nourished, powerful bodies and minds free from anxiety will do his best to secure them against the possibility of many days' forced idleness in the course of a year, involving of course short commons for themselves and families."

Such are some of the facts, so well glanced at by Mr. Girdlestone: he was then addressing a body of men not likely to forget the comfort of their labourers. In travelling towards the west, through Devon and Cornwall, we have ever regarded with pleasure the independent bearing and the comfort so noticeable in the peasantry; and this fact should prompt us to greater efforts in other districts of our Islands where their condition is not nearly so good.

THE FOREIGN CATTLE MARKET.

In the Report from the Committee of the Farmers' Club for the year 1866, the following paragraph occurs: "Since the last Report was agreed to, the Committee has held several meetings on the subject of the cattle-plague, and also had an interview with Sir George Grey at the Privy Council Office, when a Memorial was presented. The recommendations embodied in that Paper were not only received with every attention by the Home Secretary, but their spirit very generally adopted by other deputations—the Farmers' Club being the first of any of the Agricultural Societies that sought the Government with reference to this terrible visitation." This interview took place in November, 1865; and one of the chief clauses of the Memorial went to recommend "that all foreign beasts imported be killed for food at the point of disembarkation immediately on their arrival, or within such reasonable time as may allow of their sale to the butcher." At a meeting of the Committee of the same Club on Monday, Nov. 7, it was resolved: "That the thanks of this Committee be offered to the Right Hon. W. E. Forster for the energetic measures which have been recently taken by the Privy Council to prevent any importation of foreign cattle diseases. At the same time, the Committee begs to express a hope that separate markets for the sale and slaughter of all foreign stock will be enforced at the ports of landing throughout this kingdom." And, noticeably enough, at a meeting of the Court of Common Council on the same day a Report recommending the establishment of a foreign cattle market by the Corporation was adopted.

It will be thus seen how the farmer has at length succeeded in obtaining that measure of safety which he has been so long seeking, as we believe that the vote of thanks accorded to the Vice-President of the Council could not have been better timed. There can be no doubt but that the City has been very determinedly looked up in this matter by the Government, while a Liberal Ministry has been mainly instrumental in carrying out a movement that some people were pleased to regard as a mere revival of the old cry for Protection. And here, as we take it, the home-producer's interest, at least in this branch of the business, is at an end. So long as the new market be constructed with reasonable expe-

dition, and so long as this be placed sufficiently far away to ensure him from all danger of contagion, it can really be of little moment to the farmer whether the site be on the North or South side of the river, or if the convenience of the Whitechapel butcher should or should not have been becomingly consulted when arriving at a selection. All such points as these rest entirely between the City and the consumer, as represented by the trade; as it is only fair to assume that the Corporation in making its arrangements has given every possible care and attention to the requirements of the public. Of course there will be some still ready enough to complain and protest, as we hear certain salesmen and butchers have petitioned against Deptford Dockyard, are others in favour of it, just in fact as they wrote *pro* and *con* so recently in *The Times*. But with this dispute the English farmer has little or nothing whatever to do. The City has determined on, and the Government will give its countenance to a site, so that there should be strong warranty of its capabilities, while there could, surely, be nothing in much worse taste than any further agitation or demonstration from a quarter which, so far, has simply obtained all that it asked for. There is as yet no complete railway communication it is urged, although it might as sensibly be said in protest there is as yet no market constructed, for the one may be as easily and simultaneously supplied with the other. The veterinary authority of a contemporary says: "It cannot be questioned but that the road to Deptford is in all respects a better way than that to Plaistow, Millwall, or North Woolwich." And again: "The Brighton and South Coast and South-Eastern Railways run within a short distance of the dockyard, and there will be no difficulty in completing the communication between those lines and the Foreign Market if necessary; but good cart roads are of much more importance than good railroads. Most of the butchers who will buy and slaughter cattle at the waterside market will convey the carcasses to their destination in their own carts."

While, however, we are giving our thanks to Mr. Forster, we must not be altogether unmindful of the Civic authorities whose task has been by no means an easy one. In the outset they have had of course to encounter a number of disinte-

rested people, who had each and all the very best ground for the purpose to sell. In fact, we scarcely ever remember such an outcry as has been raised over the extraordinary suitability of this place and that, the very safety of the country apparently depending on the purchase of some Company's docks or somebody-else's yards. But even beyond this the Markets Committee has had to withstand the opposition of some of its own brother Councilmen. Although the report was eventually carried by "an overwhelming majority," this was only accomplished in the face of sundry amendments, such as "the Report lie on the table," or "the Report be sent back for reconsideration." Moreover, Mr. Bedford, "with many others, repudiated the idea of making a new market at all, and for many reasons. The market was absolutely unnecessary for any possible purpose, except for raising the price of the food of the people, or for the purpose of putting money into the pockets of the landowners of the country; and this was the secret of the Bill. It was a Bill to raise the price of food;" while Mr. Game, a member of this very Markets Committee, "did not rise to support a site, but to take this opportunity of saying, as a member of the Markets Committee, that, during the time this question had been in agitation, he had visited the sites on two or three occasions; and he had no doubt that, if it were necessary that there should be a foreign cattle market in the metropolis, the site chosen would be the most preferable. But it was a mistake to suppose that a large portion of the meat which came to London from abroad was consumed in the East-end; two-thirds were consumed in the north-east and the south-west. If they took the other side of the river, there was but one-third consumed there. For that reason he believed it would be greatly to the advantage of the trade and to the public, if a foreign cattle market was to be made, that it should be made on the south side; but he was of opinion that they did not want a foreign cattle market in London; it was the greatest absurdity ever brought before the public. They were told that it was to be a paying concern, and they were asked to rush into it.

They had been told that there was an Act passed that there should be a foreign cattle market for London, but there was no Act compelling them to build it." We quote thus much to show that it was not quite such plain sailing with the Corporation as might have been imagined; as, indeed, the last sentence or so of Mr. Game's remarks is very suggestive of what might have happened. There is no Act compelling the City to build a market, but the Common Council might have delayed doing so for another year or more, when the power to deal with the business would have passed into other hands. It is the fashion to laugh at the civic authorities, and no doubt some disappointed speculators will rail loudly enough at the conclusion come to; but if Mr. Forster and the Veterinary Department of the Privy Council Office are satisfied that a really eligible site has been chosen, we cannot see that any one, excepting always the great Whitechapel interest, has any cause to complain.

On the Monday the Farmers' Club, as we have stated, passed a vote of thanks to Mr. Forster, and on the Tuesday the Central Chamber of Agriculture put a resolution very much to the same purport. There can be no question but that such a compliment has been well merited, as even at this moment some further warning is about to be issued as to the unsatisfactory condition of the continent, where the cattle disease rages, and the necessity for every vigilance on our part. From his first interview with the agriculturists we have spoken to the grave care which the right honourable gentleman has given to the question, and in his sanction of site, we repeat, there is something of a guarantee. It must be borne in mind that the first choice of the Markets Committee was not approved by the Lords of the Council, and this of itself serves to show the close supervision which the proceedings of that body has received from the Government. Greatly as such a market is needed, we confess that we have wearied of the way in which the matter has been too often discussed; as we would counsel the farmer to be no party towards raising any further difficulties now that his object is virtually obtained.

NO POLITICS!

At a meeting of the Devon and Cornwall Chamber of Agriculture, in October, Mr. Henry Clark called attention to what may be termed a Tenant-Right Agreement that he had framed, and upon which he desired the opinion of the members. As after a very brief discussion the consideration of the subject was adjourned until another meeting, to be held early in December, we had proposed to defer any notice of our own until the West-country farmers had more definitely delivered themselves. Sufficient be it to say here that Mr. Clark's draft contains a schedule of allowances for lime, bones, cake, and purchased manures, extending in some cases over four or five years' use previous to the termination of the tenancy. Then the landlord makes claim to nothing more than the winged game, and beyond a few fiddling clauses, such as "the tenant shall mow, spud, or roof up the thistles," and "cleanse and keep open the iron and lead gutters," this same model agreement looks to be conceived in far more liberal or give-and-take spirit than we often find in productions of this design. So far the meeting manifestly did not know very much about the matter. One man said in some sort of objection that "covenants must vary with every county;" another that an agreement with compensation clauses was "not Tenant-Right at all;" and a third that

"there was no system they could lay down as applicable to a whole district," as, of course, no one ever argued there could be. About the most pertinent remark was offered by Mr. Perry, who thought that "the way to secure Tenant-Right would be to create local courts of arbitration, which would be simple and inexpensive;" and when we come to legalise the principle there may be something more to say to this suggestion.

Nevertheless, it is clear enough from all that is just now passing that they are getting keenly alive to the necessity for some Tenant-Right or security down in the West. A recent case has created a deal of discussion, and so lead every man to ponder more carefully over the stability of his own position. It thus happened that at the Sowton ploughing match dinner Mr. Roach made this question the chief point of his speech. Game he had said, was had enough, "but there was another thing which tended to check the productiveness of the soil more than anything else he had named. He alluded to the insecurity which landlords gave to their tenants for the outlay of their capital." And again, "he was at a great loss to find why landlords, as a rule, should object to giving a good tenant a lease. He was sorry to say that the only reason he could suggest was that they wished to have political control over their tenants." And

here Mr. Roach was called to order. Mr. Daw said "No politics," Mr. Sanders was "quite sure that in introducing political topics they would be introducing a fertile source of discord," and Mr. Kennaway declared that "it was quite impossible at convivial gatherings to go into matters which required to be looked at in so many different ways as those questions of the tenure of land and security for tenant's capital." Very good. If Mr. Roach's brother farmers thought fit to stop a straightforward speaker in this way, of course there was nothing for it but to submit with a promise "never to do so any more." But, as it seems to us, Mr. Roach's brother farmers did nothing of the kind. Not one of those who protested against the topics touched upon are farmers. Mr. Daw is an attorney and an active electioneering agent; Mr. Sanders writes himself more properly a Reverend Prebendary; and Mr. Kennaway is a lauded proprietor and a county member. As chairman of the day, Mr. Kennaway had, no doubt, the right to interfere if he thought proper so to do; but it is surely something like "a liberty" for either a solicitor or a clergyman to attempt to dictate as to what the farmers shall talk about at a ploughing-match dinner. At best they are but guests upon sufferance; and it would be more becoming did they make themselves less prominent on such occasions.

Mr. Sanders, however, was sufficiently emphatic on "theirs being a meeting simply for the sake of agricultural discussions;" Mr. Daw "thought there was only one Political-Agricultural Society in England, and that was in the neighbouring parish of Woodbury, but he was afraid the political fever was very prevalent, and they had caught the infection;" while the Chairman considered "there were many subjects of a semi-political character which they might fairly go into," although he did not seem to rank land-tenure as one of these. Now, only let us picture a meeting arranged for agricultural discussion where it is "fatal" to talk about leases! Or, where such talk would change the meeting into a Political-Agricultural Society, of which description it appears there is only one other such in England. Why, what in the name of common sense can this possibly mean? If the mention of leases, the security of capital, and the independence of the farmer would go to make a Political-Agricultural Society, then we have not one but one hundred—we had almost said one thousand such Societies in England. There is not a Farmer's Club nor an Agricultural Association that holds a show or has "a convivial gathering" but where such subjects have been discussed again and again, or, as Mr. Daw puts it, with something like a contradiction, "the political fever is very prevalent." But if leases and Tenant-Right, and so forth, be "matters which it is impossible to go into at these convivial meetings," what are the unfortunate farmers, who are supposed to be here upon business, to talk about? Mr. Sanders, certainly, would infinitely prefer to know whether a furrow had been set straight, or a hedge neatly trimmed, and the chairman to leave everything else to the Chambers of Agriculture. But the Chambers of Agriculture occupy a very anomalous position, as Lord Aylesford has clearly shown. When the Warwickshire Chamber of Agriculture discussed the game evil his lordship withdrew his name, and when the Warwickshire Agricultural Society discussed the game question his lordship said this was more properly the business of the Chamber of Agriculture. From what occurred at Sowton we should be inclined to think they might turn over the farmers' capital and independence very much after the same fashion down in some parts of Devonshire. At the dinner of an Agricultural Society in Herefordshire the other day one of the speakers in advocating the uses of a Chamber of Agriculture, said: "it might not meet all the requirements

of the case, and he did not think it did. The landlord element was perhaps a little too strongly represented," as no doubt it is, not only in the Chambers, but in some other kindred institutions. What, however, does Mr. Daw imagine they chiefly talked about at this dinner of the Mortimer's Cross Agricultural Improvement Society? Why, Politics. It was clearly a Political-Agricultural Society, where they went into land-tenure and Tenant Right, maintaining, moreover, that "it was useless to stand up and talk of their grievances, unless they could give facts;" and they did give facts, and terrible strong facts too, without any learned man to call them to order, or any reverend man to read them a lecture, or any honourable man to hint that all this was out of place at a convivial meeting.

As Mr. Alfred Edwards says the landlord element is "perhaps a little too strongly represented" at the Chamber of Agriculture; while we are inclined to think that the clerical element and the political element may be a little "too strongly represented" at some Agricultural Societies and parish ploughing matches. At any rate and in any case, if the farmers choose to talk over matters that mainly concern them at their own meetings, it should rest with themselves and their appointed chairman to settle as to how far they are warranted in so doing. Any attempted interference or dictation from any outsider, who may be amongst them can, we repeat, be surely regarded as little short of an impertinence. Indeed, as we wrote it a few weeks since, people who attend agricultural dinners with the idea only of paying vapid empty compliments to each other had by far better stay away, whether they be noble lords or tenant-farmers. It is a nice question, indeed, whether men who have nothing more to say should not at once be called to order.

At the Sowton (Devon) Ploughing Match Dinner, Mr. J. H. Kennaway, M.P., in the chair,

Mr. ROACH, who responded for the judges, said he was glad to see the farmers around him looking so smiling, considering the adverse season through which they were passing, for he was quite sure that many of his friends had not made their rents out of their farms this year. Farmers were said to grumble very much. So they did, and with very good reason. But they did not despair, and they hoped to make up in time to come for the bad luck of the past. It had been said that it was the duty of a farmer to produce every blade of grass, every ear of corn, and every head of stock that he could. That was just his idea, and he believed that farmers as a rule endeavoured to carry it out. But they could not control the seasons. He was quite certain that the farmers of England had within the past two or three years sent millions of money out of the country in return for foreign produce. That was so much lost to the country, because whatever was raised at home was so much commonwealth; and if they had to send money out of the country for what was generally produced in it, that money was lost to all. As to the relations between landlord and tenant, there would always be bad farmers as well as good ones, and if a landlord had a bad tenant he would soon find it out, and would refuse to keep him when—as was particularly the case in Devonshire—there were so many good farmers in want of estates. A great obstacle to good farming was the growth of useless hedgerows and timber. Moreover, a great deal of the land was stocked with unprofitable stock—and that, he must say, by the landowners. They could have no idea what was consumed annually by the sort of stock to which he alluded. But let them not mistake him. As an Englishman, he was always proud to see a noble mansion standing in a well-timbered park, and plenty of deer in the park too; and he admired the gentleman whose liberality induced him to add to all that a good pack of hounds. And there was no more pleasing sight to him than that of his landlord trying a good piece of his turnips, with a gun and a brace of pointers, and finding a partridge or a pheasant every five or ten minutes. And if his landlord said, "Roach, we lunch at such a time and place," he would tell him "All right,"

and, depend upon it, he (Mr. Roach) would be all the better pleased, and would be sure to be there. That was the sort of feeling he liked to see existing between landlord and tenant, and where that was found the landlord might always be sure of plenty of sport. But there was another thing which tended to check the productiveness of the soil more than anything else he had named—he alluded to the insecurity which landlords gave to their tenants for the outlay of their capital. They knew perfectly well that land could not be farmed without money; and those who had money, and who had brains as well, would not lay it out without some good chance of seeing it back again. He was sorry to say that there was a growing disposition on the part of the landlords of this country in favour of tenancies at will; and under such circumstances he held that a man was not justified in making the outlay which he ought to in order to farm his estate properly. As a rule, there was not sufficient capital employed to make the best of the land. He was at a great loss to find a reason why landlords as a rule should object to giving a good tenant a lease. He was sorry to say that the only reason he could suggest was this—that they wished to have political control over their tenants—(VOICES: “No, no”). He could see no other reason. He hoped that it was not the reason; but he repeated that he could see no other—(cries of “No politics!”) He was not going into politics, but he knew that what he had spoken of was a great deterrent of the productive power of the country. He hoped it would soon be remedied. He could see by one remedy, and that was that in time they should have vote by ballot—(dissent at the head of the table)—which would in some measure do away with the fear under which many farmers lived.

Mr. J. DAW: No politics!

Mr. ROACH said he was no politician; but they had met there for their mutual good, and if anything could be said by them which would benefit each other, he maintained that it ought to be said (Hear, hear). He was sorry if he had said anything offensive to any individual present, but he had only said what he believed to be true. There was still another subject which he should like to mention, and—

Mr. DAW: The judges! the judges!

Mr. ROACH: Well, he would thank them sincerely for drinking the healths of the judges.

The Rev. Preb. SANDERS, in reference to Mr. Roach's remarks on the question of leases, wished to impress on them the great importance of keeping out of their discussions and deliberations all political allusions. He was quite sure, from his experience of these associations, that in introducing political topics they would be introducing a fertile source of discord which would be fatal to the success and harmony of their meetings. He would by no means say that other ploughing-match dinners might not properly be arenas for political discussion, but he hoped they laid down would adhere to the rule, which they had distinctly laid down, that theirs should be a meeting simply for the sake of agricultural discussions, in which nothing tending to political strife should be introduced.

Mr. ROACH said: Mr. Sanders had in the early part of the evening referred to the clergy and the position in which they stood with regard to their parishioners. He (Mr. Roach) had no doubt that the clergy liked to stand well with the laity. Now he was not going to talk politics; he hardly knew what he was in politics—he rather thought he was a free-thinker—(laughter)—and he wished there were more free-thinkers in politics, and not so many in religion. There was a great deal too much party feeling in this country. He believed that if Mr. Gladstone were to tell any of his followers to jump into the sea they would do it, and the same with Mr. Disraeli—(loud laughter). If people did not stick so much to their parties it would be a great deal better for the country. As he had said, he hardly knew what he was in politics. When Lord Palmerston was alive he thought pretty much with his lordship; but since Palmerston's death the party with which he was associated had run riot—(A VOICE—No politics). Well, they should not have any politics—he would call it religion—(loud laughter, and a VOICE—Worship of Gladstone). Lord Palmerston's party had, since his death, introduced measures which he would never have thought of. He alluded to the disestablishment of the Irish Church.

The CHAIRMAN, interposing, said he thought they ought hardly to go into that subject, upon which there were so many opinions.

Mr. ROACH said Mr. Sanders rather found fault with him (No, no), and he thought he ought to set himself right. The clergy were public servants as well as members of Parliament, and they must expect to be criticised. Mr. Sanders had said that the clergy stood well with the laity, but he (the speaker) thought they did not stand so well as he could wish. The matter of the Irish Church was one which concerned the farmers. He looked upon the disestablishment of the Church as a serious injury to the country, and he did think that in a great measure they had to thank the clergy of England for it. The clergy had tended to weaken the Church as much as any other class of men (expressions of dissent). He (Mr. Roach) meant to say the farmers were foolish, if they went to meetings like this, and heard things said relative to agricultural politics without replying to them (Hear, hear, from the farmers). He wished they in the country were better supported by the clergy than they were. He was as staunch a Churchman as any man in the country, and he believed that the Church of England and the Bible had done more to make England great than her navies had. He was sorry Mr. Sanders should take objection to what he had said. He did not intend to wound the feelings of anyone, but as an Englishman in a free country he could not help expressing his opinion. He wanted to allude to the Irish Church purely as a farmer. They would recollect that there were in England more farmers than farms, and some time ago when he wanted a farm, he thought of going to Ireland, which he believed was as much in want of capital as England. But he could not go to Ireland if he had no security for his money and his life. He wished he could have seen Ireland pacified, but it was not the case. The clergy, by making so many dissenters, had, with the Roman Catholics, succeeded in disestablishing the Irish Church, and in a few years they would disestablish the English Church (uproar).

Mr. DAW said unfortunately they were drifting into a discussion that was wisely prohibited by the rules of the Society. There was, he thought, only one political agricultural society in England, and that was in the neighbouring parish of Woodbury. He was afraid the political fever was very prevalent, and that they at Sowton had caught the infection. He had known Mr. Roach for many years, and no one could know him without appreciating him. He had also known Mr. Sanders for many years, and he could say the same of him. Mr. Roach, in his first speech, stepped a little out of the way, no doubt unintentionally—he ought to have been at Woodbury, and then he would have been all right. Mr. Sanders, he was sure, meant nothing more than to check what was dangerous, and what he (Mr. Daw) remembered was the means at one time of breaking up their association. The subject which Mr. Roach had broached was a fair one for discussion; but that was not the place for it. If he would start the subject at the Chamber of Agriculture, there were many points on which he would support him. He begged to suggest that Mr. Roach should bring forward the subject at the next meeting of the Chamber of Agriculture.

Mr. KENNAWAY would repeat what he had said before at a similar meeting, that their member ought to come there to listen, and not to talk, in order that he might go away better fitted to represent them.

Mr. ROACH: But you wouldn't hear me just now.

Mr. KENNAWAY: With regard to Mr. Roach, he felt as Chairman he was bound by the rules of the Society, and therefore he hoped Mr. Roach would not think he meant to offend him when he interposed. But he felt strongly what Mr. Daw said about the importance of leaving politics to Woodbury, because it was important to preserve the harmony of these meetings. Still, he was far from wishing that grievances should be bottled up. [Mr. ROACH: That's me.] However, there were many subjects of a semi-political character which they might fairly go into, while others which were clearly political were best omitted at these meetings. It was impossible at convivial gatherings to go into matters which required to be looked at in so many different ways, as those questions of the tenure of land and security for tenant's capital. As Mr. Daw had said, the right place for them was the Chamber of Agriculture, and he hoped that those whom he saw around him would attend and take part in the discussions of the Chamber more frequently than they were in the habit of doing. It was impossible to arrive at what was the true state of feeling between landlord and tenant without those discussions.

THE SCOTTISH CHAMBER OF AGRICULTURE.

A general meeting was held in Edinburgh, Mr. Wilson, Edington Mains, the retiring president, in the chair.

The following letter of apology was read :

“Brucklay Castle, Aberdeenshire, 12th Nov., 1870.

“Dear Sir,—I regret that it is not in my power to attend the meeting of the Chamber of Agriculture on the 15th inst., particularly being one of those members who have been sent to the House of Commons in order to further the cause of Game-law reform, and have been attempting that uphill task with very little success. I earnestly trust and expect that the result of the discussion will be to unite the farmers of Scotland in favour of some substantial instalment of reform. The prevailing feeling of Parliament, as brought out by the discussions and divisions of the last four years, seems to indicate a sense of the necessity of doing something coupled with an earnest effort to do nothing. But were Game-law reformers united in favour of some one measure, no Government, however strong, could long withstand the pressure. With these views, although responsible, along with the members for Linlithgow and Dumbarton, for a particular scheme, I have never seen any inconsistency in giving a helping hand also to the proposal of Mr. Loch. Personally, I have no objection to see both measures carried; but it is plain that to mix up the question of contract with that of the Game-laws is to invite needless opposition, and to render the hope of success of such a measure, or of any measure, exceedingly small. The proposed exclusion of hares and rabbits from the list of game has many advantages. It interferes in no way with existing bargains, nor introduces strife between the parties to them. Yet it secures an effectual protection to any tenant, under whatever terms of lease, as any undue increase of ground game under special clauses will be cleared off by the professional poacher (if the term can any longer be applied). As to the allegation that farmers will suffer so much from trespassers that they will demand a stringent Trespass Act, it has been well said that it is not the Game-laws which secure our lands from trespassers. They create trespass by creating the occasion and temptation, and were hares and rabbits exempted from their operation, we might as soon expect to hear farmers complain of trespassers in search of larks' and plovers' eggs as of the damage done by persons hunting ground game. The present law of trespass is sufficiently stringent to keep off common trespassers, which is all that is required. I look upon the proposed Government Bill—and it is generally regarded in Aberdeenshire by those chiefly interested—as practically a measure for facilitating law-suits between landlord and tenant, and conferring no right on the tenant which he does not already possess under the common law of the land.—Yours sincerely,

“WM. D. FORDYCE.”

The SECRETARY, Mr. D. Currer, read the report of the Counties' Committee in regard to the election of president and other office-bearers for the ensuing year.

Mr. GOODLET (Bolsham) then moved that Mr. Scot Skirving be *not* elected as president, as in the present circumstances it was advisable that the president should not be a party-man, but a man ready to treat all parties alike. His objection to Mr. Scot Skirving was that last year, after a vote that terminated favourably to the views he (Mr. Skirving) adopted, he stated that he had been ridden over a good while by the party opposed to him, but that that should be done no longer, as now that he had got hold of the reins he would ride over them. A man who would give expression to sentiments like these was not, in his (Mr. Goodlet's) opinion, fit to be the chairman of that Chamber.

Mr. ALEXANDER moved that the recommendations of the committee be homologated.

Mr. A. E. MACKNIGHT, advocate, begged to second Mr. Goodlet's motion. Mr. Scot Skirving was, he said, well-known to be extremely mixed up with a well-known political party in this country. Had Mr. Scot Skirving been there simply as an agriculturist, and put forward his views in discussion simply as an agriculturist, he (Mr. Macknight) would have been very happy to have seen him chairman of that Chamber. But as he was such a violent partisan—(Cries of “Oh, oh!”)

The CHAIRMAN: I must insist upon your withdrawal of that expression.

Mr. MACKNIGHT said: Well, as he was such an extreme partisan, he (Mr. Macknight) did not think that, considering the matters likely to come before the Chamber, the proposed appointment was a proper one.

The CHAIRMAN said that that was an exceedingly unpleasant discussion, and he deprecated its taking place. He thought that things had been said about the Counties' Committee which should not have been said. How was the business of that association to be carried on, unless the business was prepared for them by the parties elected for that purpose by themselves? Their Counties' Committee had made a suggestion to them that day. Their practice hitherto had been to act on that suggestion, and he simply ventured to make the suggestion that they would not on that occasion depart from that practice. They had no warrant for saying that the committee was doing the business. Then if they were to have in the chair some man whose politics were so diluted that he could have no precise views on anything, they would not get on very well.

Mr. HARPER (Snawden) was one of those who differed very strongly from Mr. Scot Skirving, and he thought it was extremely unfortunate that they should make the question a political question. He thought that under the circumstances the Chamber had done right in adopting Mr. Scot Skirving as its president for the ensuing year. If they should act upon a different principle than the one followed on that and all previous occasions, he had no hesitation in saying that they would get into hot water.

Mr. SHEPHERD (Gleghornie) thought that after the expression of opinion that had taken place, Mr. Goodlet would very probably allow his motion to be withdrawn.

Mr. GOODLET said he could now withdraw his motion only with the consent of his seconder, and however unwilling he might be take any step to mix up politics with the present discussion, he could not help thinking that the appointment of Mr. Scot Skirving on the present occasion was an act which that Chamber should have avoided.

Mr. ALEXANDER here pressed his motion.

Mr. BETHUNE (Blebo) strongly objected to the introduction of political and ecclesiastical questions into the Chamber. Then, as regarded Mr. Goodlet's speech, he (Mr. Bethune) would like to know if Mr. Goodlet wanted a lot of asses in the chair; they wanted clever, able men, who had brains among other things.

Mr. CLAY here moved the approval of the whole of the recommendations of the committee, as the proper course to be then followed.

Mr. M'LAGAN, M.P., seconded the motion. He did not think, however, that Mr. Goodlet had in his speech mentioned the words political and ecclesiastical. Mr. Goodlet had alluded simply to the appearance made by Mr. Scot Skirving at that time last year. But now, as Mr. Goodlet had expressed his opinion on the principle, he hoped he would not continue to press his motion upon the meeting.

Mr. GOODLET said that, after the opinion that had been expressed by the meeting, he should be quite willing—having got the consent of his seconder—to withdraw his motion.

The recommendations of the committee were then held as adopted.

Mr. LOCH, M.P., said he was not going to waste time in making general observations on the subject of the Game-laws, because he was quite sure that there was no one in that room who did not feel as strongly as he could do how full of mischief and injustice were the effects of the Game-laws. He was quite sure at the same time that there was not one present who did not intend to use his best endeavours, by means of proper discussion, to procure the removal of those evils. But, while that was so, there were many differences of opinion as to the manner in which the amelioration of the evils should take place, and it was more particularly with reference to that point that he now sought to consult the

Chamber. There could be no doubt that the question was now suffering a great prejudice in the public mind and in Parliament in consequence of those differences of opinion (I hear, hear). He thought, therefore, that if they could by any means show Parliament that the people were not so divergent as was imagined, the cause in hand would make much greater progress. He gave an example in his own case, and explained that he had withdrawn his bill at the end of last session, after the Lord Advocate had withdrawn his, and without making any remarks on either his own bill or the bill of the Lord Advocate—because, in the first place, it occurred to him that the House had been wearied out by the variety of desultory discussions on different plans; and because, secondly, he could not, in the state he was, declare that his bill had met with very general approval from the agricultural bodies of Scotland. For instance, his friend Mr. McLagan would at once deny that, although he (Mr. Loch) had received large assurances of it. That being so, he had thought it better to postpone the discussion till after he had put himself in communication with bodies like that of the Chamber, in order that they might arrive at some one manner of dealing with the question, so as to avoid that disadvantage. There had been, he went on to say, no less than six measures on the Game-laws before Parliament during the last session, and under those circumstances they could not be surprised that Parliament was a little at a loss to know what was the real mind of the people of Scotland on the subject, because the promoters of all the bills claimed to represent certain sections of the people. Before explaining the provisions of his own bill, which had been so little understood, he would shortly allude to one or two of the other measures before Parliament, in order to show why it was that he did not support the measures already before it. The first measure it was his duty to consider in the session of 1869 was the one introduced by his friend Mr. McLagan, the leading principle of which was to put an end to the protection now given by the Game-laws to those two animals—the hare and the rabbit—and that was, in the views of many, a good means of dealing with the question. But it appeared to him (Mr. Loch) that the measure was open to one or two serious objections. His leading objection was that it would not place the remedy of the evils in the hands of those who suffered by them, but in other hands with which they could have no sympathy—namely, into the hands of the poachers. But then, too, it was a measure which, in the extent of the remedy to be afforded, was not proportionate to the evil complained of. It would equally apply to estates on which game was not preserved as to estates on which there was the greatest over-stocking of game. It would also be open to this other objection, that it would not in fact amend the relations at all as existing between landlord and tenant. It would leave it open to the landlord to make any terms in regard to the hares and rabbits on his farm he should see fit; he might equally then as now bind the tenant down not only to abstain, himself and the servants, from destroying those animals, but to use his best endeavours to prohibit others. It therefore appeared to him (Mr. Loch) that the thing to do was to, if possible, place in the hands of the tenant-farmer full power to deal with the evil for himself, and to apply it in those cases in which in his view it was necessary to have a remedy. But he had yet another objection to Mr. McLagan's bill—it was the feeling, which the Chamber would judge for themselves, that had he been a tenant-farmer of Scotland, he should rather have disliked to have escaped that evil by any back-door such as that. He would rather that he himself should be put upon an equal footing with the landlord with regard to the killing of the hares and rabbits on his farm. Then, in regard to Mr. Taylor's bill for the total abolition of the laws, his first objection was that it was impossible of accomplishment, and that it would be better to seek for an alteration of the laws. If they were to do away with the Game-laws, every tenant of the country would be exposed to dangers in the way of trespassing from which it would be not in the power of his landlord to protect him. All who were acquainted with the subject, too, would know how impossible was the work of drawing up a general law of trespass. The Game-laws, on the contrary, were laws on trespass directed against persons having particular objects in view. Those, then, were the views by which he was actuated when he originally sat down to try and frame a Bill having those things in view; and he might add that, after having had ex-

perience now during the best part of his life with farmers in Scotland and in England, he did not feel himself entirely unfitted to deal with a question such as that, however difficult it might be. Therefore he had thought he should propose a scheme which might possibly meet the evils of which complaint had been made. He had confined his Bill to Scotland for several reasons, because it was more felt in Scotland than in England, and more easily, therefore, dealt with. It was more felt, because in the lease made with his landlord for 19 years, he was exposed for all that time to evils arising from various circumstances, over which he could have exercised no foresight at the time he entered into the lease, and the only remedy was to bring an action against his landlord. He (Mr. Loch) could not conceive a greater evil to the tenant than to be forced to such a remedy. He thought he might sum up in those few words the objection he had to the Lord Advocate's Bill. He did not think a worse measure could have been proposed; and so strongly had he felt that on his first hearing the Bill, that he had at once tabled a motion in the House of his intention to move its rejection. He felt strongly that it was a measure which ought not to seem to be dealt with for a single moment. He would not occupy the time of the Chamber by going into the clauses of the Bill, because he thought they might be pretty sure of this—that whatever intention the Government might have in regard to that question, they were not likely to make so great a mistake as again to propose so absurd a Bill. Mr. Loch then entered upon his own Bill—he confessed, with a little anxiety, though not because he had not perfect confidence as to the soundness of the principle upon which the Bill was founded; for he had laboured anxiously over it for the last two years, and he had during that time been receiving many assurances of the progress it had been making in the public mind. The leading principle of his own Bill was that it should be placed in the hands of the tenant-farmers themselves to deal with that great evil—that they should be given power and authority such as to enable them at all times, if any increase of game should take place injurious to their farms, to put down the numbers of the game of their own free will. Now, if he had stopped there, he should have been guilty of the same sort of dealing which was conspicuous in Lord Elio's Bill a year or two ago, and in the Lord Advocate's Bill of last session—namely, giving a power which might be withdrawn by a forced agreement between the landlord and tenant. It therefore became necessary to make the power given a power of which the tenant could not be divested or divest himself. He (Mr. Loch) had been accused of having been guilty of immorality in making such a proposal, and of flying in the face of the laws on which property in this country is regulated, in proposing that there should be any restriction placed on the power of regulation as between landlord and tenant. That accusation came rather in the first instance from those who desired to cast a slur upon what was proposed, and it would have surprised him if they had obtained any general support from those on whose opinions he generally desired to act. General opinions from those persons and bodies had been recently expressed to him as coming round to the principle he had just spoken of. He then went back to his bill of last year, on which, he said, he had effected certain alterations required to preserve his measure from misunderstanding and misrepresentation, but not changing it in the least. The third clause, which is the first important clause in the bill, was as follows: "From and after the passing of this Act, it shall be lawful for any tenant, by himself or any person employed by him and having his authority and permission, to kill and take hares and rabbits on the lands occupied by him, subject to the provisions hereinafter contained, and to have in his custody or possession hares and rabbits so killed or taken." Well, those provisions were to this effect: "Any tenant holding under a lease existing at the passing of this Act, in which the right to kill hares or rabbits is reserved to his lessor, may give notice in writing to his lessor that he intends, under the provisions of this Act, to kill and take hares and rabbits, or either of them, upon the lands occupied by him, and upon such notice being given, and upon payment by such tenant to his lessor, during the term or currency of such lease, of such annual stipulated abatement or allowance from the rent, if any, as may have been expressed in such lease in consideration of the reservation therein by the lessor of the right to kill hares or rabbits, or where no stipulated

abatement or allowance from the rent is provided by such lease, upon payment by such tenant to his lessor during the term or currency of such lease, of such compensation, if any, as may be agreed on or may be fixed by a valuator, to be named by the Sheriff on the application of the lessor or the tenant, it shall be lawful for such tenant to kill and take hares and rabbits as provided by this Act." Now there were, of course, two ways open to one in dealing with that question—either to postpone the operation of the powers conferred upon the tenant until the expiry of the term of his existing lease, or to make them operate at once upon compensation, or rather upon restitution by the tenant of any amount, in consideration of which he might have held his farm, on the ground that he was deprived of that power. It had appeared to him that there could be no doubt as to the way which should be taken. To have postponed the operation of the powers till the expiry of the lease would have conferred the power on farmers whose lease earliest expired, to the disadvantage of neighbours whose leases had yet years to run. And that there could be no objection to the second course was clear upon principle, and from the course the Legislature took every year in dealing with the rights of property, when public considerations were involved. Well, then, as regarded making the power an inalienable power, and of which the tenants could not divest themselves, that was to be found in the 4th clause, which was as follows: "It shall not be lawful for any lessor or tenant after the passing of this Act, by any lease or agreement between them, verbal or written, or otherwise, to divest or deprive such tenant of the power to kill and take hares and rabbits by this Act conferred on him, or to restrict him in the exercise of that power; and any lease or agreement entered into or made in contravention of this section shall be void and of no force or effect." That was the clause to which it was objected as interfering with the rights of property. That the law did interfere with those rights in many ways Mr. Loch went on to show by instancing the legislation of the law as to real property, the Truck Acts, the usury laws, and other laws. He might multiply examples if that were necessary. But he had another reason for proposing to make that power inalienable, and it was this, that many instances could be given of tenant-farmers who had complained bitterly of over-preservation on the part of their landlords as injurious to their farms, and who, when the power requested had been given them, became in their turn ardent preservers—so much so, indeed, that they in their turn became the subjects of complaint by their neighbours. Therefore it was that he had thought necessary that corresponding liability which his friend Mr. M'Lagan once told him was pure nonsense. However he was quite satisfied that, practically, there could be no more difficulty in enforcing such a clause than there would be in enforcing any other clause in regard to destruction effected by those creatures when too numerous. The sixth clause was to this effect, that in cases of compensation for damage caused by undue number of hares and rabbits, a summary petition must be made to the sheriff, who should decide. He could not see any grounds for alleging that that would introduce bad relations between landlord and tenant; while it was known that the present laws did produce them. The fact that both landlord and tenant would be put upon an equal footing would be more likely to produce manly relations between them, and it did not follow that the tenant would exercise the power given to him obnoxiously to his landlord. He did not know that he could make the matter much clearer in regard to his intentions in making that clause. He would only refer to a letter which appeared in the *North British Agriculturist* the previous week, reflecting on his 4th clause, and for the reason that if a tenant should agree to an arrangement with the landlord in spite of the clause, the tenant might, after spending money in improving his farm, and upon killing hares and rabbits on his farm, be turned out on the ground of his having no lease. The writer of the letter, Mr. Loch said, had entirely misapprehended that clause. It was not upon killing the hares and rabbits that the farmer would lose the lease, but the lease would never be a lease. Then he always supposed that a farmer in making a lease would always act with the advice of his legal adviser, who would certainly say to him that such a lease was no lease at all. He knew how imperfectly on such an occasion he could explain such a subject as that, but he had been actuated with one motive—the desire to bring to an end the state of things which now held in regard to the question,

and that the Chamber might be brought to give such a decision upon it as would not cause the question to retrograde instead of to advance.

The CHAIRMAN was sure that the Chamber, without giving any expression of opinion for or against Mr. Loch's measure, would join him in giving to that gentleman a hearty vote of thanks.

Mr. SHEPHERD asked Mr. Loch if he considered that a tenant who should, notwithstanding the bill, make a promise to his landlord not to kill the game, was bound to keep his promise.

Mr. LOCH should conceive that a tenant could make any terms he chose with his landlord, and if he made that promise he was bound in honour to adhere to it. But then they must remember the counter-liability which he was under to his neighbour for damage that might be done to his neighbour's farm by over-preserving, and the difficulty would right itself. Then they must look at the effects of a measure upon a broad view, and in a general and large view.

Mr. M'LAGAN expressed the gratification with which he had listened to Mr. Loch's explanation of the provisions of his bill; and he appealed to Mr. Loch whether he (Mr. M'Lagan) had not on several occasions assigned as a reason for not bringing forward his bill the fact that no proper opportunity had been afforded for having Mr. Loch's bill fully discussed. It was unfortunate that when there were no fewer than six bills before the House on the subject Mr. Loch had not got a single and separate night for its discussion. He had listened very attentively to Mr. Loch's explanation regarding his measure, but he was bound to confess that he had not changed his mind in regard to that bill. Though he agreed with Mr. Loch in many things that he had said, he was as much as ever convinced of the utter futility of such a bill as he proposed, and of its evasive character. He believed that Mr. Loch was perfectly sincere in the convictions under which he had introduced his bill; but, in discussing this question, he had nothing to do with his opinions or his motives—all that he had to do with was his bill. He agreed with much that Mr. Loch had said regarding his own bill, but he most thoroughly disagreed with what he had said with regard to his (Mr. M'Lagan's) own bill, which was the bill of the Chamber (applause, and "No, no"). What Mr. Loch had brought forward against this bill was, that it would encourage poaching. Now, that was not so. What he (Mr. M'Lagan) wished to do was not to abolish the Game-laws, but to take hares and rabbits out of the game list, so that all the pains and penalties would continue, and any man who went in pursuit of game with guns or nets would be as much subject to the operation of the Game-laws as formerly. After noticing the proceedings which had taken place in the Chamber in connection with the bill which he (Mr. M'Lagan) had introduced into the House of Commons, he proceeded to say that his bill was considered to be the bill of the Chamber till the opposition bill was introduced. When he stood on the floor, conceiving as he did that he was the mouthpiece of the Chamber, he felt proud of the distinction, because he felt that in coming before the Legislature of the land he was uttering the opinion of a body of practical gentlemen who had shown great wisdom and moderation in the framing of their resolutions on the subject, who came before the Legislature in a thoroughly independent manner, and without any selfish end in view, asking the alteration of laws that they felt were not only oppressive in their operation but demoralising in their tendency; and whether the Scottish Chamber of Agriculture should or should not prove true to its first love, he had given notice of his bill for next session, and would press it to a division. In proceeding to criticise the provisions of the bill of Mr. Loch, Mr. M'Lagan said, in reference to clause 3, giving tenants the power to kill hares and rabbits, that he would have preferred if it had gone the length of giving the tenant-farmers the power of killing not only hares and rabbits, but (as he had done on his own estate) the power of killing also the winged game. In reference to clause 4 of Mr. Loch's bill, by which a tenant was not divested of the right to kill hares and rabbits, he said that that constituted the leading principle of the bill. He pointed out that, notwithstanding the provision that "it should not be lawful for any lessor and tenant, after the passing of the Act, by any lease or agreement between them, verbal or written, or otherwise, to divest or deprive such tenant of the power to kill and take hares and rabbits, by this

Act conferred on him, or to restrict him in the exercise of that power, and any lease or agreement entered into or made in contravention of this section shall be void, and of no force and effect," there was no provision as to preventing the bringing in of a third party. It was evident that he might, in the first place, hand over his right to kill hares and rabbits to a third party, who might then go and sell it over to the landlord. He held that the right to kill hares and rabbits could not possibly be inalienable if the tenant was at liberty to make over that right to a third party, who might sell it back to the landlord. That provision bore an absurdity on the face of it. Mr. Loch had said that it was objected to his bill that it was exceptional because it interfered with private contracts; and he had adduced many instances, such as those connected with the Truck system, the Irish Land Bill, the Usury Bill, &c., in regard to which the Legislature interfered with private contracts when they affected the public rights of the community. But it was altogether different with the Game-laws. The complaint was against the evils which these laws created. In the case of the Truck Acts there was no law creating such evils when the Legislature stepped in. The cause of these evils was simply the difference of condition between the employers and employed; in the case of the Irish Land Bill, it was the difference between the condition of the Irish landlords and the Irish tenant-farmers; in the case of the Usury Acts, it was the difference of condition between the Jew who lent the money and the unfortunate individual who was under his screw. Now, let them take the case of the Game-laws. Mr. Loch himself, and all of them, admitted that there were evils created by these laws; but, instead of proposing the amendment or abolition of these laws, Mr. Loch asked Parliament to interfere and prevent contracts being made between landlords and tenants. Now, so long as they had a cause producing certain effects, if they did not abolish or amend that cause, it mattered not what contracts they made, the evil would continue. The Chamber said that these evils were found to be detrimental to the interests of the community; and consequently they went to the Legislature and asked the Legislature to amend these laws. If they interfered with private contracts under the proposed bill, he believed it would be the means of perpetuating the evils of the system. At the last meeting of the Chamber, it had been resolved that no measure would be satisfactory that did not take hares and rabbits out of the game list; and in the next place, they held that there should be a condition to render any contract between landlord and tenant as to the preservation of hares and rabbits under a lease illegal. That was consistent and logical; but if they abolished contracts without altering the Game-laws, they would do what was neither consistent nor logical. Speaking on the next clause of Mr. Loch's bill, Mr. M'Lagan said that under it the right was given equally to landlords and tenants to kill hares and rabbits. But, supposing that a tenant took a farm, if there happened to be any difficulty of misunderstanding arising, the tenant knew that he could not kill the hares and rabbits himself; but he might get all the rogues in the parish to come and do so. That would have the effect of increasing the danger of collision between the landlord and tenant, the evil of which had been so much felt. There would be far more ill-feeling and heart-burning between them under Mr. Loch's bill than there had been under the present system. He (Mr. M'Lagan) was prepared to prove that the operation of that bill would have an immoral effect. Most landlords at the present time were most tenacious of their rights, and especially of the right of killing game. Well, supposing that a tenant went to a landlord and said that he wished to take a farm, and supposing that there were fifteen offerers for that farm, the landlord might say that he was debarred by the provisions of the bill from reserving his right to kill hares and rabbits, but that he would not let his farm to anyone who would not pledge himself to maintain the game as at present. They knew the stringent clauses that, under the present competition for farms, were often signed by tenants anxious to obtain a lease; some of them, in his opinion, were degrading. In these circumstances a tenant, in order to obtain a lease, might come under a verbal obligation to let the game remain as it was; but if the game was found to be preserved to excess, the tenant would naturally feel annoyed at the ravages it would commit, and, rather than suffer farther, he might exercise the right which the Act conferred upon him, and which the landlord

could not prevent him exercising. That, he (Mr. M'Lagan) thought, would be dishonourable conduct on the part of the tenant, and hence the immoral tendency of Mr. Loch's bill. In regard to the 5th clause of the bill, he (Mr. M'Lagan) agreed generally with Mr. Loch. But as to the 6th, while he did not remember having characterised that clause as "nonsense," he believed it would be found to be perfectly impracticable. He did not see how, in the event of any question arising as to damages, it could be proved that hares and rabbits committing destruction on one farm belonged to the farm of an adjoining tenant. If a hare or rabbit committed depredations on a certain farm, it must be held to be the property of the tenant of that farm so long as it was there; and he was at liberty to take a gun and shoot it if he chose. In the event of a reference as to damages, he could imagine in the Sheriff Court a number of young, witty solicitors trying to find out to whom the hare or rabbit that committed the damage belonged. The question seemed to resolve itself into this—Given a hare or hares that have been proved to destroy a certain tenant's crops, which hares powers have been given under this bill to that tenant to kill—wanted to prove that that hare or these hares belong not to that tenant but to a neighbouring tenant, and that neighbouring tenant is bound to pay compensation for the damage done to his neighbour's crop. That seemed to be the question that would be raised, and he thought that the impracticability of carrying it into effect was perfectly evident. In short, he objected to Mr. Loch's bill because it tampered with good faith between landlord and tenant, with the security and with the solidity of contract. While he objected to the second reading of the Lord Advocate's bill on the Game-laws, he would have pleasure in introducing one clause in his lordship's bill, preventing the landlords from interdicting their tenants from shooting hares and rabbits on their farms—a clause which he thought was certainly a step in the right direction. He (Mr. M'Lagan) had no hesitation in expressing himself favourable to that provision; and he would be glad to introduce it into his own bill next session, which he hoped would be so improved as yet to be regarded as the bill of the Chamber.

Mr. GOODLET said he wished to put a question to Mr. Loch on a point which had been but slightly touched upon by Mr. M'Lagan. In the preamble of Mr. Loch's bill it is stated that the Game-laws required amendment with a view to give relief to the farmers from the excessive preservation of game. Now, he (Mr. Goodlet) could not see any provision to that effect in the bill. There was no doubt a clause giving the tenants the right to kill hares and rabbits upon payment of compensation to the landlords, whether these animals were in excess or not on their farms. But suppose a tenant did not wish to purchase this right, or had not the means of doing so, then there is nothing in the bill to afford relief to that tenant.

Mr. LOCH said his bill was intended to come into operation at once. It was provided that any tenant holding under a lease in which the right to kill hares and rabbits was reserved might become possessed of the right by payment of such annual stipulated allowance from the rent as might have been expressed in the lease in consideration of the reservation; or, where no stipulated abatement was mentioned in the lease, by payment of a compensation to be fixed by a valuator to be appointed by the sheriff.

Thanks were awarded to Mr. Loch and Mr. M'Lagan, and the discussion adjourned.

Mr. WILSON (Edington Mains) then briefly addressed the Chamber, and vacated the chair in favour of the newly-elected president, Mr. Scot Skirving, who on taking that position returned thanks for the honour conferred upon him.

The other office-bearers were as follow: Mr. R. Scot Skirving, President; Mr. Archibald Paterson, Senior Vice-President; Mr. J. C. Shepherd (Gleghornie), Junior Vice-President, Directors—Messrs. George Wilson (Harelaw); George Hope (Fentonbarns); C. Alexander (Whitefield); Adam Skirving (Croys); David Dunn (Baldinnies). Auditor and secretary re-elected.

The SECRETARY reported the returns he had received from the different counties constituting the Counties Committee for the ensuing year. He read the following report from Kincardineshire:

WEIGHTS AND MEASURES.—In regard to the metric system

of weights and measures, the Convener stated that the Kincardineshire Association of Schoolmasters had, at a general meeting, approved of it as a most desirable change—from chaos to uniformity; and also on account of its simplicity and easiness of acquirement. It is already taught in seven of our parish and denominational schools. The convener, Mr. Taylor (Cushnie), presented the association last year with Dowling's synoptic map of the metric system, which has been handed from school to school. It is published by Keith Johnston, and he suggested that the directors should procure a copy of it to hang in the hall of the Chamber. The Indian Government, under the governorship of Lord Lawrence, decided to introduce the metric system all over India; and if his lordship is appointed to the Education Board in London, his influence, no doubt, will hasten its adoption in this country by its educational institutions. It is already permissive, and all that is wanted is for Parliament to make its adoption compulsory. It is assuredly coming to this. Let each director go home and prepare the way for it, as we in Kincardineshire have been doing for the last two years.

EDUCATION.—What is most interesting to farmers here who have families, at the present time, is to obtain in the coming Education Bill of next session providing for establishing intermediate schools in rural districts, corresponding to academies or grammar schools in our larger towns. Wherever there is a sufficient population of say 3,000 existing, parochial and denominational schools should be consolidated with division of work. In this county, forty miles in length, there is not a single school above the rank of a parochial one; fortunately the teachers are a most efficient body of well educated, well trained men, but their time is too much taxed in teaching A B C up to Greek and Latin. What is also attracting much attention in this county is the establishing or technical classes for the benefit of young men who have left school. At a meeting of the Schoolmasters' Association at Laurencekirk, on Saturday last, with Mr. S. Cook, from Kensington, the teachers present expressed their approval of establishment of technical classes, and their own readiness to attend classes for teaching, so that by next year they may be certificated and qualified to teach classes themselves. The Chamber will, we hope, take the subjects of the establishment of intermediate schools in all populous rural districts, and the establishment of technical classes in every parish into consideration, and will memorialise Government that provision be made for all these three objects in the promised Education Bill for Scotland.

ROADS.—Our local road question has had much attention paid to it both by farmers and proprietors during last year.

GAME.—The game question has been under consideration of the Kincardineshire Farmers' Association, and there is herewith sent some copies of the resolutions come to at the last meeting on 10th May, 1870, viz.: That the Game-laws as they at present exist are iniquitous in principle, tyrannical in administration, and in all parts of the country lead to increase of local taxation, impoverishment of tenant farmers, demoralisation of the people, and debasement of the aristocracy, landowners, and game tenants. That the bill introduced into the House of Commons by the Lord Advocate and Mr. Bruce will not mitigate any of those evils, but will greatly add to the already tremendous power of the landlord, by increased inducement to litigation in the higher Courts; and the landlord being the richer party, such litigation, without any limit but the Court of last resort, would often be more ruinous to the tenant claiming compensation than the original loss; therefore, this meeting is of opinion that the bill is altogether unworthy of a Liberal Government, and ought to be opposed. That tenant-farmers ought to have the inalienable right of defending their crops from destruction by wild animals, whether known by the designation of game or by any other term. That the Game-laws, as has been often shown, are a fertile source of crime, pauperism, and increase of local taxation. By a Parliamentary return for 1869, there appear to have been 10,345 convictions under these laws in England and Wales alone, which must have been the cause of reducing at least 20,000 individuals to pauperism, to be supported at the public expense; and in a previous period of ten years there were 42 convictions of homicide and murder arising from breaches of these laws, representing 68 lives lost; therefore, this meeting is of opinion that the Game-laws ought to be

made less sanguinary, less oppressive, and more in accordance with the spirit of the age. That a Liberal Government, fully aware of the deplorable amount of pauperism, homicide, and murder caused by the Game-laws in England and Wales, and also of the enormous destruction and check to production of the food of the people, the impoverishment and ruin of tenant-farmers, from the ravages of game, ought not to have cast contempt on the just complaints of the tenant-farmers and people of Scotland by proposing to assimilate the Game-laws of this country to those of England. That Mr. Loch's bill would confer on tenant-farmers the inalienable right of defending their crops from destruction by hares and rabbits, provides for compensation for injury done to crops by vermin coming from neighbouring estates, for transfer of all Game-law cases from the Justices to Sheriff Courts, for abolition of cumulative penalties for the same offence; and in so far this meeting approves of the bill, and resolves to petition in its favour; but it does not give protection to the Highland farmer against the vast herds of deer and packs of grouse which in late seasons come down from the higher grounds and devour their crops, and in that and other respects might be amended. That were farmers enabled to protect their crops from injury by game, the land laws amended, the "false and evil law" of hypothec and the oppressive law of distraint abolished, so as to render it safe for farmers and those who deal with them to lend their capital more liberally to landowners in the cultivation of their estates, there is good reason to believe that in a few years, instead of the 11 million quarters of grain now grown in the United Kingdom, the 22 millions required annually for consumption could easily be produced at home. That seeing almost all landowners are preparing to set legislation at defiance by the insertion of stringent clauses, new leases for reservation, including rabbits, notwithstanding any change in the law which may take place, the total abolition of the Game-laws, as proposed by Mr. Taylor, Mr. Jacob Bright, and Mr. McCombie's Bill, would fail to give relief from the evils complained of unless a provision be introduced rendering it illegal for parties to enter into covenants for the reservation of ground game. That the bill introduced into Parliament by Mr. Harcastle and Sir Wilfrid Lawson is both tyrannical and jesuitical. By making foxes game the Highland farmer defending his flock would be branded as a felon; it declares that no one shall be criminally prosecuted for killing game, and in a subsequent clause makes game to be private property, and all who intermeddle with it thieves and felons. Any child within the kingdom who may put its hand into a bird's nest to break or take an egg, or school boy who may catch a wild rabbit or kill a tame one of his own, would be liable to six months' imprisonment with hard labour, or to a fine of £20. Therefore this meeting considers the Bill so absurd as to be unworthy of consideration.

The Forfarshire Committee have sent up the following resolution: That this meeting, viewing with regret the unsuccessful attempts that have been made by individual members of Parliament to remedy by legislation the abuses arising out of the Game-laws, and having especially in view the utterly inadequate character of the proposed Government measure, introduced by the Lord Advocate, resolve to move the Scottish Chamber of Agriculture to petition Parliament for the total abolition of these laws.

The report from Ayrshire brought up the necessity of pressing Government to a satisfactory settlement of the hypothec and game questions: "but as there is little likelihood of any proper solution of the game question so long as farmers are themselves at variance in regard to what would be a right measure, the Chamber might take steps for convening a meeting of one or two delegates from each county in Scotland, to endeavour to come to a common understanding on this vexed question.

COMPENSATION FOR PERMANENT IMPROVEMENTS.—The meeting were further of opinion that the Chamber should bring forward and discuss the propriety of having introduced into Scotland the system and compensation for permanent improvements and unexhausted manures, &c., so as to prevent land being deteriorated towards the close of a lease, and thus not only prove beneficial to landlords and tenants, but also to the whole community.

STEAM CULTIVATION.

At a meeting of the Wisbech Chamber of Agriculture, Mr. J. Brown in the chair,

Mr. ISAAC ROBINSON said: I submit for your discussion and better judgment a few facts and considerations which I have been able to gather from 12 years' observation of its progress, the perusal of much that has been written on the subject, and the practical experience taught me by my daily occupations. Steam cultivation has of late years occupied much of English thought, capital, mechanical skill, and ingenuity. There is no subject connected with agriculture which has a greater interest in the present day, because in the judicious employment of steam in breaking up the soil, we look for that which will increase the profits of farming, while it decreases its expenditure. For the progress that steam has made in other fields of labour, look at locomotion. It is less than fifty years since George Stephenson opened the Stockton and Darlington Railway, the first line used for passenger traffic, and already the whole country is covered with a net work of iron rails, and 10,000 locomotives convey goods and passengers over thousands of miles of British railway. Look at our workshops. Watt's condensing engine of the last century has had a numerous progeny. It is calculated that from 180 to 200,000 steam engines are employed at present, as the motive power of our mills, mines, and factories. Look at our ports and rivers. We have men among us who were alive when the shrew Yankee sneered in 1807 at "Fulton's Folly," as the first steam-boat was called. Now we have steam vessels innumerable, from the tiny tugs and penny boats of our rivers, to the noble Captain (whose loss we are now deploring), or the gigantic Great Eastern; and our gallant merchant ships visit every port, and traverse every ocean of the globe. We can also look at our farms. In 1841 the first portable engine was exhibited at Liverpool as a great curiosity. We have now about 14,000 thrashing engines in daily use amongst us. Such vast advantages having been gained by steam, as a motive power in other branches of industry, it is no wonder that attempts were made from time to time by energetic and persevering men to adopt the new power to the cultivation of their land. I will mention a few of the early pioneers. In 1832, Mr. Heathcoat, of Tiverton, patented a set of steam cultivating machinery, which, I believe, began to work in 1834. This consisted of an engine windlass, rope and anchor. The engine moved itself along one headland, and the anchor pulley along the opposite one, hauling the plough backwards and forwards between them. This did not prove a success, the cause being, I believe, the want of a better medium for transmitting power; hemp rope being too soon worn out, and chain being too heavy. In 1830, a Mr. McCrae patented a system similar to Mr. Heathcoat's, but being intended for the low level lands of British Guiana, where many fields are bounded by parallel canals, the engine and pulleys were placed in punts at opposite ends of the field, which were moved on as the work progressed. With these he worked a balance plough, three ploughs pointing each way, supported on a high pair of wheels, as in our present system. In 1846 Mr. Osborn, of Demeura, ploughed with two engines; one at each end of the field. In 1849 Mr. Hannam, used iron wire rope for steam culture. In 1851 Mr. Wren Hoskyns, in his amusing *Chronicles of a Clay Farm*, brought forward this theory of making a seed bed in one operation, and thus dispensing with the successive processes of ploughing, harrowing and rolling, &c. He shows that as manual labour is principally vertical, as in digging; horse labour is horizontal, as in drawing a plough; so steam is rotatory in its action—as the fly wheel of an engine. Taking, then, his idea from the claws of a mole, he proposed that a traction engine should drag behind it a set of discs armed with revolving claws, which should rasp up the soil and leave the land behind it in the comminuted state of a mole-hill—a perfect seed bed ready made. The fruit of this book was a perfect crop of patents, and many ingenious machines were made to carry out the theory—such as Romaine's cultivator—but the inventors did not take two facts sufficiently into consideration. First, that you cannot hurry Dame Nature. To make a good seed-

bed soil requires, not only comminution into small particles, but also the beneficial effects of sun, air, rain, and frost—in two words—freedom from weeds, and atmospheric influences. Second: To move a heavy traction engine over rough ground takes up so much of its power that it has little to spare in dragging an effective cultivating implement behind it. I submit this last fact to the consideration of those who are inclined to believe that the traction engine with india-rubber tires can drag a plough more economically than it can be hauled with wire rope. But to return to our inventors, I must pass over the experiments of Sir John Lallie, Lord Willoughby D'Eresby, the Marquis of Tweeddale, and others, who by their exertions have paved the way of steam cultivation, and done much that has proved useful to subsequent inventors. As to later inventions and improvements their name is legion. Time would fail to give you even a slight sketch of the labours of Mr. J. A. Williams, Mr. Collinson Hall, Mr. Fiske, Mr. Boydell, Mr. Falkett, and others—not undervaluing their good service in the cause, but wishing rather to bring before you the names of the founders of the two systems of cultivation now in practical use among us—those of Fowler and Howard. The late John Fowler was one of those remarkable men possessing all the qualities of a great inventor: skill, ingenuity, indomitable energy and perseverance, a resolution never daunted by obstacles or failure, nor satisfied with any success short of completeness, and the rare ability of being able to learn by other people's failures, and profit by other people's experience, and of being able to call to his assistance a number of clever men who assisted him in his toils. I think I have heard that he spent three fortunes in perfecting his great invention, and he died, in the prime of life, leaving his representatives to reap the fruits of his active and persevering exertions in a large and ever increasing business. In 1854, Mr. Fowler exhibited at Liucoln a draining plough worked by steam. In 1856 he showed at Chelmsford his well-known balance plough, worked by a stationary engine on the round-about system. Next year at Salisbury, Mr. Fowler began the direct system: he mounted a portable engine on a windlass-frame, which moved along the headland by an anchor fastened a-head. An improved anchorage pulley moved along the opposite headland as the work proceeded. In the same year the Highland Society awarded him the £200 prize, as having found an economical substitute for horse power. In 1858 the Judges of the Royal Agricultural Society at Chester, awarded the £500 prize to Mr. Fowler, saying in their report: "It is beyond question that Mr. Fowler's machine is able to turn over the soil in an efficient manner, at a saving, as compared with horse labour, of, on light land, 20 to 25 per cent.; on heavy land, 25 to 30 per cent, and in trenching (deep cultivation), 80 to 85 per cent.; while the soil is left in a far more desirable condition, and better adapted for all the purposes of husbandry." It was on this occasion that steel-wire rope was first used, and from this date the economical commencement of steam cultivation. Since 1858, Fowler's Tackle has received upwards of £3,000 worth of prizes at the different shows where it has competed; each year showing an improvement in some detail. 1,200 hands are now employed at the Leeds factory, in a trade which, I believe, is now only in its infancy. After John Fowler, I would mention to you the name of Mr. William Smith, one of the fathers of modern steam cultivation. He is a farmer at Woolston, Bucks, and his occupation is 200 acres of heavy land, or less. Having become convinced of the superiority of cultivating over ploughing, by reasons I propose to mention presently, he invented his cultivator (which was made under the superintendance of Mr. Fowler), and in December 1855 he began steam cultivating, with a seven-horse portable engine, and smashed up oat, pea, and wheat stubbles with satisfactory results. Mr. Smith's system has not been greatly altered since its introduction, and is in common use on hundreds of farms. The engine and windlass are fixed in one corner of the field, round which field the rope runs, carried on rope porters, and the cultivator is hauled between the shifting pulleys at each headland. At

the Chelmsford show in 1856, Mr. Smith competed for the prize, but although the work was fairly done, the judges did not consider it more economical than horse labour. Mr. Smith did not exhibit at Salisbury, but made his appearance again at Chester in 1858, by his manufacturers, Messrs. Howard, of Bedford, who have since conducted the manufacture on their own account in the spirited and energetic manner that distinguishes that eminent firm. Messrs. Howard cultivated the land assigned to them in good style, and the judges awarded to them the large gold medal of the Society. The same day the award was published, Mr. Smith's neighbours and friends presented him with a tea service worth one hundred guineas, as a testimony of their sense of the mechanical skill, talent, and perseverance evinced by him in bringing to a practical result the application of steam power to the cultivation of the soil. Mr. Smith since this time has shown no inclination to hide his light under a bushel; he has published pamphlets and letters, and delivered speeches innumerable; but if he has viewed his own inventions and practice with somewhat too favourable an eye, and those of other inventors with some amount of prejudice and distrust, we must remember that he has used steam cultivation for nearly fifteen years, that all this time his farm has been open to the inspection of all the world, and that he has been able to give the plainest practical evidence of the profitableness of steam tillage, and thus fairly earned the gratitude of his brother farmers, and of the community at large. Since 1858, Messrs. Howard have gained many prizes for their steam cultivating machinery, and have made many hundred sets of tackle, principally on the roundabout system advocated by Mr. Smith. I am glad to notice, however, that they now adopt also the direct system of Fowler, cultivating with a traction engine on each headland, certainly the most economical method of applying power, where it can be adopted. It is noticeable, also, that since 1858 Messrs. Fowler and Co. have manufactured many more cultivators than the ploughs with which they won the Chester prize. After this sketch of the introduction of steam cultivation, let me call your attention to some of the practical questions of my subject. First, the advantages of cultivating over ploughing. At certain times of the year every farmer is glad to employ a cultivator, grubber, or scarifier, and acknowledges the benefit of doing so; but the obstacle to their more extended use is to be found in the fact that every effective implement of the kind is more or less of a horse-killer. Mr. Smith was, I believe, the first to demonstrate that the cultivator, when drawn by steam-power, is not only an auxiliary but a vastly superior substitute for the plough. I will read you an extract from his letter to Mr. Greaves, 1856. "The most approved of our common ploughs simply and absolutely turn over the soil, placing the former surface from four to six inches below, and bringing up the smooth surface of the under soil to the top. By this process all the seeds, weeds, and roots are deposited below the surface; whence the weeds which are propagated from roots or layers—such as couch-grass, water-grass, crow-foot, coltsfoot, and others, being divided by the plough are indefinitely multiplied; and do in fact, after four or five years, become increased to so great an extent as to render it absolutely necessary for the farmer to leave his land practically barren for the purpose of removing these obnoxious weeds; to do which the plough entirely fails him, and he is driven to the scuffler, cultivator, or other implement which he has invented for this purpose. Roots also of the thistle kind spread horizontally just beneath the pan which is trodden down by horses, and unless recourse be had to subsoiling, can scarcely be eradicated at all." Mr. Smith then goes on to contrast ploughing with spade husbandry 10 to 12 inches deep, and questions whether it would be generally advantageous to cultivate more than 6 or 8 inches deep, if the subsoil were to be laid upon the top, as is commonly the case in ploughing. Following out these thoughts, and endeavouring to find an economical substitute for the spade, Mr. Smith not only invented an efficient cultivator but he made it take the place of the plough for all operations, except ploughing in clover layers. Ever since '56 he has stuck to his text, with these results: his farm is as free from weeds as a garden, his crops have increased, and his land is cultivated at much less expense than before. Wherever steam culture is used, ploughing is used less, and cultivating more than before; for we find by experience that by cultivating you can destroy weeds

better, work your land deeper, and leave it in a more productive state. There is some land, however, where inversion of the soil is desirable, and the plough is the best implement. What is called "digging" also is very popular in some places. It is done by substituting digging breasts for the ordinary mouldboards. The land is worked ten or eleven inches deep, and is partially inverted, as when done by the spade. Let us now consider some of the advantages of steam cultivation. 1st, It deepens the soil. There are thousands of acres of good land in this and nearly every other county of England that have never been ploughed more than four or five inches deep. Year after year the plough slade has ridden over the subsoil and the hoofs of the horses have trampled it, until it has become a solid pan, effectually preventing the roots from penetrating or even the water from passing through it—in fact the subsoil has become "puddled clay," like the bottom of an artificially-made pond. Now modern farming condemns this; and many good farmers make a practice of subsoiling their land, two furrows deep, once in every rotation, in spite of the expense; but steam does this more effectually and much cheaper. I could point out to you land in this neighbourhood which had grown nothing for years, until it was steam cultivated, and it then, and since, has produced most luxuriant crops of wheat and oats. Mind, we do not want the raw clay brought to the top, and the good soil and manure buried five inches below it—as a gentleman near St. Ives told me he had served some land six years ago, the effect of which was five years' bad crops—but we want to keep the good soil at the top, freshened with a slight mixture of subsoil, and we want to smash up the solid pan, letting the surface water down by the drain, and exposing the heavy subsoil to the combined influences of sun, air, rain, and frost, so as eventually to make it good soil, fertile and productive. What becomes of those large lumps of clay left on the surface where draining has been going on? Atmospheric influences pulverize them, they mix with the neighbouring soil, and so far from injuring they actually improve it—so is it with the portions of the subsoil brought up by the cultivator. To get the full benefit of steam cultivation, it is, however, necessary that clay land should be broken up when dry, or it soon consolidates again, nearly as hard as before. The beetroot growers of France and Germany have become converts to deep cultivation; for chemists have shown them that more sugar and spirit can be obtained from a ton of roots grown on deep soils than from the same weight grown elsewhere, for it is that part of the beet underground that is richest in sugar. Consequently they are now largely buying steam tackle (or were before this unhappy war broke out) and working their land 18 to 24 inches deep. Mr. Campbell, of Bascot Park, who grows sugar-beet on a very extensive scale, loosens his land 24 to 27 inches deep, and finds a great advantage in doing so. I confidently look forward to the time when deep cultivation will be the rule, and not the exception in this country. You remember the old fable—a man when dying, told his sons that he had hidden a good deal of money in one of his fields, but he could not remember which, but "dig deep" said he and you will find it. After his death they began to search—field after field was dug to a great depth, but no treasure could be found. But when the harvest came, the land, broken up to so unusual a depth, produced abundant crops of grain, and then the father's meaning was understood. The moral is, if you want to find the treasures hid in the soil you must try deep cultivation. The second advantage I claim for steam cultivation is expedition. You can break up your more quickly than by horses, at a time of the year when time is money. I have often seen a good crop on a field which could never have been cleaned and sown that season had it not been for steam power. But steam not only thus helps the backward farmer, but it prevents a man thus ever getting behind. Look at the advantages of steam cultivation, are they, even now, estimated as they ought to be? I say, fearlessly, they are not, we should not see such a quantity of stubble land or unbroken in October. It is directly after harvest, when the sun is hottest, when the land is driest, when the weeds are most easily destroyed, when you can give a half-fallow to your land, when one day's work is worth a week's labour in the spring, it is then that the land wants breaking up. I believe that a farmer who buys extra horses for this work does wisely. But, by the steam cultivator, you can smash up 10 to 30 acres a day. The steam-horse

wants no rest, you can work him from sun rise to sun set, you can even work him by night if you have hands enough to manage him, as Mr. Cambell has done by the use of the magnesium light. People speak of the great expense of steam cultivation, the question is can we properly estimate the value of work done at such a time. A reaping machine costs a great deal of money, but if you can cut 12 acres a day with it, when your wheat is all ripe together; how trifling in comparison is the outlay! On many farm whole fallows have been done away with by the use of autumnal steam cultivation, and the land nevertheless kept quite free from weeds. The third advantage of steam cultivation is that it improves drainage. On ill-drained land, especially where the subsoil is a horse-trampled pan, the rainfall runs off the surface by grips and water-furrows, into the ditches, and thus its valuable chemical constituents are lost to the soil: nor is this all, the water which is retained and cannot get away, stagnates and keeps the land wet, cold, and sterile, while on well-drained land, when the pan has been broken up and horses kept off it, water-furrows are unnecessary, the rain filters through the thirsty soil to the drains, leaving most precious manure behind it. By doing away with grips and water-furrows you not only utilize the land thus wasted, but the reaping machine and every other implement is worked with greater ease and economy. I could also give you examples of farms where by steam tillage they have been able to grow turnips and feed them off the land, which was before impossible. The fourth advantage of steam cultivation is that on heavy land you save those 350,000 hoof-marks, the toll us horses leave in every acre of land ploughed. When your clay land is dry, it is too hard to plough, when wet the weight of the plough and the trampling of the horses poach the subsoil into the pan we have spoken of. But the steam-hauled implement leaves no mark behind it, and in unfavourable seasons, when you cannot get horses on the land at all, you can still use steam. The fifth advantage in using steam is that you are able to work a farm with less horses, and spare the horses you keep for the hardest work. Horse labour in the great expense of the farm. Look at the first cost of a horse, take the annual depreciation of his value, cost of his keep, blacksmiths', saddlers', farriers', and implement makers' bills, add cost of ploughmen and horse-keepers' wages, and you will find the expense to be from £40 to £50 a-year. Mr. J. Chalmers Morton, a well-known agricultural authority, in a paper read before the Society of Arts, gives the statistics of the horses kept on twenty-one different farms, and the average cost of each of the 282 horses was £46. On a large farm there are always horses kept, all the year round, for the sake of their work at certain seasons of the year. Substitute steam labour at such times, and you save, not only the difference of their keep for the few weeks, but for the whole year. Supposing that by the partial use of steam, you can save four horses' keep—at Mr. Morton's estimate that would amount to £184. Some people have saved much more than that. If you look at the R. A. S. E.'s report on steam cultivation 1867, when its commissioners, visited 140 farms, under steam-tillage—you will see that nearly all these farmers have largely reduced their horse labour, some keeping ten and some even twenty-five horses less than before. The sixth advantage of steam cultivation is that, by its use, the land requires less working, and fewer operations, such as ploughing, harrowing, rolling, clod-crushing, &c. Even when used occasionally, steam-cultivated land is easier to work for years afterwards; but, if the full benefit of steam be obtained—the land broken up at the proper time, and not a horse-hoof allowed to trample and poach the land afterwards—if steam be used continually, and not occasionally, for the light operations of the farm every year, as well as for the deep-cultivation every four years, the saving would be enormous. Mr. Smith asserts that the total cost of preparing his seed bed for wheat is 7s. 6d. an acre, including every expense; but we must remember that this is after years of continuous steam-cultivation. The seventh advantage of steam-cultivation is that it improves the position of the agricultural labourer; it enables a man to earn better wages for himself with less toil, and to do a better day's work for his master; it quickens the pace, and makes a man more handy, smart, active, and self-reliant. I do not think that it will displace any manual labour, but it will rather turn the labour to better account. The eighth advantage of steam-cultivation is, that you can get better crops at less expense, and that the fertility of the land is increased by

it. By deep cultivation and good drainage the temperature of the land is raised, the land dries quicker in a wet season, and in a dry season like this year's summer it remains moist and does not parch under the blazing heat of the sun. I could give you facts from my own observation as to the increase of crops from its use, but prefer to refer you to the employers of steam-labour round us, and also to the report of the R. A. S., mentioned above, where you will find an increase from four to eight bushels of wheat an acre obtained in many places. How is it that a labourer can afford to give double the agricultural price for his allotment? how is it that a market gardener can raise such large crops from land no better than that of his neighbours? Liberal manure does something no doubt, but the great secret is in spade-cultivation, by which the land is kept free from weeds and open to the rich fertilizers contained in every breeze and in every shower of rain. That it is not the manure, look at the Lois-Weedon system of growing wheat. You know that by a strip of fallow between every three rows of wheat you may grow a good crop of wheat for twenty years in succession if you will, without a spadeful of manure (as the Rev. Samuel Smith has done), and then have the land in as good a condition as ever. What is the secret? only that the land has been kept open to receive nature's bounty. I have not gone into the question of the peculiar advantages of steam-cultivation on light land, because in this neighbourhood our land is principally heavy or else in small fields; but I will say briefly that where the enclosures are of good size, as in parts of Lincolnshire and Norfolk, steam has won triumphs as signal as any of those gained on heavy soil, and is of equal value to the farmer. To recapitulate in brief a few of the advantages of steam-cultivation: It deepens the soil, and does it more cheaply than horse-labour, and much more efficiently; it enables the land to be worked at the best time of the year more expeditiously, and thus destroys weeds; it improves the drainage, and thus makes the land drier, warmer, and more open to receive the blessings of the rain; it saves expensive horse-labour; it prepares a seed bed in flower operations; it improves the position of the labourer; and increases fertility. My subject is not exhausted, gentlemen, but I fear that I have already trespassed too long on your patience. Had I time, I should have been glad to have given you a sketch of the various kinds of the steam-cultivating machinery now in use, and the latest improvements in practice; to have discussed the best kind of tackle suitable for farms of different kinds, and the expense of purchasing and working them; the cost of hiring them in different counties, and the customs belonging to them; when it pays best to buy and when to hire; the causes of success, and the causes of failure, with illustrations from modern practice; but time fails. I will therefore only notice some of the objections urged against steam-cultivation, and some of the obstacles to its progress, and then briefly consider how the objections may be met and the obstacles removed. Objections against buying tackle: Want of capital, want of mechanical skill, the example of those who have tried it and not succeeded, the difficulty of getting men to manage the machinery, the risk of breakages, and the cost of repairs; against buying tackle in partnership there is the possibility of all the partners wanting it at the same time, and the additional difficulty of managing men who have to serve several masters. Objections against hiring: Farmers cannot sell part of their horses, because they cannot be sure of getting tackle when they want it; and, having horses enough to do their farm work, hiring steam is an extra expense; and, then, you know, contractors charge such high prices. General Obstacles: No leases, want of Tenant Right, fear of disturbance or increased rent, bad leases, compelling a certain rotation of crops, or forbidding the use of the scythe or reaping machine, timber in fields and hedges, bad roads, small fields, crooked hedges and ditches, want of draining, bad water, want of water. My answer to these objections is this: That any energetic young farmer, who will give his mind to it, may soon acquire enough knowledge to drive an engine and to see that his men keep the machinery in order. Such a one will have little difficulty with either men or machinery; and for him £700 to £800 laid out in steam tackle will be an investment that will pay him tenfold, as it has done hundreds of practical men. As to hiring, if you make a bargain beforehand with a contractor, you are certain of getting tackle when you want it, and can thus get rid of the extra horses. As to the high prices charged, the great point to be considered is

whether the value of the work done is worth the money, all things considered. Competition brings all prices to a fair level. If the trade be profitable, contractors will be multiplied; if unremunerative, they will soon be starved out. But it is evidently to the advantage of the steam-employing community that the men who spent their time and capital in order to bring steam-cultivation within the reach of the smallest occupier, should be able to live by their business. Let farmers only prepare their farms properly for steam-cultivation, and offer a good breadth of land; and they will be surprised how cheaply and eagerly contractors will work for them. How then, is a farm to be prepared for steam, to get its full benefits? For this landlord and tenant must unite and work together. In this district we suffer principally from two great hindrances—brackish water, which destroys an engine's fire-box in two seasons, and small and irregularly-shaped fields. In time, however, pits will be dug, and tanks made to retain that valuable rain-water which we now waste so carelessly. Mr. Torr of Aylesbury and others, for example, have filled up open ditches, laid pipes instead, and conducted these mains into corner-tanks, where two or three fields meet. Fields of thirty to a hundred acres will be the rule, not the exception; and their boundaries will be straightened. New farm-roads, straight and good, will be made, on which engines can stand when at work. Trees and other obstructions will be removed. A knowledge of steam-cultivating machinery will be deemed as essential a part of a young farmer's education as the rearing of stock or the rotation of crops; and the next generation of farmers' sons will compete for silver cups at the local shows for steam-cultivating, instead of ploughing.

Mr. WALKER wanted to know why a field should not be a garden. They could not dig it all, and they could not garden it all, but they could do a great deal towards it by steam-cultivation. The land in the Smeeth and Marshland was just the ground for steam-cultivation. He had used a steam-engine on his land for thirteen years, and he would be very sorry to leave it off. The great question is, what sort of steam-cultivation farmers should use, the single system or the double system? He maintained that every farmer ought to have a steam apparatus upon his premises. As Mr. Robinson had fully observed, however, it required a mechanical mind to work a steam-engine and to work the tackle. Men as a rule are not acquainted with the working of such machines, and he had found great difficulty in getting men who would keep to the work. The boys he thought became the best men for that sort of occupation. He had boys in his employ whom he taught all they required of farming operations, and when they had gained the necessary knowledge he gave them 3s. a day, and some of them earned a guinea a week. There is one thing they had to contend against in steam-cultivation, and that is prejudice, but that would die away; everything that is right would succeed in the end. His opinion was that every large farmer ought to have an engine and tackle of his own.

Mr. ROBERT DAWBARN said at a meeting of the Society of Arts in London he remembered it formed a matter for discussion, what effect the introduction of steam-cultivation had upon agricultural labour. They had returns sent from about forty English and Welsh counties, and some from Scotch counties. The effect of it was found to be, not as had been expected, but that steam-cultivation was very much to the advantage of the agricultural labourers. One of the most unfortunate counties in England for agricultural labourers is Wiltshire, where the labourers get only 7s. a week. The result of the introduction of steam-cultivation into that part of the kingdom was that the labourers' wages were increased 2s. per week. The introduction of steam-cultivation into other parts of the kingdom had been followed with a like beneficial result. This he thought would remove from every kindly heart the feeling that an impediment was caused by the introduction of machinery owing to the disarrangement of labour it caused.

Mr. CATLING said there are one or two points in Mr. Robinson's paper which struck him as being rather faltering. He had stated that by the ordinary system of horse-ploughing land was rendered barren every fourth or fifth year, and that by steam-cultivation the fallow was rendered unnecessary. He then went on to say that Mr. Smith had grown twenty crops of wheat upon the same land in succession. Mr. Walker then

called attention to a well-cultivated garden, and asked the question, "Why is not every field a garden?" Now, it did appear to him that that is a very important question, but it is very much interfered with by the clauses which are usually in agreements, and he considered the application of capital to land is very much interfered with by the customs which prevail everywhere. The discussion on this subject is a very important one, and he thought probably they might carry it to another meeting, and then consider the customs of land tenure in this immediate neighbourhood, with the view, if necessary, of altering them. He would conclude his remarks by proposing the following resolution: "That the application of science and capital is greatly restricted by covenants which limit the use of land, an advance of the cost of labour, and lowering of the range of corn prices, and the power to induce agents to consider greater freedom of management."

Mr. RUSTON presumed that a man would not buy a large engine, and work on the direct principle if he had only a small farm. The next question for consideration is whether the round-about system is better to use, and in what particular instance the one is superior to the other. He could not help thinking that the round-about system is the best where a man purchased his own tackle and did not hire, because then he could use his engine when the weather was favourable; whereas if he hired it he would have to put up with inconvenient weather, during which the engine would remain idle. The great object they had in the application of steam is to benefit the land, and there is no doubt that steam-cultivation is double and treble the value of ploughing. The steam-cultivator turned everything up out of the ground, and at the same time exposed the earth to the advantage of atmospheric influence, and also enabled it to be enriched by the sunshine and the rain. He did not advocate deep cultivation at once, because they might have too much of the fertilizing element; the ground should be cultivated deeper and deeper gradually. Mr. Ruston concluded by stating the satisfactory results that had followed steam-cultivation on his own land, and that he believed steam-cultivation would be much more extensively used than it is at the present time.

Mr. OLLARD would like to know the cost of steam engines and tackle, and the cost of employing them on land. He thought the resolution that Mr. Catling had proposed should be supplemented in some way, because in its present form it would leave no practical result in the mind of anybody.

Mr. CATLING said he was thoroughly convinced that bad land by steam cultivation could be made comparatively good, and that they could apply the system to land so ably represented in Mr. Robinson's paper. He hoped the result of their discussion would be that they would arrive at some practical result, and that they would induce gentlemen of large influence to give proper consideration to the matter.

Mr. WALKER, in reply to questions put to him, stated that the cost to him of steam cultivation was about 4s. an acre if only ploughed one way; but he ploughed his land two ways, therefore it cost him 8s. an acre. The engine he reckoned cost him about 6s. a day.

Mr. LOOKER asked Mr. Walker if he would let the engine for 6s. a day, and he replied in the affirmative, stating that he would let Mr. Looker the engine for 6s. a day now for three months. Mr. Looker answered that he would have it, and would send for it to-morrow.

The CHAIRMAN did not know whether it was Mr. Robinson's own calculation or whether he had borrowed it, but what he had said about the maintenance of an agricultural horse being £46, he considered to be very excessive indeed. He had known practical men who had gone thoroughly into the question, and he knew from them that the maintenance of a horse did not amount to any such sum. At the adjourned discussion he thought they could take into consideration whether steam cultivating is everything, and steam ploughing nothing, and he hoped too something would be said in favour of the cart-horse so as to show that the cultivation could be done by the cart-horse as cheaply, if not as effectually, as it could be done by steam cultivation. He would be very glad to see those present attend the adjourned meeting, because he thought the subject is one of very great interest. They had not yet had a meeting out of Wisbech, and therefore he proposed that the adjourned meeting should be held at the Griffin Hotel, March, on the 24th of November next.

Mr. ISAAC ROBINSON said, in reference to the maintenance

of a horse, that the estimate was quoted from a report by Mr. J. C. Morton. That included the cost of everything in connection with the animal, the cost of harness, the wages of the man to look after it, &c. He should not like it to go forth that he meant it would cost £16 a year simply for the keep of a horse.

Mr. W. C. LITTLE said it would be very necessary for them to know the cost and the expense of the work which had been spoken of. His own experience was very different to that of Mr. Walker. The cultivation of his land cost him 30s. an acre, which was very different to 8s. an acre.

A vote of thanks was passed to Mr. Robison.

ROSS AGRICULTURAL SOCIETY.

There was a small show of Hereford stock, though what there was was of some quality and in good condition, considering the bad season. The competition was exceedingly limited, being confined, in many of the classes, to the very minimum number of entries compatible with the awarding of a prize at all; in several of the other classes the entries were confined to either one or two, while in others, again, there were none whatever. The Shorthorns were but meagrely represented numerically, although such as were on show were of a superior kind. The sheep classes were good throughout, as they always are at Ross, though like the cattle, the show was small, and the competition consequently limited. The same may be said of the pigs, there was a good show as to merit, but a scanty one as to numbers, albeit the competition was more brisk, as it might well be in this department. Extra Stock comprised a few horses, some Shropshire sheep and lambs, and a few calves and heifers, to most of which, as will be seen from the list, prizes were awarded. It should be stated, however, that there was scarcely any competition in this extra class, the several specimens shown being each rather exceptional than otherwise. The several samples of wheat and barley sent were of excellent quality, and mostly of good colour. The show of roots, like the show generally, was small, but, regard being had to the before mentioned difficulties, which the cultivators of the soil, by reason of the excessive drought, have laboured under, the several specimens entered were really almost better than could have been hoped for. Some of the mangolds, and also the swedes and turnips, with the cabbages were stupendous as to growth, and apparently equally fine as to quality. The implement department was mainly made up by local exhibitors.

PRIZE LIST.

CATTLE.

HEREFORD.

Bull, more than two years old.—Prize, £3, P. S. MacDougall (Noble Boy). The class highly commended.

Bull under two years old.—Two entries. Prize withheld for want of competition.

Breeding cows and their calves, over three years old.—Prize, £5, T. Duckham. Highly commended: P. S. MacDougall, Benhall.

Pair of heifers under three years old.—Prize, £2, P. S. MacDougall.

Pair of heifers under two years old.—Prize, £2, P. S. MacDougall. Highly commended: T. Duckham.

SHORTHORNS.

Bull, irrespective of age.—Prize, £3, G. Clive, Perrystone (Sovereign 1st). Highly commended: I. Theyer, Walford Court.

Two breeding cows and their calves, over three years old.—Prize, £2, Rev. W. H. Beever, Penraig Court.

ANY OTHER BREED.

Lot of breeding cattle in proportion to the acreage of land in the occupation of the exhibitor.—Prize, £3 3s., T. P. Brown, Weir End. Commended: P. S. MacDougall.

SHEEP.

LONG-WOOL.

Pen of ten breeding ewes.—Prize, £3, R. Loveridge, The Callow.

Pen of ten yearling ewes.—Prize, £3, R. Loveridge.

Pen of ten ewe lambs.—First prize, £2, R. Loveridge; second, £1, C. Kearsay, Glewstone.

Pen of ten wether lambs.—First prize, £2, R. Loveridge; second, £1, A. Webb, Moraston.

Ram lamb.—First prize, £2, R. Loveridge; second, £1, C. Kearsay.

Yearling ram.—First prize, £3, not awarded; second, £2, T. S. Bradstock, Cobrey Park.

SHORT-WOOL.

Pen of ten ewe lambs.—Prize, £2, W. Marfell, Tretire.

Pen of ten wether lambs.—Prize, £2, W. Marfell.

PIGS.

Boar.—First prize, £2, Rev. W. Holt Beever; second, £1, C. Kearsay.

Sow in farrow or with pigs.—First prize, £2, J. Hartland, Biddlestone; second, £1, J. Marfell, Pigeon House.

Pig belonging to an agricultural labourer.—First prize, £1 5s., W. Greeuway; second, £1, J. Castree; third, 15s., John Worgan.

EXTRA STOCK.

Berkshire sow and Pigs.—Prize, £1, C. Kearsay.

Entire cart-horse.—Prize, £2, I. Theyer.

Ten Shropshire wether lambs.—Prize, 10s., A. Armitage, Dadnor.

Ten Shropshire ewe lambs.—Prize, 10s., A. Armitage.

Fifty Shropshire ewes, under two years.—Prize, £2, A. Armitage.

Fifty Shropshire ewes, over two years.—Prize, £2, A. Armitage.

Nag horse (hunter).—Prize, £1 12s., A. N. Dowle, Bernthan Court.

Yearling cart colt.—Prize, £1 12s., A. N. Dowle.

GRAIN.

Four-bushel sack of white wheat.—First prize, £2 2s., J. Cadle, Over-Ross Farm; second, £1 1s., C. Kearsay.

Four-bushel sack of red wheat.—First prize, £2 2s., A. Armitage; second, £1 1s., J. Cadle.

Four-bushel sack of malting barley, a fair sample from a bulk of not less than 100 bushels.—First prize, £3 3s., John Cadle, Ballingham Hall; second, £2 2s., John Cadle, Over-Ross Farm.

ROOTS.

Four acres of swedes.—Prize, silver cup, A. N. Dowle.

Four acres of turnips.—Prize, silver cup, J. Hartland, Biddlestone.

Three acres of swedes.—Prize, silver cup, I. Theyer, Walford Court.

Three acres of turnips.—Prize, silver cup, T. P. Brown, Weir End.

Collection of roots grown on the same farm, twelve of each to be exhibited of mangel, swedes, turnips, and carrots, any variety.—First prize, £1 7s., R. Scudamore, Fengethley; second, 15s., I. Theyer, Walford Court.

At the dinner, Mr. G. CLIVE, the Chairman, said, Mr. Duckham had, in a very plaintive tone, expressed a hope that he would become a patron of the white faces, and not patronise the Shorthorns. He read the able letter of Mr. Duckham in the *Agricultural Gazette*, in which he proved that the Herefords were better than the Shorthorns. But why should Shorthorns be excluded from Herefordshire? If the Shorthorn was so inferior, why should it be shut of the county? It was invidious to keep it out. Now he had got a prize that day for a Shorthorn, but Mr. Duckham through an unfortunate accident failed. He did hope that Mr. Duckham would allow those who wanted milk for their dairies to get those cattle which were best adapted to supply what they wanted (laughter). The Shorthorn, although it did not lay on so much flesh as the Hereford, was better suited for many countries than the Hereford.

The Rev. W. HOLT BEEVER asked whether they could not all join to get up a good exhibition. They could do it if they would simply take some interest in it. He partook of none of the jealousy about Shorthorns and

Herefords. He could tell them that he greatly admired their Herefords, but he claimed for the Shorthorns that they were good cattle, and he did not see why those who had begun with them should not continue to go on with them. They might have a magnificent show at Hereford. They had the animals. There were Mr. Arkwright's animals, Mr. Wigmore's, and many other gentlemen whom it would be invidious to mention, but what they wanted to do was to unite together and to determine that they would have a good show. They had the elements of a first-class Cotswold, and they had a fine, square-built, flourishing, close-wooled sheep, and also several other very excellent varieties. Let all these be cultivated, and let every man exhibit and they would have a good show. He did not think that they could go on as they were, because he thought they were going on a false idea.

Mr. T. S. BRADSTOCK said the falling off this year was attributed to the want of keep, but in his opinion there was another reason, viz., this, that a good deal of the stock had been sold during the last two or three weeks. He regretted hearing of some instances of cattle being sold £2 or £3 per head less than they were worth in the spring, because he feared that they had been sold owing to the shortness of keep and to provide for the payment of rent, tithes, rates, and other expenses, the heavy charges to which the occupiers of land were liable. It had been ascertained that the growing crops gathered last harvest would not, when brought to market, be more than sufficient to pay the half-yearly rental, and a good deal would be required for the keep of the cart horses which could not be sold off the farm. It would not, therefore, under these circumstances, have surprised him if he had not seen anything in the showyard. He could not help saying that he had felt surprise in reading the reports of agricultural meetings in this and other counties held during the last month or two, to observe that scarcely any allusion had been made by any of the speakers as to the unsatisfactory state of the agricultural interest, aggravated by the long drought from which they had suffered. It seemed to him as if all the speakers had been

so wound up by the horrors of the war on the Continent that they had not a word of encouragement to cheer the farmers in the trying times now before them. He recollected some twenty years ago, when great depression prevailed, that there was scarcely a meeting at which sympathy was not expressed for them. He recollected the late Sir Joseph Bailey, in acknowledging the toast of the Members for the County at the Agricultural Society's dinner, after speaking feelingly and forcibly to his constituents with respect to the difficulties they had to contend with, said he thought that at such times as those the landowners should look around them and see whether there was not some pleasure or some luxury which might be dispensed with and which would help their tenants. He knew of no greater benefit to a district than the landowner who spent his income in the neighbourhood in which he lived; but there was one luxury which he had no hesitation in saying ought to be dispensed with, not only because it was a tenant-farmer's grievance, but because it was a national grievance, and that was the over-preservation of game. It was a grievance, because it robbed the tenant-farmer of his profits, and this was particularly so with regard to rabbits, which in many instances were gamekeepers' perquisites. He thought compensation ought to be made, but he had heard of many instances of compensation being obtained, and of cases where compensation should have been received, and yet the tenants very soon afterwards quitting the farms. He knew of nothing more enjoyable than good sport, and a gentleman had a perfect right to reserve to himself the right of shooting, but in his opinion only so long as he did not injure his neighbours. He wished it to be understood that he was not speaking of any one. He knew some landlords who preserved their game, and who had some fine shooting, and yet their tenants were prosperous and happy men, and were perfectly satisfied with their landlords. They would easily guess the reason why.

Mr. W. MORRIS, the secretary, said that there had been various reasons assigned for the smallness of the show, but he attributed it to a want of money. He thought if they could increase the premiums they would soon have a larger show.

SALE OF THE CASTLE FRASER HERD OF POLLED CATTLE.

The fine herd of polled cattle, the property of Colonel Fraser of Castle Fraser, Aberdeenshire, was disposed of by public auction at the home farm. Mr. Thomson, Clayhills, Aberdeen, was the auctioneer. The buyers, animals, and prices were as follows:

COWS AND CALVES.

Maggie, calved June, 1863, bred by Colonel Fraser.—Mr. Fraser, Aquhertoun, Kintore, 26 gs.
 Maria (heifer calf), calved April 25, 1870.—Mr. Walker, Portlethen, 13 gs.
 Sybil, calved April, 1864, bred by Harry Shaw, Bogfern.—Sir George M'Pherson Grant, Bart., of Ballendalloch, 63 gs.
 Fred's Darling (twin heifer calf), calved March 14, 1870.—Mr. Morison, Bognie, 39 gs.
 Fred's Second Darling (twin heifer calf), calved March 14, 1870.—Mr. Paterson, Mulben, 37 gs.
 Lily, calved April, 1865, bred by Colonel Fraser.—Mr. Smith, Burnshangie, Strichen, 40 gs.
 Major (bull calf), calved April 27, 1870.—Mr. Morison, Bognie, 41 gs.
 Blanche, calved July, 1865, bred by Colonel Fraser.—Mr. Fordyce, M.P., Bruckley, 50 gs.
 Melrose (bull calf), calved July 5, 1870.—Mr. Walker, Portlethen, 26 gs.
 Georgina, calved March, 1866, bred by Colonel Fraser.—Mr. Mitchell, Balgreen, Gamrie, 37 gs.
 Delta (heifer calf), calved April 7, 1870.—Mr. Manson, Oakhill, Old Meldrum, 32 gs.
 Countess, calved February, 1865, bred by Colonel Fraser.—Mr. Beaton, Nethenty, Old Meldrum, 14 gs.
 The Laird (bull calf), calved May 10, 1870.—Mr. Anderson, Anglesfield, Aberdeen, 40 gs.

Young Grace, calved April, 1864, bred by Colonel Fraser.—Lord Aberdeen, 16 gs.
 Sir William (bull calf), calved July 14, 1870.—Lord Fife, Duff House, 53 gs.
 Fanny, calved June, 1866, bred by Colonel Fraser.—Lord Fife, 40 gs.
 Lord Ornoch (bull calf), calved June 3, 1870.—Mr. Duncan, Fortray, Gamrie, 31 gs.
 Cyril, calved April, 1867, bred by Mr. M'Combie, Easter Skene.—Mr. Buchan, Auchmahoy, 27 gs.

TWO-YEAR-OLD HEIFERS.

Lively, calved January 20, 1868, bred by Colonel Fraser.—Lord Huntly, 67 gs.
 Bella, calved May 24, 1868, bred by Colonel Fraser.—Colonel Ferguson, Pitfour, 36 gs.
 Emily, calved May 1, 1868, bred by Mr. M'Combie, Easter Skene.—Sir A. Bannerman, Crimmoagate, 34 gs.

YEARLING HEIFERS.

Susy, calved January 13, 1869, bred by Mr. Harry L. L. Morison of Blair.—Mr. Morison, Bognie, 42 gs.
 Beauty, calved July 5, 1869, bred by Colonel Fraser.—Mr. Taylor, Glenbarry, 37 gs.
 Lovely, calved April 27, 1869.—Mr. Ferguson, Skellymarno, Old Deer.

BULLS.

Cupbearer, calved March 20, 1868, bred by Sir George Macpherson Grant of Ballindalloch, Bart.—Mr. M'Combie, M.P., Tillyfour, 38 gs.
 Harry, calved March 11, 1869, bred Mr. Harry Shaw, Bogfern.—Sir A. Bannerman.

ONE-YEAR-OLD STOT.

Charlie, calved April 24, 1869.—Mr. Martin, Aberdeen, 25 gs.

SALE OF MR. LYNN'S SHORTHORNS,

AT STROXTON, GRANTHAM, ON THURSDAY, OCTOBER 27TH, 1870.

BY MR. H. STRAFFORD.

A paragraph has recently been going the round of the papers headed, "What is show condition?" It might readily be answered "Successful advertising"; for although it is risky, expensive, full of anxiety, and often the cause of sore disappointment, yet it is the great means of introducing good cattle to the notice of one's own countrymen and the satisfaction of the foreigner, who is often ready, if the animals please him, to close on the spot, irrespective of pedigree, breeding, or price. Moreover, if a man can win about £30 or £40 a year, it pays him, and all over that becomes with ordinary luck a profit. Mr. John Lynn's animals have been going the round of the show for several years, and with very fair success. Since the days of Great Comet (16192), a noted winner, he has exhibited at the Royal, the Lincolnshire, and adjoining county meetings, while at the more local shows he has generally had it very much his own way. Except the great training quarters at Warlaby and Towneley, Osberton and Broad Hinton, Branches Park and Broughton, few animals have left their quarters in better condition, more evenly fed, or in greater bloom than those from Stroxton. Queen of Diamonds, the second prize heifer at the Manchester Royal, was, we believe, sold for 200 gs. to go to Canada, and the great New York Mills firm took one also at a long price. Occasionally bulls, too, have been sold at large prices, as it was announced here that Sir Thomas Whichcote had given a hundred guineas for one.

All who left for Grantham on that bright October morning expected to find things in famous condition; nor were they in the least disappointed; for with the exception of two or three that had just calved, they were all, and especially the calves, in fine bloom. Full of hair, mostly pleasing roans, and with plenty of flesh, they were good to see. A very large company assembled by noon, and Mr. Strafford, anxious to be punctual, could not commence until the last relay had got something to eat in the somewhat too little barn; this, with a badly arranged entrance and exit for the cattle by double gates side by side, looked to be the only hitch in the sale. Mr. Earle Welby, M.P., presided at the luncheon, and, as Mr. Strafford said, "was a most business-like chairman."

Clematis, the first lot, fourteen years old, was short on the leg and had a nice head, and this, with good condition, sent her along to 32gs., at which price Mr. Woods got her for Mr. Foljambe; a pair of plain three year old twins by Prizeman from this cow he let pass, but he secured one of the twin's daughters by Cambridge Duke 4th, a nice little red heifer, fine in the bone and low in the loam, at 36gs., and the old cow's own daughter by the same bull at 40gs., a pretty thing full of hair, with a long face. The two bulls of the same tribe, like all the bulls and everything else, sold remarkably well. Ama, the second cow and winner of half-a-dozen prizes, went at 31gs. to Mr. Sharp, of Northamptonshire; her bull Grandee 2nd, a hairy roan, with white hind legs, had a rather narrow loin, but was otherwise one of the best, and fetched 50gs.

The Pomp family was the tribe, however, upon which Mr. Lynn has been most successful. Old Pomp herself, Prizemen, and Pompous had all been noted prize winners, and the sort was brought by Mr. Lynn's father, from Earl Brownlow, in 1845. Pompous was certainly a fine large cow, somewhat patchy on her rumps, but with a good breast end and on short legs. Thirty was the opening bid, and Mr. H. Burt at last got her at 44gs.; her half-sister, Princess of Wales, was also another good lot, and near calving; and Mr. Caswell got Prima Donna, own sister to Princess of Wales, two years; younger and all, 16gs. cheaper. Patina out of Pompous, and three years old was a very fine animal, even, of good growth, heavy in condition, but very healthy looking; she was quite one of the best, and competition ran high for her all round the ring; Mr. Wilkinson's sharp "five" was too quick for his opponent, and he got her at 75gs. Some thought Pride of Thorndale, three years old, out of Princess

of Wales, the better of the two; at all events she had youth on her side, and she goes to Mr. Catchpole, in Suffolk, probably to appear at the county meetings next year. Peep-o'-night, a plain red and white, with fine forequarters, went cheap at 40gs. to Mr. Wortley; being headstrong and obstinate she took some time to get from the ring, and the pedigree was given of Proud Rose, before she could be removed. A nice heifer out of Pompous, elicited several bidders, until 40 was called; "guineas" said Mr. Holland, which was taken as two, and she went cheap. Prize Rose of this family was also very good, and a prize winner; going into Mr. Prudd's possession at 45gs. she will, undoubtedly, come out again next year. Prince Lincoln, a smart stylish bull, was bought by Mr. Upson, of Essex, at 63gs., also for showing, and Prince Imperial, a fine hairy roan calf, made 48gs.

The fashionable blood could not, however, in point of personal beauty, compare with the old P. family, which came originally from Mr. Wilkinson's stock through Earl Brownlow. Cheerful, by the mysterious Mystic (20391), out of a daughter of Mr. Adkins' Charmer 5th, was anything but handsome; Mr. Baxter, however, thought more of her than most people, and he bought her at 60gs. for Colonel Towneley; a tolerably good proof of her excellence. Her heifer was also pretty to look at, and she was bought for Mr. Graham at two guineas dearer than her dam. May Dew, a white heifer, of the old No. 13 tribe, went cheap enough to Mr. Burgess at 31gs., and a white Blanch heifer, level and very good, only made 47gs. for Mr. Wilkinson. Seraph, with two pure Bates' crosses on the Seraphina tribe, had a good deal of style, and there was considerable bidding for her, Mr. Snodin going well up to 100gs., at which price she was sold. Her son seemed light of flesh and narrow topped, but Mr. Burchall fancied the three pure Bates' crosses, and got him at 40gs. Gipsy Gwynne, an 85gs. purchase at Biddenham, was put in at 50 and ran away with Mr. Howard and others up to 55gs., when the glass was hoisted. Six came at last, and Mr. Snodin and Lord Norris closed until the latter secured her at a 100gs. for Towneley. Cambridge Duke 4th, who was paraded stands on short legs, with a good head and neck; while his stock were very good with fine bone but narrow tops, reminding us very much of Lord Chancellor's produce at Mr. Rowland Wood's last year. As no one offered the 200gs. reserve he was passed out again.

A few pigs were offered at the close of the sale, bred chiefly from Lord Radnor's sort. Mr. Lynn has won so many prizes with them that they were bound to sell well; one boar making 12gs. and another 10gs.

Soon after the sale finished a heavy shower came down on the departing company, who were all, still, in good spirits to find a persevering tenant-farmer had had such a capital sale. We hear that some eight or ten animals are left with a heifer and calf of the Cambridge Rose blood as a nucleus of a future herd.

COWS AND HEIFERS.

Clematis, roan, calved February 1, 1856, by Sir John (12054), out of Clementina by Clementi (3399).—F. J. S. Foljambe, 32gs.

Ama, white, calved in June, 1853, by Marquis of Exeter (14906), out of Amy by Burglar (10007).—Mr. Sharp, 31gs.

Pompous, roan, calved in March, 1861, by Great Comet (16192), out of Pomp by Sir John (12054).—H. Burt, 44gs.

Cheerful, red and white, calved April 26, 1862, by Mystic (20391), out of Coquette by Mameluke (13289).—Col. Towneley, 60gs.

Carry, roan, calved November 19, 1862, by Waverley 4th (21084), out of Clotilde by Alma (12387).—Mr. Blankney, 30gs.

Princess of Wales, roan, calved March 31, 1863, by Waverley 4th (21084), out of Pomp by Sir John (12084).—Mr. Garfit, 56 gs.

Fair Maid, roan, calved in August, 1864, by Waverley 4th (21084), out of Fame by Great Comet (16192).—Mr. Kirk, 34 gs.

Prima Donna, roan, calved in June, 1865, by Waverley 4th (21084), out of Pomp by Sir John (12084).—J. H. Casswell, 40 gs.

Lady Julia, roan, calved in June, 1865, by Julius Cæsar (22008), out of Comet's Farewell by Great Comet (16192).—T. Adwick, 37 gs.

Juliette, red, calved in June, 1865, by Julius Cæsar (22008), out of Fame by Great Comet (16192).—Mr. Blankney, 30 gs.

May Dew, white, calved June 26, 1866, by Claxton (21433), out of May Queen by Master Rembrandt (16545).—J. Burgess, 31 gs.

Patelina, rich roan, calved in August, 1866, by Waverley 4th (21084), out of Pompous by Great Comet (16192).—Mr. Wilkinson, 75 gs.

Seraph, roan, calved December 6, 1866, by 6th Grand Duke (19876), out of Seraphina 19th by Imperial Oxford (18084).—J. Snoden, 100 gs.

Charm, roan, calved in December, 1866, by Prizeman (24870) out of Clematis by Sir John (12084).—Mr. Garfit, 36 gs.

Charming, roan, calved in December, 1866, by Prizeman (24870), out of Clematis, by Sir John (12084).—J. H. Casswell, 40 gs.

Pride of Thorndale, rich roan, calved July 20, 1867, by Thorndale Grand Duke (25310), out of Princess Royal by Waverley 4th (21084).—N. Catchpole, 71 gs.

Peep o'Night, red and white, calved February 20, 1868, by Prizeman (24870), out of Peep o'Day by Great Comet (16192).—E. Wortley, 40 gs.

Proud Rose, rich roan, calved February 27, 1868, by Garibaldi (17919), out of Pompous by Great Comet (16192).—W. Holland, 42 gs.

Princess of Thorndale, rich roan, calved April 30, 1868, by Thorndale Grand Duke (25310), out of Princess Royal by Waverley 4th (21084).—Mr. Johnstone, 45 gs.

Blanchette 2nd, white, calved May 10, 1868, by Costa (21487), out of Brilliant by May Duke (13320).—Mr. Wilkinson, 47 gs.

Peep o'Rose, red, calved in December, 1868, by Garibaldi (17919), out of Peep o'Day by Great Comet (16192).—Capt Aveling, 28 gs.

Lady Gray, roan, calved in December, 1868, by Thorndale Grand Duke (25310), out of Lady Julia by Julius Cæsar (22008).—Mr. Wyles, 22 gs.

Gipsy Gwynne, red and little white, calved July 24, 1869, by Grand Duke of Lightburne (26290), out of Goody Gwynne by 5th Grand Duke (19875).—Lord Norriss, 100 gs.

Lady, roan, calved in September, 1869, by Thorndale Grand Duke (25310), out of Lady Julia by Julius Cæsar (22008).—R. Burchnall, 25 gs.

Florence, roan, calved in September, 1869, by Thorndale Grand Duke (25310), out of Flora by Waverley 4th (21084).—Mr. Hall, 18 gs.

Prize Rose, roan, calved in December, 1869, by Cambridge Duke 4th (25706), out of Peep o'Day by Great Comet (16192).—J. Frudd, 45 gs.

Christmas Rose, red, calved in December, 1869, by Cambridge Duke 4th (25706), out of Charming by Prizeman (24870).—F. J. S. Foljambe, 36 gs.

Primrose, rich roan, calved in January, 1870, by Cambridge Duke 4th (25706), out of Patelina by Waverley 4th (21084).—Mr. Marrion, 40 gs.

Cheerful Rose, red, calved in April, 1870, by Cambridge Duke 4th (25706), out of Cheerful by Mystic (20391).—Mr. Graham, 62 gs.

China Rose, roan, calved in June, 1870, by Cambridge Duke 4th (25706), out of Clematis by Sir John (12084).—F. J. S. Foljambe, 40 gs.

Wiseton Rose, roan, calved in April, 1870, by Cambridge Duke 4th (25706), out of May Dew by Claxton (21433).—Mr. Mackinder, 34 gs.

Parting Rose, roan, calved in July, 1870, by Cambridge Duke 4th (25706), out of Prima Donna by Waverley 4th (21084).—Mr. Tennant, 31 gs.

BULLS.

Cambridge Duke 4th (25706), red and white, calved June 1, 1867, by 4th Duke of Thorndale (17750), out of Red Rose by Marmaduke (14897).—Reserve 200 gs., not sold.

Prince Lincoln, roan, calved in August, 1869, by Thorndale Grand Duke (25310), out of Prima Donna by Waverley 4th (21084).—J. Upsom, 63 gs.

Duke of Suez, roan, calved in October, 1869, by Cambridge Duke 4th (25706), out of Seraph by Grand Duke 6th (19876).—S. Burchnall, 40 gs.

Cantab, red, calved in November, 1869, by Cambridge Duke 4th (25706), out of Charmer by Prizeman (24870).—Mr. Garfit, 55 gs.

Grande 2nd, rich roan, calved in January, 1870, by Cambridge Duke 4th (25706), out of Ama by Marquis of Exeter (14908).—Col. Reeve, 50 gs.

Prince Imperial, roan, calved in February, 1870, by Cambridge Duke 4th (25706), out of Pompous by Great Comet (16192).—Mr. Mackinder, 48 gs.

Cockswain, red, calved in April, 1870, by Cambridge Duke 4th (25706), out of Camilla by Waverley 4th (21084).—Mr. Hack, 32 gs.

Charley, red, calved in September, 1870, by Cambridge Duke 4th (25706), out of Carry by Waverley 4th (21084).—Mr. Turner, 17 gs.

SALE OF SHORTHORNS IN ABERDEENSHIRE.

The first of the numerous sales of young Shorthorns in Aberdeenshire for the season has been held at Upper-mill, parish of Tarvas, where 25 young bulls and 23 heifers, the property of and bred by Mr. W. S. Marr, were offered by public auction. Of the 25 bulls offered, ten had for sire the three-year-old roan bull Macduff, bred by Mr. Bruce, Broadland, Huntly; eight of the bulls were descended directly from the old bull Gold-Digger; three were after Julius Cæsar, bred by Mr. Cruickshank, Sittyton; the other four were by Prince Louis, Highland Chief, Roseberry, and Star of Peace. The heifer calves were all after Julius Cæsar and Macduff; while Alonzo, Prince Louis, Macduff, and Prince of Stokesley were the sires of the yearling heifers. Among the sires of the two-year-old heifers was Marmaduke II., the old roan bull bred at Sittyton, that in the possession of Mr. Cochran, Little Haddo, carried the challenge cup as the best

Shorthorn at the Royal Northern Agricultural Society's Show at Aberdeen in 1869. Mr. Mitchell, St. John's Wells, Fyvie, discharged the duties of auctioneer. The following were the list of the buyers, the animals, and the prices realised:

BULL CALVES.

Minstrel Boy, red, calved May 5, 1869.—Mr. Brown, Pitnamoon, Kincardineshire, 29 gs.

Young Gold-Digger, red, calved November 26, 1869.—Mr. Noble, West Aldie, 27 gs.

Bazaine, red, calved February 18, 1870.—Mr. Bruce, Inverquhonnery, 30 gs.

Agamemnon, white, calved February 14, 1870.—Mr. Barclay, Aberdour House, 19 gs.

Renown, roan, calved March 8, 1870.—Mr. Maitland, Nether-ton, 35 gs.

My Favourite, roan, calved March 17, 1870.—Mr. Barron, Mains of Crichtie, 32 gs.
 Mitrailleuse, roan, calved January 25, 1870.—Mr. Gordon, of Craignyle, 24 gs.
 Rip Van Winkle, roan, calved March 7, 1870.—Mr. Leask, Skelmaffilly, 25 gs.
 Lesseps, red, calved April 9, 1870.—Mr. Morrison, New Seat, 21 gs.
 His Highness, red, calved April 24, 1870.—Mr. Maitland, Little Methlic, 35 gs.
 Nugget, red, calved April 24, 1870.—Mr. Milne, Kirkton of Bourtie, 19 gs.
 Steinmetz, red, calved March 29, 1870.—Mr. Brown, 16 gs.
 Bismark, red, calved April 5, 1870.—Mr. Anderson, Auchincrieve, 24 gs.
 Artilleryman, red and white, calved March 31, 1870.—Mr. Ritchie, Mill of Burns, Fyvie, 22 gs.
 Ready Money, roan, calved May 4, 1870.—Mr. Philip, Gownor, 21 gs.
 McMahon, red and white, calved April 26, 1870.—Mr. Brebner, Balquhanduhty, Methlic, 20 gs.
 Mountain Chief, red and white, calved April 26, 1870.—Mr. Burr, Tulloford, Tarves, 19 gs.
 Moltke, red, calved March 31, 1870.—Mr. Hay, Nethermill, 15 gs.
 Merry Andrew, roan, calved May 31.—Mr. Jafray Banks, Fyvie, 15 gs.
 Caledonia, roan, calved May 11, 1869.—Mr. Croke, Cromlet, 32 gs.

HEIFER CALVES.

New Year's Gift, red, calved January 1, 1870.—Mr. Gray, Bartle Chapel, 20 gs.
 Annie, roan, calved February 10, 1870.—Mr. Mollison, Inverness, 29 gs.
 Cinderella, red and white, calved March 20, 1870.—Mr. Gordon, of Craignyle, 29 gs.

Mavourneen, roan, calved March 14, 1870.—Mr. Anderson, Auchincrieve, 17 gs.
 Rocket, red, calved March 6, 1870.—Mr. Mollison, 17 gs.
 Diana, roan, calved April 1, 1870.—Mr. Leask, Skelmaffilly, 20 gs.

ONE-YEAR-OLD HEIFERS.

Amelia, roan, calved April 30, 1869.—Mr. Ironside, Cairns, New Deer, 15 gs.
 Rosebud, red, calved June 30, 1869.—Mr. Pirie, Orchards-town, Udny, 18 gs.
 Regina, red, calved February 24, 1869.—Mr. Gordon, 20 gs.
 Dinah, white, calved January 29, 1869.—Mr. Walker, Tillymaud, 25 gs.
 Joan of Arc, roan, calved March 23rd, 1869.—Mr. Adam, Mill of Balcairn, Old Meldrum, 24 gs.
 Moss Rose, red, calved April 4, 1869.—Mr. Shepherd, of Aldie, 31 gs.
 Songstress, red and white, calved February 14.—Mr. Duthie, Tarves, 20 gs.
 Molly, roan, calved March 28, 1869.—Mr. Campbell, Kinellar 26 gs.

TWO-YEAR-OLD HEIFERS.

Cleopatra, red and white, calved May 20, 1868.—Mr. Mitchell, Meikle Haddo, 25 gs.
 May Queen, red, calved May 20, 1868.—Mr. Thompson, New Seat, 25 gs.
 Romp, red and white, calved March 16, 1868.—Mr. Bruce, Inverquharney, 28 gs.
 Sporrán II., roan, calved March 15, 1868.—Mr. Duthie, Tarves, 29 gs.
 Goldie VIII., roan, calved March 18, 1868.—Mr. Oran, Kirkton, Inverness, 36 gs.
 Lady Polwoth III., calved March 22, 1868.—Mr. Pirie, Orchardstown, 30 gs.
 Helena, roan, calved March 30.—Mr. Mollison, 30 gs.
 Apricot X., red and white, calved January 10, 1868.—Mr. Bruce, 26 gs.

THE BATH AND WEST OF ENGLAND SOCIETY, AND SOUTHERN COUNTIES ASSOCIATION.

The usual meeting of the Council was held on Tuesday, October 25th, at the White Lion, Bristol. Present, Sir J. T. B. Duckworth, Bart., in the chair, Messrs. T. D. Acland, M.P., R. Brenbridge, J. T. Boscawen (Hon. and Rev.), W. A. Bruce, C. Bush, R. H. Bush, T. Danger, J. T. Davy, J. Daw, A. F. M. Druce, F. W. Dymond, Jonathan Gray, A. R. Grenfell, J. W. King, J. Lush, H. A. F. Luttrell (Colonel) H. St. John Maule, H. G. Moyses, T. Phillpotts (Rev.), J. C. Moore Stevens, A. C. Thynne (Rev.), H. Williams, H. Spackman (official superintendent), W. Smith (official accountant), and J. Goodwin (secretary and editor).

GUILDFORD MEETING, 1871.—The Council resolved that this meeting shall commence on Whit-monday, May 29th, and having approved the stock and poultry prize sheets ordered that they be forthwith printed and circulated. The amount offered in prizes by the Society is much greater than at any former meeting, in addition to which there are local prizes for wheat, hops, and groups of Southdown ewes and lambs. Sussex cattle are placed on the same footing in the prize sheet as Devons, Herefords, and Shorthorns. There are also prizes for four classes of Channel Island cattle. In the sheep classes several additions have been made. As a means of encouraging the horse show the Council has resolved again to reduce the charge for horse boxes in the show yard. In the pig classes there are separate classes for Berkshires, which will not be allowed to compete with animals of the large or small breed, Mr. Miles, of Exeter, again offers prizes for horse-shoeing.

Among the special conditions affecting the exhibition of stock are the appointment of "two inspectors to examine sheep on their admission to the show yard with instructions to report to the stewards any cases in which sheep have not been really and fairly shorn bare," and that "all cattle will be required to be paraded in the ring at least once a day at the discretion of the stewards."

Members, subscribing not less than £1 per annum, elected on or before the last Tuesday of February next, will be entitled to exhibit with special privileges.

THE IMPLEMENT COMMITTEE reported that they had amended the regulations with a view to the exclusion from the showyard of any frivolous objects, and any articles thought unsuitable or foreign to the purposes of an agricultural meeting.

THE MEETING OF 1872.—Mr. H. Williams having presented an invitation to the Council, from a public meeting of the inhabitants of Dorchester and neighbourhood, for the Society to hold its meeting there in 1872, a deputation was appointed to visit the town, to inspect the ground offered for show yard and fields, and to report to the Council at the next meeting.

NEW MEMBERS.—C. G. Roberts, Shotter Mill, Haslemere; Capt. Long, Woodlands, Congressbury; W. Baker, Templestreet, Bristol; J. Galpin, Dorchester.

ECHOES FROM THE AUTUMN MEETINGS.

CHESHIRE.

At Over, Mr. JOS. ASTON (Brassey Green) considered the show of cheese had been good for a local society, and that to which prizes had been given was excellent. It was true that the one they had tasted at dinner would be better if it contained a little more fat, or, as he should have said, a little more butter, and if it were about three weeks older, for he had no doubt in his own mind that it would improve by keeping. When a goodly number of competitors met in a show yard, he knew from experience that most of them were sanguine about taking prizes, and if they failed in doing so they were disposed to lay part of the fault to the judges, whereas they might be entirely innocent in the matter. It was possible for an unsuccessful exhibitor of cheese to have a better dairy of cheese at home than a successful one, but the latter might be more fortunate in selecting the cheese he exhibited in a more forward state for the market; but the former, by keeping his cheese a little, might ultimately secure a higher price than the party who had gained an advantage over him in the show yard. He considered the show of butter very excellent. Most of the samples exhibited were of a superior description, and Mr. Bate and himself experienced some little difficulty in awarding the prizes; and if they did err, either as to the cheese or butter, he assured them it was only after frequent comparisons and great care and deliberation. They had heard a great deal of talk of late about American cheese-makers driving them out of the market, but he could assure the possessors of first-rate dairies of cheese that there was no fear whatever of that. He knew as a fact that there had been several lots of Cheshire cheese recently sold in London from 14s. to 16s. per hundred-weight higher than the top price obtained for American cheese. Notwithstanding the very large quantities of American cheese which had lately been imported into this country, nothing had yet reached the English shows comparable to the best English or Cheshire dairies. He believed that the American cheese-makers were jubilant when the English farmers were down upon their backs through the rinderpest attacking their cattle, and that the former confidently expected to dislodge the latter from the high position they had hitherto occupied; but, so far, they had failed to do so. The best Cheshire cheese possessed rare excellencies, and he, as a Cheshire man, did not feel disposed to give quarter to any cheese-maker in the world. This was a great dairy county; it once stood head and shoulders above all others, and its high position was still mightily felt when it came into competition with other dairy districts of England and Scotland. They had a practical demonstration of that when the Royal show was held at Manchester. But, notwithstanding the excellencies of Cheshire cheese, he advised them to keep their eyes open and to learn all they could in reference to cheese-making; and if with that they were skillful, energetic, and persevering, no doubt they would still succeed in making cheese.

Colonel CHOLMONDELEY, the chairman, said it was a fashion with newspaper writers and people in towns, to write or talk of the agricultural labourer as if he had scarcely any intellect. He wished to goodness that some of those men who wrote those paragraphs, and stated their opinions of the agricultural labourer, were set down in Australia or America, or anywhere, and left to shift for themselves compared with an agricultural labourer, instead of going about agitating others, who had only the wish to do their duty in the state of life in which they were placed. Take an agricultural labourer, and tell him they wanted a thing done—whether it was a bit of slating, of carpentry, of roofing, levelling, hedging and ditching—and there was no one thing which he would not do; he could turn his hand to anything—of course he (the speaker) was talking of the good one. Look at him with his 12s., 13s., or 14s. a week! his house so clean that you might eat your dinner off the floor! Look at him with a wife and children, and yet contriving to lay by something for his club. He (the speaker) only wished that the clubs were better, that he could persuade the members to put their money into the Government Savings' Bank instead of into clubs, where they sometimes lost the

accumulated savings of many years—lost them just at a time when they were most needed; whereas if they had Government security it would not be so. He asked them to look at the agricultural labourer, even when overtaken by distress or trouble; at such a time, who so independent, so loath to have anything done for him as he? If he (Colonel Cholmondeley) went out hunting or shooting and met an agricultural labourer—he was talking of men of a certain age—your agricultural chap between eighteen and three or four and twenty, who considered it manly to be uncivil and say only “no” and “yes,” was detestable; but, after he got settled and married, he had always a smile, touched his hat, and did something which made it a pleasure to meet him. If they met a fat-man he would say what was equivalent to “Bless you!” but if they met a man with a white jacket he scowled at you; and yet he, the skilled labourer, was preached up as a paragon of perfection; in him was supposed to be all the intellect and power of the country, and yet when he met you there was a scowl in his face, as much as to say “What business had you on that horse? I ought to be on it.” Well, all this was leading up to a point, and it was this—that as they had a special class for agricultural labourers, he would like to suggest to the members that those labourers who took prizes should receive dinner tickets.

Mr. R. DUTTON could not agree with what the chairman had said about the agricultural labourer, as he believed that education must tend to general advancement, and he hoped it was not true that the instruction given to the last generation had tended to their deterioration. Their young men might not seem so respectful as they ought to be, but he did not think that education was to blame for this; if so, what would be the case when education became general? They must bear in mind that if they educated a man he would think for himself; he would claim for himself, what was the right of every man, to form his own opinion on the subjects which came before him. He (Mr. Dutton) hoped that education would induce sober and industrious habits as well as a more intelligent performance of duties of the agricultural labourer. He would be glad if he could endorse all that had been said about labourers' cottages, but he happened to know that even in the neighbourhood of Delamere the floors were not quite so clean as the colonel had represented. Considering the population, in fact, there was no part of the county from which a larger number of nuisances was reported to the sanitary committee than from Delamere, and he was afraid therefore that the cottages which came under the notice of the colonel must have been some of the cleanest and best ordered. He hoped they were all as good as the colonel had represented.

At Tarporley, Sir PHILIP GREY EGERTON, the chairman, said, As to agreements between landlords and tenants, he had read many pamphlets and many speeches on this subject, and, so far as his judgment went, all that he had read had been based upon a false foundation—that of the possibility of adopting one regular and uniform plan in the drawing up of all agreements between landlords and tenants in the United Kingdom. He thought it would be impossible, owing to the different habits of the people, the difference in the modes of agriculture, and the varying customs of different neighbourhoods to establish one form which would adapt itself to the whole country. Of course, if the foundation were rotten the superstructure must fall; but he would say a word or two about that. It proceeded on the assumption that all ought to be left to the tenant. He perfectly agreed with that, if all tenants were good tenants. Any landlord could trust a good tenant, but he must have some hold upon a bad tenant. Now all the restrictions in leases were for the purpose of protecting the landlord against the bad tenant, and not with the view of tying the hands of a good tenant. They knew perfectly well that if a bad tenant got hold of a farm and took everything off it without putting anything into it, the farm must deteriorate, and if it went into the market and a tenant could not be found the landlord was obliged to take to the farm and work it for eight or ten years before he could

get a tenant; and therefore it was necessary there should be some restrictions, but that they should be interpreted liberally. He would give them an illustration of what he meant. In his leases there was a condition, that for every ton of hay taken off the farm a fine of £10 should be imposed. The other day he met a magnificent team of one of his tenants taking a load of hay off, which had been sold, and his only regret was that it had not been sold when hay fetched as much as now; and he (Sir Philip) was glad of this because he knew that man had manured his land with sovereigns. Although he had it in his power to have fined that tenant £10 for every ton, of course he was glad to see him making a profit of his farm in that way. But if that hay had belonged to a tenant, to a man who had neglected his farm, then he had the power in the lease to come down upon him. He gave this to show that a liberal feeling ought to exist between the landlord and tenant. Depend upon it, no written document or anything a lawyer could devise was equal to a good understanding between landlord and tenant—a mutual feeling of dependence one upon the other—a feeling of honour as between man and man, and Christian man and Christian man. The form of letting depended not upon landlords nor upon tenants, but upon both, and societies such as that were very well calculated to promote mutual good feeling between them. That led him to another subject which had been much discussed, the over-preservation of game; and certainly in some districts there was an excess of game—he was not alluding to rabbits, which were vermin, and ought to be exterminated—he had no feeling for a rabbit, except it were smothered in onions. But with reference to game, not in excess, he thought it would be for the benefit of the farmers to encourage it. They knew very well that gentlemen must have amusements, not battues, but moderate shooting, provided rabbits could be kept down. It was his greatest pleasure to see his neighbours coming out to beat, and take part in the sport. In some counties, where there is an excess of game, he thought there ought to be some special arrangements, not only as between tenant and farmer, but between the holders of adjoining farms, where the one farm was likely to be overrun with game from another. Still the great thing was to keep gentlemen in the county, because if the game were wholly destroyed there would be nothing for gentlemen to do, and they would go to where they could get shooting. He did not think this county suffered from an excess of game, but, depend upon it, the secret of keeping down game—he would tell them all, and he wished it were known beyond that room—to be to encourage fox-hunting—not that the foxes destroyed the game, but because the landlord invited all his friends to partake of the sport, and that, not to speak of collateral advantages arising through the sale of oats and other things, helped to keep down that excess of battue shooting more than anything else in the world.

CUMBERLAND.

At Brampton, Mr. W. TORR, of Aylesby, said: With regard to science and practice in agriculture, he believed it was now pretty well known and ascertained that intelligence could reach the farmers as well as any other class in the kingdom. It used to be a favourite maxim, and he knew a Prime Minister of England once said, that the farmers had heads as thick as the clods they cultivated. Well, that day they knew pretty well had gone by. "The piping times of peace" had not lately been very prosperous ones to farmers; they had suffered somewhat during the last three years; and no one perhaps could speak more feelingly on that point than himself, for he believed he had lost as much money as, if not more than, most farmers in England. And he was not himself responsible for that. He had done his best, rising up early and late taking rest; he had not exactly, perhaps, "eaten the bread of careflessness," but he had made no money, and he had lost a lot of money. He believed this, that the farming of the present day was a very slow way of getting rich. He did not know of any farmer of his acquaintance who had managed his farm so that another man could farm after him, and paid a good rent, who had saved a great deal at it. But a farmer took a great deal of breaking. They might trespass on him a good long while before he would break, and he thought that in paying 20s. to the pound he was more honest than his neighbours. However, be that as it might, they must now rouse themselves, and keep their heads wide awake, and maintain that improved position which the farmers of England had, to his certain

knowledge, attained within the last quarter of a century. They must take advantage of science and everything they could, but they must mind not to spend thirteence for a shilling's worth of labour, but rather to spend a shilling for thirteence-worth. He believed that in the steam cultivation they had an opportunity now of doing work which their forefathers never had, but he looked upon it rather as an addition to good cultivation than a cheapening of ordinary cultivation. It was simply that they could do by steam that which they never could do by horses. But they would never find that steam would do away with horses. If they adopted steam cultivation, he ventured to say they would not save one pair of horses in ten; they would do the work much better and more effectually by steam, but they would always have a thoroughly good lot of cart horses (as they had in Cumberland) to cultivate their land. He had lately had a long journey with his friend Mr. Gibbons—than whom he found there were few men more respected in Cumberland—through the counties of Bucks and Oxfordshire, to find a finely cultivated farm for a prize of 100 guineas. It was a compliment to Cumberland and Lincolnshire that the task was left in the hands of men belonging to those counties, and, putting them together, he thought they would take a good deal of beating. At all events they found a farm answering the necessary requirements, and as there were some ladies present he would willingly tell them it was a farm belonging to a widow. He ventured to think that a Cumberland farmer if he went down to Oxfordshire would find something to learn in the management of sheep. Travelling from home always learned people something. As Shakespeare said, "Home-keeping youths have ever homely wits," and this was as true as anything he could tell them. With regard to steam cultivation he held a little croquet of his own. He thought if they introduced it into the county on a broad scale of hiring, they were more likely to do good to their county than if they spent a lot of their own "tin" in purchasing machines. If the system obtained, a small farmer would hire for a twenty-acre field, when he would not employ steam if he had to buy his own implements. He hired very largely himself, and the more he hired the better he liked it. An engine was all the better for being worked, and the man who attended to it constantly was more likely to work it well than a casual hand.

Colonel SALKELD said there were questions which had such local interest, particularly to agriculturists, that he thought he should not be unfairly infringing their rules if he ventured to refer to one or two of them on the present occasion. The local taxation of this county was becoming a subject which was attracting the attention of farmers, and had frequently been discussed at Farmers' Clubs and agricultural meetings for the last few years. Now, during the last few years, Chancellors of the Exchequer had been very fortunate in claiming credit to themselves for obtaining, by their economy and good management, a considerable surplus; and when there was a surplus at the end of the financial year there was great expectation as to what taxes would be remitted. But on no occasion had he ever heard of a remission of local taxation. On the contrary, while there were lots of remissions of imperial taxation, our local taxation was constantly increasing, and this was a subject to which he thought we were fairly entitled to call the attention of our hon. members. It was not many years ago since in this county alone we spent on a lunatic asylum scores of thousands of pounds. Since then we had spent in improving our gaol, forced on us by Act of Parliament, tens of thousands, and in the last session of Parliament an Act for the better education of the people was passed. He did not intend on this occasion to discuss the merits of that Act; it was one he believed as to the expediency of which they would nearly all agree; but what he wished to refer to was the fact that any money required for carrying out that Act was to be obtained by local taxation. Perhaps there were good reasons why that money should be obtained from the country by local taxation, and he had no doubt the hon. members present on this occasion would tell them why it was so. He did not wish to trespass further upon their time; but he was sure the hon. members would agree with him that on occasions like this there were certain questions in which agriculturists took great interest, which it was quite legitimate that they should have an opportunity of discussing with their representatives, and exchanging views in a friendly way.

The Hon. C. HOWARD, M.P., said the business of the last

session of Parliament was of such a character that it was impossible to discuss all those local questions that Colonel Salkeld had referred to. He thought it was a happy thing that two such measures, and of such very great importance as those relating to the Irish land and the education of this country, were discussed at a time when there was not that alarm about war which at present so much occupied our thoughts; but he hoped in the next session of Parliament they would have time to attend to matters of great local and great social importance. There were many measures of importance before them—the game laws, the licensing laws, and the measures to which Colonel Salkeld had alluded. He thought they were aware that a Committee sat on the subject of local taxation, and made a recommendation that there should be a division of the system of rating. They had recommended that half the burden should fall upon the occupier and half on the owner. There were various other measures to be considered in connection with this. He believed, and he was glad in believing, that a measure would be proposed by the Government which his friend Mr. Percy Wyndham recommended—a measure for taxing mines and woods. He thought it was probable that in addition to that there might be proposed some system of taxing game. The question to which Colonel Salkeld had called their attention was one of a most important nature, and one which at this period of the evening he should hardly have time sufficient to discuss. But he agreed with him that the local burdens of the country had very much increased; they should be carefully considered, and he hoped they would be diminished. But we must remember, in considering any question of local rating, that there was a very great matter behind it, and that was the incidence of the income-tax. Those who had been in the habit of attending to the debates of the House of Commons must be aware that the great complaints that came from business men and annuitants were that they and a great many of the class who were in the habit of paying income-tax were called on, out of their incomes, to pay a greater share than was fair. Well, the answer to that had been hitherto, "It is true you have to pay so much of your income, but, on the other hand, farmers and owners of agricultural property have to bear the burden of local taxation, and their case is not properly considered." He hoped the result of their labours next session would be that the question might be fairly considered, and that they might come to a fair result.

Mr. H. M. JENKINS, Secretary to the Royal Society, had heard something said about steam cultivation, and he was delighted to find that Northumberland and Cumberland were becoming rapidly the head-quarters of steam cultivation. He hoped the interest which Cumberland farmers felt in the matter would be evinced next year by their large attendance to witness the trial of steam machinery at Wolverhampton, and they would learn then, he hoped, how to induce the Society to pay another visit to this part of the world.

BUCKINGHAMSHIRE.

At Buckingham, Mr. R. P. FITZGERALD, the chairman, said he wished to call the attention of Mr. John Treadwell to a speech made by him at Aylesbury, in which he stated that it would pay much better to break up grass lands and grow roots upon them. Some grass lands thus treated had produced 36 tons to the acre. As a landlord he was very glad to hear of any improvement which would benefit the farmers, but he did not think all the grass land wanted breaking up. Speaking fearlessly—for he thought he saw more than one hearty face that agreed with him—he could not understand the desire to break up the grass land over which they had so many pleasant rides in the hunting field. The changes in agriculture must have been marvellous since the time—some 80 or 100 years ago—when a history of Buckingham was written, from which he read the following extract: "So rich and fertile was the soil about Aylesbury and Buckingham, that it was considered a disgrace to a farmer to allow a heap of manure to be at the end of his field, to plough in straight lines, or to allow one drop of water to remain on his land beyond what fell from the heavens." He thought the agriculture of Buckinghamshire had advanced since then, as had been proved by the show that day.

Mr. R. DOIG said, with reference to the remark of the chairman about breaking up grass land to grow root crops, he might be excused for saying that the chairman showed by his observations that he was not a practical man. No practical farmer would think of breaking up rich grass land

All they wanted was to break up the poor grass land, which would then produce 50 to 100 per cent. more than it did at present, and would give what they wanted, twenty or even fifty times more employment to agricultural labourers than poor grass land. Was the absence of the county members, who were present at Aylesbury, and of the member for Buckingham, Sir Harry Verney, attributable to the fact that the North-West Bucks Association was thought unworthy of countenance by those gentlemen.

Mr. RICHARD GREAVES said the absence of members of Parliament at the present time was a slight upon their constituents and the agriculturists of that district of Buckinghamshire.

BEDFORDSHIRE.

At Biggleswade, Colonel GILPIN, M.P., said: Well may we be proud to represent such a county—a county which stands pre-eminently for agriculture, but equally so for the ability and devotion of its tenantry, and I hope I may say, if necessary, something for its landlords—a county which, under the auspices of the Member for Bedford and his family, produces agricultural machinery of world-wide reputation. But let us not forget how speedily the raw material of agriculture is, by the good taste of our friends on the southern side of the county, fashioned into articles of costume and wafted on the wings of commerce to all quarters of the world. I only wish I could congratulate you and the country on the total absence of the foot-and-mouth disease, which is raging fearfully in some parts of the country, and on my side of Bedfordshire. We never shall have an opportunity of seeing these diseases, which are of foreign importation, banished from this country until we have a quarantine for all store stock, and a place of slaughter for fat stock at the port of debarkation. I have told you your Members have passed through a long and laborious session; allow me to give you a short retrospect. The Government introduced an Irish Land Bill, either for good or for evil, but I hope for good. That passed the second reading with the greatest unanimity, but it revolutionized all the rights of property and flung to the winds all the principles of political economy. We had hoped that other measures we had previously passed would soften down the state of society and the asperities of feeling, but outrages prevailed. We saw the mid-day murderer walking away from his victim and not a hand held up to stop his progress. The Government introduced into the House of Commons and Parliament passed a Coercion Bill of no ordinary stringency. The next Bill was for the education of this country. Under the voluntary system, subsidised by Government, we stood second only to Prussia, where a man can say to his neighbour—"Unless you send your child to school I shall send you to gaol." If the success of that measure is equal to all the ability, good temper, and tact with which it was carried through Parliament by the Vice-President of the Council, it will leave nothing to be desired.

Mr. FOWLER (Henlow) reviewed the progress of the Bedfordshire Agricultural Society for the last 70 years, and the benefits it had produced not only for agriculture, but for agricultural labourers. Amongst these he enumerated the manufacture of iron ploughs at Bedford, and the impulse given thereby to agriculture.

Mr. HARVEY said: We have just heard from the gallant Colonel that an Education Bill has been passed which will render it compulsory that the labouring classes should be in future educated. That makes the question very interesting to us, and I will not attempt to inquire into the merits of that Bill. But there is one question we must all consider. Before we meet again this time next year every parish in the county will be obliged by that Act to provide education for its poor. I hope many have already provided it. I strongly recommend those parishes which have not provided it to do so before the term of grace expires, and I am quite sure it will be far more pleasant that it should be done by voluntary subscription than by rate. Landlords and agriculturists have too much of rates. It is a disgrace that the maintenance of the poor of England should be thrown entirely on the real property of the country. A great wit and foreign statesman was apt to talk of our "ignorant impatience of taxation;" but I think we, the owners of property, are guilty of ignorant patience when a man of £21,000 a year of personal property is not called upon to contribute a halfpenny. I wish for one moment to consider what will be the effect of

this Education Bill, which is at once to make the poor man contented with his lot, sober and honest, and to improve him in every way. I hope it will make him content with his lot, but we shall be rash if we take it for granted. Although education may make a man contented, still if he feel that his distress results from causes which no person can control it will make him impatient. It behoves us to remove every possible complaint, and I think it would be wise to do it, for depend upon it now they are possessed of knowledge—which is power,—they will not submit to many things they submitted to before, and one of those is the way in which they are crowded into cottages. I believe this evil is second only to that already intolerable evil drunkenness itself, and that it is one of the greatest causes of drunkenness. The landed interest is in odium through the country on account of this consideration, and some landlords were guilty of the cruelty of pulling down those cottages and throwing the people upon the rates. The Union Rating Act was passed as a remedy, but I don't believe any landlord dare act now in that way. I speak my sentiments without any desire of flattering the poor; it is mainly owing to the improvidence of the poor themselves. If a boy of 19 will go and marry without a house what remedy can there be? I hope this measure of education will show them that they should exercise some control and not marry until some means of providing for a family are prepared. If a man is lodged like a hog he cannot be expected to live like a Christian, and I hope every man with means will increase cottage accommodation to meet that crying want, and that the labouring classes will do all they can to make the accommodation go as far as possible, and not incur the responsibilities of a family without having a place to put their heads under. I never in the course of my life, which has been passed amongst the labourers, recollect so much distress in the summer as this year. I had twenty men come to me at once for a day's work saying they were starving. It arose from the extraordinary drought, but also in a great extent from the perfection to which our agricultural implements have been brought. Therefore I think those gentlemen who have been enabled to cultivate their fields at much less expense owing to these machines should assist their poorer neighbours when distress arises. One means is emigration, and for £4 they may send a man to Canada, where he may find plenty of work. It would be a great benefit to themselves and to the ratepayers. I think on the whole the labourers bear their privations well, but I fear next winter will be a bad one, and we should do as much as we can, consistently with our means, to assist them.

The Rev. J. W. C. CAMPION, dissented from the view of Mr. Harvey as to the result of employment of machinery, his experience being that machinery rather enabled agriculturists to employ labour than otherwise. The man who employed machinery and cultivated his land well did a good service to his country and was a great benefactor to the neighbourhood in which he resided.

Mr. W. PIKE said: We have been told that the legislature has passed a measure of Irish Tenant-Right, but not one word have I heard of English Tenant-Right. I have heard a good deal spoken about the labourers, but how can you expect they will have good places and advanced wages, or that we can employ the splendid engines of Messrs. Howard, without a system of Tenant-Right? It has been my misfortune to take one or two farms out of condition, but thank goodness I am under a lease; that is my protection. How many farmers on my right and left have any protection? With a system of Tenant-Right we can stir up the soil deeper, and have a more perfect cultivation, and then we can employ labourers at a better price. We have held many meetings with a view to get a voice in the county expenditure, but we have not succeeded. The legislature has given us an opportunity of having our voice felt in education, but let us have a voice in the expenditure of the money we pay in rates, and we shall be satisfied.

Mr. C. HOWARD said, as to the Game Laws, he considered that if the sentiments uttered to-night obtained with all landlords we should hear very little about the game question. When we found men driven to their graves by this system, when those who were intimately connected with Agricultural Benevolent Institutions traced the downfall of many persons to that system, they could not expect an Agricultural Society to sit quietly by and ignore those facts. The sooner the question was settled the better for all classes. He was happy

to say he had the shooting over his own farm, a privilege which every man in this country ought and will have in conjunction with his landlord.

DORSETSHIRE.

At Cranborne Lord ASHLEY said: With regard to farming, he thanked God that it was something more than the radicals in some of the large towns would have them believe—a mere commercial transaction between landlord and tenant. If there was not mutual accommodation, life in the country would be intolerable. If landlord and tenant passed each other without a hearty grip of the hand, or a cheery 'How are you?' he thought they might as well live in Kamshatka."

ESSEX.

At Dunmow, Lord EUSTACE CECIL, the chairman, said: I know perfectly well that there are many earnest philanthropic gentlemen, of whom I may mention Canon Girdlestone as the head, who are of opinion that the position of the labourer in this country is disgraceful, and very little better than that of the serfs of feudal times. ["No, no," and a voice: "It shows he knows no better"] (laughter). I beg leave entirely to differ with those gentlemen, for I believe that whatever evils they complain of, and perhaps justly complain of, they are partial and local; and that on the whole the English labourer is better paid, better fed, better looked after, and better educated than any other labouring population in Europe. Now why do I say this? Certainly not only from my own experience—although I have had the good fortune to travel freely abroad, and have had an opportunity of hearing and seeing something of the labouring classes in other countries—but I speak from official information. I speak from books which have lately been published, which all may read. I mean the reports of the Inclosure Commissioners and the reports of the commissioners instructed to inquire into the employment of women and children in agriculture. And what do they show? Why they show this, that in place of the labourers' wage diminishing it is constantly on the increase. I find that many labourers throughout the kingdom are earning as much as £100 a year; I find that another very large class of labourers are earning as much as £50 a year; and I find, better than all, that many of the peasantry of this country have got deposits in the savings banks. Then I come to what has been very often spoken about, deficient cottage accommodation; and on that head they say that the cottage accommodation, although faulty in some places, and requiring improvement, is on the whole very much improved during the last thirty years. And we see further that allotments, though not universally, still by public opinion are held to be necessary. And I look forward to the time—not to any very distant time—when every labourer throughout the kingdom will have a bit of land which he can call his own, practically call his own, and cultivate and take care of. Well, then, when we come to the question of education, I think no gentleman in this room can doubt that the prospects of education were considerably brightening even before the Act of last session was passed; but now I am greatly in hopes that through the exertions of all classes—of the landed gentry as well as the tenant farmers—that there will be schools open to which every labourer can send his children, and which will give a cheap, ready, and good education to every poor child. I think all this is very satisfactory—[A voice, "I don't," and a laugh]—and I think it is very much due to such societies as this, because I believe they have been instrumental in awaking public opinion on the subject. But, gentlemen, I might be deceiving myself, and deceiving you too, if I were to suppose or to say for one moment that all had been done that should be done, and that we had arrived at the millennium of perfection. Much undoubtedly has been done, but I believe much also remains to be done. Following in the excellent footsteps of my worthy colleague, Sir Henry Selwin Ibbetson, who has devoted a great deal of attention to the matter, more especially to the principles of the act which he succeeded in passing last year and the year before, I think it would be a very great good if the number of public-houses throughout the country were diminished, and if the disgraceful practice—for I can call it by no other name—the disgraceful practice of adulteration were put a stop to. In my own humble way I have laboured to that end in parliament. I do not take any credit to myself in the least, but I have at last succeeded in obtaining from the government an assurance that

of a certainty they will consider the subject. And I have every hope, from what has fallen very lately in some remarks the Home Secretary made to his constituents in Scotland, that something is likely to be done in the licensing law, which he will have to introduce at the beginning of next session. Be that as it may, I am convinced—whether I fail in drawing public attention to it, and in securing something being done in the matter or not—that the question will have to be taken up by a more eloquent voice than my own. Turning again to the commission, whose reports I have previously alluded to, I think the commissioners recommend, and I believe it would be a very good thing, that in all districts where wages are partly paid in beer or cider that they should be wholly paid in money. I believe it would be for the benefit of the farmers as well as of the labourer, and I have no doubt that before long it will become the universal custom. I would add that I think something might be done in the way of technical education. That word technical is a difficult word. It is not always understood, particularly when used in reference to labourers. But by technical education I mean education in a particular calling to which they are born. I think it would be a very good thing if boys belonging to the labouring classes were brought up to understand the different branches of their trade—if they were taught to become good carters, good shepherds, and good ploughmen—early in life. Then, I think, a very great good might be initiated—I mean the classification of labourers. I am convinced that if something of this sort were carried out the farmers would be protected, and the labourers would receive better wages. The farmer would be protected because he would not be obliged to give the same wages to good and bad labourers alike, which, I believe, he is obliged to do now, and at the same time there would be a stimulus given to the labourer if he found himself classified with a bad class, and only receiving the wages of that class, to try, by sobriety, industry, and good conduct to reach a higher grade.

At Castle Hedingham, Mr. ROUND, M.P., said: I believe I am right in saying that the entire income derived from all sorts of property in this country is £650,000,000, and that the rateable value of property which is assessed is only £100,000,000. I believe that the amount which is collected from that £100,000,000 for local taxation is £16,000,000, of which £11,000,000 are raised under the name of the poor-rate, and of that £11,000,000 only £7,000,000 are actually expended in the relief of the poor. So we see that only one-sixth of the whole property of the United Kingdom is called upon to contribute towards that which is now paid for out of the local rates. This was never contemplated when the Poor Law came into operation. The words of the act were that every inhabitant should contribute to the relief of the poor according to his ability. The present system presses very heavily upon the holders and occupiers of land. However you re-distribute taxation it must mainly fall upon the rich, and it is quite right that it should do so—but the present system falls so heavily upon the poor occupiers as to furnish one great reason why we should interest ourselves in obtaining a redistribution. One of the evil effects of the present system is that it discourages the investment of capital in agriculture, because it involves a tax upon outlay in improvements; and another of its evil effects is that it discourages the building and improvement of cottages about the farms, for no capitalist cares to invest his money in building cottages if the returns for such expenditure are less than he would get from other investments, because of the heaviness of local rates, and the result of this is that labourers are over-crowded, they are driven into the towns, and have to live in a most uncomfortable and improper manner very often.

Colonel BRISE, M.P., was sorry he had no good news for the large number of earnest malt-tax repealers he saw before him. At the commencement of the session he thought the Chancellor of the Exchequer was inclined to listen to their just demands, and that there was certainly some chance of getting a portion of the malt-tax repealed, but the only concession made had been a permission to farmers to sprout their own barley, a permission which was hampered with so many restrictions as to make it perfectly useless. So strongly did he feel that these restrictions would invalidate the gift that he moved an amendment against them, and they had a much better division than he expected, only being beaten by a small majority. The great question of the day was local taxation.

Mr. Goschen, at the commencement of the session, moved for a committee on the Local Taxation Bill. They thought at any rate that that committee would include the area of taxation, and inquire how far the burdens had increased and how far the general property of the country had increased, but when they got into committee they were told all they were to inquire into was how far it was expedient that rates should be divided between owners and occupiers, and, if they were so divided, what changes in the administration of the rates were necessary. The President of the Poor-law Board, chairman of the committee, whose experience was entirely gained in a metropolitan and urban constituency, was of opinion that the Poor-law was not administered in as efficient a manner as it ought to be by the occupiers who at present constituted the Boards of Guardians, and that the owners were not sufficiently interested to stir themselves up as they ought, and he proposed to put a great portion of the rates directly upon the owners. He (Col. Brise) ventured to say that in Essex the owners of property were perfectly satisfied with the administration of the occupiers on the Boards of Guardians, and that it was impossible for the owners to be more economical. When he said this there was somewhat of an incredulous smile came over the committee, as much as to say, "Oh, this is all political clap-trap—Essex is an exceptional county." He believed, however, that the owners present at this meeting would bear him out in what he said. Well, the committee finished their labours, and the chairman drew up an elaborate report; but the committee—a committee appointed by the Government of the day—declined to agree to the report of the President of the Poor-law Board. They, however, permitted it to be read a first time, and then agreed to consider the question by resolutions. Their first resolution was to the effect that it was contrary to sound policy that all charges should be placed on the occupiers; the second, that it was advisable there should be some division of the rates between the owners and the occupiers; the last, that it was inadvisable that there should be any legislation upon the subject until there had been a still further inquiry into the question, and not merely upon that one branch of it to which they had been virtually committed. This left the matter very open. He (Colonel Brise) was not prepared to say that he did not agree with the first of these resolutions. He thought, for instance, that the county rate might be placed on the owner, and there were rates—such as the education rate—which possibly might be shared between the owner and occupier. He believed the reason they had heard so little lately of the agitation for Financial Boards was, that it had been discovered that the county expenditure was a very small portion of the expenditure in rates. In Essex the county expenditure was only something like 3d. in the pound. In his own parish the rates, including the voluntary church-rate, were something like 4s. in the pound, and therefore the occupiers had control of 3s. 9d. out of that 4s. at the present moment. He believed that chambers of agriculture and the landed interest generally would have very little effect upon the Government and the House of Commons in this matter, unless they got the cordial co-operation of the liberal members of the towns, who, with one or two exceptions, had taken very little interest in it. The value of the rateable property in this country was something like £120,000,000. Out of that £70,000,000 was house property, and only £55,000,000 was connected with the landed interest. It was of no use, therefore, the representatives of the £55,000,000 agitating alone. The representatives of trade complained that they had a grievance quite as hard, viz., that they should be called to pay income-tax for precarious incomes at the same rate as incomes on landed estates. He (Col. Brise) did not mean to say but that there was some hardship in this, and if the landed interest could get the mercantile interest to co-operate in getting relief from the increasing charges of local taxation they would do well to assist the mercantile interest to get rid of this grievance. Mr. Gladstone cautioned them to take care lest it might turn out that real estate after all was not unfairly taxed in proportion to other property, but all they asked was a full and fair inquiry, and they would not be content with anything less. Now there could be no doubt that it would be almost impracticable to tax the fund holder in this country. He was not prepared for a national rate, and he did not see his way to any direct taxation on personal property, but their grievances were great and increasing every day. The owners of property had no objection to maintain

their obligations for the support of the poor, but they objected to increasing charges being thrust upon them, not for local but for national purposes. Their expenses in this county for the poor's-rate were something like £200,000 a-year; of that £200,000, not less than £60,000, or nearly one-third, was for the relief of vagrants, and lunatics, and for salaries. The poor-rate for the whole country was between £11,000,000 and £12,000,000 a-year. What did the Government give them in aid of these expenses? Not half a million. If Government gave them the expense of vagrants, lunatics, salaries, and charges of that kind for national objects, that would be £3,000,000 at least per year. He wanted to get that £3,000,000, and he must have a still further grant for police, militia, and other expenses of that kind.

HERTFORDSHIRE.

At Tring, Mr. TREADWELL said: With respect to labourers' cottages, they ought to be on the farms; and not only so, but in the hands of the farmers. And then the labourers would be as good as those Mr. Bailey Denton sent for. He thought that about the food and the beer was a point stretched rather too far; nothing did a man so much good as a drop of good beer. He thought if many of the useless trees and abominable spinneys on farms were grubbed up during the winter season, and nice cottages and gardens put in their places, it would be a great advantage to society. A friend of his said, why didn't more compete for prizes? It did good to compete. It made a man look about to see what he should do, and what others were doing; and he knew that if he laid out £10 to compete for a cup for the farmer's prize, he saved £20 by it. But the great drawback to farm prizes were the confounded broad hedges and the nasty spreading trees. With regard to the cattle disease and the foreign stock, Mr. Forster had been kept back from doing what he ought to have done long ago, but he was doing about right now. They were told there had been sheep brought in lately infected with small-pox. These sheep had been allowed to go all over the country, and how could they stop it in future but by having the sheep killed at the waterside? Why not have them killed at Odam's wharf, where there was ample space? And if all foreign cattle were killed at the landing-place there would be a constant flow of meat into the country as well as into London. What he did care about was the safety of our home flocks and herds. He believed they were improving in farming, when they saw 200 acres of roots on one farm all admirably managed by the farmer's sons; and when they saw roots of such size as they had seen to-day, they must admit it did the growers great credit: they were first-rate. But in sowing for roots, they must take care and not plant too wide. Then they must have their land clean; no man should have foul land. Then the ploughing must be well done; the ridge thrown well up; it was the ridge to-day which got the first prize for ploughing.

Mr. W. BROWN said he would now trouble them with one or two remarks, as they had on previous years listened to his observations. One was, pure water *versus* dirty water. On this topic Mr. Disraeli had spoken at Aylesbury—he advocated the necessity of storing up water; and, in such a season as they had just had, and on the hills, it was a matter of serious consequence. Mr. Disraeli thought it could be done by reservoirs, or open ponds; but he was not so much an advocate for these as for close tanks. He knew several instances where these had proved very beneficial, and were not too expensive. His brother had paid large sums to take water in carts to his cattle; but it occurred to him he had seen water washing down his land; so he had a reservoir made twenty feet deep and fifteen feet diameter, and all this season he had not to cart one barrel of water. Mr. Lowades, of the Bury, Chesham, had tanks made on his up-hill farm, which takes the water from his roofs, and they answer perfectly well. The tanks had no bricks except on the dome. It therefore behoved everyone to store up water by these means for the sake of those about him.

KENT.

At Tunbridge Wells, Sir WALTER STIRLING regretted the absence of many of their representatives, who might possibly enlighten them on the subject of contagious diseases in cattle, on Tenant-Right, and even the use of horse-chestnuts as food for stock.

Mr. GREGORY, M.P., said: The great questions of local taxation and financial reform were those which would come before the House, and for which they (the members) would be

found at their posts, ready to do that which their constituents might consider for their benefit, and which they themselves might think most conducive to it.

LINCOLNSHIRE.

At Long Sutton Mr. W. E. WELBY, M.P., had been challenged to say a few words on the Education Bill. The effect of that Act would be shown in the future. Every parish in the kingdom must provide sufficient and suitable schooling for the children of the poor. That might be provided, as it hitherto had been, by school fees and voluntary liberality, supplemented by Government grants. He thought the voluntary aid for schools would be found preferable, because, firstly, they gave greater liberty of religious teaching. Secondly, if they had Government interference, there would be the expenses of the maintenance of the School Board to be provided out of the rates. Thirdly, under the School Boards the attendance of children would be compulsory, and he knew there was a strong feeling against that; he had a very strong feeling against it himself. He advised them to meet in vestry and to calculate as nearly as they could what schooling would be required, and make such provision for it as should secure the keeping of the management of the schools in their own hands, and as far as possible keeping clear of Government interference. There were one or two matters connected with agriculture during last season which he would refer to. They were enabled to procure the exemption of farm horses from taxation, even though they were employed for drawing material for the highways. It was never intended, he was sure, by the Government to pass such a clause, but they were now in a better position than they were before. Until recently they were liable to be taxed, though the law was not put into force, but now it had been distinctly laid down that horses used in that capacity should not be taxed. The permission to steep barley for feeding cattle was a cession which would be variously estimated. One great feature of the session was the overwhelming majorities with which measures had been passed—not only the Education Act but the Irish Land Bill. It showed that any Government which had the courage and ability to produce good measures, might reckon upon support, and bear down factious and interested opposition from any quarter, carrying them to a successful issue.

At Torksey, Colonel AMCOTTS, M.P., the chairman, said They did not generally consider those books called "blue books," in which were recorded the proceedings of Parliamentary committees, light reading, neither did they look at them exactly in the light of novels. Nevertheless they were interesting and of great value to those who took an interest in the subject to which they related. And when he (the chairman) alluded to the particular blue book which treated of the employment of women and children in agriculture, they would agree with him that it treated of a subject of great interest to every one. It was surprising, on reading the evidence, to find how different was the payment for labour in different parts of England. Upon the whole, the labouring classes in the North carried off the palm for well-being, with one or two exceptions; while those of the South and some of the South-Western counties appeared to be the worst off. And he must say that it was lamentable and painful, on reading the copies of the evidence of gentlemen sent by the committee to inquire into these things, to see a county pointed out for lowness of wages, and for the badness of its cottages. He trusted that they would not unduly flatter themselves—that they would not unduly glorify themselves—when he said, not for himself only, but for a great many landlords, and on the part of a great many farmers, that Lincolnshire stood pre-eminent—it having been called the labourers' paradise—for the excellent wages labourers received as a rule. Their cottages, too, were not pointed at as in some counties. He did not mean to say that there was not much yet to be done. Agriculture, as they all knew, was an experimental science, and a progressive science. They saw no limit to the production brought about by successful agriculture. But he was sure he might say this—that the improvement in farming, and in labourers' cottages generally in Lincolnshire, had been considerable in his lifetime. The consciences of landlords had been touched in regard to cottage building. It was an expensive luxury, but few things gave greater pleasure than building good cottages for good labourers. Thoroughly to appreciate the reports, they should take the book and scan it over for themselves, and they would see

things which, as agriculturists, would surprise them. With regard to the employment of women and children in agriculture, the work was said to be healthy, and there were no complaints against it from the people engaged in it. There was another question which had been largely taken up, and that was the difficult question as to how they should educate the children of the labouring-classes. He must confess that, after reading through a mass of the evidence published, he felt more puzzled than enough, and what to recommend he scarcely knew. That the children should be brought up with a reasonable education all would agree, and if they could get the parents to properly appreciate the value of education, they would take care that their children received it. He thought it was impossible to secure a high standard of education amongst the labouring-classes. Amongst those far above them they knew how few cultivated education and reading for knowledge and reading-sake. Be that as it might, if the parents could be enlisted in the cause of education—if they could be shown that their children, by being educated, could get higher wages, and that they would have a better chance of making their way in the world, there would be no difficulty in educating every child. But it should be remembered that there were two educations—the education of the head, and the education of the hands; and both must constantly be going on at the same time, up to a certain age. The children of labourers must be taught to plough and to sow. It was not merely head education—reading and writing—that was needed; the other education, that of the hands, ought not to be lost sight of, for upon that mainly their future welfare depended. There came before the House of Commons the question as to whether there should be compulsory education, and, wisely, he thought, the compulsory clause was struck out; it therefore entirely depended upon the people of a district whether schools should be established or kept up. He saw the greatest difficulty about the compulsory clause, and when Mr. Welby (one of the members for the southern division of this county) brought forward a motion to the effect that it be struck out, Mr. Forster, on the part of the Government, very wisely, as he (Colonel Amcotts) thought, accepted the proposal, and left education optional.

NORFOLK.

At Docking, Sir WILLOUGHBY JONES, speaking of America, which he had lately visited, said the effect of the immense growth of corn in the West had been to entirely stop wheat growing in the New England States. He had travelled 200 miles without seeing 20 acres of wheat; it was far cheaper to buy it from the West than to grow it themselves. The Western States had gone into dairy farming, and grew a great quantity of Indian corn for forage, and also of sorghum—the sugar grass (*Molens saccharatus*)—which grew eight feet high, and was a beautiful crop, also a great deal of beetroot. He was also struck by the way in which everybody seemed to go into fruit-growing. The quantity of apple-trees, and the land under melons and tomatoes, and peach orchards, and all kinds of things. The consumption of fruit in the United States was large to a degree we could not form a notion of—everybody seemed to be eating fruit all day, and the quantities sold in the large towns were immense. He was sure the capabilities of consuming fruit were not half developed in England, and we might take a leaf out of the American book in that respect. An apple-tree cost nothing; and if we grew three or four times the number of apples we had now—if every farmhouse had a good bunch of apple-trees and every cottage an apple-tree, the consumption would increase, and we should find it pay very well, and the people would have a great treat and good wholesome fruit. [LORD LEICESTER: Is not the climate more suitable?] He thought it was. The labourer going from England to America, would find certainly a very great increase in his wages, but he would find it necessary to make a few set-offs. He did not mean to say that he would not be better off there than here, but the advantages were not completely on one side as he might at first be disposed to imagine. He would find a climate in which there were very great extremes of heat in summer and cold in winter, instead of the very moderate climate to which he had been used; he would find very heavy taxation, everything except the bread he ate, excessively dear; the prices of clothes and house-rent, and other things, perhaps three or four times what he was accustomed to; all the winter time he would not be able to do any

agricultural labour in consequence of the intense cold and snow, the land being frozen to a great depth; and he would have to learn the salutary lesson of absolute self-reliance, for, if from his wages in summer he did not lay by sufficient to support him in the winter, he would find no poor-law to help him, and he would not have even the resource of begging, for no such thing as a beggar was known in the States, and if a man did beg he would not get anything; and he would be under the disadvantage also of being removed from his family, and all the friends of his childhood, and all those with whom he had been accustomed to be in affectionate and daily intercourse. But for all that he (Sir W.) was not disposed to say on the whole the labourer would not be better off there than here. There was no doubt the very large wages he got and the lessons of self-reliance he learned would raise him in the social scale and make him a better man, and altogether a more reliable man than he is now. He would be better off, but perhaps not exactly in the way he expected. He must be a Jack-of-all-trades, ready to turn his hand to anything, and whilst he got a good day's wages, must be prepared to do a good day's work. In Canada the wages were not so high as in the States, but everything was less expensive—heavy taxation, such as that of the States, did not exist. For his (Sir W.'s) own part, he should be disposed to say that a labouring man going to the province of Ontario and the highly farmed districts of Upper Canada would be, on the whole, about as well off as a man who earned his bread by his arms could be.

At Blofield, Mr. C. S. READ, M.P., said we ought to be thankful to the Ministry for not embroiling us in a great European war. The farmers in the light land districts found that they had a poor crop of corn selling at a miserable price, and a conclusive illustration as to the condition of farmers was to be found in the fact that in one of the Norfolk papers just before Michaelmas there were to be found the advertisements of agricultural sales. Not much was done for farmers in the last session of Parliament. The Chancellor of the Exchequer, with an overflowing revenue, would not ease the malt tax even of the 10 per cent., which was put upon it some years since. Farmers were now selling decent barley at 16s. per coomb, and the 2s. 9d. duty which they had to pay on malt had something to do with the unfair depression which they experienced in barley. The Chancellor of the Exchequer, at his (Mr. Read's) request, took off the few hundred pounds paid on the insurance of cattle through loss by hail; but in order to compensate himself for having done so much for the agricultural interest, he inflicted upon it a gun tax, which would produce, at the expense of agriculturists, the same number of thousands. The Irish Land Bill introduced by the Government embodied many ideas which he (Mr. Read) was able to support; but one thing which he had strenuously opposed was that occupiers, whenever their landlords thought fit to turn them out, should, if they were small tenants, be able to demand seven years' rent. He thought that this would be the end militate against tenants. No injustice could be done to one class at the expense of another class, without its ultimately falling upon the class for whose supposed benefit the injustice was wrought. With the competition which prevailed for land in Ireland, he had no doubt that, if a landlord had to pay such a fine, he would ultimately make his tenants pay it for him through an increase of rent. He (Mr. Read) thought, however, that, whenever a man was ejected from his farm, he should be paid for any actual improvements which he might have effected. He (Mr. Read) had opposed Sir Baldwin Leighton's Police Poaching Bill. A man must know that he had no more right to snare a hare than he had to rob a hen-roost, but ground game, unlike poultry, was generally fed at the expense of other people, either neighbours or tenants, and did not pay for the protection which it enjoyed. Where game existed in large quantities upon a farm it depreciated the assessment, and threw a heavier burthen on the rest of the ratepayers. Under the Act in question game had exceptionally unfair privileges. If a suspicious-looking man were found on a road at five in the morning with a hare in his possession the hare was immediately confiscated and the man was liable to be convicted, but if it were a goose it must be shown that a goose had been lost, and the bird must be identified before the same result would follow.

NORTHAMPTONSHIRE.

At the Peterborough Ploughing Match, Mr. SCORER, one

of the judges, had seen very little of the double-furrow ploughing, but in North Lincolnshire they were about giving prizes, and he should be very glad to see any of them at Alford on the 11th of November. His colleague wished him to say that the ploughing had been done in an excellent manner.

Mr. AMOS, C.E., said: Some of the implement makers might not have been satisfied, but it was not for want of judges. He had met with many men before, but he never saw three men with better elements for their work.

Mr. RANSOME said, this had been the first time in this kingdom where such a large trial of double-furrow ploughs had taken place. The trials had been conducted in a satisfactory manner. In the double-furrow ploughs a large horse saving might be effected, as they could do more by having two ploughs drawn by three horses instead of four, besides the saving of a man.

Mr. LOVE (for Messrs. HOWARD), said, with regard to double-furrow ploughing they had always considered that unless there was a saving of horse-power the sooner the idea of making them was exploded the better. They took a simple dynamometer with them and they invited parties to use one of them with one of their own single against a double plough. Whatever power it takes to draw a single half as much more will be required for a double, the only exception being the soil. It was a question for them to investigate for themselves. It being a matter of soil it would be for them to say whether it would be an advantage to the district or not. It was for the purpose of giving the light land farmer the opportunity of trying it instead of steam. The double-furrow plough might bring them into as good a position as on a strong land farm.

Mr. C. W. GRIFFIN said as farmers they would undoubtedly always buy the best they could get for their money. Meetings of this kind gave them the opportunity of testing one against the other, but they seldom met with land where they had the advantage of doing so. It was a question with him whether the dynamometer was a good test where the land had been steam ploughed. The land was dry and he did not believe it was a fair test. When the ploughs came to be tested on strong clay land they would not stand the test they had done that day.

Mr. W. WHITTING the Chairman, said there had been a great deal of the work done that he did not like, but on the other hand it was compromised because there was some done that he did like. If they would apply to the implement makers for a cheap article they would supply them with it, but if it did not answer the purpose they had better keep their money in their pockets. There were light implements sometimes used for heavy work, and it was impossible for it to be done well. The better implement they got the less it would cost them in the long run.

Mr. BARFORD said one thing on the previous day pleased him amazingly, and that was the way in which the local men did their work. Taking the class as a whole it shamed the maker's class.

Mr. MARTIN said he had no idea that he should have been called upon to speak, and he would therefore remind them that he was not born when boys were sent to school by Act of Parliament. He was glad to see implement makers present and to congratulate them upon the rapid progress they had made during the last few years, but the double-furrow plough was only yet in its infancy. He did not approve of the dynamometer they had had that day as he did not think it was a proper test between the single and double ploughs. This was one of the best meetings of this kind he had ever witnessed, and he thought it would be a good thing if the Royal Show would grant the use of their dynamometer. He thought they would be very glad to lend it, as it was lying idle for four or five years. At these double-furrow ploughs the men worked hard and were doing too much, and the question for them to consider would be whether they should give the men a shilling per day more, or make the plough go easier?

At Daventry, Mr. EMERY, of Drayton Lodge, said many persons asked him how he got such sheep, and as there was some young men present he would give them a hint how to get good sheep. In the first place, they must get good animals, and then they must keep them well. He did not mean that they should pamper them, but they should not let them starve. If they had enough natural food they should not give sheep artificial food, but if they had not enough,

they must. He weaned his lambs early, and he would tell them how he came to do so. He had a lot of lambs doing very bad, although they were on first-rate land, and in April he told his shepherd to take the ewes away, for if the lambs did worse without the ewes than they did with them they must be bad indeed. The lambs did better, and now he never let the lambs be with the ewes after the 10th of May. If he had forty ewes he took them away about ten or twelve at a time, and he always found that the lambs took to the pasture. Before weaning his lambs he generally broke up a little oil-cake, and put it in the troughs, and they ate it, and he gave them a little for a short time after they were weaned, and when lambs became bad in the autumn, he generally thought it was because they had not been properly weaned. Sheep, too, wanted plenty of water. Some years since he did not think much about that, but he should now as soon think of keeping his beasts as his sheep without water.

SHROPSHIRE.

At Ludlow, Col. CORBETT, M.P., was sure they would all agree with him that the past season had been a very trying one to exhibitors of stock of all kinds. The absence of grass must have sharpened every farmer's wits to find out how to keep his stock in sufficient order for the show yard, for it was a *sine quâ non* that stock should not be fed with artificial food, and so the difficulty became all the greater. The result, however, showed that they were able to meet any difficulties of the sort that might arise, for he thought that a better show for a small district could hardly be expected, and at few places could it possibly be so good as it had been there that day. Of course that was the centre of a district where some of the best Herefords in the kingdom were bred, than which there was no better class of stock to be seen anywhere, for they had kept their place at the Oxford show and everywhere else. The cattle shown that day were excellent. They were of a good useful character, and good framed, and showed great "kindness" in handling. The fat ones, he thought, were particularly good, and the breeding stock, being not over-burdened with fat, were such as would bring a man a calf every year, and not one in three years. The malt tax had come before the House during the early part of the session; but nothing came of it more than usual. The Chancellor of the Exchequer was not able to make up the £8,000,000 which would be lost to the Government by the repeal of the tax; but he did make one concession, which was to allow farmers to sprout their own barley under certain conditions. It was a much vexed question as to what the advantage of this would be to the farmer. If it was any good, farmers would now have an opportunity of trying it; but the concession was hampered by one condition that must reduce the value of it considerably. It was that no barley should be so sprouted within a quarter of a mile off a malt house, and he thought there were few places, therefore, where farmers would be able to avail themselves of the provisions of the Act. The question of local taxation had also been before the House. Sir Massey Lopes had taken the matter up in a very able way, the question had been discussed by the Chamber of Agriculture, and he believed they might look forward to a satisfactory solution of the question at no very distant day. There was the question of turnpike gates. ("Pull them all down.") When he was canvassing the county a farmer spoke to him upon that subject, and objected to the abolition of toll-gates on the ground that if his cattle or sheep got out of the field and strayed, they were stopped at the gate, and so he had not so far to go to find them as he otherwise would; so that everybody looked at the matter for his own point of view. For himself he agreed with Mr. Mansell, who said "Pull them all down"; but he (Col. Corbett) certainly did not think it right that the debts, and all, of the trusts, should be thrown upon the ratepayers. He was glad to see that those present were of the opinion they had expressed, but the difficulty to be got over was to decide who was to be saddled with the debt. The roads are not at present what they used to be—the great arteries of the traffic of the country, the railways took a great deal of the traffic. He thought the whole question should be looked into and well adjusted. The new gun tax was another matter we should refer to. He did not know what view was taken of that subject by the holders of land, but they had a great fight in the House to carry Mr. Read's amendment to allow occupiers to carry a gun to kill birds and vermin upon their own land. The Government opposed it, but they had carried it by

a very comfortable division, and it would, he believed, prevent a good deal of annoyance that might be felt. Although the tax might do some good in the neighbourhood of towns, he thought it remained to be seen whether or not it would be an inconvenient and vexatious tax to people living in the country.

At Forden, Colonel CORBETT said that Parliament had given to farmers the power to half-sprout their barley for feeding purposes. He did not know what they might think of it, but he was speaking to a farmer recently who said that this year he thought the privilege of sprouting barley would be of great service, on account of the failure of many of the green crops, as the sprouted barley was a valuable change to so much dry corn. The one condition against it, and that would interfere with its usefulness in many places, was that it must not be sprouted within a quarter of a mile of any malthouse. In consequence of this condition many farmers can make little use of it in the neighbourhood of villages, where there was generally one or two malthouses. The progress of farming was due in a large measure to the manufacturers of agricultural implements, who had adopted to practical use every scientific improvement. Since the year 1846, when he commenced farming, great improvements had been effected in agriculture and agricultural implements by men possessing scientific knowledge, and it had pushed on the bucolic mind amazingly. It had a similar effect to putting a slow ploughman behind two fast horses; if he intends to plough well he must step with them. He must congratulate them on the good work done by the champion ploughmen, the farmers' sons, and the other ploughmen, which was all very creditable. The hedging was uncommonly well done, and he flattered himself that he knew a bit about "hedging." He had named the three first in the Severn Valley Club, and to-day he had "spotted" the winner. Fairplay for those who allotted the work to be done, for they must be good workmen who could make good-looking hedges out of some of them; but, however, the work was got through and well done. He could see in places that it was hard work to get through the ditches. The furrows in some of the ploughing were done very well, the edges showing up sharp for the harrows. The ploughing of the farmers' sons was very good; and these prizes stimulated in all a healthy competition. The young man must not know only how to hold the plough, but how to set it to do the work required, and therefore they ought to be taught these things by those who do know. In illustration of this he might tell them that one day—in his farming days—he went into the harvest-field, and his man who had loaded the waggon had done it so badly that it upset the waggon. He remonstrated with the man, who said he could do it no better, when he (Col. Corbett) got upon the waggon, and loaded it himself, and it did not fall down either. He wished to tell them that they must know "how to go along," and not "how to come along." They must push the work before them, and not drag it after them. Then as to the American plough. It seemed to be a wonderful plough, and did extraordinary work; and he thought that they could not do better than discuss the merits of that invention at a meeting like that for an hour, as it would be most profitably spent. He thought that plough would become a most useful plough, and be a great addition to their agricultural implements.

At Much Wenlock, Colonel CORBETT, M.P., said the rinderpest was following in the wake of the Prussian army in France, and he believed that unless great diligence and care were exercised by our own Government, we should again have it within our own shores. He hoped that such would not be the case; but what he had stated went to show that the discussion which had taken place at the recent meeting of the Shropshire Chamber of Agriculture was not premature. He was satisfied that if steps were not taken to have proper markets erected at the different ports, that they would be in great peril of being again visited by that frightful scourge. He had great confidence in Mr. Forster, that he would use all vigilance, so long as he was in office, and that such care would be taken that they would not be likely to have a recurrence of that disease. But the Metropolitan Market was not yet erected—it was not settled where it was to be; and he did think it behoved all of them as agriculturists, and all consumers as well—for all their interests were in the well-being of agriculture—to keep watchful eye upon the Government, and see that those markets were made with as little delay as possi-

ble, and that no diseased animal should move out of them when they were erected. There were not many other subjects of interest that he need bring before them, but there was one subject that they all took great interest in, and which had been adverted to when the militia was mentioned—he meant local taxation. It was a matter that pinched all of them in the rural districts especially. It never could be right or just that eighty per cent. of the local taxation of the country should be such that the ratepayers, or their representatives, had no power of saying whether it should be spent or not, for out of every £100, £80 was paid by order of the central Government for different items over which the ratepayers has no control whatever. And what were those items? One of them was the expenses of militia depôts. But surely the militia was as much for the national good as the regular army, and if so, why should it not, like the regular army, be supported solely out of the national funds? Then there were the lunatic asylums, which, although they partook more of a local character than the militia, still, he thought, ought to be supported by the funds of the nation at large. And when they considered the manner in which the rates were at present levied, it seemed to him that such item of expenditure ought in fairness to come out of the general funds of the country. He was well aware that there was great difficulty in levying a rate equitably over the whole of the country, but he certainly thought it unfair that any parish should be called upon to pay a rate for those items which belonged more to the nation at large than to any particular parish. Their representatives had not yet been able to do much for them with regard to the malt tax, but one point had been gained—that of a privilege to farmers to sprout barley for the feeding of cattle. A friend of his had told him that owing to the scarcity of succulent food this year he intended to try sprouted barley, but even with that there was one drawback, which was that those who were within a quarter of a mile from any malt-house could not take advantage of it, and very few he presumed would, in some parts of the country, be able to avail themselves of the privilege.

Mr. A. H. BROWN, M.P., said the question of local taxation was one in which he had taken a great deal of interest. They were all aware probably that a committee of the House of Commons had sat upon the subject that year. He was not a member of that committee, and no doubt many present would have read what had been done by them, but he thought he might recapitulate some of the points which had been arrived at. He would first refer to the manner in which this question affected farmers. To make himself understood he would take a case. He, for instance, wished to rent a farm. He inquired from the landlord what was the rent, inspected the farm, and saw how it was situated as to a market town. Now if he thought the rent of that farm, with the taxes, was such that he could recoup himself, he should conclude the bargain; but if the rates were higher than he could afford, he should not do so unless the rent was proportionately low. From this it would be seen that the rates affected the rent a landlord could get for his farm, and they fell therefore to a certain extent upon the owner of the property. That was the first bearing of the case. Then it might so happen that he took a farm on which the rates were not high; but that the rates, as they seemed invariably to do in this country, rose, and the whole of his previous calculations were upset. The committee seemed to be of the opinion that this increase of taxation should be divided between owners and occupiers, so that the latter should not have to pay the whole of it out of his own pocket. In addition to that part of the question there was the other part that referred to the incidence of the local rates, whether they should fall upon real or personal property, or both, and he hoped that matter would be taken into consideration by the committee in the ensuing year.

Mr. RALPH BENSON, the chairman, said that grounds for the congratulation of the agriculturist were this year wanting, for he feared that this year would be an unprofitable one to many of them. The drought of the past summer had bleached their pastures and covered their root crops with blight and fly, to so great an extent that it would be a matter of great difficulty to provide food for their cattle and sheep. He had, it was true, been told that it had been a capital time for cleaning the stubbles, and he hoped they would be thankful for small mercies and find that their stubbles were perfectly clean. He had attended some of the discussions and he really did not see

why they should not have what he believed would be a great attraction, a bit of dinner first and the discussion afterwards.

Mr. TREVOR said he had, it was true, been beaten for fences, but he thought he had been beaten by a bit of stratagem. If his late agents had met him with the same liberality that Mr. Bigge had done, his fences would have been equal to any in the kingdom. With respect to the root crop, he managed it upon the old fashion system, and he should continue to do so until he was convinced that the new system was better than the old one. He employed a great many implements, and there was one particularly, an old fashion one, that was a great favourite of his. It was the plough. He always ploughed his land up two or three times for turnips. His friends told him that by so doing he lost moisture. Well, he admitted that his root crop did, some seasons, grow "patchy," but he had a greater weight per acre than Mr. Acton, and he thought he could even beat Mr. Davies in that respect. If he lost moisture at first, the deep cultivation retained moisture afterwards. If they would look around the country they would see, also, that his stubbles were cleaner than under the other system. One serious matter for them to look to was the supply of water, which he thought was getting very short—a consequence, as he believed, of the increased drainage of the land. He thought every gentleman who had an estate should turn his attention to that matter.

SOMERSETSHIRE.

At Shepton Mallet, Mr. GENGE ANDREWS said: Major Paget wished to know their opinion of the Derbyshire cheese which he had set before them at dinner that day. Now it so happened that he (Mr. Andrews) was himself perhaps one of the greatest cheese growers in Somerset, having kept on his farm two hundred cows. Therefore he thought he ought to be a judge of cheese, and at his end of the table there were many friends who were cheese-makers and also excellent judges of cheese. Well, having tasted the cheese set before them, and which the hon. gentleman had so kindly procured for their opinion, they all said that Derbyshire cheese was a very good cheese, but it was not so good as Somersetshire cheese. He was in London yesterday, and he happened to fall in with the chairman of the Local Taxation Association in the county of Warwick, and also with a Derbyshire gentleman, and the conversation turned upon cheese. The Warwickshire gentleman seemed to have a great understanding of cheese and the current prices, and he gathered from him that the price of cheese in Warwickshire was very much superior to the price in Somersetshire, and he also believed it was very much the same in Derbyshire. Now he just gave that information on this occasion for the advantage of the cheese dealer in Somerset. We had lately a very strong north-east wind; and they might depend upon it that if the price went up in Warwick and Derby the price would go up in Somerset. It seemed that nothing decent could at the present time be bought in the county of Warwick for less than 80s. per cwt. (A voice: What weight?—112 lbs.?). He had a discussion on different weights in the county, and he meant 80s. for a Somersetshire hundred-weight. And he hoped that gentlemen here would not throw away their best cheese for less than 80s. per cwt. There was a feeling, and they had seen it publicly expressed in many of the prints of large circulation, that it would be better for this country that we should have a paid, rather than an unpaid, magistracy. He totally dissented from that doctrine, and he believed it would be an evil day for England when the administration of county affairs was in the hands of paid officials. Nevertheless, he was sorry to say he had heard recently, even among their own class—the agricultural class, who supported the county magistracy, as a rule, in every respect—he had heard a feeling expressed that there was not that sympathy and cordial union between the county magistrates and the class by whom they were supported which he hoped, and which we ought, to see. He was sorry to hear such expressions of feelings; he regretted it exceedingly. He hoped that feeling would not increase, and that the sympathy and support of the magistrates of the county would on all occasions go with the feelings and interests of the classes by whom they were surrounded. They knew that the magistracy was drawn very largely from among the landed proprietors; and it had been said, without his consent, that he (Mr. Andrews) would say something here to-day on a question in which the company all felt very great interest—he meant all

who were occupiers, not only in the county, but to a very large extent in the towns; and that question was an unjust charge with respect to the poor-rate assessment on those who owned houses and lands—what was known and described as "real property." It was not his intention to address to them any set speech on the subject, and it was the more unnecessary because the subject was well known and understood in every parish in the county—by every guardian, every clergyman, every magistrate. Or, if they did not understand it, it was their own fault. It was well known to those present that he (the speaker) had taken some trouble to organize a county association in this county, and that one of the most important questions which they had undertaken was that of a reform of the Poor-rate assessment in its bearings. Now, what was the question, simply and shortly, which the association had put before the public? It was simply this: That they attacked an exemption—and everybody knew what an exemption was. In every parish all the real property was rated. Now, what would they say if two-thirds of the property in any parish or town was exempted from the Poor-rate—a tax of £11,000,000? Why, they would say, "We will appeal to the Assessment Committee, and we will have it assessed." Now all they had to say with regard to the assessment of personal property was this: that if it was just that it should continue to be exempted, let it be so; but if it was unjust, let it be remedied. Now in proposing this toast of the Magistrates, he should venture to say that they had not that sympathy and support from the great body of magistrates in this County Association, which had been founded immediately by farmers, which they had a right to expect. There were on the list of Somerset county magistrates 250 names, and he thought on the list of the County Association they had not more than perhaps 20. They had every one of their county members on that list. They had the Marquis of Bath on that list—they had the Lord-Lieutenant on that list—they had the Hon. Mr. Chichester Fortescue, Chief Secretary for Ireland, on that list—they had the late Chairman of Quarter Sessions, Sir William Miles—and there were many others, a few others at least, that he might name. But where were the mass of the magistrates that they did not come forward to support their county members and their Lord-Lieutenant by following their example in this matter? He would not be surpassed in respect to the magistrates by any man in Somerset; he respected them—he admired them; but he could not understand the man who said he could not understand a simple question put in this way: That a man having £10,000 a-year from a mortgage shall pay no Poor-rates, and that a man receiving 40s. a-year on a house shall pay Poor-rates. Now the county magistrate that said he could not understand that simple question of the rating of the smallest amount of what was called real property, and the non-rating of the largest amount of personal income that they could imagine. A large manufacturer or a large holder of bank stock received his income surely, received his income as quietly and snugly, and very far more so, than any owner of a house. Then why should he not contribute his fair share to the duties which were unquestionably imperial duties? Now the one grand reason which was assumed by many county magistrates who could not see their way quite clear upon the subject—the one grand objection was, that it would do away with local self-government. Now many of those now present were members of Boards of Guardians, and must all know that the limit of their expenditure as Boards of Guardians was set them, not by anything that they could economise, but by the duties which the law charged them with. The law charged them with the relief of the poor, the payment of the police, maintenance of lunatic asylums, registration of voters, registration of births, building bridges, and now they were to have education, and then soon they were to have a million added to the Poor-rate for turnpike-roads. That was called "local self-government!" He should like to know what sort of local self-government turnpike-rates were, or boards of guardians even, or county magistrates? They (the guardians) had their duties laid down, and they were governed by the Poor-law Board in the very smallest items of outlay. The orders of the Poor-law Board were as absolute as any Acts of Parliament. The President of the Poor-law Board hadn't to go to Parliament for the powers which he exercised over boards of guardians: he took it as a matter of course. He was the greatest despot in Britain—he could do what he liked. With regard to the county magistrates, they governed the county ex-

penditure; but we were told that more than 80 per cent. of that expenditure was laid out under laws passed by the Parliament; that they had no power to limit those expenses, the only control they had was over only 12 per cent. of the county expenditure. Now he should like to know what financial boards, county magistrates, or anybody else, were going to save out of the expenditure? And if we were going to have a large extension of the militia, he should like to know the justice of a house in Shepton Mallet being rated to contribute towards the maintenance of militia stores and buildings; which certainly was a matter of national importance. Although they (the association) were not supported in this county as they ought to be, yet he might tell this meeting that the association had been able to set afloat this movement against the unjust assessment of Poor-rate, in every county of England. And further than that, they had induced gentlemen of the House of Commons to take up the question in the House, and it had become, through the movement in this county, one of the most important questions of the day. He trusted the magistrates in the county of Somerset would pay attention to the circular letter of Sir Massey's, and that they would at quarter sessions follow the example which was set by the Devonshire court in moving some motion in favour of the question. He had always held the opinion that if our county magistrates in every county spoke out as they ought to speak on this question, no ministry—Whig, Tory, or Radical—could resist the demand of the county magistracy. Now, if that were so, if his opinion were correct in that respect, we owed it to the county magistrates of England, the Whigs and Tories, the continuance of this abominable and unjust burden on real property. It was on them, and not on the ministry; for you might depend that no ministry would venture for a moment to deny the consideration of this question to the body of the magistrates of the kingdom. For what did we see? We saw that every ministry for the time must take the gauge of the public opinion. And if they knew that the parties who were chiefly interested were satisfied to rest under the burden, it was no part of their duty to take up the question as a Government, and so damage the position of the party to which they belonged. That was the real question. Neither of the two great political parties had yet ventured to touch this question in the House; and until they did, one or the other of them, venture to touch it, you might depend upon it no great effective measures would ever be undertaken by any Government. But he believed that public opinion would go on and press them on. He would instance the case of an association which had been established in London, with the present Lord Mayor, Mr. Besley, at the head of it, for the readjustment of the poor-rate question, and for a national Poor-rate. So strongly did he feel with reference to the movement in London, that he had written to Mr. Besley to tell him he should be very glad to become a member of that association for the whole being cast upon a Common Fund—a national rate for England and Wales. For it was utterly impossible to regulate the operation of a tax levied on personal property for small areas, such as a union; and you could only properly apportion it for England and Wales.

Colonel NAPIER knew that great fault had been found of late years with regard to the economical management of the finances of this county by the magistrates. He believed they should on some future occasion have other people besides the magistrates to assist in the management of the finances of this county: he for one should certainly not be opposed to it.

Mr. RICHMOND did not enter fully into Mr. Andrews' views, and he did not hear all he said, because he thought the best way to discountenance anything of that kind was to go away and leave the room, which he did; but he heard enough to show him that all that gentleman's conclusions were not correct. He believed the inhabitants of Somerset were fully satisfied with the decisions of the magistrates, and he believed it was consistent for them to be satisfied so long as they had no reason to grumble.

Mr. E. H. CLERK (late President of the Society): He hoped those gentlemen whom he had the pleasure of meeting in this room believed that if he thought any movement was likely to be a great benefit to the agricultural interest, he should be the first to give it a hearty support. But he was not so certain that if this plan of Mr. Genge Andrews', of rating all property both real and personal—which he quite agreed with him was only just and fair—he was not at all convinced that if they were carried out, the agricultural interest would get any very great

benefit. He was one of those who believed that in the present time they were more likely to suffer than to derive benefit; and though he felt that personal property should pay to the support of the poor, he was not certain that if it were rated the agricultural interest would get the benefit. Mr. Genge Andrews had stated that no Government—Whig, Radical, or Tory—had ventured to move in this matter. He (the hon. magistrate) thought they had very good reason for it. It was a very easy thing to talk, but it was very difficult to carry out. Well, and when they came to look at this—and he had looked at it, and the more he looked at it the less he saw his way out of it—they would find the difficulties increase the more they went into detail. It was perfectly true that personal property ought to contribute; for it got more benefit in many instances than real property. But let them take one instance. Let them suppose that a gentleman living in that town had £10,000 a-year in property in London. How would they rate that property, in this union or in London? [Several Voices: "By a national rate."] Very well, just so; he would come to that. They said, "Oh! they would have a national rate." A national rate! They were to pay out of the Consolidated Fund, they meant? Very well, who was to have the management of that fund? They said, local bodies. He said, it would never work; they would never get anyone to put it in the hands of local boards. He thought there were a very large number of classes at present massed together under the poor-rate which might come on the Consolidated Fund with advantage; but that was a very different thing from taking the relief of the poor and putting that on the Consolidated Fund. The militia and the police, he thought, they might put on the Consolidated Fund—those were not poor-rate, they were county-rate. But what did they amount to in the end? Why a mere nothing—when it came to be looked into and examined, it was a mere nothing, a very small point indeed. However, this was not the place to discuss the question, and he had merely endeavoured to show them that there were two sides to it. The only reason that he had for not taking up the question was that he did not see his way out of it.

Major PAGET, M.P., said: Often at these meetings they had had the opportunity of getting the advice of several of the leading cheese dealers of the neighbourhood; and it struck him the ones they rather harped upon was this—that the American cheese was gradually creeping up and improving in description, that it was going to ruin their very heart, and that there was but one safeguard for them to take to ensure themselves against such hurtful opposition, and that was the introduction here of the American system of cheese-making. Now it so happened that in London last year a friend of his in the House of Commons, one of the Derbyshire members, was talking to him (Major Paget) about this American system, and told him that he had just started it in Derbyshire. He let him into a great many details, and as he saw that he (the Major) was greatly interested in the subject, he invited him down to his place in Derbyshire to see it. He took the opportunity; and for fear that an unpractical man would not take in the whole of the working, he also availed himself of the invitation to take down with him one of the principal cheese-makers in Somerset—a man whom they would all say knew his work thoroughly—Mr. John Hoddinott. Well, they went down there, and they inspected the whole of the system of cheese-making, and he thought Mr. Hoddinott would be inclined to tell them the same as he now said—we had something to learn from them. As to the practical results, they all knew that the proof of the pudding was in the eating, and they had had the opportunity of eating some of the cheese. He told his Derbyshire friends that there would be an agricultural meeting in his neighbourhood in the course of the autumn "Send me one of your best cheeses, and I will take it down to the Society, and they shall examine and taste it. I will send you up one of our best cheeses; and then we shall each know what the other is about." Now from all he had heard of the observations of those around him, and from the little opportunities he had had of receiving the opinions of those who were thoroughly able to give a good opinion on the subject, he might say that the cheese they had to-night was what they would all agree was good cheese—rich cheese—well-made cheese—but it seemed to him not so good as Somerset cheese. However, he would say that having an opportunity of seeing the cheese factory, he determined that he would see

it thoroughly. He went in the morning, soon after the milk was brought in, and he stayed there four hours, and saw the whole thing from beginning to end. There were one or two things which, perhaps, it would be no harm to them to be aware of. One thing, no doubt, was, that by getting the amount of produce of a great many dairies brought to one spot by an organized system, they made up cheese for less than they could before. They had the milk of 340 cows sent in from a number of farms, the most distant of which was, perhaps three or four miles away. The staff required to make all that milk up into cheese was one head-man, two able-bodied men, and two boys; five persons altogether. There was no doubt a saving on that. If we could be absolutely certain that we should be in no danger of injuring the high description of our cheese by doing that it might be a good system to adopt here; but we were not so certain. He was not going to advocate at once the introduction of the system. They saw that it had produced a cheese, which he was told was as good as the best cheese which was made before in Derbyshire; but it only showed him, what he was convinced of before—that that was a long way short of the best cheese that was made in Somerset. The American superintendent of the cheese factory stated that the milk of the cows was rendered irregular in quality by their being kept in a small field until the grass was eaten close, and then changed into plentiful grass; instead of their being kept on a large and even pasture. He heard that the best quality of the cheese made in America remained in that country. One of the farmer's wives in Derbyshire expressed herself delighted with the new system, under which she received 6½d. a gallon for the milk, and got rid of all the trouble. He hoped they would give him credit for his investigations. He had no fear whatever for the Somerset dairies; but having heard a great deal of this American system, and as it had been introduced into Derbyshire, he was anxious to see it for himself, and, what was more, he was anxious to give them an opportunity of seeing for themselves what it could produce. They had had a little too much of local taxation. Mr. Andrews and he had often discussed those matters, and he was quite ready to go with Mr. Andrews to the full extent of admitting that there was a great grievance in the present inequality of taxation. He thought they should recognise it, and that it should be brought home plainly to everybody, and that it should form a ground of agitation. They wouldn't get anything by sitting still. They must be ready to agitate, and ready to insist on the fact that that grievance existed. That grievance for a long while was denied; it was denied out of the House of Commons, it was denied in it. But they were changing their tone without, and the tone within was changing at least as rapidly, and he could say that a great step had been taken in the fact that this inequality of taxation was being recognised. It formed the subject of a committee last year, although that committee only touched on a very small end of the question. It would assuredly form the subject of a committee this next session, and he did hope that they might look for a successful termination to it. But they should not have it unless they were all as fully convinced as those upon whom the burden bore the hardest that they had got a grievance.

Mr. S. WHATLEY congratulated the farmers present on the fact that they did not live under landlords who, if they saw them making ten tons of cheese extra, would immediately raise their rents.

Colonel NAPIER liked to see his tenants put as much money in their pockets as they could, being sure they would improve his land in proportion.

Mr. WHATLEY would ask Major Paget if he would do such a thing, namely, raise the rent as described?

Major PAGET: I am astonished, Mr. Whatley, that you should ask me such a question.

SUFFOLK.

At the Stowmarket Farmers' Club, Col. PARKER, M.P., said: Many questions, though ably discussed during the late session, had by reason of the mass of business, been put off to a future time. He was aware that amongst those so postponed were several questions very interesting to the constituency he had the honour to represent. He might enumerate the Poor Law Rating, Financial Boards, and the Game Law question, which he saw, by proceedings that took place in that very

town, was made the subject of a discussion which would very materially assist those who would eventually have to give an opinion upon that important question, and this was the best assistance that a constituency could render to its representatives.

Lord AUGUSTUS HERVEY, M.P., said: With reference to the Education Bill, that was a measure the working of which they would have to see in the future, but he was persuaded that in its direct and indirect effects it would be greatly for the advantage of the community.

Colonel F. M. WILSON, said: There were two questions immediately interesting on the present occasion—the first of which was the contagious diseases among animals, and the second the education questions. Cattle diseases were more immediately interesting at this time, because they knew, as a fact, that the cattle plague had been imported into France, following the steps of the victorious Prussian armies for a very considerable distance, and it had also appeared in Saxony and Dresden. They hoped that these cattle would all be eaten up before they arrived in England, but they knew how fearful a calamity the cattle plague was, and it was a matter of great moment to them that their shores should be, as far as possible, guarded from it. The Privy Council, however, seemed to be doing their duty, having adopted a new and stringent order with reference to the matter; and while so far as this country was concerned he believed there was no cattle plague within it, with regard to other diseases it might be interesting to them to know how they stood; and he had, therefore, obtained a return from the Clerk of the Peace on the subject with reference to pleuro-pneumonia. From the 23rd of July to the present time, there had been only five cases in the county of Suffolk, viz., one in the Stowmarket district, one at Laxfield, one at Bury, one at Snape, and one at Fressingfield. With regard to foot-and-mouth disease, he was sorry to say that they had had a great deal more of that, during the same period, there having been in all 29 cases. The greater part of them came from the Blything Union, four from Beccles, six from Hartismere, three from Ipswich, two from Lackford, one from Clare, and three from Lewestoft. In his neighbourhood they had been particularly free up to the last week, but unfortunately there had been a great outbreak in the parish of Troston, on the farm of a gentleman who had just taken to farming very considerably. They were probably aware of the course taken by the Privy Council and by the authorities of the country with reference to this disease. Last year, they would remember the Privy Council issued an order directing that this disease should be placed in the same category as cattle plague and the more serious diseases, and the cases should be inspected and reported on by a veterinary surgeon every week. They carried out the instructions of the Government, but at the same time memorialised them to the effect that they were putting the county to a great and needless expense, because a veterinary surgeon could not be expected to inspect a case without being paid for it. No notice was taken of the memorial beyond the usual acknowledgment, and when they found that nothing could be got out of the Government they took the matter into their own hands, and decided that the veterinary surgeons should not be inspectors with regard to the foot-and-mouth disease, but that the police should report upon it. This had been the rule since that time last year, and it was the rule now. It was working very satisfactorily, the expenditure being very much reduced, and the business being carried on better than before. But in this matter they might do a very great deal themselves. They might have police and inspectors, but if any individual who saw a gross case of an animal being driven along the thoroughfare would only bring it forward they might save themselves to a great extent. With regard to the Education Act, it was a very long one, and he was not going through all its provisions, but he agreed with Lord Augustus Hervey that it would be a beneficial measure, and at all events it was a better one than he expected to get. At the same time a great deal of power was left in the hands of the Council, and of course they would act as through Government Inspectors. Now he knew by experience what they were. He had not a word to say against them, but if a man was sent down with authority to inspect he was like other men—he had a hobby, and he rode it to death. He thought it was right that every parish should provide school accommodation, and he hoped and believed it would be provided without having recourse to the rates. They did not want to throw

any more burdens upon them, and if they had to go to the rates they must have undenominational teaching.

WORCESTERSHIRE.

At the Severn Valley Farmers' Club, Mr. WOODWARD said he was sorry he could not in reference to the lauded interests of the neighbourhood congratulate them upon the successful result of their labours during the past two years. They had lost their hay crop—he should rather say they never had one—this year. The swede turnips had suffered to a very large extent, and their common turnips were a total failure. For want of the necessary moisture he feared the corn crops were not at all satisfactory in this neighbourhood, although in some parts of England they were reported as being very good. It was generally believed that the wheat crops in the Eastern Counties, more particularly in the fens of Lincolnshire, in Suffolk, in Cambridgeshire, and in other large corn-producing counties, had been very good indeed. He knew of cases where as much as eight quarters to the acre had been produced in several of those counties, and they would hardly credit him when he referred to this neighbourhood and said he did not think the average was twenty-four or twenty-four and three-quarter bushels per acre. In addition to this, they had to bear with the low prices consequent upon excessive foreign importation. While he believed twenty bushels per acre had been a common crop in the Midlands, he was quite sure the price obtained from the consumers was not only unremunerative, but attended with great loss to the grower. At the meeting of the club at Alveley last year, he took the opportunity of recommending that more attention be paid to the cultivation of barley. He was desirous now of reiterating the opinion he then gave, that too little attention was paid to the selection of seed for barley and to its cultivation in general. They had at the present moment a good demand for barley at high prices, 40s. per quarter, while they had to submit to 44s. for very fine wheat produced in the present season. As much wheat was imported as they could possibly consume, and they should not, as they had done, make the cultivation of wheat a leading feature in the neighbourhood. He believed they could not produce wheat crops at 44s. per quarter: they lost by it; but they could grow, he was persuaded, barley at 36s. and 40s. per quarter with a profit. It was a mistake to suppose that, because they had stiff land in this locality, good samples of barley could not be produced. Good seed and early sowing were necessary.

DEVONSHIRE.

At Newton, Canon GIRDLESTONE said there were a great many questions connected with agriculture in which they could not but feel the deepest possible interest, and hope, for the good and welfare of the people, that they might be speedily and wisely decided. Take, for instance, such questions as the alteration of the law of entail, security to the tenants for that which they put in their land, the question of game, and then of county expenditure; and no one could but be struck with the extraordinary fact that the expenditure made for the good of all classes should be almost entirely borne by one class. Take the general incidence of local taxation, and they could not but be struck with the great anomaly that, while one class of property was wholly exempt, another class had to bear the whole burden by itself. Now, these were questions in which the clergy were all deeply interested, as well as the agriculturists; and he heartily hoped that before long these questions would be wisely, properly, and amicably settled, to the satisfaction of all parties. On all these questions there was, no doubt, a widespread difference of opinion. When he looked at their prize-list and saw the various objects for which prizes were offered, he could not but think that they were doing a work which very greatly conduced to the welfare of the age and of the three twists of the agricultural cord. He could not on an occasion like this travel over the whole of the programme; but he would direct their attention to one item—a prize for the labourer with good testimonials who had brought up the largest family without parochial relief, and whose youngest child was not less than seven years of age. He did not particularly see why they should give particular encouragement to the growth of large families among the agricultural labourers. His experience was that these little olive-branches were likely to crop up quite as often as they were expected, perhaps oftener than

they were wanted. But in giving the prize they had acknowledged two very important principles, in both of which he fully concurred. One was that there was no quality in the agricultural labourer which they should more encourage than self-reliance and independence; the other was that at the root of that striking absence of the spirit of self-reliance was the present administration of the Poor-law. They had admitted these two facts. They could not shut their eyes to this, that if there was one thing that more than another conduced to the misery among the labourers of this country it was this thorough want of self-reliance. As a general rule they never looked to any future at all except the Poor-law. There was no forethought or preparation among them for old age, and he believed this would be the conclusion come to by nearly all those in the country who were experienced in the matter. Now the Poor-law was never intended to bring about this state of things, but simply to supersede the operation of those religious houses which were closed at the time of the Reformation; the use of these houses were to help the poor and friendless—not the profligate and abandoned—who not from any fault of their own had been reduced to a state requiring aid. In Scotland the Poor-law had not been in operation more than 25 years, yet even the Scotch were beginning to feel that its introduction—according to the testimony of Dr. Chalmers—was the means of sapping the feeling of self-reliance and independence of their labourers. The chairman of the Edinburgh Board of Guardians had also borne testimony to its degenerating influence. These opinions led him to believe that the Poor-law there was leading to the same misery and increase of pauperism as in England. He believed the people of Scotland were looking forward to soon abolishing the Poor-law so far as out-door relief was concerned. Now in England to abolish the Poor Law at once would be a social revolution. But if they could not abolish it they should endeavour to improve its administration, and he believed that there was nothing which could be done that would tend so much to the advantage to all the twists of the agricultural cord—landowner, occupier, and labourer—as a more careful and judicious administration of the relief of the poor. Some people said that it would be cruel to refuse relief except in sickness, but so far from its being a cruel thing he thought they could confer no boon so great on the agricultural labourer as to encourage and stimulate him to more self-reliance and independence. In proportion as the labourer was advanced, improved, and educated, in that same proportion would the whole agricultural interest be improved and benefited likewise. He was well aware that he was speaking in a union where perhaps the Poor Law was better administered than in any other union in the county. By the kindness and hospitality of some of the Newton guardians he was privileged to sit the whole morning in the board room and listen to the manner in which they conducted the business of relief and watch the care with which they entered into every case, and he was not surprised to find, on referring to the statistics of the Poor Law Board, issued a few months ago, that in the administration of relief to the poor this union stood, if not first, at least second in the whole county.

Mr. H. CARTWRIGHT thought the magistrates deserved all the honour they received, inasmuch as they were constantly employed in the public service without fee or reward, and as a body they strived faithfully and impartially to do their duty. It had been stated that it would be desirable to have paid magistrates. For himself he quite concurred in the desirability of this as far as large towns were concerned, but he protested against a paid magistracy for rural populations inasmuch as the present county magistrates were generally the friends and advisers of all who chose to come to them; their work was not simply sitting on the Bench and administering the law; but a stipendiary magistrate would give them the bare dry law and nothing else. One of the most desirable as well as influential and powerful bodies of men in this country was the county magistracy. They must remember, too, that it was most desirable to the ratepayers that the present system should be maintained, because if they had paid magistrates then there would be an increase of these burdens which at present existed.

Earl DEVON said the legislation of the last thirty or forty years had tended towards the bringing of different classes into more harmonious co-operation, and he rejoiced to know that in the main the intention of the Legislature in that respect had been cordially welcomed by the various classes of the com-

munity, and carried into practical and successful results. First, they had the Poor-law, which brought the occupying farmer and the landowner into harmonious working; then they had the highway boards established, and now they had the law on Education, to which he was glad to bear his testimony, believing it would be fraught with benefit to the community at large if carried out in the spirit in which it was introduced. Then in the next session the benefits of this class co-operation would be further secured by the adoption of the County Financial Boards.

Mr. SOWTEN (Ipplepen) said all knew that in this country a tenant was subject to a six months' notice to quit, and this he thought was a shame; and there was no doubt much truth in the saying that such a power being in existence did not encourage a yearly tenant farmer to lay out much money in his land, because, after he had invested it he could not tell for certain that he would get anything out of it. There were, no doubt, some good landlords; but land might change owners, and a dispute might arise, because, perhaps, a tenant laid violent hands on those peculiar animals called rabbits. And if landlords and tenants could not agree, then they should part; but if a tenant had six months' notice, he went out without any real claim for the property he had in the estate. Now that was not the sort of thing that ought to exist in this country. They all had the welfare of this country at heart, and they ought to strive to make the land produce all they could, and know that if they had to leave a farm they would have justice done to them and receive their right. Looking at the other side of the question, a man now, if he felt he was not treated well and made up his mind to leave the farm, might do the greatest possible injury to it. He could take everything out of the ground, sell anything off the farm, and leave it in such a state that the succeeding tenant would not for years be able to make it produce that which he had a reasonable right to expect. He did not care about Tenant Right, but what he wanted was justice between landlord and tenant. If there was a law passed securing fair dealings between landlord and tenant, both on entering and leaving an estate, it would not be only to the advantage of the parties immediately concerned, but it would also be better for the whole community at large. It would be for the benefit of all classes if a bill was passed in the House of Parliament for "justice between landlord and tenant."

At Halberton, Colonel ACLAND, M.P., would not speak to them to-night on leases and Tenant-Right, because he believed most of them knew what he thought on one of those subjects, and what was going on lately under an Act of Parliament in another country had set a good many men thinking on the position of tenant-farmers in England. Indications were cropping up that some men who were not in a very comfortable position did not sit quietly under it, and that they didn't intend to. He was not going to flatter them, and he was not quite sure that they would be pleased with what he would say. He was sure that most of them who knew anything about him knew that it had been an old story with him for more than a quarter of a century that there should be security of capital to the farmer. It was a very difficult question, and he would tell them that the first condition of a satisfactory settlement depended on the public opinion of the farmers themselves at the markets and at their tables. He would tell them why he said that. He was an Ecclesiastical Commissioner—and he wished it to be distinctly understood that there was no fee or emolument attached to that office—and he had occasion last year to travel overland on the north coast of England, going over farms from fifty to two thousand acres. He saw a good many farmers in Lincolnshire, and he asked them how they carried on with such wonderful success their system of going in and out of farms when there was such difficulty in the matter in other parts of England? The answer was that they had had their plan in operation a good many years, and they got good farmers by a system of honest valuation. So vital to them was it, they said, that if they found any man acting any other than straightforward in the matter either against the farmer or landlord, his character would be blasted through all the county, and he never would be employed again.

DORSETSHIRE.

At Wareham, Mr. JOHN FLOYER, M.P., said: With regard to this new Education Bill, I trust you will agree with

me in endeavouring to carry it out, and to promote its being carried out upon the old lines. Dorsetshire, happily, holds a place inferior to hardly any county of England in the education it has already provided for its poor people, and I should be sorry indeed to see that education seriously interfered with. I have no love, no taste, for undue interference by the Government. I believe we know pretty well our own business, or we ought to do so. That our present system of education might be improved and extended there is no doubt, but I believe we should do very wrong if we largely departed from the system which has been hitherto pursued. I believe that the old education, the old teaching, which led us to know our duty to God and our duty to our neighbour is a part, and a most important part, of the education for the poor man, and I will say for the rich man also. I would therefore hope that in this county we shall exert ourselves, as my good friend on my left has said, to improve our existing schools and to carry them on efficiently, so that we may have as little interference as possible from the Government and the authorities connected with the central power. There is one other matter, and only one, upon which I will speak with regard to education. My friend Mr. Bond has alluded to the age at which it is intended in some parts that children shall be obliged to go to school. District boards are armed with what are called "compulsory powers." Now I am no lover of compulsion, I like the freedom which an Englishman always regards as his best birthright; and, if I like it for myself, I certainly would not desire to take it away from others. It may be, and it is, most important that all children up to a certain time in their lives shall receive such instruction as can be provided for them. But I would rather this were done by the good influence of those to whom the parents look up for guidance and direction. I would rather this were done by the influence brought to bear upon them by those amongst whom they live—the employers of labour, the landowners, the clergymen, tradesmen, and gentlemen living in the towns and in the country. I would rather that it should be done by their influence than by any legislative provisions, for I think it would be a most painful thing to a magistrate or anyone who has the duty of putting the laws in force to do so against a poor man, and to put a penalty upon him—to rob him, as it were, of some portion of his hard-earned income, or to commit him to prison, for not sending his children to school. I consider this would be a most painful thing to any magistrate, and I hope it will never become our duty to put such laws in force. But the only way in which we can be saved from such a duty will be by the influence exercised by you, the employers of labour, by ourselves, the owners of property, and by the clergy and others amongst whom the lot of the poor is cast, and to whom they look for counsel and direction in this matter. It can only be done by inducing parents to send their children to school till they are ten years of age, which is agreed upon as a very reasonable time up to which they may be sent to school, and by exercising that influence by making them take a part in and derive the consequent benefit from this great measure of Government education. I think politics may be discussed at meetings of this kind, in such a way as to give offence to no man. Politics are the business of county members, and politics are also the life and spirit of all English society. It will be a wretched day for this country when men cease to take an interest in politics.

At Melplash, the Hon. W. H. B. PORTMAN, M.P., said: With regard to the Education Act, he had supported the principle throughout that religious teaching was not to be kept out of our schools, but he had heard since that many opponents of the Bill considered it to be a much better measure than they expected it to be. There was one clause in the Bill which he considered was of very great importance, as well as highly desirable. It provided that in the future no children should be to put work in the fields before the age of ten. It was a very satisfactory arrangement; it was one which he always upheld; and had publicly advocated its adoption. There could be no doubt that the son of a labourer might get a sufficient amount of education before he was ten years of age, which would serve as the foundation of better things in after life, as he had the opportunity of improving himself at night-schools, and making himself more intelligent. But there was so much difference of opinion as to the age at which boys should go to work, that it was really very difficult to settle the point. He happened to mention to a friend of his, who was

one of the members of the East Riding of Yorkshire, that ten should be the minimum age. But that gentleman seemed surprised, and said, "In the East Riding no boy ever goes before thirteen, and generally not before fourteen." In legislating upon the matter, therefore, there had been a good deal of difficulty; it was necessary to consider the habits of the people in different districts. There were one or two other questions upon which he desired to say a few words, for, on occasions like that the members must be excused for talking a little "shop." First there was the gun tax. He did not know whether they really understood it. At this end of the county it was not perfectly understood, and he had had the pleasure of explaining it to several persons. It was supposed that if any one took out a licence for his man, and they quarrelled, a new licence would be required for the new servant. Thus two or three licences would be obtained within the year if a suitable servant was not secured. But this was not the case. The licence served for the year, and they might change their man every month if he did not suit.

GLOUCESTERSHIRE.

At Highnam, Sir MICHAEL BEACH, M.P., said: The agricultural interest has in this country to contend against many difficulties: not the least of these is the difference in weather and climate between this and other more favoured countries of the world. I have travelled lately a good deal, and I have seen in Spain, for instance, large tracts of land whereon with the merest scratching of the soil splendid crops of wheat can be produced year after year almost indefinitely, and this simply because the heat of the sun and the climate generally are so much more genial than in England that the place may properly be called a wheat-producing country. Then, again, not long ago I visited a still larger wheat-producing country—those enormous plains and prairies of America which enable the inhabitants there to compete on such unequal terms with us in England. Their soil is inexhaustible because the extent of it is inexhaustible. When the farmer has used up one piece of land, all he has to do is to change his location and go to another: he has no trouble about manure, and need go to very little expense. Then, again, in California, I saw enormous tracts producing perhaps the finest crops of wheat in the world; and the farmers there had the extra advantage that they had an ample length of fine weather, and no rain at the time of harvest, so that they were put to no expense either in gathering in crops or in providing halls or granaries wherein to store them: they simply thrashed out the corn upon the ground and exported it at once. I mention these matters to show that we in England have rather a hard battle to fight against other countries in producing grain, though, fortunately, there are a pluck and an energy in Englishmen—and nowhere more manifest than among our English farmers—which go far to conquer these obstacles of climate, and somehow or other enable us, by the application of skill and capital to the task, to obtain nearly all that it is possible to produce. That is one of the advantages connected with these societies in encouraging the best manner of cultivating soil as regards ploughing. But there is another and not a less important advantage, and that is the way in which they bring us together for pleasant social meetings. I am sure, from what we have to read every day as to the horrors and miseries of the present war, I do not want to say anything more than I can help about what is passing on the Continent at present. But just for a moment look at the effect in France of the connection between the agricultural interest and the State. If you had in France such a gathering as this, you would probably have found it under the direct patronage of Government, presided over probably by a Government prefect. If there had been present an independent Liberal member, such as my friend Mr. Price, he would have been subject to very grave suspicion on the part of the Government official, and would probably have had every word he uttered taken down, not by the reporters of the country papers, but by the police. The whole system, indeed, is thoroughly and entirely under a paternal Government. Well, now, we in England manage these things in a better fashion, and have done so for many years. We gather together on these occasions; we meet probably under a local landowner, who is a man—I don't refer to present company in particular—of considerable experience and ability in some point or other; we meet the principal farmers holding varying extents of land; and, in fact, such a gathering everywhere embraces

different classes collected together for the expression and continuance of friendship and kindness. Now, to my mind, this is no unimportant matter in what I hope will long continue a distinguishing principle in our English system: I mean the principle of local self-government. You see what has happened in France. Everything there was dependent upon a central Government. That has all fallen through in a moment, and you have nothing left. There doesn't seem to be any single set of persons in the different districts of France who are recognised as the natural leaders of the people, to whom everybody looks up, and in whose hands in such a fearful crisis as this they are ready to place themselves. I don't think that under any circumstances such a state of things could possibly happen in England. Owing to our principle of local self-government we are used to act together in concert. People in that way learn independent thought and action among themselves; they learn also to whom they can safely trust for guidance and control in times of difficulty and danger; and if sometimes those questions occur which introduce a little dispute and unfortunate feeling among men who meet at the Board of Guardians or elsewhere, yet in gatherings like the present we meet together as friends, hear what one another has to say, see one another in our best and kindest moments—and I am quite sure that the intercourse gives an element of friendship to our connection in society generally, and is of very great importance in the social economy of the country.

Mr. W. P. PRICE, M.P., said: I have just returned from a trip of the same character through the fertile plains of the Danubian Principalities and elsewhere, in districts which, I should imagine, might produce corn enough for all the world; but anything more barbarous than their system of cultivation I cannot conceive. The great undulating plains are covered with wheat and grain and crops of different kinds. The Tartar natives once a year plough up the land with five pairs of oxen drawing a little wooden plough, exactly the same as that used in the Roman Republic, two thousand years ago; upon that, in the spring-time, they sow broadcast the wheat or maize or other grain. When harvest comes they cut wheat and flith together. As soon as it is cut it is thrown into heaps, as we put hay together, and made into ricks at once. When they come to thrash it, it is thrown upon earthen floors and simply trodden into chaff by pairs of oxen driven over it, and then it is exposed to the wind, so that the lighter particles may pass away whilst the heavier remain behind. What the produce of these countries might be if only they had a different system of cultivation it is impossible to say, but I can't help supposing that it might be at the least four or five times what it is. In some parts of the country the natives are no doubt alive to the evil of this condition of things. I saw on the banks of the Danube in many places steam-thrashing machines bearing, I think, the names of Clayton and Shuttleworth, and in some places I saw ploughs which had evidently been imported. But on the Turkish side of the river that condition of things does not at all prevail. There they seem to set their faces altogether against any possible kind of improvement, and they seem also more barbarous in their method of cultivation; for when the corn is cut the farmer can't carry it away until the Government has taken its tithe of it. He has to wait until the Turkish functionary can come at his leisure and take out every tenth stock to add to the Government revenue. The consequence of this state of matters is that I have passed by miles of maize and barley and wheat which have been reduced to an absolutely worthless condition by the bad weather to which it has been exposed while waiting for this process of tithing. I have no doubt that our own methods of cultivation were originally as barbarous as theirs. We have been rescued from that condition of matters partly by the instinctive enterprise of the country, partly by good laws, and partly by our security of property. But it cannot be doubted that within the last twenty years our agricultural progress has been stimulated very much by the action of such societies as these.

Mr. HALLEWELL: There is a question which I think may occur, and which I once alluded to here. The question remains now with a small party, but I believe will increase in importance—I mean the question of the compulsory division of land. There are persons endeavouring to carry a measure of that description at some time or other; but they never will, for we must all be satisfied that a measure of that description would destroy the prosperity of British agriculture. I think

that the tenant-farmers of Great Britain as a class of men are the first in the world in agricultural pursuits. When we look at their capital—in the aggregate amount not much less than a thousand millions of money, of which some individuals possess as much as £20,000 or £30,000—and when we see what has been accomplished by the tenant-farmers in this country, they certainly do prove themselves to be a class of men which no other country can produce. I allude to this matter because in the country in which war is now proceeding that system of compulsory division has prevailed for two or three generations, and I believe that its present prostrate condition is due to that fact. If they had had in France such a class of men as our tenant-farmers it would have been impossible to have seen such a collapse of power and energy and means of self-defence as we have witnessed there. A measure passed during the last session with an object very much connected with the interests of the labourer employed by the farmer was the bill for the reform of the beershops. I don't think any Act ever passed by our Legislature has done so much mischief to the community as the old beer-law. That law has now been reformed. The matter has been put into the hands of the magistrates, and they are responsible for the beneficial exercise of their power; and I think you will agree with me that if they do not do their duty by abating the present nuisance they will no longer hold that confidence of the country which they have hitherto had.

KENT.

At Sevenoaks, Mr. H. B. MILDMAY, the Chairman, feared that the period since they last met together had been one of great disappointment to the farmers, for during the year, or rather the larger portion of it, the value of corn (wheat especially) had been most materially lessened by the large imports placed in the market for sale. They all knew the necessity to this land of the cereals they derived from foreign countries, but unfortunately at times the supply was out of proportion to the current demand, and the wants of the country, and those periods and the influence caused by the importations were not such as to strengthen their hands. The summer, with its long-continued drought, made a sensible improvement, and the outbreak of the war gave a further impetus to an upward tendency in prices, but such large purchases were made from the continent that prices were again checked, and when the supplies from France, Germany, and the Black Sea were considered, it was almost impossible to say what the future prospects would be, but when other crops had been the source of so much depression he was happy to think that hops formed some exception. They had had an abundant yield, and quite time too, he thought; for one or two years following they had been rather deficient in this respect. He hoped that when these great sellers who had placed their parcels in the market had cleared off they would see a return to satisfactory rates. During the past winter a large number of labourers had been out of employ, and he had witnessed with much interest the great efforts made to supply them with work. Even from the commencement of the harvest he was afraid many of them were in want of work, owing to the completion of the two railways passing through the district, and the buildings consequent thereon, which had afforded a great deal of employment, but these constructions having been finished, the agricultural requirements did not call for an increase of labour, which, by the way, was rather economised than otherwise by the use of steam machinery. Some felt and expressed a desire to emigrate, and in many of these cases it might seem best to render assistance, but unfortunately it was the most industrious, and generally those from whom they were the least willing to part, who desired to seek their fortunes across the water; and he could not but regret that when they were willing and able to earn their own livelihood, they could not find the means to do it, but had to go to another land. The time was fast approaching when the new Education Bill would come into operation. He was not aware how far its provisions would affect this part of the country, but he presumed that as far as the numbers of schools were concerned, it was very well supplied, although in some respects the building might not have accommodation sufficient, according to the number of the population. Therefore, he hoped that in this diocese alterations and additions would be effected where necessary, and that they would continue under the old auspices. Of course those who resided in the more outlying parishes would take steps to ensure sound and efficient management where a School Bill was found to be requisite, and see that the children in their employ were re-

ceiving the blessings of instruction, thereby obtaining a more intelligent class of men, not only for themselves, but for those who should come after them.

Lord MAISON could not understand why there should be such a deep-rooted prejudice in favour of the old Kent turnrise plough, for he must confess that to his mind the iron ploughs were not only equally good, but an iron plough drawn by two horses did twice as much work as a wooden one drawn by four horses, and he therefore could not understand why this should continue to be the case. They considered now that everything in the shape of time was money, and he could not quite understand how to account for the fact he had stated.

At Stonehill, Mr. J. ALLEN said the question of local taxation was at the present moment occupying the attention of the Government, and giving them a good deal of trouble and anxiety. The committee upon the subject had just issued their report, and he must say it was the most ridiculous report ever issued. It was putting money into one pocket and taking it out of the other. They suggested that the landlords should pay part and the tenant part, but by that arrangement no relief would be given, for they knew the Small Tenement Act provided that the landlord should pay the rates, but they all came out of the tenant's pocket.

NOTTINGHAMSHIRE.

At Calverton, Mr. NIXON, the Chairman, said: There appeared very little for farmers to congratulate themselves upon for the past year, or perhaps for the last three years. It might be said that in 1868 and 1870 they had some good wheat crops; but, taking the produce of the farm on an average, he thought he had been a very fortunate man who had held his own.

CARMARTHENSHIRE.

At Llandoverly, Captain LLOYD, the vice-president, said he had been many years in the country and paid much attention to the farming around him; and he should like to say a word on the question of turnips *versus* wheat. Every tenant, however small his farm might be, liked to cultivate a crop of wheat; but the vital question was this, which would be the most profitable to the tenant-farmer the growth of turnips or the growth of wheat? He would venture to reply in favour of turnips, and in order to give practical effect to his views he would give next year a prize of £5 for the best four acres of turnips. They all knew that at spring fairs higher prices could be got for cattle than at the late fairs. Why should this be the case? Why should not every animal get his belly full through the whole of the winter? The fact was that cattle now lost flesh in the winter from want of proper sustenance, and it was in the summer that they were turned out to get fat. Of course if they wished to keep the cattle in condition or even get them into good condition it must cost something. Take a number of young cattle into a fair in winter; they have perhaps been fed on turnips and straw. They go into the fair in good condition, and the fact was that the drovers would not look at the others. If they brought a number of cattle into that same fair fed upon hay, the chances were they would be very thin and it would be impossible to get a good price for them. This humid climate was better suited for turnips than any other crop. In the adjoining county of Brecon the very excellent cattle and turnip crops constituted the very staple of agriculture in that county. No doubt there was a great disinclination to adopt such ideas because they were new; and as he had previously stated, every tenant-farmer liked to grow a wheat crop. Still a conviction of the advantage of adopting the ideas he had expressed would come by degrees. It was his firm belief that a good crop of turnips was the very foundation of farming.

SCOTLAND.

At Kilmarnock, Mr. HEWITT, of London, one of the judges, said he could speak of the cheese with very great satisfaction, as they were fit to compete with any cheese manufactured in the empire. The lots shown were in the best condition he had ever seen. The cheese had been well handled, well made, well manufactured, and the quality was as good, generally, as could be expected from such a season as last. The weather had been unfavourable for cheese-making, and had affected the flavour more or less, and also the colour. He saw less bad cheese this year than last, but there were not so many pure good coloured cheese this year. The colour of the cheese was not so clear as they could wish it to be. There was nothing

in the show, however, which should not give the Association encouragement. There was no doubt the exhibitors were capable of producing the best quality of cheese, fit to obtain the highest price in the market. He complimented the Scotch farmers on the state of the country of which he had obtained a glimpse from the train, and congratulated them on their beautiful pastures and full stackyards.

Mr. OSBORNE noticed the fact the makers from the South had carried off many of the best prizes. This should not be so, as Ayrshire was the nursery of cheese-making. The circumstance arose, he thought, from their not having in Ayrshire such good houses to ripen the cheese, and he believed landlords were somewhat to blame in the matter. The cheese were only half-made in the chesatts, and unless they were properly cared for in the houses they could never be shown as first-class cheese. Another thing he thought they ought to aim at was to make all their cheese more regular in shape and size. Every stranger must have been struck with the dissimilarity of the cheese: there were hardly two lots like each other: they had them of all shapes, sizes, and forms. Ayrshire farmers did not seem to understand how much it improved the cheese to have them as much as possible of one size. This had always been a fault here, which did not prevail in England or any other part he had been. They brought out their cheese elsewhere as uniform as the lots of butter. He recommended the Society to get the makers to make their cheese more of one shape.

Mr. LINDSAY said, 14 or 15 years ago, when he attended the first or second show of the Society, cheese, butter, and roots were exhibited in the hall where the company was met. They saw the size of the exhibition now; but the fact to which he wished to draw their attention was that in the small exhibition to which he had referred there were more bad lots of butter than at the present show. He did not say that the butter exhibited had all reached perfection; there certainly were some exceptional lots, but the proportion of objectionable butter was almost invisible. He attributed this fact to the fine season. There was evidence, notwithstanding, that the greatest possible improvement had been made. In curing butter, he advised dairymen to preserve as much of the original quality of the fresh butter as possible. They destroyed the original flavour of the butter by killing it with salt. It should also be clean and firm. A considerable portion of cured butter shown had been spoiled by over-working. These were points to which the attention of makers should be directed.

Mr. RAIRD, the chairman, said: The Ayrshire Agricultural Association had done a great deal of good to property in Ayrshire. It has no doubt enhanced the value of land. I believe, but for this and similar Societies improving the capabilities of the soil, improving the implements for its cultivation, for the manipulation of dairy produce, and improving the breed of cattle we would have been left in the state we were thirty years ago in these things, and rents would not have been raised a penny. I am surprised that all that has been done has been by the tenants, the proprietors doing comparatively nothing. I am surprised that this should be put in at the end of this toast now, because I do not think the proprietors could have failed to see the benefits that this and similar Societies confer upon them. They are now getting rents they never would have had but for this and other Societies. Standing here between the member for South Ayrshire and the Provost of Kilmarnock, I may be excused for expressing the Radical sentiment, that property has its duties as well as its privileges. This exhibition has shown that it requires all the ability of our Ayrshire farmers to keep pace with those around them. They never have been able to take the first prizes for cheese. They are excellent makers of cheese, and show first-rate produce; but the first prizes always go away to Galloway. I hope you will bestir yourselves, and that you will stir up your proprietors. One of the judges has remarked that you have not good houses. You must call upon proprietors to give you better houses. Don't let the judges say the cheese are only half made, or spoiled after they came out of the chesatts. If you have not houses then you have not a complete stabling, and are not fit to manufacture cheese. I have been rather severe on the proprietors, and tenants require a little admonition too. There are a great many of them I see go to the town on the market days weekly where they have no business. They get out their gig and horse, and go to the town, and stand in the

market, and spend money, and they have not a particle of business to do. Every week there they go to the market. Now, if they would stop at home and look after their work, and get things properly done there, they would be far better employed.

The Hon. Mr. VERNON, with all due deference to the chairman, thought the success of Galloway dairymen was not altogether due to the want of cheese houses, as he knew of many farms where there were excellent houses in Ayrshire. It was hardly possible that the landlords could do all that was expected of them, and farmers knew they had had harvests recently, and rents were not always forthcoming. Cheese-houses, besides, were very costly parts of farm buildings.

Provost GUTHRIE, Stranraer, referring to the challenge of £200 a-side for cheese, given by the Galloway makers to those of Cheshire, said the former wanted to bring their produce before the public. The Cheshire farmers, however, had everything to lose and nothing to gain, and they declined the challenge. One gentleman said £200 was too small a sum, and spoke of £1,000 as stake. He (Provost Guthrie) asked him if he was empowered to offer that, but he immediately backed out of the affair.

At Paisley, Mr. BRUCE, the Secretary of the Home Department, said he regarded an absolute abolition of the game-laws as simply impossible.

At Crieff, Mr. GRAHAM said: "To the enterprise of the tenant-farmers of Perthshire we owe, along with the other branches of industry of the county, the important fact, that the county of Perth is one of the most important in Scotland. Perthshire, as you all know, is eminently an agricultural and grazing district. We make no pretensions to the mineral wealth of the southern counties; indeed I do not know that any effort has been made to develop the mineral resources of the county, if it has any, with the exception of an attempt made by the late Marquis of Breadalbane to work a lead mine on his property at Ardeonaig, and an unsuccessful attempt, twenty-five years ago, to discover coal at Laigdoors, on the Perth estate. Our agricultural and our grazing resources are the true foundation of the wealth and greatness of the county, and as these are intrusted to the tenant-farmers, they are entitled to a just measure of praise for the position they have enabled us to take as a county. We are so much accustomed every day to see around us marked indications of high-class farming and of successful stock-breeding, that we are apt to take it for granted that matters were always in that position. But when you consider what the state of agriculture in this county was 150 years ago, you will at once see the enormous stride that has been made in the direction of improvement in that comparatively small space in a nation's history. At the time of the "'45," agriculture was at a discount in the county. A broadsword was a far more venerable object in the eyes of our ancestors than a ploughshare; indeed, every species of industry was considered by our Highland neighbours to be degrading. The law of the country at that time was a dead letter north of the Sma' Glen and Spittal of Glenshee. Our neighbouring clansmen had very loose notions of the rights of property, and it was not an uncommon thing for a farmer or stock-breeder to find his corn and cattle carried off in a night's time by people who certainly had not sowed the one or reared the other. In such an age the agricultural development of the country was out of the question, and history accordingly tells us that districts like Perthshire, lying in the mouth of the Highlands, were a comparative waste. Little more was then cultivated than what was necessary for the bare maintenance of the inhabitants. That, indeed, was the age of the straw brecham and the wooden plough. Fortunately, however, a better day was in store for Scotland. The extinction of the Rebellion, and the passing of the Heritable Jurisdiction Act, put an end to the petty sovereignty of clanship, and taught the people of this country to be amenable to law, and insured that the farmer might reap in safety what he had sowed. From that date onwards, the prosperity of this great county, in an agricultural point of view, has been continuous, and we now boast of having a larger number of cultivators of the soil, and a larger average under crop, than any county in Scotland except Aberdeenshire. All honour to the tenant-farmers of Perthshire, who have accomplished this fact. Formerly, as I have said, our agriculture was barely sufficient to supply the immediate wants of the inhabitants; now, we are able not only to serve that first law of nature, but to send supplies to the great centres of population of the country. You have, no doubt, all

heard the time-honoured remark, particularly prominent at agricultural meetings, that every man ought to be considered a benefactor to his country who has made two blades of grass grow where only one grew before. For the tenant-farmers of Perthshire I claim even a higher feat than that. They have made many blades of grass grow where no grass grew before. Vast tracts of country, which had been in the undivided possession of the whin and broom for centuries, are now smiling corn-fields, and the bog and morass are yielding luxuriant crops of turnips and potatoes. All honour to the men who have carried out such a work. The successful agriculturist is, in my opinion, entitled to a larger measure of praise than the conqueror of a province. The one is marching in the van of civilisation, the other in the retrograde movement toward barbarism.

IRELAND.

At Piltown, Lord BESSBOROUGH said: I think I ought to apologise to the cows, for having been so inhospitable in not receiving them inside the park-walls this year; but I thought it more proper not to do so, considering that early in the season I suffered somewhat severely from cattle distemper, and I therefore did not wish that the slightest risk should be run by admitting cattle to the park. Although, I am happy to say, that for the last five months my cattle have been perfectly free from disease; yet as there are rumours of cases in various parts of the district, I thought it much more prudent that cattle should not come within where disease had existed, and that for this year the show should be outside the park. While on the subject of distemper, let me express my great hope that all the farmers in this district will unite with the authorities in endeavouring to put a stop to distemper when it arises. Now, I know it is very much the habit of those who have a case of lung distemper to endeavour to conceal it; but nothing could be more prejudicial than this to themselves and to their neighbours; and further than that, what may not be generally known, the fact of concealment renders a person who has the disease among his stock liable to a severe penalty. I will, therefore, call on every farmer in the district, if any cattle are attacked, to at once give notice to the authorities, that at all events it may be known throughout the locality, that cattle coming from the place may be avoided, and that proper remedies may be applied. Now, speaking of remedies, it is impossible to say which is the most proper. It may, however, be interesting to farmers to know what has been the result of my experience. In the cases I have had of lung distemper, inoculation has been perfectly successful; but whether it would be well for farmers in general to adopt the same course, I really cannot say. This I do know, that the greatest amount of care and skill is required in the performance of the operation, and the greatest care should be given to the animal after it. In my case I had one hundred and forty animals inoculated by an experienced veterinary surgeon—Mr. Pallin of Kilkenny—and from that time to this I have had no case of pleuro-pneumonia. Now, in my case the operation, as I have said, was most successful; but, at the same time, I would advise farmers not at once to rush into thinking that inoculation will be successful; because, if it is not performed by the most skilful hand, the danger will be very great. I trust, however, that in this locality we may hear but little more of the disease, and that if unfortunately it does arise, every precaution will be taken to prevent its spread. Much as I regretted the losing of a large quantity of stock, to which I had paid great attention in the breeding, I was still more sorry that I was obliged this year to deprive my tenants of the advantages I heretofore was able to afford them of access to my sires; but I hope next year I will be able to do so. I think it would be impossible for us, agriculturists, to meet this year without an expression of thankfulness for the admirable harvest we have had. I really believe we may consider that Ireland has this year been the favoured country; and of all Ireland I know of no place more favoured than this peculiar district. Why, when I left England the pasture there was somewhat the colour of the streets of Piltown; but when I come over here, though we have been talking of the great drought, I find everything comparatively green. Now, this district I consider has been favoured in a special manner; because while in many places we hear the wheat-crop spoken of as a failure, in these parts it is good. Therefore, I think the agriculturists of this district may consider themselves highly favoured by Providence in the harvest of this year.

At Gowran, Lord ERNE said he was one who had always thought that the best things that could have been originated in this country were Agricultural Societies, because their exhibitions tended to bring men of all classes together, and enable them to understand each other's interests. They would teach farmers many things, and be a lasting benefit to them. The more these shows could be brought home to everybody the better, because they would then take a greater interest in them. For instance, there was an agricultural exhibition at Enniskillen in each year, and that answered very well for those who were in that town or near it; but it was a different matter entirely to those residing in Lisnaskea. He thought the small local shows were the best means of gaining the desired object. He was anxious to say a few words about some matters which nearly concerned them, because he thought it would be better if they endeavoured to instruct each other, instead of scratching each other's backs. With reference to their markets, he was glad to find that they were on the increase, because markets were everything to them as well as to the country at large. The more attention they paid to the subject themselves, and the better the market was made, the more buyers would come, and they would do good service to themselves and to their neighbours. With this view, he would suggest that a committee should be formed, to see whether the markets were really conducted as they should be, and whether any changes would be advisable. He might state that, for the year ending May 1st, 1869, there was an increase in their markets as follows: 994 pork pigs, and 181 pigs in the slaughter-house, 10,000 stones of flax, 58 tons 10 cwt. of tow, 40 firkins of butter, and 12 cwt. of small butter. This was a very satisfactory state of things, and he hoped their markets would go on increasing. There was another point on which he desired their attention, and that was as to the introduction of farming implements. He would suggest that four or five neighbours should join together, and purchase one of the mowing or reaping machines. He had had a letter from a man in Dundalk who hired such things, and he thought it would be an advantage if they could do the same in Lisnaskea. His steward stated that he cut 86 statute acres in ten days with a one-horse machine, and found it a saving of a great number of hands on every day's work. They would observe how great an advantage could be derived from the use of these machines, and besides they must recollect that they would soon be forced to use them instead of manual labour, because labourers could not be obtained. With regard to the drainage of Lough Erne, they were all aware of the meeting held there last year. He thought it was the most unanimous meeting he ever saw in that or any other place. Not only his tenants, but all those from neighbouring estates, came to it, and were unanimous on the subject. The drainage was a very vast undertaking, and, knowing that, the landlords having laid at the lake selected the best engineer they could find, and laid before him all the plans they had received for four or five years. He was now at work to see how the drainage could be best effected for the money which they could afford to pay for it. If they had to pay a high price, he did not think any of them would like it. If accomplished, however, it would be of the greatest benefit to the country and the health of the people. They were all very anxious about it, because in two or three instances similar undertakings had failed. In the case of Lough Neagh a great deal was done at great expense; and the landlords whom it affected were worse off than ever. He would take great care in his own case, and would mind both himself and his tenants. He trusted that matters would soon be settled in a satisfactory manner.

IRELAND.

At Carlow, Mr. H. BRUEN, M.P., said: Turning to the show-yard, they ought to ask themselves whether what they saw there evinced the progress and improvement which they had made in agriculture. The progress and improvement, if it existed, would be seen there, because he believed that show-yards were the mirrors in which they saw themselves. He did not intend to usurp the office which had been confided to the judges, in saying whether that improvement was what it ought to be; but he recommended them not to be content with what they had already achieved. He who stood still did not advance: while all the world was advancing around them, to remain still was to retrograde. They showed progress with the times. On taking up a copy of the

rules, they saw on the back a picture of a mowing machine. Ten or fifteen years ago it was the picture of a plough. In place of this, when would they see steam ploughs in the hands of farmers? Whether they did it themselves or by combination, this would and must be the future of agriculture in this country. They must not be content to reap their produce with implements they had been using ten or twenty years ago. Every one must perceive the advantages resulting from introducing a better breed of cattle, and improvements in agricultural implements. If those things were done, they would be seen in the show-yards. It might be said that the landlords should show them the way in such matters. No doubt, in the beginning it was quite right that they should do so, but in England they saw the tenant-farmers coming into the field and beating their landlords. That was what he wanted to see here. Let them not be content with the old implements of agriculture, but look for new ones, when, the tenant-farmers might rest assured, the profits would go into their own pockets; for they were not experiments, but had been found a success. To revert to the question which he started with—did their show that day evince progress? The answer to that interrogatory would, no doubt, be given by the judges, whose health he would ask them to drink, for coming there from a considerable distance and giving them the benefit of their experience.

Major BLOOMFIELD said: There was no country in the world which had been so blessed by Providence as this was, and if its people did not progress and improve, the blame rested entirely with themselves. He was sorry to say that the show that day did not exhibit the progress which they were led to expect. The gentlemen's class was fair, but the best in it, he understood, belonged to a tenant-farmer. Their second farmers' class was miserably poor, but their third farmers' class was uncommonly good. The progress manifested there was shown from the wrong end. Progress was a thing to be expected in agriculture as in other matters with which they had to do, and it should never be forgotten that they must either stand still or go on. Standing still was as bad as going back. No doubt grass land had had a bad time of it this year, and therefore they could not expect to see cattle in the same condition as was to be observed in other years; but yet there were artificial means at the disposal of the farmer which, if resorted to, would have aided the production of grass very considerably. Now, he would give them a hint or two as to what might be done. The first thing usually done after cutting down a crop of hay was to turn the cattle into their clover. In a dry year like the present that was a great loss to the farmer. He knew a man who had bad pasturage to put his cattle in shed, when he gave them some cotton-cake, by which he paid himself over and over again, instead of turning his cattle into his clover. Now, that was a very useful thing to know. The person he alluded to had got his cattle into better condition, and he had paid himself in doing so. In the course of a few years he hoped that the second-class farmers and gentry would exhibit greater improvement than he saw there that day. In the third class there were better cattle, and they were certainly in better condition. They should not forget that they were a very favoured Society. Theirs was a favoured county, where the landlords and tenants pulled well together, and they had a better Society than was generally to be found in Ireland.

Mr. Low said Carlow was one of the best farmed counties in Ireland: indeed, he would say it was the Lothian of Ireland. The farms were well fenced and the labourers well and comfortably housed. For his own part, he was much pleased to see that the third-class farmers showed most creditable animals. He hoped they would go on and prosper, inasmuch as he liked to see the tenants beating their landlords; for, in doing so, the result would be to confer advantages on all parties. The animals shown that day would do credit to any national exhibition in England, Ireland, or Scotland.

The Rev. R. W. BAGOT said he cordially agreed with Mr. Bloomfield as to the show of roots, which was highly creditable. In travelling down from Chester to Oxford about two months ago with a gentleman, they computed that they saw ten thousand acres of turnips, but they also computed that they would not give ten acres for those ten thousand acres. The judges had great difficulty in coming to a decision as to which should get first prize for roots in the tenant-farmers' class. With regard to the implements, he thought it unfair for a manufacturer or agent to turn out all the implements in his yard and compete with not only the tenant-farmers, but

also the landlords. Other arrangements, he suggested, should be adopted to put an end to this anomalous state of things. The chairman had stated that he would be always pleased to hear of his own tenant beating him well; his own tenant had beaten him that day in implements. At the next show of the Society he hoped that instead of having three or four classes of implements entered for competition, the secretary would have to procure a larger field for that purpose. It was a source of gratification to him to see so many fine animals. He did not like to see the landlords competing with the tenants for male animals; but he thought the tenants should subscribe and give a prize to the landlords for the best bull kept for the use of their tenants. The third and fourth classes were a credit to any show-yard, but he would not say as much for the other classes.

At Wexford, Mr. BOLAND, the Secretary, said the Society had done much; but yet it had a wide field before it, and he would throw all his energies into the working of it. It was gratifying to know that the Society was in fair working order and fast gaining ground. Besides, the farmers were daily perceiving the advantages to be derived from such a Society, and were throwing their hearts into the work. At all their shows the tenant-farmers now admitted that the object of the society was what its promoters professed, namely, the general prosperity of the country. It would be well for a moment to pause and reflect when they engaged in any undertaking, to see if it was calculated to do good, and if the best means were adopted for doing it: whatever view they took of the Society they must be satisfied with it. The development and improvement of agriculture was the great implement and sheet anchor of the country, and everything which enabled the farmer to produce more cattle, corn, and such things must tend to the material prosperity of Ireland and her people. Now, he would ask, had the Society within itself the elements whereby this desirable object could be obtained? He thought it had. There was no stronger feeling than that of the spirit of emulation created by the rivalry entered upon, which was one of the causes of the success of the Society. It was brought out very much in the show-yard. He had heard sensible men say, because they were beaten, they would never send an animal into the show again. Now, this spirit of emulation was one of the great principles which came within the scope of the Society. In this age of progress, the peculiarity in matters of education was the great system of object teaching. Now, this was done in matters connected with agriculture, when Mr. Bolton and other gentlemen sent in their Shorthorns for exhibition, by which means people could he made to understand what was necessary to be done better than if volumes were written to convey the same thing. It was pleasing to himself and the members to find that the Society possessed those elements, which rendered it worthy of a liberal and generous support. For his own part, he had merely to repeat that he would do all he could to increase the usefulness of the Society, in which he felt confident every right-thinking man would back him up. There were things outside the show of equal importance. Farming did not consist of one idea, and he believed the most successful farming was that which was in some degree mixed. The growing of corn was of equal importance to the raising of good cattle. He wished to bring before the meeting an important matter connected with modern husbandry. It was now well-known that farmers could not go on without using largely artificial manures, so that it was of the first importance that they should be supplied with an article of superior quality. The surest way of ascertaining this was by availing themselves of the advanced science of the age, inasmuch as an analysis of a properly qualified chemist at once showed what was the best manure for him to purchase. They could send a specimen to a chemist, and he would tell them what it was fairly calculated to produce. The Society met this feature of husbandry in a manner calculated to ascertain this important fact, whereby the farmer was benefited, inasmuch as he might obtain a sample from any vendor, and the secretary would send it to the chemist of the Royal Agricultural Society, who, for a moderate charge, would report as to its quality. Of course, under these circumstances no person who adopted the sale of artificial manures as part of his business would, for his own sake and for the sake of his reputation, rest satisfied without having the confidence that such analysis would inspire. He could not impress too strongly on the agriculturists of the county the im-

portance of this matter, and he hoped that next year advantage would be taken to have this test tried, and that the farmers would back up the Society in securing for them good artificial manures. Then, again, he thought there was room for improvement in the mode of tillage which they adopted; for he was confident that they would grow better and heavier crops by employing more capital, skill, and labour. In the lower part of the district in which the Society carried on its operations the laud was was all that could be desired, but he regretted to say that the farmers allowed themselves to be robbed by the great quantity of weeds which were to be found on their farms.

At Ballineen, Lord Bandon congratulated the Club upon the character of the fair and flax market that day, and was confident both would improve. The quantity of stock shown that day and the quality of it should be very gratifying to the members of the Club. He had to complain that the Government had not yet established a telegraph station at Ballineen, which would be a matter of the greatest importance to the flax buyers in the market as well as the cultivators; for the latter would be able to telegraph to Ballineen on any fair day, at a trifling expense, and ascertain the prices in the flax market there, thereby enabling them to dispose of their produce to the best advantage. Another thing they had to complain of was the mismanagement of the railway system between Cork and Ballineen. The Cork and Bandon Railway Company appeared to give very little facility indeed to any one for the transfer of goods from the West Cork line, and they had to complain that no steps had been taken to increase the facility at two places along the line, one being the gate of Castle Bernard, which would open communication with Courtmacsherry, Timoleague, Kilbrittain, and Gaggin, though the expense of doing so would be trifling. Another thing brought under his notice was that the rates of that electoral division amounted to two shillings in the pound. He was himself an *ex officio* member of the Dunmanway Board of Guardians, and he was determined upon inquiring into the cause of so great a rate being levied. He was more than pleased to find that at the fair that day there were two hundred head of cattle, one hundred loads of pigs, and five hundred sheep, and that they all had been disposed of at remunerative prices. Although it was the first day for the flax market, he was glad to find that there were upwards of two thousand stones of fibre exhibited, all of which had been disposed at prices varying from 8s. to 9s. 6d. per stone. He need not remind the meeting that they had a dry summer, and that many of their countrymen had been as yet unable to bring their produce into market. Since last he had addressed them he had been engaged in Parliament in discussing the Irish Land Bill. That bill was now passed, and he was only going to say with regard to it that its operation would make little material difference in that part of the country. In fact, he would be right in saying no difference. It had been said throughout Ireland that farmers had no security for their capital; and though he was happy to say that the cases were few in which it was shown injustice had been done, yet it was alleged that it was possible that injustice might be done by the landlord. It was said that the tenants had £20,000,000 in the bank; but supposing it was one-fourth of that sum, there was no possible excuse now for them not laying out their money on their farms, and by using it on the land they could make more profit than if it were in their pockets. The land bill being passed, it was the duty of every one to carry it out, but the duty of doing so depended more upon the tenant than on the landlord; for it rather prevented the landlord from doing mischief than enabled him to do good. It enabled the tenant to lay out his capital on the land, and now that every possible grievance he could complain of had been removed, he hoped that all farmers' clubs would unite together and develop the resources too long neglected in this country.

JERSEY.

At the dinner of the Royal Jersey Agricultural and Horticultural Society, M. DROUYN DE LUNYS said: You cannot expect from me, in the melancholy circumstances to which my presence among you is attributable, any very extended or flowery speech. I may well adopt the language of the Hebrew children of old, and say, "How can I sing a song in a strange land?" Methinks I hear from afar, while sojourning here, a stranger among you, the din of battle and the shrieks of death in my beloved country. Methinks I see in the dark perspective

long days of havoc urging their destructive course, and brilliant squadrons mowing their bloody way through embattled hosts. Pardon me if for a moment I have cast a shade of gloom over this smiling scene. As your guest I express to you my sincerest gratitude for the cordial hospitality accorded by you to me as President of the Société d'Agriculture de France.

THE SMITHFIELD CLUB.

COUNCIL MEETING on Wednesday, November 2nd. Present—The Earl of Powis, President, in the Chair. Lord Tredegar and Lord Walsingham, Vice-Presidents. Messrs. H. Aylmer, Barnett, J. Beasley, J. N. Beasley, Canning, Clayden, Downing, Samuel Druce, Joseph Druce, Duckham, Walter Farthing, Brandreth Gibbs (hon. Sec.), Charles Howard, Leeds, Newton, H. Overman, Rigden, Torr, J. S. Turner, and H. Webb.

The hon. Secretary was authorized to make the usual application for a licence for holding the Show.

The same Committee as last year was appointed to make arrangements as to the disinfecting cattle conveyances, &c., as heretofore.

Mr. C. Stephenson, of Woburn, Bedfordshire, was elected a Member of Council in place of Mr. Twitchill, deceased.

The Council prepared the house-list of eight members of the Club for election on the Council to succeed the eight who retire by rotation.

Mr. James Edward Ransome was elected a Member of the Implement Committee in place of Mr. Heald.

The offer of the Earl of Powis, the President, of a prize for the best instrument which shall be an efficient substitute for the pole-axe for slaughtering animals by separating the spinal marrow was accepted, viz., a prize of £20. The instruments to be delivered at the office of the honorary secretary on or before the 1st of October, 1871. The exhibitors to show in practical operation at such time and place as the judges appointed by the Club shall determine.

It was determined not to have an annual dinner this year.

It was decided to discontinue the report on the animals exhibited at the Show.

Authority was given to Messrs. Thomas, the Club's silversmiths, to prepare the pieces of plate and silver cups to be awarded at the ensuing Show.

Several letters were read and instructions given in reference thereto.

The following were elected members of the Club:

Bailey, Rev. H. G., The Vicarage, Swindon, Wilts
Benjafield, A., Stalbridge, Dorset
Byron, Jno., Kirkby Green, Sleaford
Cooke, Grimwood, Horseheath, Cambridge
Davy, John, Flitton Barton, North Molton, Devon
Everett, F. H., The Grove, Bridgham Harling, Norfolk
Jenkins, Richard David, Pantirion, near Cardigan
King, George, Saffron Walden, Essex
King, Richard Pocock, Southstoke, Wallingford
Kingsley, Thos., Boar's Craft, near Tring, Herts
Mumford, Jno. Aubrey, Chilton Park Farm, Thame, Oxford
Nockolds, Martin, Saffron Walden, Essex
Priece, John, Court House, Pembroke, Herefordshire
Rush, Thomas, Chalk Farm, Babraham, Cambs
Southwell, Charles, Albion Foundry, Rugby
Tazewell, John, Hay Grove, Bridgewater
Wood, Henry, Wolley House, Romsey, Hants.

The thanks of the meeting were voted to the chairman.

HIGHLAND AND AGRICULTURAL SOCIETY OF SCOTLAND.

The first monthly meeting of the directors for the season was held in George IV. Bridge, Edinburgh, Mr. Graham Binny in the chair.

The following report on the different specimens of horse shoes exhibited at the Dumfries Show was read. The Charlier shoe possesses the following advantages: Lightness; a true bearing on the crust; frog pressure; avoids all suction, and cannot pick up a stone; does away entirely with the use of the drawing knife; is very easily fitted, as the gauge knife can only cut the proper seat. These shoes appear to be more adapted for light work than for draught horses. In expressing this opinion, the committee regret that they have had no opportunity of seeing horses shod on this principle for a sufficiently long time to give them a practical illustration of the system.

Gray's patent grooved steed-faced horse shoes. Workmanship good, and price reasonable. We think some improvement might be made in the method of nailing, especially in the lighter shoes.

Robertson's Snow Plates.—These are only adapted for slow work. There is some merit in the invention, and if further improved upon might be found useful in cases of sudden falls of snow. Portable Frosted Horse Shoe.—Not so serviceable, and more complicated.

(Signed) WILLIAM VARLEY, V.S. (1st Class),
13th Hussars.

J. ANSTRUTHER THOMSON.

Dumfries, 29th July, 1870.

A silver medal was awarded to M. Charlier.

It was remitted to the Committee on General Shows to fix the premiums and adjust the regulations for the show which is to be held at Perth next year.

Requisitions from the counties of Berwick, Roxburgh, Selkirk, and Peebles, to the directors to hold the General Show for 1872 at Kelso were submitted.

Mr. F. N. MENZIES reported that, according to previous arrangement, the Duke of Argyll had received deputations at the India Office on Friday the 15th of July, from the Highland and Agricultural Society, the Royal Horticultural Society, and the Institution of Surveyors, on the subject of forest appointments in India.

The reply to the Society's memorial was as follows: "India office, S.W., 29th July, 1870. My Lord Marquis,—I am directed by his Grace the Secretary of State for India in Council to acknowledge the receipt of the memorial, dated the 1st of June, which was presented to him on the 15th instant, on behalf of the Highland and Agricultural Society of Scotland, stating objections to the present system of training young men for the forest service of India in France and Germany. In reply, I am desired to inform your Lordship that the present system was adopted, after very deliberate consideration of the question, as well by the authorities best qualified to judge of the requirements of the service in India as by his Grace's predecessors in the department, and his Grace is satisfied that the conclusion arrived at was sound. As the first set of these young men was sent to India only at the close of last year, there has been as yet no opportunity of forming a judgment on their practical fitness for the duties required of them; but it is impossible to speak too highly of the attention which is bestowed upon the young men already sent for training in France and Germany, and of the supervision which is exercised over them in all respects. Judging, however, from the reports received from the foreign establishments in which they are placed, from the statements of the young men themselves, and from the expression of their parents or guardians in respect to their position abroad, the Duke of Argyll has every reason to expect that the system will prove successful in supplying a body of well-trained and competent gentlemen for service in the higher grades of the Forest Department in India. A mere inspection of the Continental forests, as proposed in the memorial presented by your Lordship, would not answer the objects which the Secretary of State in Council and the Government of India have in view. I am to point out that how

sufficient soever the training in what may be called the auxiliary sciences, mathematics, surveying, mechanical, and natural sciences, may be in this country, it cannot, in his Grace's opinion, be doubted that the science of managing and administering forests on a large scale, is not and cannot be so fully developed here as it is in France or Germany, where forestry is recognised as one of the scientific professions, for which public forest schools are established, and where the forest lands are of vast extent and managed upon principles more nearly approaching those which are most suited to forests in India than is the system pursued in England and Scotland. His Grace is not prepared to admit that the same results could be obtained in Great Britain as are gained by the training in France and Germany. He would therefore regard it as most unfortunate should the present outbreak of war between France and Germany lead to an interruption of the present system; but, as her Majesty remains at peace with the Sovereigns of both these States, the Duke of Argyll does not anticipate that such an interruption will be necessary. I am to add that although the knowledge of the French or German language is required of candidates only in order to enable them to receive the teaching imparted to them abroad, it is a knowledge, nevertheless, which cannot fail to prove of the highest service to them in their subsequent career, as the best books on the science and practice of forestry are undoubtedly written in those languages.—I am, &c.,

(Signed) J. COSMO MELVILL.

The President of the Highland and Agricultural Society of Scotland.

The SECRETARY stated that the India Board have now sent a number of students to St. Andrews to study under the auspices of Dr. Cleghorn, these students having been ordered home from the forestry schools of France and Germany in consequence of the war.

It was further reported that the next examination of candidates for the Society's forestry certificates would take place on the 3rd and 4th current.

Mr. F. N. MENZIES read a letter from Dr. Anderson, stating that, though much better in health, his doctor would not allow him to return to his work till spring, thanking the directors for the kindness hitherto shown him, and requesting an extension of his leave of absence, also enclosing a medical certificate from Dr. Eryant, of London.

The board, believing that the interests of the Society had not suffered from the arrangements made by Dr. Anderson, and knowing that his opinion has been expressed in every case sent for analysis, agreed to grant the leave of absence requested.

It was announced that the session of the Edinburgh Veterinary College had been opened on Monday, the 31st ultimo, with an address by Dr. Peter Young.

A communication was read from the office of the Privy Council for Trade, sending copy of a letter which had been received through the Foreign Department from Chevalier Cadorna, setting forth the wish of the Italian Minister of Agriculture and Commerce to receive certain communications direct from the Society, and expressing the hope of the Board of Trade that the directors may be able to afford the assistance desired.

The board agreed to send the Transactions of the Society, and any other documents of interest.

Consideration of the letter from the secretary of the Society of Agriculturists of France with reference to a proposed international assembly to be held in Paris in 1871, which was before the general meeting in June, and remitted to the directors, was deferred in consequence of the war.

In consequence of the offer of Sir Roderick Murchison to join the Government in endowing a chair of Geology in the Edinburgh University, the board resolved to memorialise the First Lord of the Treasury in favour of the measure; and it was remitted to a committee—consisting of Dr. Balfour, Mr. Irvine of Drum, and the secretary—to draw up a memorial on the subject, and have the same forwarded to Mr. Gladstone.

Two letters were submitted from Mr. James Kerr, Sheriff

Court-house, Edinburgh, with reference to the dry-earth closet and urinals proposed by the late Sir James Simpson.

A letter was reported from Mr. Mathew Andrews, jun., secretary of the Flax Extension Association, Belfast, sending a pamphlet containing instructions for the culture and preparation of flax in Ireland, and other documents, and intimating

that he would be happy to supply copies to any farmers desirous to gain a knowledge of how the flax crop is managed.

A letter was read from the Home Cattle Defence Association to the directors, who, though not in a position to subscribe as a board, expressed a hope that an Association so likely to benefit agriculturists would not be neglected.

THE WENLOCK FARMERS' CLUB.

AWARD OF PRIZES.

At the annual dinner Mr. RAINFORTH read the following report: We, the undersigned, being appointed to inspect the farms, root crops, and fences of the competitors for prizes given by the Wenlock Farmers' Club, beg to hand you the following report:

For the best cultivated farm.—At Mr. Smith's, Sutton Madlock, we found the land well cultivated, the fields well laid out, and divided with new straight fences of young thorns. The mangold crop is very good and clean. The swedes are irregular and short of plants. The stack-yard and cattle sheds are not so neat as they should be. Mr. Horton's Harnage Grange: Here we found the land well cultivated. The swedes are clean, and a fair crop for the season, but part of the soft turnips have suffered from the drought. Mr. Horton has done a great deal for the farm in pulling down old useless fences, and bringing the others in a proper form. The stackyard and cattle yards not so neat as they might be. At Mr. Trevor's, Westwood, the land is well cultivated, and free from weeds of any kind. All the implements which were not in use were under cover. The rickyard and premises were neat and clean. We have come to the conclusion that Mr. Trevor has won the prize for the best cultivated farm, taking everything into consideration.

For the best cultivated root crops generally, on a farm of not less than 200 acres.—On Mr. Trevor's farm the swedes look healthy, have been well cultivated, and are free from weeds, but are irregularly planted. Mr. Davies's, Patton: The swedes are very good, one-half of the first field being the weightiest and best we have seen, but the field is irregular. The land is well cultivated. Mr. Acton's, Brocton: Here we found the ground regularly planted, well cultivated, and perfectly free from weeds of any kind. We have come to the conclusion that Mr. Acton is entitled to the prize for the best cultivated root crops.

For the best managed fences.—At Harnage Grange a great deal has been done to the fences, but it will be some time before they are sufficient. Mr. Trevor's, Westwood: All the fences lying to the south are good and well managed, but where the land is exposed to the north-west they are deficient. Mr. Lloyd's of Westwood: The fences here are very good and well managed. We agree that Mr. Lloyd should have the prize for the best managed fences.

For the best cultivated root crop on a farm not exceeding 100 acres.—We are both of the same opinion respecting the merits of the different lots entered in this class, viz., Mr. Cooper takes the first; Mr. Moreton second.

WM. LOCKHART,
EDWARD RAINFORTH.

PRIZE LIST, 1870.—Essays: A prize of £10, the gift of Lord Wenlock, for the best essay on the advantages of steam cultivation, and the best means of introducing it into the Club district, to Mr. Stables, Kirkbank, Yorkshire.

The best cultivated farm.—Prize to Mr. Trevor, of Westwood.

The best cultivated root crops.—Prize to Mr. Acton, of Brocton.

The best cultivated root crops on farms not exceeding 100 acres.—First prize to Mr. R. Cooper, Much Wenlock; second to Mr. Moreton, Wenlock.

The best managed fences.—Prize to Mr. G. Lloyd, of Westwood.

REPORT OF THE COMMITTEE, 1870.—Gentlemen: The celebrated Earl of Chatham, when Prime Minister of England, once reproved an ambassador for the paucity

of his despatches, when the ambassador excused himself by saying that there was nothing to write a despatch upon. Your committee, on this occasion, are in a similar position to the ambassador in having little to report to you; at the same time, not wishing to fall under your censure for taciturnity, we follow our usual practice by making that little known to you. Shortly after our last anniversary meeting the Shropshire Chamber of Agriculture occupied one of our meetings for discussion by holding their discussion in Wenlock. A very large and influential meeting was the result, and matters of the highest importance to the welfare and prosperity of agriculture were discussed with a freedom and ability seldom or ever excelled at any of our meetings, and your committee are happy to say that the result of that meeting added fresh laurels to the fame of the Wenlock Farmers' Club; at the same time the discussion at that meeting so exhausted the energy of our members that we have only been enabled to hold one other meeting during the year. Lord Wenlock, at our last anniversary meeting, placed the sum of £10 in the hands of the committee to be offered for the best essay on the advantages of steam cultivation, and the best means of introducing it into the Club district. Your committee regret that his lordship's liberality and laudable anxiety for the welfare of the Club should have been so feebly responded to, only one paper having been received by the committee. This paper was submitted to Lord Wenlock, when it was decided to award it the prize. The essayist attended a meeting in June to read his paper, but owing to its great length the members were precluded from entering into any discussion on its merits, and your committee regret that at present no action has been taken in the matter. Lord Wenlock's liberal offer to take a large number of shares in a steam cultivating company not having been responded to, this, in some degree, may be accounted for by the circumstance that our original and principal members' holdings are on the Ludlow rock formation, and the proximity of the rock to the surface makes deep cultivation impracticable; but the Hugglely valley and the south side of the Corve are admirably adapted for the steam cultivator, and the proprietors of these districts would act wisely by affording every facility and assistance to their tenantry by introducing it upon their respective estates, as the result cannot fail to be successful. Our president kindly offered a prize of £10 for the best paper on the most desirable means of giving security to tenants for capital invested in the improvement of lands and buildings. Only one paper for this prize was sent in, which being submitted to the president and the Editor of the *Mark Lane Express*, was pronounced by those gentlemen as not of sufficient merit to justify the prize being awarded. The paper was returned to the author, with a copy of the judges' report. Mr. Benson places the £10 in the hands of the committee to be offered for an essay next year. J. M. Gaskell, Esq., having withdrawn his name as a subscriber of £2 to the implement prize, A. H. Brown, Esq., M.P., on application, kindly consented to fill up the gap. The members for the Southern Division of the county having renewed their prize of £10 for the best cultivated farm, three competitors have entered the list. The awarding of this, as well as the root crop and fence prizes, was placed in the hands of Mr. Lockhart, of Culmington, and Mr. Rainforth, of Monk-hopton, whose report will be read before you. Your committee met on the first Monday in October to audit the accounts, when a balance of £2 19s. 1d. was declared in the treasurer's hands, and arrears of subscriptions owing amounting to £12 15s. Your committee cannot close this report without earnestly soliciting volunteers to come forward as readers of our discussional meetings. There are several sub-

jects now requiring the earnest attention of this old-established Club: The importation of foreign diseases, by which our flocks and herds are yearly decimated; the injustice and inequality of the local taxation of the country; the best means of increasing the home supply of the food of the people, and making England less dependent on a foreign supply. These and

other questions now await consideration at our hands; and your committee hope that some good men will, during the ensuing year take up these or other subjects, and raise our discussonal business to its former glory. Your committee beg to congratulate you upon the prospect of Lord Acton's acceptance of the presidency of our Club for the ensuing year.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

MONTHLY COUNCIL: *Wednesday, November 2.*—Present—Lord Vernon, President, in the chair: the Earl of Lichfield, Lord Chesham, Lord Tredegar, Lord Walsingham, Sir Watkin Wynn, Bart., M.P.; Mr. Amos, Mr. Barnett, Mr. Booth, Mr. Bowly, Mr. Cantrell, Colonel Challouer, Mr. Clayden, Mr. Dent, M.P.; Mr. Druce, Mr. Edmonds, Mr. Brandreth Gibbs, Mr. Hollaud, Mr. Horsby, Mr. Wren Hoskyns, M.P.; Colonel Kingscote, M.P.; Mr. Leeds, Mr. Milward, Mr. Pain, Mr. Randell, Mr. Ransome, Mr. Ridley, M.P.; Mr. Rigden, Mr. Stone, Mr. Thompson, Mr. Torr, Mr. Welby, M.P.; Mr. Wells, M.P.; Professor Simonds, and Dr. Voelcker.

Mr. Henry Chaplin, M.P., Blankney, Lincoln, was elected a Governor of the Society.

The following new members were elected:

Arnold, William, Lichfield Street, Tamworth.
Baxter, Benjamin, Elslaek Hall, Skipton.
Beckett, Samuel, Eccleston, Chester.
Boucher, A. E., Wolverley, Kidderminster.
Clerk, Arthur, The Mead, Chepstow.
Davey, J. G. Ellis, Horningtoft, Letcham.
Dunlop, Alexander M., 1, Westminster Chambers, Victoria Street, S.W.
Gilbey, Walter, Hargrave Park, Stanstead.
Hetherington, R. Bealy, Park Head, Silloth.
Holman, Stephen, Spring Lodge, Ealing.
Howells, J. Lewis, Blackwood, Monmouth.
Lovatt, Henry, Finchfield House, Wolverhampton.
Poole, Commander George, Langynider, Crickhowell.
Shuttleworth, Alfred, Heighington, Lincoln.
Tangey, Richard, Cornwall Works, Birmingham.
Townshend, C. Uniacke, Hatley, Burlington Road, Dublin.
Wall, T. Senior, 120, Maida Vale, London.
Ward, T. Johnson, New Lease, Olveston, Bristol.
Waterer, Anthony, Knapp Hill, Woking.

FINANCES.—Colonel Kingscote, M.P., presented the report, from which it appeared that the Secretary's receipts during the past three months had been duly examined by the committee, and by Messrs. Quilter, Ball and Co., the Society's accountants, and found correct. The balance in the hands of the bankers on October 31 was £1,406 10s. 4d. The quarterly statement of subscriptions and arrears to September 30, and the quarterly cash account, were laid on the table. The arrears then amounted to £1,303. The committee recommend that the £1,800 now at deposit be transferred to the current account. This report was adopted.

JOURNAL.—Mr. Thompson (chairman) reported that it had been intimated to the committee as highly probable that £200 will be offered to the Society by gentlemen resident in Shropshire and Staffordshire for two prizes of £100 each to the best managed arable and dairy farms respectively, within a limited distance of Wolverhampton; and that the committee, therefore, requested the Council to decide whether, in case of such offer being formally made, the committee shall be at liberty to announce the willingness of the Society to offer second prizes of £50 each; also, whether the committee, after ascertaining the views of the subscribers, shall arrange the limits of the district to be included, and the other conditions of com-

petition. It was also reported that the Society's publisher had received a lawyer's letter on the subject of the reflections on Messrs. Bradburn and Co. in the report of the Chemical Committee lately published, and that the committee recommended that they be authorised to support the course adopted by the Chemical Committee. This report was adopted. A conversation followed, in the course of which Mr. Thompson stated that the expenses of the last farm-prize competition amounted to about £325, including the 2nd and 3rd prizes given by the Society. Notwithstanding this expenditure, the Journal Committee had recommended that the scheme be carried into other districts, on account of the interest of the competition, and the value of the report to the readers of the Journal; and Mr. Thompson particularly referred to Mr. Keary's report of the Oxford Prize Farms, as showing clearly two points—first, that the 1st prize had been awarded on the satisfactory ground of profitable farming, and not to a model farm; and secondly, that the profitable cultivation of poor land like that of the stonebrash was to be done by a large expenditure in cake and corn. He also remarked that Mr. Keary had brought out the weak points in the various farms in a clear, but unobjectionable, manner. The Earl of Lichfield, in seconding the recommendation of the committee, expressed his conviction that the £200 would be raised by the landowners of the two counties, and his satisfaction with the report of the Oxford competition. Mr. W. J. Edmonds gave notice that in December he would move that the sum of £10 be voted to the Cirencester Chamber of Agriculture, for the purpose of assisting its committee to carry out, in conjunction with the professors of the Royal Agricultural College, manurial and other experiments upon corn and root crops.

SHOWYARD CONTRACTS.—Mr. Randell reported that as Mr. Penny's contract expires after the Wolverhampton meeting, the committee recommended that a general table of conditions and specifications, prepared by the surveyor, should be printed under his direction, and sent to the members of the committee for their consideration before the December Council meeting; that the tenders be then advertised for, and that they be sent in by January 20, to be opened and classed by the surveyor and Mr. Randell, who will report on them to the February meeting of the committee. It was also recommended that the members' tent shall be made available, with accommodation for writing, &c., during the whole period of the country meeting; that Messrs. Suttons' suggestion to keep separate the stands occupied by manure-merchants be adopted; and that the surveyor be requested to proceed to Wolverhampton, and to set out the levelling required in the showyard for the use of the local committee.—This report was adopted.

IMPLEMENT.—Mr. Thompson reported that several letters had been received from implement makers, containing suggestions of alterations in the conditions of competition at Wolverhampton, which had been sent them in accordance with the resolution of Council in August last; some slight alterations had been adopted, and the conditions, as revised, were recommended for

adoption by the Council. The committee also recommended the following addition to the prize list, viz. :

For the best root or stone extractor £10

The committee having received the instructions of the Council to consider what prizes should be offered for implements and machinery employed for the cultivation of nops, they recommended the offer of the four following prizes, viz. :

1. For the best machine for the cultivation of hop gardens, to supersede manual labour £20
2. For the best machine for washing the hop plant to remove the aphid blight 10
3. For the best hop-presser 10
4. For any other improved implement, or implements, used in the cultivation or management of hops 10

It was recommended that all the implements entered for trial shall be in the yard by the evening of Saturday, June 24, and other articles by Tuesday evening, July 4. With reference to the question of duplicates the committee recommended that no exhibitor be allowed to enter duplicates of the same article, and that a maximum fine of 10 per cent. on the declared price, and a minimum fine of £1, be imposed for each article exhibited in breach of this rule. They also recommended that if this rule be adopted, the regulations affecting miscellaneous articles and the space required by exhibitors remain otherwise as heretofore. It was also recommended that in future no medal be awarded to any implement included in the quinquennial rotation which is not placed in the classes tried at that meeting, or to any miscellaneous article capable of trial, until it has been subjected to such trial as the stewards may direct ; also that no commendations of miscellaneous articles be made by the judges. This report having been adopted, a vote of thanks was unanimously offered to Mr. John Medworth, on the motion of Mr. Thompson, for the classified list of implements exhibited at Oxford, prepared by him for the use of the committee.

GENERAL WOLVERHAMPTON.—Lord Walsingham reported the recommendation of the committee that the showyard at Wolverhampton be open from the morning of Monday, July 10, until Saturday evening, July 15, at 6 o'clock inclusive, and that the implement yard alone be open to members and the public on Saturday, July 8, during the usual hours. On the question "that this report be adopted" being put to the Council, a discussion arose, in which Mr. Thompson, Mr. Dent, Mr. Rigden, Mr. Ransome, Mr. Amos, Mr. Booth, and Mr. Wells, followed by Lord Walsingham, successively opposed the recommendation of the committee, on the ground that exhibitors objected to their stock being so long away from home, that the actual receipts, as proved by the experience gained by trying the two plans at other large towns (Manchester, Leeds, and Newcastle especially) were not much increased by the extra day, while the expense to the Society was considerably enhanced, and that to the extension of the Society's show for so long a period as even five days is to be attributed the small show of horses which characterised the Society's meetings. On the other hand, it was urged by Lord Lichfield, who had proposed the additional day in committee, as well as by Mr. Torr and Mr. Randell, that Saturday was the only day on which the working-classes could visit the showyard. Ultimately it was proposed by Mr. Thompson, and seconded by Mr. Dent, "That the showyard at Wolverhampton shall be open on the same days as at Oxford." The amendment having been put from the chair, it was carried by 22 votes against 7, subject to which the report of the committee was adopted.

STOCK PRIZES.—Lord Walsingham presented the report of the committee, embodying the first draft of the stock prize-sheet for the forthcoming Wolverhampton meeting. After some discussion, the report was received, and referred back to the committee with some suggestions for their consideration, and resolutions for incorporation in the regulations of the prize-sheet, namely: It was moved by Mr. Booth, seconded by Mr. Torr, supported by Mr. Bowly and Lord Walsingham, and carried unanimsly, "That each animal entered in the Short-horn classes shall be certified by the exhibitor to have not less than four crosses of Shorthorn blood, which are registered in the Herd Book."

On the motion of Mr. Milward it was resolved that in the pony classes the height should be altered from 14.2 to 14 hands, and that the classes immediately above them should range from 14 hands to 15.2.

It was moved by Mr. Dent, in conformity with the resolution passed at the June Council, that prizes of £10 and £5 be offered for the best and second best mule, irrespective of age and sex. This motion having been seconded by Lord Chesham, and commented on by Mr. Pain, Mr. Randell, and other members of the Council, was put to the vote, when there appeared eight for it and the same number against it. The President thereupon gave his casting vote against the proposal.

Mr. Milward gave notice that at the next meeting of the Council he would move, "That the resolution of June 1, respecting prizes for mules and asses, be rescinded."

On the motion of Sir W. W. Wynn it was resolved that the consideration of the Stock Prizes Committee be directed to the question whether prizes may not be given to Cheviot and other mountain sheep; and at the suggestion of Col. Kingscote, M.P., the Stock Prizes Committee were requested to consider whether it is not expedient that in the classes for "mare in foal, or with foal at foot," the sire of the foal, as well as the sire of the mare, should be given on the certificate of entry.

A memorial from some breeders of Berkshire pigs was also referred to the Stock Prizes Committee.

EDUCATION.—Mr. Holland (chairman) reported that the committee made application for the renewal of the education grant for the ensuing year, and in the event of its being granted they recommended the following alterations in the Society's previous regulations :

1. That the next examination should commence on Tuesday, April 18, 1871.
2. That the forms of entry, duly filled up, together with a certificate of general education, must be forwarded to the secretary by March 1, 1871.
3. That no candidate shall be eligible for the Society's prizes who has completed his 21st year previous to the said March 1; but that any candidate, irrespective of age, may compete for the Society's certificates.
4. That the prizes for aggregate merit, to be awarded to successful candidates who are eligible and are placed in the first class, shall be: 1st prize, £25; 2nd, £10; 3rd, £5.

This report having been adopted, the education grant was renewed for the year 1871.

A letter was read from Mr. Alfred Rogers on the subject of inspection of shearing.

The Earl of Lichfield gave notice, that at the next monthly Council he would move: "That in selecting a town for the holding of the exhibition of 1872 the plan of the Bath and West of England Society be adopted."

The December general meeting was ordered to be held on Thursday, the 8th proximo, at 12 (noon).

AYRSHIRE FARMERS' CLUB.

FARM FENCES.

At the quarterly meeting held in Ayr, Mr. R. M. CUNNINGHAME, Shields, president of the Club, in the chair, said: During the three months which have elapsed since we last met together, some of the most important of our farming operations have been accomplished under very favourable auspices as regards weather. About the time of our last quarterly meeting the hay harvest commenced, and whether or not any of it was cured according to the method described by our friend Mr. Dalglish in his valuable paper, there has certainly been one of the bulkiest crops of hay ever grown in Ayrshire secured in excellent condition. I had occasion to travel through part of the higher districts about that time, and it was very pleasing to see the various fields and meadows thickly studded with ricks of beautiful green succulent hay, which must prove not only profitable to the owners, but also very palatable to those animals who are privileged to consume it. Scarcely was hay work over when the corn harvest commenced, and I think I may safely say that seldom if ever have we in this precarious climate experienced a more favourable time both for cutting and carrying the grain, and most assuredly both in high and low districts a bulky oat crop (which is the staple one) has been gathered in first-rate order. Then again the potato harvest has also just been concluded under equally favourable circumstances as the hay and corn, so that, altogether, the prevailing weather during the past summer and autumn, has admirably suited both the high and lowlands of this county; and the various crops, whether of grass, grain, or roots, will contrast favourably with most other parts of the kingdom. Then again, gentlemen, during these same past three months, there has been a fearful war raging on the continent; the horrid scenes of bloodshed and carnage to human life it is painful even to read of, and though it should soon now terminate, which, we sincerely hope it will, the sufferings and misery it has caused will not soon be effaced. Seeing then that we here are in the full enjoyment of these inestimable blessings, *peace* and *plenty*, there is surely special cause for our rendering praise and gratitude to the bountiful Giver of all good. I now beg to call on Mr. Peter Murdoch, Holchouse, who has kindly agreed to read a paper on "Farm Fences: their Erection and Management."

Mr. MURDOCH said: My experience in the erection of fences has been so very limited, and my style of managing them has been so unworthy of imitation, that I feel ill qualified to do the subject the justice it deserves, and I have, therefore, to crave your indulgence in respect of my shortcomings. After making some investigation lately into the state of farm fences in this district, I am sorry to say I find they are in anything but a good condition. The hedge fences, as a rule, are full of gaps; while dead and half-dead thorns are very numerous. There are a great many good stone fences, but the majority are in a kind of tumble-down position, and in much need of being rebuilt. No branch of agriculture seems at present so much neglected as the management of fences. They seem indeed in many cases to have been left to take care of themselves. Yet nothing is of more importance than good fences, and nothing gives more trouble and annoyance to the farmer than bad ones. The origin of fencing is believed to be a very ancient one, but into that question I do not purpose to enter, though the study might be an interesting one. The general division of land, however, into enclosures by means of fences seem to have been a recent one in this country. In Ayrshire, probably, all the present fencing was erected within the last 100 years. Indeed, I have spoken with old people who remember when a person could, and did, ride miles and miles straight through the country without coming in contact with more than one or two. Not unlikely the first attempt at fencing was directed towards keeping crummies out of the kail-yard. In early times, rivers, burns, and other convenient marks were used as boundary lines, both between different proprietors and farmers. Still in some cases marches seem to have been very badly defined or fixed, and disputes frequently

arose in consequence. It is Sir Walter Scott, I think, who tells a rather amusing story of two Highland lairds, whose march seems to have been so indistinct or badly defined that it came to be lost altogether, and gave rise to the question seriously disputed, where it originally was? But being Highlandmen, their ingenuity was equal to the difficulty. Each agreed to select an old man of a certain age, to travel from certain opposite points on a given day, till they should meet, and the place of meeting, it was agreed, should be the boundary in future. King or boundary fences seem to have been the first in use to any extent. They were often erected with stones, but were rudely constructed. More frequently, I think, they were formed of earth, or cut turf, and were known as turf-dykes. Numerous traces of both are still visible, especially in the upland districts of the county. As the erection of fences has been already all but completed, in some form or other, by our industrious, if not very enlightened forefathers, it appears to me that unless we are going to root out or rebuild a number of our old bad fences, we have more need to study the best method of renovating or improving existing ones. I intend saying a few words on this, however, before finishing. There are three kinds of fences in general use amongst us, namely, thorn, stone, and wire ones. Paling and flakes are also used, but only as temporary or moveable ones. A gentleman with whom we were in conversation the other day, suggested there was still another kind of fence, and which, if he is right, is about the best and most reliable of all. It is, in fact, a locomotive one, that can be moved at pleasure, with the power of action within itself, and which he called a "herd." That a herd is a fence we cannot see, but we at once admit the usefulness and trustworthiness in general of such servants. As there are no kinds of fences so common in our cultivated districts as thorn ones, we shall consider their erection and management first. First of all, let us see what are the characteristics and points of a good hedge. I think they are impenetrability, regularity, and occupancy of the least possible space. How, then, best to attain these ends are points for our consideration. We must, of course, first plant a hedge, next nurse and train it well, and then, if we have succeeded in erecting a good fence, the last but not least important matter is to keep it so permanently. But, again, how these desirable ends can be easiest accomplished is rather a subject of dispute, and one about which I have no decided opinion. In the planting of hedges two methods are pursued. One is to plant the young thorns, or quicks as they are commonly called, on the brow of an open ditch made for the purpose of keeping the roots of the young plants dry, the earth taken from the ditch being heaped up in a kind of bank above the rest of the plants. From the depth of the ditch, this covering is mostly composed of subsoil matter. A fence of this kind will take up a stretch of land 6 or 7 feet broad. The other method is that of planting on the surface, or flat as it is called. When this mode is adopted, the intended thorn-bed should be deeply dug or trenched to a width of 30 inches, and also a little raised above the general level by throwing some extra soil on it, six months or so before the plants are put in. Either of these modes may be adopted, according to pleasure or circumstances, and, if I may venture an opinion on their relative merits, I would prefer the latter. On good dry soils it seems to me to cause little difference which way the work is done. Planting on the surface takes up much less space, is the least expensive method, and, with equal soil and attention, will produce a fence equally good. In the old ditching system the ditches were made so large that they appear to me not only a waste of land, but a positive injury to the hedge itself. By having a deep ditch on one side, the roots are not only all forced to take one direction, but they also soon get bare in consequence of the earth falling down in winter when loosened by frosts or rains. Again, from being planted so much above the level of the soil, and covered with such a great bank

of poor, cold subsoil clay, the plants have a hard struggle to live at all. The most favoured may indeed succeed in throwing out a few new shoots annually, but far more only leaves, while not a few annually give up attempting either. Unless when running water requires to be sent down the ditch, I would reduce the size of the ditch as much as possible. Any surface water is much better carried off by drains, one of which should always be quite close to the hedge. In upland districts, with cold wet land, hedges should never be attempted. I have never seen them succeed. Hedges may be planted with various kinds of plants, either singly or mixed, such as white-thorn, crab-tree, privet, and beech. White-thorn is mostly used alone, though I like a mixture better. I would say that a hedge fence could not be planted and fenced on each side under 1s. or 1s. 2d. per yard. In the rearing and training of young hedges, it is indispensable that they should be kept clean, and well defended by guard fences of some kind. I would be in favour of wire ones for this purpose. It is necessary also that they should be trimmed occasionally, and brought into form. I would not cut a young hedge before the second or third year. I would then cut both the breast and top-shoots, and give it the wedge or A form—broad at the bottom and narrow at the top—leaving it about two feet high. I think many of our hedges are trimmed too narrow at the bottom to make secure fences. I would afterwards trim them every second year for the next 6 or 8 years, at each cutting allowing them to rise in height 6 or 8 inches, according to the progress they made. By this means, at the end of 8 or 10 years I would have a good fence from 4 to 5 feet high, and be able to dispense with the guard or temporary fencing altogether. I am aware many treat their young hedges differently, and that even a few never cut them at all. Many are in favour of trimming every year, while some prefer one shape and some another. In reading a discussion on this subject—that took place in England some time ago—I observed one of the speakers, a proprietor, contended that a hedge should be trained till it was 6 feet broad at the bottom, and he ended by showing what excellent protection such a fence afforded to game. This seems rather an unnecessary waste of land. Still, in looking at our best trimmed hedges, I think we are the other way. Land, no doubt, is valuable, but good fences more so. In the after management of hedge fences there are various systems pursued. The first is to cut the fence annually; the second, to cut it occasionally; and the third, which can only through courtesy be called a system, is to leave it alone altogether. The first gives the fence a very neat and tidy appearance, and those who practise the system consider the hedge thrives best under such treatment. This may be called the advanced system. The second, though less in favour, has most followers, and is the one to which I belong, both in faith and practice. In comparing these two methods, I admit nothing gives a finer appearance to a farm than good, well-trimmed hedges, yet, generally speaking, much depends on whether you have a purely cropping or grazing farm, and whether you are in a high, unsheltered situation or not. Besides, from all I can see, these finely trimmed hedges are frequently more open and bare at the bottom, however close they may be at the top, and are also in a less healthy and thriving state than those only cut every second or third year. Altogether there is more beauty than utility; more show than substance; and more expense than benefit about regularly trimmed fences. I will now leave the respective merits of these two methods to be more fully brought out in the discussion, and would only remark on the third, or let-well-alone system, and that with a view of mitigating that wrath to which I may be exposed from those who follow it, that such fences alone produce that splendid show of milk-white blossom which so much adorns the landscape, pleases the eye, inspires the poet, and perfumes the passing breeze, while they also provide a shady retreat for cattle from the summer sun, and a cosy shelter from the wintry blast. Hedges, however well or ill kept, on a cropping farm, generally overgrow themselves in a longer or shorter period. There is then no other way of renewing it but that of cutting it in or ribbing it, and allowing it to make new wood all over. Either one or both sides may be cut, according to circumstances. When both sides are cut, the height may be brought down to about 3 feet. Cutting of this kind ought always to be done when the fields on each side of the hedge are under crop. If crop should only be on one side of the hedge, then I would only rib that side,

leaving the other till a similar opportunity occurred, so as to prevent having it damaged by cattle. In ribbing a hedge, the cuts should all be carefully made upwards, and the side branches cut pretty close to the main standard. Cutting may be done any time between November and April. This method will generally restore an ordinary hedge, but something more is needed to restore our really bad ones, the handiwork of our predecessors, spoken of before. As perhaps nearly one-half of our hedges are of this character, the task is a difficult and expensive one. With not a few, I am convinced by far the best plan would be to root out the old plants altogether, and plant new ones a short distance from the old situation. In endeavouring to improve old hedges, a very good method is to cut them about 6 inches from the ground, clean out all the old rubbish, dig along the back of the hedge, and plant the gaps with good strong young plants. I would prefer beech ones for this work. Another plan, called plashing, sometimes succeeds very well; where there is plenty of wood, a branch is laid down from each side of the gap whence the fence is being cut, so that the two shall meet in the centre. They are then fastened to the ground by a peg. When gaps are very wide, however, there is no alternative but to fill with plants, and when the soil is poor, a little dung or rich earth may be applied to advantage. I have got another and an entirely new plan to bring before your notice, and though a somewhat novel one, and one which you may be at first disposed to smile at, nevertheless I will state it. It is simply this, when you have an old hedge of the nature I have been describing, allow a good quantity of old grass and under-growth to collect about it; some good March day set fire to it, and give the old half-dead stems a good scorching. They will, though apparently half burnt up, send out numerous fine strong healthy shoots—the basis of a new and better hedge. I saw a rather extensive instance of this kind of renovation lately. A neighbour of mine, who farms his own lands, had two or three fields which had neither been grazed nor cut for the last three years, and which were accidentally burnt down last spring. As the amount of combustible matter was considerable, the hedges were much burnt, and seemed all but destroyed. Now, however, beautiful long healthy sprouts may be seen growing from the roots of the old plants, and while some of the old plants are seemingly dead in the tops, the greatest number are still alive. If the old thorns were now cut down, I believe the hedges would be vastly improved. Whether equally good results would follow every such method, I don't pretend to say. Every one is at liberty to think as he pleases about the matter. We have now done with hedge fences. In upland districts, or where the soil is cold, damp, or poor, by far the best fence is to use a stone one. It makes, indeed, a good fence on any farm, and for grazing land or march boundary it is invaluable. In erecting a dry stone fence, care should be taken to provide good large stones for the founds. The larger the stones, the stronger the fence will be. It is impossible to obtain large stones to build all the fence single, but I would have the butts or double parts short—not more than 4 or 5 feet. I consider a dyke built solely with small stones at the bottom a perfect waste of time and money. Five feet is a very good height for a fence of this sort, and if well built and limed on the top, it will last a lifetime. As to the cost, much depends on the distance the stones have to be driven. They are generally, however, driven by the farmer. The building itself may be done at from 9d. to 1s. per yard. There are many of our old stone dykes in much need of being rebuilt, and that operation can be done for a similar sum, while only a few additional stones are needed. A stone dyke, when erected, is a fence which at once gives good shelter, and entails almost no expense on the farmer afterwards for repairs, unless, indeed, it should be favoured with a passing visit occasionally from our hunting gentry; and then, though there should be a few gaps to build up, the honour of having to do so is considered to be ample recompense for the trouble. The farmer, besides, has the unspeakable gratification of seeing how quickly some can dismount and pull it down; or, better still, the noble chance of being offered a shilling to do it himself; or, still further, being astonished at the style in which each afterwards charges and clears the few remaining stones. In some places gates have been wisely put up to prevent such things taking place. On the estate with which I am connected, this has been partially done, and the results have been very satisfactory. The last description of fencing

we have to consider is wire fencing. It makes a good fair fence, is cheaply and easily erected, occupies little space, and when well put up keeps in cattle or sheep well. When it is intended to be used as a permanent fence, good strong wire and posts should be used, otherwise cattle will soon break or injure it. It may be erected at a cost of from 3d. to 1s. per yard, according to the strength and number of wires, and size of posts used. Railway Companies are adopting wire in preference to thorn and wood fences. I have now endeavoured to bring forward and give an opinion on most of the points relating to the different kinds of farm fences, and the various modes of erecting and managing them; and while conscious that I have not been able to invest my subject with as much interest, or furnish it with so much information as might have been the case in abler hands, yet I have no doubt what is wanting in these respects will be amply supplied in the course of the after discussion.

Mr. CUNNINGHAME (Chapelton) thought hedges, after they were a few years old, were greatly improved and invigorated by being dressed annually, and he believed this system was also the most economical. To give vigour to thorns after being planted, he thought manure of some description should always be put in. He was very well pleased with stone fences, though to render them complete there should be a wire put along the top of them. He did not know whether this would be an advantage to the fox-hunters; but wherever there was a wire across the top of a stone fence the wall lasted longer, for people were not so apt to go across it. He thought wire fences were too open for our northern climate, and unless where done with iron standards, they were very perishable. He thought Mr. Murdoch should have taken notice of the necessity of having good farm gates. In his part of the country, he was sorry to say, there was not one good gate in a hundred. Generally speaking, it cost as much trouble to open a gate as to take down a dyke. It was one of the surest tests of good management to see the fences and gates on a farm in good order.

Mr. CALDWELL (Knockshoggle) said his experience had been confined to thorn fences alone. There used to be an idea that the thriving of a hedge depended on whether or not it was planted to face the sun; but he believed there was nothing in this. The great secret of its growth, he believed, was to put its back to the hill, and then the rootlets fed into the rising land. Where a hedge had been planted with its back downhill, and became weakly, it helped it to put a tile in the ditch, and bring the soil to the level of the roots. Sometimes hedges got into a sort of diseased state; and he thought in such cases a crab thorn was the best to fill up the gaps. It would grow often where beech or other thorns would not grow.

Mr. BONE (East Sanquhar), said both the altitude and situation of thorn fences had a good deal to do with their growth. For instance, in situations within three or four miles of the sea, such as some of them were placed in, hedges, more particularly those with their broadsides to the sea, were invariably injured by the storms and the sea spray. This was particularly the case where the subsoil was light. In many such cases it would be better if some other kind of fence could be substituted; for fill the gaps as they might, the hedge proved a failure. He remembered once carting a quantity of ballast brought over by Irish vessels to the harbour, and putting it along the back of a hedge which had begun to canker. It did good for a time, but portions of the hedge were again dying out, and it seemed that nothing would cure it. His experience was that the hedges were easier kept in higher altitudes than in the lower districts near the sea.

Mr. WHYTE (East Raws), said this was a subject that demanded more attention than it had received. A well kept fence improved the look of a farm very materially; and farmers ought to get a considerable amount of encouragement from their proprietors to attend to the fences and gates, as they gave an estate quite a different appearance when properly attended to. In the district he came from the hedges were not particularly good. They had had their origin at a rather early date, before the country presented the appearance it did now; and some might think they owed their arrangement to some awkward ideas of the managers of the soil at that time. But it should be remembered that in those days the country was apt during winter to be overrun with water, and the fences had to be placed on the tops of the ridges, which were not always straight, and consequently gave rather a curved line to the

hedges. Generally the ditch or face of the fence was turned to the hill, so as to catch the water when it came down, but he agreed with Mr. Caldwell that it was better to have the back of the hedge to the hill. Mr. Murdoch seemed to approve of a hedge being planted on the level rather than with a ditch; but he differed with him in this. In the district he came from, where dairy farming was generally followed, they found that hedges grown on the level were apt to be eaten over by the cattle grazing on both sides, and thus became unhealthy. He thought it was better to allow young fences to be five or even six years old before they were dressed. To begin dressing them at two years old, as Mr. Murdoch preferred, never allowed the plant to get up to a proper height; and, according to the height, so was the strength of the stem generally. Afterwards he would approve of dressing every year. Mr. Murdoch seemed to prefer a wire protection to the young fences from the cattle; but he invariably found that a young fence grew better by being protected by old thorns set up on each side of it. It was not so much exposed to the storm, and grew better than when protected by wire fencing. Where plenty of stones were to be got ready to hand, he would consider a stone fence as cheap, and better for shelter, than any other kind.

Mr. ROBERTSON (Ryeburn), said that in the district where he came from, when making a new fence, they commonly adopted a plan that had not yet been referred to, viz., that of making a sunk fence. They were built somewhat in the same form as a ditch fence. They first of all cut out what was to be the foundation of the fence, and then built sometimes a foot, and sometimes fifteen or twenty inches of stones, and laid the thorn bed on the top of these stones. Then the earth from the slope in front was thrown over behind the thorn roots, which gave them plenty of good soil, while the roots were kept up from the subsoil. This kind of fence, though a little more expensive, took up less room, and was the best thorn fence they had when well taken care of. He agreed with Mr. Cunninghame as to the trouble there was connected with farm gates. He had experienced this himself; but a few years ago he spoke to his landlord to get some iron gates made by the district blacksmith. He had now seven of them, and he believed they would last a century. The blacksmith provided them and fitted them on for some 2s. or 25s. each. He did not hang them on iron pillars; for he generally found that iron gates hung on pillars were always getting off the plumb. The way he did was to build a wall four feet behind the gate, and two feet thick, with a large stone at the end reaching to the top of the wall, to which the gate was hung. He knew gates hung in this way that had stood 50 years. They were a little expensive to put up, but were most durable, and gave little trouble.

Mr. BROWN (Ardneil) said he neither agreed with Mr. Murdoch nor Mr. Whyte as to the best time to begin dressing young hedges. To begin at two years was too early; but to allow it to stand till it was six years old would allow the hedge to get out too much at the sides. They should be guided as to the proper time for dressing by the appearance of the hedge. The sooner it was cut in his opinion the better, if there was sufficient strength of standard left. A great many thorn hedges had no body; but just great branches at the top and thin at the bottom. This took away from the usefulness of a hedge, except for shelter. His opinion was that a thorn hedge should always be kept down till it got thick at the bottom, and that it should be always kept thin at the top. As to whether a hedge should be dressed every year depended, in his opinion, on soil and situation. On poor soils, where the growth was slow, he would say once in two years would be sufficient; but on good land he would dress them every year. It was of importance to protect the young hedges from being eaten by sheep or cattle; but he was surprised to hear Mr. Whyte recommending old thorns for that purpose. These would inevitably encourage the growth of thistles, grass, and weeds, which would have a tendency to choke the young thorns. He thought a wire fence about three feet from the young hedge was the best mode of protection. He had a number of stone fences on the farm where he now was. He did not know whether it was that they were ill built, but he could not say that they were good, and he was not sure they were profitable. He did not think they gave very good shelter unless they were put up very high and were very closely built. His objection to wire fencing was that it afforded no shelter.

Mr. FERGUSON (Auchenbay) confessed that Mr. Murdoch's

plan of burning the hedges was something quite new to him. If he had known Mr. Murdoch's plan some years ago, and if it was really effectual, of which he would like to have some further proof, it would have saved him many a pound.

Mr. DALGLISH (Templand Mains) thought Mr. Murdoch's remarks about the planting and managing of fences were pretty correct. He had planted a number of hedges about seven years ago, and they were now just coming to be fences, and he was taking away the wires from them. The way he did was to examine the nature of the soil and the situation where they were to be put, and if possible to adapt them to the circumstances. He believed it was a great error to make too deep ditches and too heavy banks, but it was also a great error to make them too light. These must be adapted to the soil. On poor soils, as Mr. Cunningham had remarked, it was a capital plan to give them plenty of manure at the first, as it brought them sooner to maturity. In high altitudes and a poor climate he would never think of scutching the hedges oftener than once in three years; if done oftener, they would be apt to fog and die out. He had had some experience of the burning system. The Iron Company happened to lay a bing behind one of his old dykes, and roasted it, and he thought the hedge would be destroyed. But the fire seemed just to anger the old thorns, and they grew remarkably well after it. If they would only let it stand now it would do very well, but if they gave it another dose or two he would not be sure about it.

Mr. LAUGHT (Grange Mains) agreed with some of the remarks made by Mr. Dalglish. If he were a proprietor he would not approve of dressing the fences every year, because he thought it weakened their growth; but he would vary according to soil and climate. He agreed with Mr. Murdoch as to the benefit of cutting down old thorns to about nine inches from the bottom. He had proved the utility of this. The best time for cutting down old thorns, in his opinion, was about the month of April, when the sap was coming. If they cut them in November they were apt to give way under the winter's frost.

Mr. WALLACE (Brachhead) said our forefathers had reared too many fences for the present system of farming. He was in a farm once where there were seventeen divisions, and the first thing he began to do was to put them into six. Where there happened to be good fresh thorns, he transplanted them at very little cost into trenches, filled in the bottom with surface soil; and now at an interval of twenty years these hedges were still growing vigorously. He thought thorn fences were as much in need of a little manure occasionally as anything else. Perhaps manure in a raw state was not good, but decomposed vegetable matter did very well. This could be done in seasons when the land was being green-cropped. He would recommend the filling-up of gaps by transplanting good fresh thorns of some years' growth. He would himself go miles to get thorns for that purpose.

Mr. YOUNG (Kilhenzie), thought that hedges and gates were rather neglected in this county. He thought more favourably of wire fences than some of the speakers, and in the higher districts or on moors where stones could not be got, and thorns could not be easily grown, a wire fence was calculated to be of great service, and it could be erected at moderate expense. The renewal of fences by fire was, he thought, rather a dangerous experiment; the difficulty would be to know when they were burnt enough. Where stones could be readily got, he approved of that kind of fence as giving good shelter, and being able to be kept up at less expense than any other kind. He had found on his farm that it was desirable to let some of his hedges grow to a considerable height for shelter, and on that account they were not trimmed so well as they might be.

Mr. REID (Clune), did not approve of cutting hedges every year except just along the road-side for appearance sake. He

thought one cutting in 4 or 5 years was sufficient for hedges intended to give shelter to cattle. If cut every year they were more subject to be eaten by the cattle. The neighbourhood in which he lived was very unfavourable for the growth of fences, and they needed great attention to keep them from dying out.

Mr. MURDOCH, in replying, said the reason why he had not mentioned gates in his paper was that he did not think they were properly embraced in his subject. Mr. Whyte had expressed his preference for an old thorn guard for young fences; but this would require to be renewed every year, as he never knew old dead thorns last more than a year. Besides, as Mr. Brown had remarked, it would encourage the growth of thistles and weeds. In regard to the renovating and keeping of hedges in order, the system followed on the estate on which he was a tenant was to employ a man for that special purpose, paid half by the landlord and half by the tenant. He thought that system was very beneficial, as the general farm servant could not be expected to trim hedges as they ought to be done.

The CHAIRMAN corroborated the remarks made by Mr. Bone and Mr. Reid as to the difficulty of growing fences in the district where his farm was situated. He agreed with Mr. Murdoch that fences should be planted on the flat, provided the land was drained as all cultivated land ought to be. Of course the subsoil should be dug out if it was poor, and rich earth and manure of some kind introduced. The knife should not be used too freely on young fences; they should be four or five years old before they were touched, and not trimmed oftener than once in two or three years afterwards. In speaking to a gentleman to-day who was a member of this club, but who could not be present at their meeting, he remarked to him, "It is very easy growing fences where you have everything your own way; but if you have got a good many hares and rabbits about, you will not grow good fences. I put in 4,000 thorns one year, but I don't think there are half a dozen but what were destroyed by the hares and rabbits." This was an element in the question which had not been taken notice of to-day, but he believed it was impossible to grow fences and keep them where there were rabbits burrowing in the sides and about the roots of them. He differed with Mr. Murdoch about gates not being included in his subject, as he thought no fence was complete without a gate. Mr. Young had made some remarks, which he would bear out, about the necessity of allowing fences to grow to a considerable height for purposes of shelter. He found that a considerable advantage on the farm he was now in. He remembered when he came to Shields thinking his hedges had been very much neglected and allowed to get their own way, but he could see now the reason why the former tenant allowed the fences to grow so strong—it was for the sake of shelter. Mr. Wallace had spoken of his sub-divisions being too small, but his were too large. As he had only six divisions in 280 imperial acres, he found there was great want of shelter for cattle, sheep, and also for grain crops. He believed they lost more from the shaking of grain in unsheltered situations than any other way. In his case, with fields 600 yards long, there was little shelter from the western gales, and he found that cattle and sheep suffered very much from that cause, and he was certain they required a greater amount of food to bring them to condition than if they had good shelter. He would be inclined even now, after the experience he had had, to erect shelter for both cattle and sheep, but sheep especially, during winter. He believed it tended very much to increase both the growth of wool and of mutton. He believed a big thorn fence afforded much better shelter than a stone dyke, as any one could judge for himself by trying it.

CAPITAL IN AGRICULTURE.

At a meeting of the Gloucestershire Chamber of Agriculture, Captain de Winton in the chair, Mr. D. LONG read a paper, in which he said the causes calculated to prevent the investment of capital in agriculture are these—1st, the law of preference, or the prior right of the landlord to seize for rent;

2nd, the constant increase of local rates and taxes; 3rd, the game-laws, and over-preservation of game; and 4th, insecurity of tenure. And, first, as to the law of preference. It is manifest that when, as the law stands at present, the landlord has priority over other creditors for rent, a tenant with in-

sufficient capital to develop fully the productive power of his farm is, in the eyes of many landlords, an equally eligible tenant with a man of ample capital, more especially if, as is generally the case, he be willing to pay a higher rent than a better class of tenant; provided only that the value of the tenant's farming stock be sufficient, in case of an emergency to secure the full payment of the rent to the landlord. This unsatisfactory state of the law unfairly increases the competition for the occupation of land, and is often productive of great mischief in decreasing the fertility and cleanliness, and reducing the productive power, of the soil; and I think that if landlords were obliged to share the assets of insolvent tenants equally with other creditors, they would naturally become more anxious to find tenants of good standing and with sufficient capital, the speedy consequence of which would be a fuller development of the productive capabilities of the soil, owing to the introduction of the larger capital of the improved class of tenants. Secondly, as to the increase of local taxes. The great and continual increase of local taxes discourages the application of capital to agriculture so long as that capital, if otherwise employed, is not subjected to them. And, moreover, we are further threatened with an additional increase and discouragement for the purposes of education, which, like many other burdens to which personal property does not contribute, certainly must be a national obligation, and the cost of it should not be borne by real property alone. I now come to the third part of my subject—the game-laws and over-preservation of game. I am of opinion that the game-laws, as they at present exist, tend more than anything else to excite feelings of jealousy and distrust between landlord and tenant, and to diminish those feelings of friendship and cordiality which ought to exist between all classes, and more especially between the owners and cultivators of the soil; and I think that these special laws with regard to the preservation of game are an anomaly which requires the immediate attention of the Legislature, with a view to their entire repeal and the substitution of an effective law of trespass. With regard to the over-preservation of game, I would ask why should a landlord take a tenant as occupier and receive the absolute value of the land annually in the shape of rent, and then, through the medium of his gamekeeper, stock the same land and consume the produce grown on it by, and at the expense of, the tenant with game reserved for his own exclusive use and enjoyment? This is the case in the neighbourhood of Gloucester to some extent, and in many places in this county, and I say it is high time that such an unsatisfactory state of things should cease, and that all game should be made the property of the occupier of the land on which it is kept. Landlords who preserve game and reserve the right of shooting, and more especially those who let this right, ought to be compelled to contribute to the rates and taxes in respect of the annual value of such right of shooting. The custom of letting the shooting of estates to strangers, who, having paid for the right, naturally think themselves entitled to exercise and enjoy it to the utmost, and who have no inducement to conciliate and obtain the goodwill of the tenants, is, I think, one of the causes of careless and ineffective cultivation of the soil. This custom often has a kind of demoralizing effect on the tenantry, and, though landlords may have a legal right to do this, they ought to feel themselves under a strong moral obligation not to give power to strangers thus to damage, discourage, and annoy their tenants. If landlords are desirous of preserving their game, why do they not keep land in their own occupation for that purpose? They might then honestly and fairly preserve as much as they wished, since the benefit and enjoyment they would derive from the game would be counterbalanced by a corresponding diminution of income or deficiency in their own crops, instead of, as at present, in the crops of their unfortunate tenants. I now come to the fourth and last division of my subject—insecurity of tenure. And this is a very difficult subject to deal with. A lease is undoubtedly the most desirable and best safeguard to the tenant, and offers the greatest inducement to increased exertion and more liberal employment of capital. But, setting aside the question of leasing, I am of opinion that if all tenants, whether holding from year to year or otherwise, were provided by our law with as ample powers and facilities for recovering the value of their permanent and unexhausted improvements on quitting their farms as landlords now have for recovering damages in cases of breach of covenant and dilapidation, this would go far to obviate the difficulty, inasmuch as it

would induce occupiers without leases to develop the capabilities of their land by the introduction of the greater capital, and would prevent unscrupulous landlords from robbing their tenants of the capital thus introduced.

The CHAIRMAN said it would be a very unhappy result when good feeling between the landlords and tenantry of this country should cease to exist, and the members should discuss the matter with temper and discretion. He did not put himself forward as a practical farmer, but he yielded to no one in interest in agriculture, and desired, in order to avoid one-sidedness, to look at the matter alike from the landlord and tenant's point of view. He quite agreed with Mr. Long in his first proposition that if we could always have tenants on the farms of England with sufficient capital to work them well it would be better alike for the tenant, the landlord, and the land, and certainly much better for the community at large; for if the judicious employment of capital upon a farm does not make that farm pay nought else will. The only difficulty in thinking of the proposition is that its general adoption would to a great extent put aside the men of small capital. And we should have further to decide what is a sufficient amount. A landlord having a farm in a certain condition would naturally say to an incoming tenant, "I've put my land in a very good state at considerable cost to myself, and I desire that you shall prove to me you have sufficient to preserve it in that condition, so that after a certain time it may not be returned into my hands deteriorated." The tenant would answer that truly the land was in a certain condition, but that there was room for the application of more capital, which he must supply; and thus the matter would be discussed between them, and the result be an agreement mutually fair. But you would find great difficulty in securing the landlord in case his tenant became bankrupt or shouldn't leave sufficient on the farm to make up the rent. Landlord and tenant are equally interested in preventing a greater burden than they should bear falling upon land and real property. The fundholder has an equal interest with the man with real property in the maintenance of the poor and of roads—which will shortly be thrown upon real property—and in matters of education. The game-laws was a very proper question to discuss here. If a landlord is not himself an occupier, the tenants would wish that he should have some amusement in the neighbourhood in which he lives; and there might be and should be such a cordial feeling between him and his tenants as that the benefit of the game on the estate should be shared. He should like to agree with a tenant somewhat in this way: "I'm very fond of shooting; there's a certain amount of game upon the farm you are about to take; you or your sons enjoy sport: let us come to some equitable arrangement by which we can both share the sport, and the game on your farm shall not amuse me to your injury—that you shall not, in fact, raise crops upon which my game feed at your cost." The tenant, in most cases, would say, "I and my sons are as fond of shooting as you are, and if you'll only say what amount shooting you would like, I'll always take care that you have it. I only ask that when you shoot I or some of those connected with me may be allowed to go with you or alone." I believe if this plan were followed, the landlord would have as much game as he wished for, and the tenant would be given an interest in its preservation. He protested against the letting of the game on an estate, for as a tenant he should certainly say to a landlord whose farm he thought of taking, "Whatever agreement we make, there is one thing I must stipulate for: I can't allow a stranger and his keepers to come upon my farm and interfere with my produce and go over my land whenever he pleases." Such a system as he had sketched would nurture a sort of clan feeling between landlord and tenant, while the vermin, rabbits, should be disposed of at the will of the tenant, and that the sooner they were exterminated the better. But you should not lay down strict laws; they would interfere with independence on either side. When an honest landlord and tenant meet together, all matters can be duly arranged without appeal to a legal court. His legal knowledge did not suffice to enable him to say whether a lease or a yearly tenancy was the better, but if it were possible some competent valuer should go upon the farm when let and state the condition of the land, and when given up should compare its condition then with its former condition, and the difference in value should be paid to whichever side it were due.

Mr. CLEMENT CADLE said: I think Mr. Long has left out

the chief cause which prevents the application of capital to agriculture—and that is that it pays better in almost every other way in which you can invest it. It was a very easy matter to discover whether a farm required £8, £10, £12, or £15 an acre for its working, and certainly no farm should be let to a tenant with capital insufficient for its working. With reference to leases, they were fast going out of fashion; and hence the greater necessity to agitate for a good system of Tenant-Right—a system which answered very well in Lincolnshire and other places, which had to some extent been recognized by the Government in Ireland, and which in its nature must necessarily be equally for the benefit of landlord and tenant.

Mr. T. MORRIS expressed his curiosity in regard to the origin of the landlord's undue preference as a creditor. The game question was a very delicate point for any set of men to discuss, and said he always looked upon it as a matter of mutual agreement between landlord and tenant. The landlord lets his farm with or without game, and therefore it is a matter of agreement. We should never have heard so much about the game-laws if gentlemen had been content with legitimate sport. They don't go out now for sport; the whole idea is to make a large bag, and the man who makes the largest bag is thought the most of.

Mr. CURTIS HAYWARD said that the question of landlords' preference had been much discussed of late, particularly in Scotland, where it was of far wider importance than in England. It was a privilege the landlord might very fairly yield, seeing that it was very seldom used. If privilege of distress did not exist, there would be the greater inclination to use that power of re-entering upon the land and taking possession of it which forms part of most leases. But all these matters should be arranged with due regard to mutual interest; anything giving exclusive benefit on either side should be fairly put away. He did not think there were many tenants who were really much damaged by game. Of course if a man took a farm upon which game was moderately preserved, and the landlord increased the stock without making ample compensation, he would be doing the tenant a material injury. But, on the other hand, if a man takes a farm upon which the quantity of game is diminished, the landlord has an equal right to say to him, "You took the farm under very different circumstances to the present, and therefore I am entitled to the increased rental due." But in the case of great people who preserve game to the enormous extent they do, the country itself has a right to urge a grievance. Between the landlord and tenant it is, or it should be, a matter of mutual agreement; in the case of injury to the country, the practice should be thoroughly discouraged and deprecated. The profit of letting game was far less than the profit of uninjured crops. With regard to leases, they were not needful to enable farmers to make the most of his land, and certainly they were often inconvenient. But he thought a fair system of compensation was possible in all cases, though he considered it impossible to lay down any regular law without leading to evils and abuses—for instance, to a system prevailing in some parts of Surrey, under which the amount required from the in-coming tenant made it profitable for some speculators to live by taking and giving up farms. But it was obviously quite as much to the interest of the landlord as to that of the tenant that a farm should be yielded up in good condition; there is no man taking a farm who would not be thankful to pay all it can possibly be worth to receive the land in good condition; and therefore it must be to the landlord's interest to encourage any system having that result. In reference to local taxation, the question was attended with much difficulty and should be carefully discussed, and it would be well to keep up a little pressure in order to induce Government to take it in hand as soon as possible. Government should not be deterred from taking it up because of its difficulty; and it was very clear that because the system was the only one which could be adopted in the time of Elizabeth was no reason why we should continue it without change.

Mr. CAPEL said: I have been a sportsman all my life, yet have had no difficulty with tenants, and I can see no reason why there should be difficulties. I think the system of letting a large farm to a tenant, and then, living a great distance from it, to employ a keeper to preserve a large stock of game upon it, and come to it twice a year shooting, is a very bad system, and tends much to the deterioration of good farming and the decrease of produce which should

benefit the country. In cases of landlords who do not care much about sport, they might employ a keeper and send their friends to shoot or let the shooting; but in the latter alternative I think the tenant should have the first refusal of the shooting, his rent being slightly increased because of the privilege, and that thus the man who is practically a foreigner to the neighbourhood should be excluded. The wise plan was to give the tenant the refusal of the shooting. With regard to Tenant-Right, I used to farm pretty largely thirty years ago, and I believe that the system prevailing then is now altered, and that the principle is generally adopted of paying an outgoing tenant for all improvement. I dare say there is some valuer present who always in his valuation regards the condition in which a farm is left; and I quite agree with Mr. Curtis Hayward that an incoming tenant never objects to pay additional compensation for the farm being left in a good state of tillage.

Mr. LONG alluded to a landlord accepting the poor tenant who offered a little additional rental. Now it was a very difficult question to know what rent should be, and there are few people capable of dealing with it. In these days of science farmers don't care to send out their corn-laden waggons in the middle of the night, as they used to do; and in determining the rental you have to consider questions of local and railway situation, and so forth. Farming has made rapid strides of late years. He began in 1828, and farmed for nearly forty years; and at that time there was no regular system of tillage laid down. Since the formation of the Royal Agricultural Society the views of landlords and tenants alike have been very much enlarged with regard to farming; and we cannot succeed in these days unless you adopt the motto of that Society—Practice with Science. No doubt it is needful that a certain quantity of land should be rented. But the amount of capital needed varies in different localities: several farmers living in their hilly country have to employ four horses to do work which farmers in the vale could accomplish with two. Hence the necessity of a landlord seeing the need of his tenants; and they lived in a country wherein most of the landlords resided upon their estates and were thus enabled to arrange with their tenants and work with them—and a tenant will always work with a landlord who will work with him. There were many people in these days who urge that farms should be subdivided. We heard a man say one day that no farmer should occupy more than fifty acres of land. Such a man could know nothing of farming. The question of landlords' preference was one for the Legislature of the country, but he should like to hear an answer to Mr. Morris's question as to how it originated?

Mr. H. BUTT then said it was untrue that, as a general principle, tenants were compensated for improvements they made upon their farms; but Earl de Grey's agent told me in London some years ago that on the Earl's estate there was a certain system of compensation to the outgoing tenants, and that, as a result, he had never had a farm left in a bad state of cultivation. With regard to ascertaining what rent should be charged, there's rather a novel system sometimes followed of getting persons to value land for nothing by putting up farms to be let by tender. I think that such men as Mr. Knowles and Mr. Clement Cadle should know the value of land sufficiently to make such a system as that needless. A case of the kind recently occurred within my own knowledge. I was one of several persons who made an offer for a farm put up by tender, and which was eventually let to a man who had made no tender, the landlord thus getting our ideas of value without cost. As to the farms of fifty acres, such a system is very good for market-gardening; but I don't think there are many farmers with capital who would care to put their shoulders to the wheel to earn eighteenpence a day.

Mr. LONG said he had only desired to refer to the game-law discussion at Winchcomb, where Sir Michael Beach's opinion that the abolition of the game-laws would cause a non-resident proprietary, and that the game should be a matter of agreement between landlord and tenants was very well answered by Mr. Holland in urging that the game-laws should be swept away in order that the land might be left clear for agreement between landlord and tenant.

A resolution was put and passed, "That it is highly desirable that the liberal application of capital to agriculture should be encouraged in every possible way."

THE FRIENDLY SOCIETY ASSOCIATION.

A conference has been held at Maidstone on the question of Friendly Societies, when the chair was taken by the Earl of LICHFIELD, the president of the Association, who said that a Royal Commission was about to be appointed, which he was very sanguine would lead to very important results in its bearing on the question of friendly societies generally. In the appointment of that commission the Friendly Society Association, he said, had been very active. He would glance at the causes which had led to that commission having been appointed, and the efforts that had been made by the Legislature to bring about improvements in the condition of friendly societies generally, and to encourage provident institutions among the working classes. Under the Consolidating Act of 1855, which was passed for the purpose of encouraging and regulating friendly societies, evils had grown up which they had met for the purpose of discussing, and pointing out what are the remedies which they thought ought to be applied. It was not at all necessary for himself or anyone else, he said, to enlarge on the importance of provident institutions for the working classes. On that point he would take it that they were all agreed. In pointing out the remedies for those practical defects in the management of those institutions, he said they must be careful that they did not in any way make suggestions which might interfere with the good points in those societies, or in any way interfere with that spirit of independence and self-reliance which had prompted the establishment of many useful and good societies throughout the country. First among these he took the large affiliated societies, such as the Odd Fellows and Foresters, and he asked whether, as regards this class of society, there were not certain admitted evils connected with the vast amount of good which, undoubtedly, existed in the management of these societies. He said admitted evils, for he had scarcely on any occasion, when the subject had been publicly discussed, and leading members of Odd Fellows and Foresters had been present, not heard opinions expressed by them as to certain defects in the management of those institutions. They had an imperfect manner of keeping their accounts, and of sending up their returns to the Registrar. As a body, the Odd Fellows and Foresters undoubtedly had a very correct appreciation of what rates are really required to make their society, as a society, sound, but, unfortunately, they had not been able to secure the adoption of those rates in all their lodges. Then there was another question in connection with those large affiliated societies which bore very materially on their efficiency, and that was the payment of sick benefit after an age when it was very difficult to distinguish between sickness and incapacity from old age. With regard to the accounts, of the 22,000 annual returns asked for by the late Registrar of Friendly Societies only 10,000 were sent in. His lordship then referred to the county societies, of which they had such an admirable example in this county, which, he said, were not so popular with the working classes as one would think that they deserved to be. Even in this county, where the society was admirably managed, he was afraid that the proportion of members to the population of the whole county was, after all, very small. Now that certainly pointed to the importance that the working classes attach to the management of those institutions being in their own hands. How that could be combined with the efficiency of management and security provided by such a society as the Kent Friendly Society was one of the questions which might be very carefully considered. Then, he said, there was a vast number of societies attached to public-houses, most of them thoroughly unsound. That was a sort of society which he thought it would be almost impossible for the Legislature, or the efforts of benevolent persons, effectually to deal with. How to provide a substitute for them was one of the subjects which would have to be considered by the Royal Commission lately appointed. In reference to that he wished to say with what great pleasure he had heard that Sir Stafford Northcote was appointed the head of that commission. He believed it was utterly impossible for the Commission to be in better hands, and he

thought Sir Stafford's appointment as chairman was as good ground as they could possibly have that the Commission would come to a satisfactory report, and afford Parliament an efficient guide in legislating for the future. In the town of Newcastle alone there were 18,000 or 19,000 members of sharing-out clubs, and the argument that was used in their favour was that the population in that district was of such a variable nature that it was the only sort of club which would really suit the wants of that particular class. Those clubs were, of course, utterly and entirely inconsistent with the principles of all provident institutions, but to what extent there was weight in the argument which was used was, of course, a matter for very careful consideration. There might be a great deal to condemn in them, but those societies must not be considered as altogether wanting in some of the features that make provident institutions attractive to the working classes generally. They now came to Burial Clubs—societies of a totally different nature, and to the proceedings of which they were mainly indebted for the fact that Parliament had at last made up its mind to inquire thoroughly into the subject. He had on many previous occasions called public attention to the very serious evils that he felt were connected with the management of that particular sort of insurance office. The operations of some of these insurance societies were upon a gigantic scale. The Royal Liver Society was receiving from the working classes no less than £176,000 a-year. That society has at the present moment £232,000 of invested capital, and the expenses of management were about 40 per cent. on the whole of the income. Some of the arguments used in favour of such societies were very plausible. It was said that the only means by which they could persuade the working classes, as a mass, to join a provident institution at all was by going from door to door, visiting them, and entreating them to join a society. They were kept up by a huge system of advertising, which had been most successful. But then came the question whether, having succeeded in securing a desire for providence among the working classes, the societies were really in a position to meet the liabilities which they were accepting. Upon that point he candidly confessed he had never heard any opinion which placed him in a position to form a very decided conclusion. They were told by those societies that the rate paid as a premium was sufficient amply to cover the 40 per cent. of their expenses of management, but if they came to look for any statistics, or any information which would bear out that statement, he must say he entirely failed to find them. The number of members and their average age was not even known to the managers of the society. Without feeling the slightest desire to say anything which might injure any institution which directly or indirectly benefits the working classes, he must say that that was a subject which would require careful consideration at the hands of the Commission to be appointed. Unless they succeeded in obtaining information from the hands of the members of friendly societies themselves their labours would be entirely thrown away. How was that information to be obtained? Obviously but in one way—that of sending Assistant Commissioners into every large town in the country, where they would be able to obtain from members, and those who were carrying on the work of those societies, exactly the mode of conducting the business, and the manner in which the accounts of the society are kept. A proposal had been made to establish a Post Office Friendly Society, and in answer to the question whether an equivalent advantage was to be gained in Government security for that tendency which would probably exist to discourage that self-reliance and habits of independence, which induce so many of the working classes now to manage these societies well for themselves, he said that instead of injuring the societies to which he had referred, it would have the effect of bringing a vast number of members to join them, simply because there would be a greater appreciation of the advantages of provident institutions generally among the masses of the people. But if it were asked was it practicable for the Government to undertake the management of a benefit society, he must confess that he had the gravest

doubts on the subject, although he should rejoice if such a thing could be brought about. He would then refer to the great success attending Post Office Savings' Banks, and the comparative failure of the insurance and annuity scheme, and pointed out what he considered the causes. If the Government had any real intention of providing the necessary security for the working classes in the matter of insurance, they must go at any rate as low as £5.

The Hon. and Rev. SAMUEL BEST, one of the secretaries, read the following report :

The report or statement, which as the secretaries of the Friendly Society Association we have to lay before this meeting, is rather an expression of the hopes of the future than details of the operations of the past. It is not that the Association has no history or no past transactions to record, but that it hopes, in the present very unsettled state of the Friendly Society question to take up a part which shall be useful in the settlement of the vexed points now at issue, and to render aid in the formation of a good and sound, and settled system on which the friends and founders of friendly societies may for the future act. It may be interesting, however, to those who for the first time hear of this Association to know that it is not a new society now springing into existence for the first time in these days of great fertility in this respect, but that it has been labouring for some years in a quiet unobtrusive form, endeavouring to bring societies together, and to correct some of the evils under which they have been labouring. It arose in a union of the three county friendly societies of Hants, Wilts, and Dorset, about the year 1863. Its first meeting was at Salisbury in 1864, under the presidency of the Right Hon. T. S. Estcourt. It then removed to London, and enlarged its scope and interests by including all friendly societies within its operations, but still holds its meetings in the country, moving from place to place, to meet the convenience of its members, and according to the nature or locality of the business which came before it for consideration. Several very important questions, as matters of appeal, or advice, have at different times been submitted to it, and efforts were made, but not with any great success, to procure from the different societies in union with the association, such returns of sickness as might afford some practical guide in determining the soundness of the tables on which societies are acting. The opening of the Friendly Society question last year, and the efforts made to secure for them a safer and more equitable basis determined the managers to give a more central and general character to the association. By the implied permission, and though the kindness of the Society of Arts, it was allowed to hold its meetings in the rooms of that centre of social improvement. It reformed its rules, added largely and prudently to the numbers of its vice-presidents and council, and had the good fortune to secure for its president the noble earl in the chair. The object of the Association is fully set forth in the prospectus, and claims to be the promotion of friendly societies or benefit clubs upon sound principles of assurance suited to the industrial and labouring classes 1st, By devising plans for the development of the principles of insurance societies. 2ndly, By the examination of the rules of societies, and suggestions for their alteration or improvement. 3rdly, By the encouragement of the interchange of rights and privileges between the members of different societies. 4thly, By consideration of the bearing the Poor Laws on Friendly societies. 5thly, By the suggestion of legislative measures. 6thly, By acting as a court of reference or arbitration. To these your secretaries would specially request your attention, and in saying a few words in enlargement or explanation of its object, close this report or statement of the designs, proposals, and objects of the Association. It will be readily admitted that friendly societies and benefit clubs are not now upon sound principles of assurance, nor upon such a basis as is suited to the industrial and labouring classes. It is very desirable that the real position of friendly societies should be recognized. The Government of the country endeavoured to give protection against insolvent and fraudulent officers. In the eyes and judgment of the public, in spite of all reclamations, it has been supposed that the signature of the registrar certified the safety and soundness of the society. Even the variety of rules and tables, and the wonderful differences and discrepancies of the latter does not appear either to open the eyes or shake the confidence of the members or their friends. The late Mr. Tidd Pratt constantly disclaimed, but in vain, that his signature

certified anything more than the legality of the rules, and that the tables had been certified by an actuary. To the varieties and discrepancies of those tables allusion has been already made. To the same actuaries are referred the quinquennial valuations of the liabilities and assets of the societies, and with the same uncertainty. These are difficulties and obstacles which require and ought to be provided against, but there are others, and especially as contemplating village societies, which are of a still graver character—namely, the inadequate hands into which the management and working out of such societies fall. The calculations and tables may be perfect, the rules carefully and wisely drawn up, and the whole society *en regle*, but if it wants an understanding mind or minds to enter into the spirit of it, or habits of business and account in its officers, what security can be felt in it? It is too nice and close in its calculations to leave any margin for incapacity or fraud. It may be hoped that these points will be brought under the consideration of the Royal Commissioners about to be appointed, and that such a body of men will be put upon that commission as will be capable of entering into the real difficulties of the case, and who, not treating it merely as a financial question, will see in it one which affects vitally the dearest and best interests of the largest class of her Majesty's subjects, and who, at least in this respect, require more than all others encouragement and protection. It is the best, most thoughtful, and most provident of the working-classes whose interests are involved, and we must not on the one hand either ignore their present state, which education it is to be hoped will enlighten, nor must we throw them off into the cold shade of perfect freedom and irresponsibility without an effort on the part of the Government of the country to give security to their societies, their savings, and investments, by protecting them against incapacity and fraud. The efforts of the committee on friendly societies, which laboured to procure the Royal Commission on this important subject, must not be passed over without the warmest thanks of all the promoters and members of friendly societies, and especially of their sister association, which is now labouring to carry on and complete the work. The result must rest with the commissioners not yet appointed, but if the subject be not inquired into in all its ramifications and consequences—if it be contracted or limited in its application, and the opportunity be lost—it will be a cause of grief and lasting grief to those who have looked to it, and, reasonably, for the clearing up of a great question, and for the removal of the overwhelming difficulties which now paralyze the exertions of those labouring to secure independence, and to keep themselves from the cold comfort and charity of the poor's rates. It is earnestly hoped that the papers about to be read, and the discussion provoked thereby, will lead to the elucidation of questions of interest, and the furtherance of the cause which our very presence here shows that we have at heart.

The Hon. EDWARD STANHOPE, M.A., read a paper on "Benefit Clubs from the Point of View of the Agricultural Labourer." After describing the "sharing-out," and similar clubs in the rural district, he thus concluded: The last agency to which I would direct your attention is one that has often been described, and has of late years met with increasing favour. It is the proposal to extend the system of Post Office Insurances, and to enable labourers to insure themselves at the Post Office for sickness-pay, just as they can now secure annuities. It is a scheme which has been strongly advocated by several able writers, which received the approval of the Royal Commission on the employment of the agricultural population, and was strongly urged upon the attention of the Government by a deputation from the Kent Friendly Society, and numerous other associations in Kent. "It was in effect a petition for a Post Office Friendly Society, which being conducted by the same central authority which is already managing the business of annuities and sums payable at death, shall make its way to the labouring classes through the same channel, the country post offices." One formidable difficulty in the way of the adoption of any such scheme is the enormous amount of additional labour already cast upon country postmasters. But this appears to me to arise not from the excess of labour, but from the miserable remuneration offered for the services performed. Higher pay would soon secure a class of persons well able to undertake an extra duty which, although responsible, would not be very onerous. But would it be possible to guard against imposition, the usual safeguard of personal supervision by neighbours, members of the same club, being removed? The

conclusive answer to this briefly is, that in practice small local clubs are not found to suffer less from imposition than large county ones. The county of Kent Friendly Society, for instance, whose operations are extended over a very wide area, claim that their sickness rate is not only not greater than in small societies, but is actually reduced to a little more than one-half by the energetic means of self-protection adopted by the society. Would not a Post Office Friendly Society have the same means of guarding against fraud! Such a society, besides the unquestionable security which it would offer, would extend a trustworthy system of insurance to all parts of the country, and would give facilities to the members of moving from one part of the country to another, and of making or receiving payments in their new home, far greater than those offered by the large organizations, such as the Manchester Unity of Odd Fellows, which have proved so great a boon to the labouring class. I trust that it may be in the power of this association to endorse this scheme, and to press it strongly upon the attention of the Government and of the Royal Commission now about to commence its inquiry. To country districts it cannot fail to prove an advantage of incalculable importance.

"Benefit Societies and the Poor Law" was dealt with by the Rev. J. Y. STRATTON, of Ditton, one of the secretaries to the association, who said: The poor-rate is the virtual superannuation fund of the farm labourer's societies, and the annual election is the trap-door by which the member is transferred to the rate. He concluded his paper as follows: In order to prevent the spread of a state of moral and social degradation which is engendered wherever men tamely submit to the humiliating position of paupers, and spend their wages and often waste their time on paperising benefit clubs, the special attention of the Poor Law Board is required. Leaving to Boards of Guardians the usual discretionary power of applying a fixed principle of dealing with members of clubs who apply for relief, it would not be difficult to insure such a course of treatment as would encourage labourers to take more care in the investment of their surplus wages than they have hitherto shown. For instance: 1. Let boards grant outdoor relief to applicants belonging to approved friendly societies, where the sickness pay is insufficient for their need. 2. Let them refuse relief, other than the house, to applicants being members of clubs which in their construction, cost, and management, have the poor-rate relief in view. For which purpose certain facilities should be given to the Registrar of Friendly Societies which would enable him to give a list of approved and trustworthy societies to Boards of Guardians. 3. The mischief which has resulted to cottagers under the compounding act in force should also be dealt with. It would have a most salutary effect on the moral and social condition of cottagers, if they were made to pay their share of the rate as it fell due, instead of paying in the rent a sum in excess of the amount chargeable on their tenements. The mode of "farming the rates," as it has been termed, constitutes in the opinion of intelligent labourers a grievance. Why should they be charged 4d. or more a week in the rent in lieu of rates, when the owner does not pay more than 5s. or 6s. a year? Their notion of redressing this grievance is to get as much as they possibly can from the rate. Claims which at present are pressed on the Guardians, with the support and sympathy of cottagers, would fall into disfavour as soon as it became their interest to lighten the burden of the rate, instead of being, as they are now utterly indifferent whether there are two rates in the year or three or more. The difficulty of collecting the rate as it falls due appears to have been overstated. The cottager will pay with no greater reluctance than those who rent larger houses, the tenants being in either case little more than the channel through which the rate is paid, though they have sufficient interest to insure their wishing that payment to be small. In conclusion we express the hope that the forthcoming Royal Commission of inquiry into Friendly Societies will direct its attention to the bearing of the poor law on benefit societies. The assistance of the Poor Law Board would probably be given for this purpose, and a circular letter, accompanied by a few questions to Boards of Guardians, would elicit information at little trouble and expense, and of great value to the country. Closely following on such alterations as are advocated in this paper in the mode of administering relief, and in the collection of rates, we should begin to mark improvements in the benefit societies. At the same time it seems

only fair to the classes on whose behalf we write, that if the facilities for help from the poor rates should become somewhat less, the attention of the legislature ought to be drawn to the provision of means, which, at no cost whatever to the country, might be given to enable young and prudent labourers to work out their own independence, by investing in safe insurances those funds which at present are being wasted in benefit societies so called. Such beneficent care on the part of those who govern, would not only save persons, not by nature more improvident than their fellow countrymen, from ultimate penury, but what is of more consequence, would in the long run contribute largely to their social and moral elevation.

The "Friendly Society of the Future" was described by Mr. W. H. MICHAEL, who said, as a fundamental principle, friendly societies should be interfered with as little as possible by the State. Centralization would deprive the people of a powerful means of self-education; besides, idleness and malingering can hardly be prevented by post-office supervision. He says an inexpensive mode of arbitration in the difficulties continually arising between members and societies is much wanted, and he suggests that a barrister, a doctor, and an actuary should form the commission. As there are more than 20,000 societies in existence, the payment of 5s. annually from each would supply a fund adequate to its effective working, without entailing any cost on the country, the registrar then, as now, being the only charge on the Consolidated Fund. Each member should have a policy and copy of rules upon admission to a society, and no change from one society to another should be valid without written authority from the member; while, where collectors are appointed, no forfeiture should take place from failure of the collector to call for the periodical subscription until notice had been sent from the chief office, or nearest branch office of the society, of the default of the member, stating the amount, and giving seven days' notice of claim for payment. To each society a benevolent fund attached would be a great boon; and to those who wish to aid friendly societies would do good service by subscribing. Out of this fund loans might be made, or gifts of small sums to deserving members pressed down by sudden calamity or distress, in order to prevent a loss of benefit by non-payment of subscription money; but that form of benevolence now existing, which maintains and upholds a society, and without which it could not exist, is hurtful rather than beneficial, for it makes the members trust to others where they should depend on themselves; and when from death of the benefactor, or other causes, the help is no longer forthcoming, the society can no longer exist. The adoption of regulated rates of payment according to age, supervision of funds, and prevention of management expenses trenching on sickness and death funds, supervision of accounts by the registrar, their production rendered compulsory, an easy mode of settlement of differences, and help and advice to societies in difficulties, appear to be the chief wants, which, when supplied, would procure for the friendly society of the future an extended sphere of national usefulness.

Mr. PINCHBECK, the parliamentary agent to the Foresters, gave some information with regard to that society, and he pointed out that if one of their courts were broken up the members could come on the district fund, and afterwards on the High Court fund. He could not conceive any question more difficult than legislation on the matter of friendly societies.

The Rev. R. B. WRIGHT described a Court of Foresters which had been formed in his parish, and said he found a very vicious point in the rules. All paid the same sum, whatever their age. This he had succeeded in inducing them to alter with regard to the admission of new members. He was not at all aware that there was any fund on which the members could rely should their own fail.

Mr. KEEN regretted to say that the largest number of members on the sick-list of friendly societies generally was when there was a dearth of employment.

The Earl of ROMNEY referred to the popularity of the small clubs in this district, and said, speaking upon his own experience of the Kent Friendly Society, working men, if left entirely to themselves, did not make their selection very wisely.

Mr. BONHAM-CARTER said those who advocated a Government interference had no idea whatever of taking the control out of the hands of the governing bodies of the various societies.

Lord LICHFIELD, in resuming the discussion, said the case as made out by Mr. Stratton against the sharing-out clubs in this district was a very strong one. Those societies were formed, it seemed for the express purpose of throwing their members eventually on the poor rate. He could not help thinking that they had among them many persons who had been, or were still, members of those sharing-out societies, and it was for them to say whether the serious charge brought against them by Mr. Stratton was really correct or not. One of the most important subjects that was brought before the conference that morning was one that must be of the greatest possible interest to all who desire to see habits of providence cultivated among the working classes. It was a proposal in Mr. Stanhope's paper for the establishment of societies by the Government with Government security, not only as they at present exist for insurance and payments at death, and for annuities, but also for payment in sickness. At the opening of the conference he pointed out the difficulties which would attend any such plan, and several who spoke afterwards pointed out that it would be almost impossible for the Government through the Post Office to protect themselves against fraud and malingering. He must confess that if the Government were able to see their way practically to carry out such a scheme, he did not think their doing so could be objected to on anything like reasonable grounds. But here came the next question, which was, to his mind, of the next importance in what had taken place in the morning. That was as regards Government interference with those societies, and on that point he wished very much to hear some further opinion on the part of members of those societies, and persons who have peculiar experience in the working of them. The question was what would they call Government interference? If the Government required that such accounts should be laid before the public annually, as to enable all persons easily to form a correct conclusion as to the solvency of such societies, would that be called Government interference? All he could say was that at the present moment the large insurance offices for the rich are under far more stringent restrictions and regulations. Not one half of the societies now sent up their returns, and those who did, sent them in a shape utterly unintelligible to anybody who wished to obtain information from them. This should be remedied in some kind of way. If they did not comply with the regulations laid down by Act of Parliament, he thought they should not be recognised, as they hitherto had been, by obtaining a Government certificate. He entirely agreed that there should be a minimum of interference on the part of the Government, but more stringent regulations and restrictions should be insisted upon. It was of the utmost importance that the Royal Commission about to be appointed should be supplied with every information that can be obtained bearing on the constitution and management of all the different classes of societies throughout the country. Then Parliament would be in a position to legislate satisfactorily on the subject. Of this, however, he was perfectly assured that whatever remedies are contrived, whatever Government chooses to do in the way of founding provident institutions for the working classes, that there will always be a number of societies open to all the evils and objections they had heard that day, so long as there was not among the masses of the working population of this country that better education which they all sincerely trusted the legislation of the last Session of Parliament would secure to them. His Lordship then said a question was raised in the course of the discussion that morning as to whether the large affiliated societies, such as Odd Fellows and Foresters, could lay claim to the position they professed to hold as one large united society, seeing that they had branches all over the country, some of which branches might be solvent and others insolvent, and it was implied that if one of those lodges or branches happened to be unsound, or to fail, the society as a whole would not be responsible. Now that assertion had been contradicted by Mr. Pynchbeck, the Parliamentary agent of the Foresters, and he had placed in his (Lord Lichfield's) hands a copy of the general laws of the society, which showed that members of lodges so broken up might join a district or high court fund.

The Hon. and Rev. S. BEST delivered an address on the objects of the Friendly Society Association.

The Hon. E. STANHOPE addressed the meeting on the advantages of a Post-office friendly Society, pointing out the security which such an institution would have, and combating the arguments which might be used against it. He said post-

masters had already been employed by the Kent Friendly Society, and the system was found to answer admirably, the rate of sickness being much lower than in many of the other societies. A Post-office Friendly Society, he said, need not interfere with other well-managed institutions, but it would fill up ground which was now vacant.

Lord FITZWALTER said, as a supporter of the County of Kent Friendly Society, he was very glad to hear it spoken of with such confidence. One of the first objects of their meeting was to consider how they could render those societies really useful and worthy of the confidence of those attached to them. Let them consider how a society showed itself worthy of their confidence. In the first place it must be always ready to pay a fair claim made upon it; and it should have in reserve a large sum of money ready in case the demand should be greater. In that respect the County of Kent Friendly Society was well worthy of their regard. He was far from saying, however, that small societies, similarly well conducted in the place in which they lived, were not equally desirable. It was all very well to enjoy a jovial evening once a year, but such matters ought not to be mixed up with the operations of the society which they looked upon to aid them in times of sickness and old age. The question which they had met to consider was a great one. It interested the whole country at large, for what could be more important than that the means which they had provided for the contingencies of the future should be well and properly applied? The anxious wish of the country was to consider all the points bearing on the question, and they would have the opportunity before the Royal Commission of giving evidence, and taking steps to investigate matters which seemed to require explanation. He was quite sure, as reasonable men, they would be desirous that in a fair and proper spirit those inquiries should be made.

Mr. PINCHBECK, of the London District of Foresters, entered into some of the details of Forestry, showing that members might be transferred from one district to another, and even to Australia and the colonies, without losing any of their privileges. He referred to their system of settling disputes by arbitration, and their several Courts of Appeal, and said he believed that their system was as perfect as it could be made. They wanted no Royal Commission to interfere in that matter; they preferred to trust to their own brothers rather than to any County Court jury in existence.

Mr. J. G. TALBOT, M.P., said in many matters they constantly heard that certain things should not be done without consulting the working classes, but he would remind them that the working classes were not the whole nation, and that other classes ought to be considered as well. The present, however, was one of those very few questions which concerned almost exclusively the working classes, and it was with that view that the Chairman and other speakers sought to hear their opinions, so that they might know what were their feelings on the matter. There was a necessity among the working classes, not only to provide for sickness and burial expenses—which the sharing-out clubs, he was afraid, rarely did—but that their widows and children should have something to fall back upon when they were suddenly removed by death. If he was not much mistaken very few of the working classes made that provision; and, if he spoke honestly on the subject, it was from this cause—not that they had not wages enough, but that they did not make the most of the wages that they had. He pointed out that the provident and temperate (who might naturally be expected to live the longest), who ought to have the most ample security in time of sickness from the benefit society to which they might belong, were generally those who were certain to be thrown upon the poor rate. If one of the effects of the Commission was to put a kind of stamp on sound societies, so that it might be known whether they could be really trusted, it would have a most advantageous effect. He trusted that before long Government and Parliament would take up the matter, and see that the working classes of this country were no longer deluded by bad societies.

Mr. BOOTH, a working man, said he belonged to a sharing-out club, called the Cranbrook Provident Institution, and he described its working as being upon sound principles.

The noble CHAIRMAN asked that the rules of the society might be sent to the secretaries.

The Rev. D. D. STEWART pointed out the evils which attended badly managed clubs. In the course of his experience, as a clergyman extending over nearly thirty years, he was

quite persuaded there was an evil which required removal. Over and over again he had to sympathise with artisans and labourers, whose clubs had failed when they had arrived at a time of life when they could not enter a new one. The healthy point of this meeting was that various ranks of society were bringing their minds to bear on the very same point.

Mr. BONHAM CARTER, M.P., asked for a show of hands of those who were members of friendly societies.—The result was that it was shown that a very great majority were members of some society.—He then referred to the commission about to be appointed, and said he apprehended that the great blot which was supposed to exist, and of which the merits and demerits were to be inquired into, was connected with Burial Societies, which did not prevail in this, as they did in manufacturing districts. With regard to Mr. Talbot's suggestion, he thought it was impossible for the Government to put a stamp on societies, so that they might judge if they were sound. He believed that the Government might be able to afford them the most valuable information possible, which, with a very small amount of education, they might be able to apply themselves. He referred to the manner in which the Odd Fellows had worked out their tables of sickness, which, he said, were not only invaluable to them, but exceeding beneficial to every society. What he wanted was that members of Friendly Societies should understand that the matter rests mainly with themselves.

Mr. HAMMOND (Aylesford), moved "That the Friendly Society Association, be requested to communicate with the Commission which this meeting learns her Majesty is about to appoint on the subject of the Friendly Societies, and pledge itself to co-operate with them as far as may be in their power, in giving information with regard to the state of the law, and its administration with regard to such societies."

Mr. WOOD (Aylesford), seconded the motion, which was carried.

Mr. Powell, a Forester, Mr. Povey, a member of the Friendly Society of Ironfounders, and Mr. Bramble, Secretary to a Maidstone branch of the Manchester Unity, deprecated any Government interference with the internal management of their societies.

Mr. BONHAM CARTER, in reply, said with regard to "legislative interference" the term was very much misunderstood, and he pointed out that he was present when the authorised representatives of the great societies met Lord Lichfield at his house, and begged his lordship to advocate a commission of inquiry. He believed that that inquiry would bring out the good qualities of the Odd Fellows and Foresters, that it would strengthen their hands, and enable them to sift out the chaff from the corn, and show that a certain class of societies were trading on what was not a solid foundation.

Votes of thanks were then moved.

THE CENTRAL VETERINARY MEDICAL SOCIETY.

The first ordinary general meeting of this society was held in the rooms, Lower Seymour-street, Portman-square, the president, Mr. Geo. Fleming, F.R.G.S., F.A.L.S., M.R.C.V.S., in the chair.

The PRESIDENT said that in the deliberations of the Council it had been wisely arranged that the evening of the first meeting of the society should not be occupied by an inaugural address. He had, therefore, but a few remarks to make, and they were of a brief character; for papers had been prepared for reading on subjects of great importance to the society and profession, which would claim their attention before anything he might say. They were met to inaugurate the establishment and opening of a Central Veterinary Medical Society, which had been resolved upon by the veterinarians of the metropolis in the most enthusiastic manner; and one of the greatest evidences of the zeal with which the subject was taken up might be accepted in the large attendance on that occasion. The society is following in the wake of a large movement which has been going on for some time in the provinces, closely associated with a gentleman whom he was glad to see present (Mr. Greaves, of Manchester), and although probably late in that movement, he (the president) felt that he could discern abundant elements for the widest extension and most powerful operation of the Metropolitan Veterinary Medical Society. It is well known that the position of veterinary science is not so high as it should be, nor is it appreciated by others as it deserves even now, under all its shortcomings; the position also of the members of the profession is sadly behind the requirements of the age. The Central Veterinary Medical Society will undoubtedly effect an improvement, and raise the status of both. It is a notable fact that by the rubbing together of minds, however talented, advancement must be made, and the opportunity has now arisen to cultivate this in an eminent degree. It is most probable that the position of the profession, as recognised by government and the various local authorities throughout the kingdom, is to be attributed to the undesirable state of things as now existing. Policemen, butchers, &c., are employed, to the exclusion of members of the profession, when they alone should be the competent authorities on all questions relating to the maladies of our domestic animals. They must remember that as members of the veterinary profession, they are scientific men; and as fellows of the Central Veterinary Medical Society, they are bent on scientific attainments. The objects of the society are manifold. By promoting the meeting together of the members of the profession, a mutual desire for advancement will be encouraged. They are solicited for their opinions, raised under great care and

attention, and there they will be sifted to discover their truth and applicability. The promotion and dissemination of sound doctrines forms an important feature of the society, and these will be gathered from personal observation, as well as scientific investigation and experiments, when necessary, under committees organised by and at the expense of the society. In the examination of conditions where probabilities are far greater than *bona fide* certainties, much difference of opinion necessarily follows. Each views the object of his search from a different point of view, and however widely these opinions may stray, they must not forget that each is entitled to respect. However much we may differ in opinions, it should always be our maxim to render the object subservient to the furtherance of the interests and aims of the society, and advancement of the science of veterinary medicine (applause).

Mr. F. J. MAVOR read a paper on "Thermometrical Observations on the Horse," instituted to ascertain the effects of certain medicinal agents upon the temperature of the body. The conclusions arrived at by Mr. Mavor in his experiments are as follow: The normal temperature of the horse, as taken at the rectum by one of Mr. Hawksley's Fahrenheit's thermometers, is from 99 to 100 degs. A rise of temperature, more or less, is the product of every disease. All medicines, whether given subcutaneously or by the stomach, produce a corresponding elevation of temperature. Although a very high temperature may exist as the result of disease, a dose of medicine will produce a higher elevation. Lastly, the same effects are observable in health as well as disease. The statements were supported by tabulated records of observations made with atropine administered subcutaneously to a grey mare suffering from abscess in the pectoral muscles, in which, upon every occasion during the existence of the injury, the exhibition of the drug in doses of a quarter of a grain gave rise to an increase of temperature; and when convalescence had been established, as evidenced by a decline of temperature to the normal standard, the exhibition of the same dose of the drug produced a rise of temperature, which did not subside until the third day.

The SECRETARY, Mr. G. Annatage, observed that these facts, as given by Mr. Mavor, are highly valuable to the veterinarian, inasmuch as the elevation of temperature caused by medicines given must not be confounded with the specific heat of certain maladies and diurnal variations that are found to exist. He had made numerous observations with the thermometer throughout the diseases of the lower animals, and in each case fresh evidences had arisen testifying the inestimable value that instrument is in the *clinique* of veterinary medicine.

An elevation of temperature he had found to take place after exercise, and even after food in health, when animals had previously been confined; and those allowed to go at large always exhibited a higher range in health than those confined to buildings could indicate; and it is highly important to bear these in mind when judging the amount of intensity of animal temperature as indicative of disease. His remarks had been published, which those interested could read and test for their accuracy. He could not say he had particularly noticed any specific elevation of temperature after the introduction of medicaments beneath the skin; but he had felt extremely puzzled to find, in cases of tetanus for instance, that after the use of powerful sedatives, as belladonna and hydrocyanic acid in combination, not the least diminution occurred. In the use of salines his observations agreed with those mentioned by Pereira and others, who state no diminution takes place, although the sense of coldness introduced is extreme. He urged attention to Mr. Mavor's observations, as well as to the use of the thermometer generally, as an instrument calculated to throw much light upon the nature and progress of disease, and means of much greater accuracy in diagnosis, not in ordinary diseases only, but in those of an occult and contagious character. Many of the tabulated statements of previous observers were said to be totally inaccurate, and, as far as the lower animals are concerned, the veterinarian has an extensive field before him; and facts collected therefrom may prove eminently useful to the medical man in human practice.

Mr. W. HUNTING referred to the discrepancies that are known to exist in thermometers from the same maker—two instruments, although said to be correct, registering different degrees in the same animal. He could refer to observations made by individuals in that manner, and which proved delusive and fatal. It is necessary to receive with caution new theories and results of few and unconfirmed experiments; they tend to overthrow the facts and teaching of the past, without providing the most proper and reliable substitute for them.

Mr. W. HUNTING read a paper on "The Growth and Structure of the Horse's Foot," in which the author endeavoured to show that, though convenience requires a division of the hoof into three elements—wall, sole, and frog—anatomy and physiology distinctly indicate that it is a continuous whole, and this totality applies as forcibly to the functions as to the structures of the hoof. After detailing the structural elements of the foot, Mr. Hunting went on to say: The hoof consists of horn fibres running parallel to each other, and of an agglutinating interfibrous horn. The papillæ or villi, covering the sensitive foot, secrete the horn fibres, and the surface between the villi secretes the interfibrous horn. The sensitive laminae not only afford attachment for the wall, but, like the sole, frog, &c., secrete horny matter. The whole sensitive foot is continuous, and must therefore produce a continuous hoof. Maceration in water enables us, with the aid of some force, to separate from each other the frog, sole, and wall, but not clearly. We never can obtain a definite division throughout without the aid of a cutting instrument. This partial separation merely shows where destructive forces are most powerful that the line of division is weaker than other parts. It is weaker merely because there is at such parts a relative want of horn fibres—an excess of the weaker kind of horn. The function of the hoof is to protect the sensitive foot, and to afford a firm basis of support to the animal. Every single part of the hoof acts in unison, and none in independence. The disconnected statements that "the sole will not stand pressure," "that the wall sustains the weight of the horse," or that "the heels are the weakest part of the foot," were said to be founded on narrow views of the functions of the hoof, in opposition to the fact that no one part of the foot can act properly unless other parts preserve their structural and functional integrity. A weak sole allows the wall to collapse; a weak wall allows the sole to become flattened; a small, wasted frog offers no obstacle to the contraction of the heels; and overgrown heels destroy first the form, and afterwards the function of the frog. Every element is equally important, and all work together and are dependent upon each other. He had a strong disbelief in alternate expansion and contraction of the foot during progression. As to the proper bearing surface of the hoof, he believes the border of the wall and portion of the sole immediately in contact with it take the primary bearing—that the frog is in-

tended to come in contact first with the ground, but then to yield under pressure, and allow the sustaining forces to fall on the harder and stronger parts. The bars in their integrity form a kind of internal wall, and prevent undue pressure of the frog. The arch of the sole, though taking a direct bearing on soft ground, merely allows a distribution of pressure through it on hard surfaces, just as pressure is distributed throughout all arches when applied only to the abutments.

The President said Mr. Hunting had gone deeply into the histological composition of the horse's foot. However, some of the statements might be disputed; and, as far as he had studied the subject, found they were at variance with his conclusions. It is difficult to decide what is the type of a perfect foot. In all countries various modifications and configurations are to be found, each in itself being a grand adaptation to the wants of the animal as well as to the external conditions; thus in low, marshy, countries, the indigenous breeds of horses have flat and wide feet. These would not sink so rapidly as small ones, nor so much as a hollow or concave foot. Again, in hot countries the foot is narrow, hollow, and hard as a means of withstanding wear; yet none of these can be taken as a type of the horse's foot generally. Influences of an external nature have the power of modifying the general characters of the hoof, and thus reduce it to one of a special kind and adapt it to surrounding conditions. Nevertheless, there are striking peculiarities which form principal features in all feet; for instance, the direction of the fibres of the wall are from above downwards; the plantar surface is circular; in front the hoof is conical, and in profile it is circular. In well formed feet, from which the frog and bars are removed, the outline is that of a circle, and the width is consonant with the height. Mr. Hunting had stated his belief that the frog stay is wrongly named; he (the president) did not think so, and in support of his belief had retained the term, while that part in front he had named the "toe-stay," as he believed it to be for the purpose, among others, to prevent the foot rotating in its horny covering. The supposition that the horny laminae are secreted by the sensitive laminae he thought may be readily disproved by an examination of the spaces between the papillary tubes in the cuticular cavity, in which ridges or eminences are to be found as the result of secretion from the coronary cushion, and prove to be the commencement of the horny plates. In cases of disease also abundant proof appears evident; for where the wall has been destroyed horny laminae may be seen to originate at the top and grow downwards. Maceration serves to separate each part of the hoof; but the horny wall and laminae do not admit of separation by such means, and in transverse sections of the wall epidermic cells may be observed to run in, to form the horny plates; but in disease states are modified. In health the intertubular or interpapillary substance is for the purpose of connecting the fibres of the wall and hoof, and preserve a degree of moisture and resiliency; in disease the hoof becomes dry and brittle, as a result of the modified action. At the junction of horny wall and sole is a white soft substance known as the white zone, placed there to prevent disjunction, but not secreted by the sensitive laminae which run down to and terminate it. In disease the sensitive laminae are to be observed covered with scales, which form horn, but is no integral part of the natural hoof; and likewise horny tumours formed upon the white zone or horny laminae are morbid productions, the result of diseased action at that particular part. They do not grow downwards from the top, as the nature of their construction thoroughly proves; besides, the cells of the papillæ are sent down vertically, while those in the laminae are horizontal; but no such orderly arrangements mark the adventitious productions of morbid action, while it is conducive in the healthy structures to an efficient resistance to wear and fracture. The functions of the frog have been much misunderstood, and the theories of expansion and contraction have been most disastrous to the proper treatment of horses' feet. He thought Mr. Hunting was quite right when he said the frog had no part in expanding the heels. It is, doubtless, to sustain weight at the back of the foot, to avert concussion, and protect the tendon and navicular joint above. The coronary cushion also admirably sustains weight, and receives and distributes initial concussion.

Mr. F. J. MAJOR considered the wall to be the true supporter of weight on hard surfaces, and as it is constructed is most efficiently capable of conducting jar upwards, and thence

causing it to pass off. He would not deny that upon soft ground the sole received pressure, but conceived that otherwise it is improper for it to do so.

Mr. T. D. BROAD contended that the sole can sustain a degree of pressure with benefit, and gave, as an instance, the fact of great improvement taking place in that part of thin shelly feet by the use of non-seated shoes. Among the evils in the practice of shoeing, he places the knife first, calkins second, and seated shoes last in order.

Mr. ALEXANDER LAWSON believed the crust should bear the greatest share of pressure (weight), frog next, and the sole last. It is an evil to nail on shoes tightly pressing upon the horny sole, as the many bruises and cases of suppuration which follow abundantly testify. He thought wrong principles had been embraced too long, and false conclusions had been arrived at, as well as absurd practices carried out. The frog is evidently an admirably adapted cushion to protect highly organized parts within. He approved of a modification of the Chaffier shoe—one somewhat stronger, but applied on similar principles, and he had found from experience that the feet, through the resulting sole pressure, were more prolific in horn, could resist shock much better, and the animal travel over the roughest macadam with ease and total absence of pain.

Mr. T. W. GOWING, senior, approved of pressure (weight) being borne by the wall alone. Continuous pressure on the sole had, in his experience, proved injurious.

The PRESIDENT urged that the sole of the horse's foot is intended by nature to receive pressure, and, as a proof of this, gave the fact that all animals in a state of nature present their soles to the ground, and in no single instance could he find that part absolved from taking part in weight-bearing. Another proof is derived from the undoubted fact that when caused to bear weight the animal goes well, and the feet greatly improve by it.

Mr. W. CLARKE referred to the alteration in form of horses' feet which succeeded to change of locality, when surrounding conditions were of an opposite character. He also contended that for the sole a degree of pressure is not only essential but can be borne, and gave examples from the use of leather soles, and stopping, and india-rubber cushions.

Mr. LAWSON gave further examples in proof of the benefit of sole pressure, particularly in the chronic states after laminitis.

Mr. HUNTING, in reply, said he thought Mr. Mavor had misinterpreted the statement of Mr. Broad. Pressure derived from a non-seated shoe, as recommended by Mr. Broad, does not extend to the major part of the sole, but to those portions within the circumference of the wall. As the sole represents

an arch and the wall its abutments, pressure is confined to the extremities or springings of that arch where the greatest points of resistance are presented. Pressure thrown on the frog is transmitted throughout the whole foot, and not through the coffin bone, as erroneously supposed by some; and one of the offices of the frog is undoubtedly to distribute and break the force of shock, which in its absence might be communicated to parts injuriously. As a proof might be given of the position of the coffin bone, and its elongation backwards by an amount of resilient substance, the lateral cartilages. It is a fact self-evident on a consideration of the anatomy of the parts. Shock given to the wall, as described by Mr. Mavor, transmitted through its fibres, cannot pass outwards as a material substance or of aeriform character. It is provided against by a harmonious arrangement of muscles and ligaments, with bones placed at convenient angles, all of which, engaged in a most wonderful principle of co-ordination, destroy the shock, which if communicated through an unbroken and straight column would be productive of evil results. With regard to the observations of Mr. Clark, tending to the belief that the feet of horses assumed opposite forms when removed to localities exhibiting specifically different conditions, he (Mr. H.) could not coincide. A flat foot is unnatural everywhere; it is designed that the plantar surface should be concave. Flat feet admit of unequal and inordinate pressure, and the result is absorption of the coffin bone and loss of shape (external form). He agreed with the president in the microscopical structure of the hoof, but had heard no opinion that agreed with his on the formation of horny tumours within the hoof, of which mention had been made before, nor yet one that decided the horny laminae are decidedly secreted by the coronary cushion. The argument that they are sent down from above when the wall is stripped off, he contended is without foundation, but rather that condition proves that the horn produced is direct from the sensitive laminae, as they are quickly covered by horn material. It is their natural function, he contended, and no structure can secrete in disease that which it does not in health. It is no proof that the wall and horny laminae are homogeneous, from the fact that no separation can be produced by maceration; the latter are, undoubtedly, secreted in great measure by the sensitive laminae; hence the abundant blood supply to the latter, which would serve no purpose if they were mere weight-carriers. Regarding the function of the frog, Lafosse had said it is to bear up the tendon above it. Tendons, however, are neither too long nor too short, always have the proper length, and require no such support. Its function appears to be to receive and distribute shock, and reduce its effects over the limb.

THE SUPPLY OF TROOP HORSES.

The experiences of a war, altogether unprecedented so far for slaughter, devastation, and ruin, must, of course, as its first great lesson, cause people to look at home. And we proceed accordingly to review the actual strength of our forces—our ammunition, our gnanery, our regulars and volunteers. In doing so much we come quickly to encounter an unpalatable truth. All the world over England is renowned as a nation of horsemen. We have the best of horses, and ours is the market to which of all others a man must come who wishes for the best. With the material then so ready at hand, it straightway turns out that our cavalry is miserably mounted; that a trooper is scarcely in any way the animal he should be, and that, if called into action, our more modern dragoon must as now horsed be a lamentable failure.

The reason for this is obvious enough. The Government has simply suffered itself to be outbid. For many years past other countries, with Prussia at their head, have been systematically buying up our most useful stock, and perhaps more particularly powerful well-bred mares, suitable for harness or road work. Many of our stores, as it were, like the Ridings of Yorkshire, have been gradually and thoroughly exhausted, and breeders have come

to confess that they have nothing to show you. The article is scarcer than ever, and the result precisely that which might have been anticipated. At regulation prices it is virtually impossible to procure the sort of horse really fit for the purpose; and while the cavalry of other Powers has been improving, ours has been deteriorating in something very like a proportionate degree.

Unfortunately the remedy is not so apparent, although there is by no means any lack of suggestion. Mr. Edmond Tattersall, the head of that well-known firm, recommends Horse-breeding Companies, or Government Studs. Mr. Spooner, at the Blandford Farmers' Club, would do away with Queen's Plates, and establish Government stud farms with the money—"not so much for the breeding of weight-carrying hunters and cavalry horses as for breeding sires and mares calculated to produce these." Mr. Francis Smith, of Grantham, would have "the Government and the Council of the Royal Agricultural Society of England join in setting aside a sufficient annual sum for the hire of a number of good-sized, bony, powerful, well made, thorough-bred stallions, having good action, for the use of each county." Other writers would go back to the use of nothing but Arabians; and a cor-

respondent of *The Field*, evidently with much experience of the countries he speaks of, would have us, either for home service or India, try three foreign markets—America, Hungary, and Egypt. “As regards the merits of the Yankee horses as troopers, in the year 1842 I saw a considerable number of these animals that came home in the 1st Dragoon Guards and the 7th Hussars from Canada. I rode a great many of them, and I say unhesitatingly that they were the best troop horses I ever rode in England—up to great weight, very shapely, and fine free goers, with splendid action. They were bought for about £25 each.” Again, “in Hungary, I should look for horses fit for light cavalry. Such animals in abundance can be bought for £25 to £30 each. To travel them to Trieste or some other Mediterranean port would not be expensive. They could be thence conveyed by steam to England; and for £40 at the very outside you would have a hardy useful animal, fit to take his place in the ranks in a fortnight, and capable of enduring any amount of exposure incidental to a campaign.” And as to Egypt, “the Turcoman breed run about fourteen hands in height, are hardy and stout little animals, and, although not so handsome as the Arab, possess much of his docility and fine temper. They are easily procurable for about five-and-twenty pounds each, and their conveyance *via* Alexandria to England would be neither difficult nor expensive. The supply of them for years to come would be ample.” There is something in this but not much. The seals of the Egyptian would, of course, put him out of the question, as it would be absurd to attempt to mount an English dragoon, accoutred as he is, on a pony. Then, the distance from America would render such a source of supply unavoidable the moment we get into “trouble,” as the same argument might be urged against any plan for remounting from the European Continent. Further, there is something not only impolitic but, so to speak, unnatural in the very notion of a horse-loving nation like the English seeking its cavalry from other shores. We might almost as reasonably go to Russia for men as to Hungary for horses.

Let us at the outset admit, as fair we must, that the Government and the people have alike neglected this subject; that we have permitted the country to be fairly drained without looking to the further production of the article. And this unquestionably has been the case. Wrapt up in the sleepy security of a long Peace our rulers have been content to put up with anything they could get at the price; while the manufacturer, tempted by long figures, has fairly sold himself out. At the same time our recovery should be anything but hopeless. Just now there are, perhaps, more well-bred good-looking horses to be obtained at a moderate cost than ever was known. The comparative collapse on the Turf, and the disturbances on the Continent, have alike induced to this, and there seldom has been a finer opportunity for establishing the breeding of horses on something like a system. And system it is, that above all things we want. In the first instance the regulation price must be raised, and in the next the country be encouraged to meet the demand. Mr. Tattersall invites us

to breed horses by the agency of Companies, but such a suggestion may be dismissed with a word, as we very much doubt if half-a-dozen sensible men could ever be found to invest capital in a concern for raising half-bred stock at any price. There is more weight in the proposition for a Government Stud, in considering which we should at once dismiss the prospect of its ever paying or becoming even self-supporting. On the Continent, in Prussia, Austria, and more particularly by the Third Napoleon, such establishments have been maintained at immense cost, and no question with some national advantage. The best kind of Government Stud after all, however, would not be so much that which supplied itself, but that, the rather, conducted to the co-operation of the country; and it is a very debatable point whether such agency might not be provided by some other means and at a less expense. As a nation the English are not prone to Imperial patronage or interference, and we should have but little faith in Mr. Spouner's prospectus for setting up each haras with one thorough-bred stallion, or seven-eighths-bred *ditto*, one or more three-fourths-bred *ditto*, one or more half-bred *ditto*—and so on. Not but that palpably the stallion is the animal to look to for improvement or re-generation. Farmers it is said should provide themselves with better mares, but at the low ebb to which the business is now come, it is clear that we shall have to start again with better sires.

And here we arrive at one of the most tangible points in the whole argument. Farmers, who, of all men, have the most opportunity for doing something in this way, have no doubt habitually neglected to breed their “nags” on any system. They cross anything they may happen to have with anything that may happen to come in the way; and for their benefit, as well as ultimately that of the country, the Government might do something in connection with the Agricultural Societies. The suggestion we here offer we have often offered before, although during such a discussion we do not hesitate to repeat it. The meetings of these Societies have now become amongst the successful gatherings of the day, as far more popular than the races, fairs, or feasts, and their most popular feature is the horse show. Let the Government be brought to recognise this growing fact. There are royal plates which horses run for, let there also be royal plates which horses shall show for. Let any Society of any calibre have at its disposal year by year a royal £100 for the best sound and stout thoroughbred horse to serve half-bred mares in the district during the season at a certain price. The award of such a premium would not only of itself give a character to the horse but ensure his owner from loss, and thus more men would be induced to look out for such an animal. The expense here might be easily reckoned up, say in the outset at some £1,000 or so. Whereas with farms, managers, sires, mares, servants, and so forth, it would be hard to calculate where the cost would end. The matter, no question, is a grave one, so directly bearing as it does upon the national safety. It is a business, moreover, in which the farmer is in some degree at least interested or “implicated,” and that the Royal Agricultural Society might very becomingly take up. It is otherwise pretty certain to come before Parliament.

THE VALUE OF OUR LIVE STOCK AND AGRICULTURAL PRODUCE.

Perhaps no better data could be afforded of the value and importance of Agriculture to this country, now that some of the Continental sources of supply are shut up, than an approximate estimate taken of the value of stock and agricultural produce raised for consumption. It is of course somewhat difficult to arrive at any very precise statement, for many of the figures and prices must necessarily

be assumed and conjectural. Until very lately it was impossible to determine with any degree of accuracy the amount of grain and provisions annually produced, the quantity stored, or whether a larger or smaller breadth of land had been sown in one season than another throughout the kingdom. The injury that resulted from this ignorance was not confined alone to the farmers, who were fre-

quently outwitted by importers and others flooding the markets, but all dealers in and consumers of agricultural produce were equally liable to sustain pecuniary loss therefrom, by making false calculations and depending upon erroneous estimates. The shipowner, the merchant, the corndealer, the baker, and the wheat-growers in our colonies and foreign countries all suffered from the absence of correct statistics as to the British consumption and production of grain. Within the last year or two, agricultural statistics have been collected for England and Wales, as well as for Scotland and Ireland, and we have thus some data to reason from, however imperfect or deficient they may be. Not only is it important that each country should know what quantity of agricultural produce raised on its own soil it can depend upon, but also what other countries can furnish in case of need. With respect to the United Kingdom, it appears that, while the people consume proportionately a larger quantity of wheat per head than formerly, the island itself produces an insufficient quantity to meet this increasing demand, although the cultivation of corn crops has been greatly extended in the last three years, the result no doubt of the higher prices ruling.

In the survey we propose taking, we limit our inquiry to Great Britain, including Scotland and Wales, but omitting the statistics of Ireland. Firstly, as to our hay crop. Exclusive of permanent pasture, meadow, or grass not broken up in rotation (and setting aside heath or mountain land), we have under clover, sainfoin, vetches, lucerne, and grasses under rotation in Great Britain, about four million acres, and two tons per acre may, we suppose, be taken as an average yield all round; for even if this be a somewhat high average, the produce of clover and ryegrass is often greatly more, and the aftermaths, or second crops, will bring it up to the average we have assumed.

Turning next to the corn crops, we find that there were returned last year as under wheat 3,688,357 acres, which at a yield of four quarters per acre for a good harvest, would give a return of, say in round numbers, 14½ million quarters. The tenth of this would be required for seed, for manufacturing, and other purposes.

Under oats we have an extent of 2,782,700 acres returned, and assuming that we get 48 bushels per acre, this will give us a total of 16,696,000 qrs., at an average, we will say, of 25s. a-quarter.

Of barley we have 2,251,480 acres, omitting as we have previously done, the odd hundreds, and assuming a yield of 40 bushels per acre for a good crop, we arrive at 11,255,000 qrs., worth about 35s. the quarter.

Under pulse crops we have 971,381 acres, and taking the general yield of peas and beans, all round, at 24 bushels to the acre, we get at 2,913,000 qrs., which we may calculate at 40s. the quarter. We leave out of our inquiry the yield of 65,000 acres under rye, merely adding that the total acreage under corn crops in Great Britain last year was 9,750,000 acres.

Turning next to root crops, we have 585,211 acres under potatoes, and if we take the yield as low as five tons per acre, this will give us 2,926,000 tons.

Under turnips, swedes, and mangolds we have 2,464,268 acres, but it is very difficult to form an estimate of the average yield and value of this crop, much of which is eaten off on the farm by stock; 145,251 acres under cabbage, kohl-rabi, and rape, and 14,344 under carrots, completes the average of the green crops, and for these we cannot fix a lower estimate than £5 an acre.

But there are two other agricultural crops that must not be passed over—flax and hops. The extent of land under flax in Great Britain is increasing, as 21,000 acres were returned last year, from which a yield of 600 lbs. of clean fibre per acre ought to be obtained, say, 5,620 tons, at £40 per ton.

The hop return is a more difficult matter to estimate with precision; the land under hops is now about 62,000 acres. We may calculate the yield for all general purposes at 6 cwt. the acre, which would give 372,000 cwt. for the total crop, worth—at say £4 10s. the cwt.—£1,674,000.

Our next estimate must be the transactions in live stock. Passing over the horses, of which there are necessarily large sales yearly, we may place on record that close upon one million-and-a-half horses were returned last year by occupiers of land; this is exclusive of another half million believed to be owned in the metropolis and other towns. We turn next to the live stock used for food, and the returns of these, in 1869, were 5,313,473 cattle, 29,538,141 sheep, and 1,930,452 pigs. In estimating their value, we must take their prices as sold by the farmer to the public for consumption, a totally different estimate to that of the value of yearlings or two-year-olds, as sold by one farmer to another. We cannot be far wrong, therefore, in taking the value all round at 35s. per head for sheep and lambs, £15 for bullocks and calves, and 25s. for pigs. This we consider is a fair approximate estimate, which, after all, can only be obtained. The prices for sheep and pigs can certainly not be considered too high an average. The difference in the relative number of sheep and cattle in Great Britain and Ireland, it may be remarked, is very great. To every head of cattle there are in Great Britain about 5½ sheep, and in Ireland 1¼ sheep. Cattle are, however, kept in larger numbers in Ireland, in proportion to the acreage, than in Great Britain. A small addition has to be made to the total live stock of Great Britain for the Channel Islands—Guernsey, Jersey, and the Isle of Man: in these there are in all about 10,000 horses, 37,000 cattle, 64,000 sheep, and 18,000 pigs.

It is generally considered that a fourth part of the entire stock is annually slaughtered for consumption, and we may therefore take it at fully 1,300,000 head of cattle and 7,250,000 sheep. In this running survey, and from the totals brought out we shall arrive at some fair notion of the aggregate value of the agricultural produce of the kingdom, although, in our estimate, we have, as already stated, not touched Ireland.

The appended summary gives figures of a magnitude not perhaps generally considered by the producer or consumer. It places the position and importance of the farming interest of the country in a prominent and clear light, when the total annual value derived from the soil is found to exceed £300,000,000 sterling. To this ought justly to be added straw, the dairy produce, milk, butter, and cheese, as well as poultry—all of which come under the head of farm produce.

Our calculations are founded on data sufficiently accurate for all general purposes. It is not essentially necessary that our estimates of yield, or assumed prices, should be precise, fluctuating as these necessarily do year by year under many influencing causes.

Wheat	14,750,000 qrs., at £2 10s.,	£36,875,000
Oats	16,696,000 qrs., at 1 5s.,	20,870,000
Barley	11,255,000 qrs., at 1 15s.,	19,671,000
Beans and peas ...	2,913,000 qrs., at 2 0s.,	5,826,000
Hay	8,000,000 tons, at 5 0s.,	40,000,000
Potatoes	2,926,000 tons, at 3 0s.,	8,778,000
Turnips, & other } root crops	2,624,000 acres, at 5 0s.,	13,120,000
Flax and hops ...	83,000 acres,	1,898,800
Cattle	5,313,473 head, at 15 0s.,	79,702,095
Sheep	29,538,141 head, at 1 15s.,	51,691,746
Pigs	1,930,452 head, at 1 5s.,	2,413,065
Horses	1,500,000 head, at 20 0s.,	30,000,000

THE CENTRAL FARMERS' CLUB.

THE FEN COUNTRY.

The first meeting for discussion, following the usual autumnal recess, took place on Monday evening, November 7, the chair being filled, in the unavoidable absence of the Chairman for the year, Mr. J. Howard, M.P., by Mr. Charles Howard. The subject appointed for consideration was "The Fen Country," the introducer being Mr. A. S. Ruston, of Aylesby House, Chatteris.

The CHAIRMAN said: Gentlemen, I am sorry to say that I appear before you this evening in consequence of the indisposition of my brother, who is recommended to keep comparative quietude for the present. I am glad to see so many gentlemen assembled, at this the first meeting, as it is generally called, of our session. Since many of us last met, the agriculturist, of this country have passed through a very trying time, one of the most trying that they have ever experienced (Hear, hear). Indeed I may say that, so far as the graziers are concerned, many hundreds of thousands of pounds have been sunk, and, upon all the light corn-growing districts of the country a very serious deficiency has been witnessed. I have no doubt that upon all the deep soils a good wheat crop will be realized, and I think I may say the same of the barley and the bean crops. ["No; not the bean."] Well, we can only speak, you know, from our own observation, and I do not mean to say that in every case the result will be what I have stated (Hear, hear). The farmers of England have met to a considerable extent, and no doubt their condolences with each other have been cordial and frequent. I hope that better times are in store for us; but at present there appears but little prospect of any great profit being realized in the pursuit of agriculture (Hear, hear). The subject fixed for discussion this evening is "The Fen Country." That district presents, perhaps, very few attractions; but many great scientific achievements have been wrought in that part of our land. Though unattractive in a rural aspect, in an agricultural point of view it occupies a very important place in the agriculture of this country. Had my brother been present he would probably have told you that during his visit to Ireland he was very forcibly reminded of the Fen country of England; and that had the same amount of labour and of capital been applied to the marshes of Ireland as have been expended on those of England, similar results would have been realized. Mr. Ruston has undertaken to bring this subject before you this evening. The drainage of the Fens will, as you may suppose, form a rather important part of his paper. It may take up more time than some of you may think desirable; but from what I know of Mr. Ruston's literary attainments I feel quite sure that a treat is in store for you. Without saying more I beg to introduce Mr. Ruston (cheers).

Mr. RUSTON then read the following paper:

Once amid the darkness and confusion of chaos was heard the authoritative mandate of Omnipotence: "Let the waters under the heavens be gathered together unto one place, and let the dry land appear; and it was so." From the earliest times land and water have seemed to be in antagonism. The ever-recurring encroachments and recessions bear ample evidence of this. The great tide-wave has defied all opposition, and has claimed as its own whatever it willed; twice every day carrying out to sea by slow but sure and steady progress the once fruitful field which had yielded to man's culture, and depositing elsewhere for other man's benefit, those stolen elements of fertility: and it has alike taxed all man's energy and ingenuity to curb and restrain old Ocean's power, and to retain surely and well his gifts—and these are not merely the histories of the past, but they live on, and are the every-day processes of the present. To-day, to some extent, are these changes being repeated, and are gradually, but constantly, reforming the boundaries of our own sea-girt isle. The Fen country has a history peculiarly its own, and we must look beyond this slow, although every-day, action of tide and wave for some more violent convulsion of nature—some grand up-

heaval and depression—for the solution of how the Fens came to be. That there was something analogous to our Fens in the earliest times we gather from one of the oldest books extant—a book supposed to have been written more than 3,000 years ago—wherein it is said, "Behemoth . . . lieth under the shady trees, in the covert of the reed and fens. The shady trees cover him with their shadow; the willows of the brook compass him about." The reed and the willows, twin-signals of Nature's distress, sufficiently indicate the fenny nature of their homes. But when and how these Fens, which run from Cambridge to Lynn and Peterborough, and stretch far away into Lincolnshire, in their horse-shoe form, resembling a great bay scooped out of the surrounding hills, became fens, we have no historic record to tell us. Kingsley says, "to describe how the Fen came to be, one must go back, it seems to this writer, to an age before all history; an age which cannot be measured by years or centuries; an age shrouded in mystery, and to be spoken of only in guesses. To assert anything positively concerning that age, or ages, would be to show the rashness of ignorance. 'I think that I believe,' 'I have good reason to suspect,' 'I seem to see,' are the strongest forms of speech which ought to be used over a matter so vast, and as yet so little elaborated." It is not my purpose to ask you to follow me into a maze of guesses and conjectures, nor do I intend to lay down any geological hypotheses to account for the phenomena which on every side so forcibly present themselves. But although I attempt no explanation of the different processes which in the far past were so surely carried on in Nature's great laboratory, building up that which we see, and which so puzzles us to-day, I would, however, invite your attention to some of those evidences lying embowelled deep down in the earth below the peat and the bog, which go so clearly to establish the fact that these lands were not always the home of the eel and the wild fowl and the birth-place of ague and fever. Dugdale, writing many score years ago, tells us that in Marshland, about a mile to the west of Magdalen Bridge, in erecting a sluice, there was discovered at a depth of 17 feet, furze bushes and nut trees pressed flat down, with nuts sound and firm lying by them, the bushes and trees standing in solid earth below the silt which had been brought up by the inundations of the sea. He also tells of a large fish, nearly 20 feet long, discovered near Conington, lying in perfect silt six feet below the superficies of the ground, and as much above the then level of the Fen, and which by its long continuance in that kind of earth had become petrified, and that divers of the bones of the back and other parts were preserved by Sir Thomas Cotton, bart. And at the present day trees of varying kinds and sizes are constantly being discovered. The continued subsidence of the Fens through drainage, and the system of deep cultivation so generally prevalent, bring them within reach of the plough; and a deeply-ploughed field (and by way of parenthesis, I should say some of these are ploughed from 18 to 30 inches deep, with 8, 10, or 12 horses, as the case may be) oft-times resembles a mighty disinterred forest. Oaks, yews, saplings, and nut trees, with nuts and even leaves, fresh and perfect, by their side, are not unfrequently found. Some of the oaks are of marvellous dimensions. About thirteen years ago one of these grand old trees was removed from a field on a farm only a few miles from Chatteris. Its length was 109 feet, and its diameter at the bottom end 9 feet 2 inches, and at 85 feet from the ground 4 feet 2 inches. Only the top 24 feet were sound, the remainder being decayed and hollow. The cost of its removal was something considerable, amounting to several pounds. This is just a sample tree, and sufficiently indicates the size to which some of these noble forest-kings attained. These trees are commonly found imbedded in the clunch or peat (both vegetable) subsoil, resting on the clay; and the water oozing through these black vegetable products being absorbed by the oaks, and coming in contact with some che-

mical properties they contain, gives them a thorough fen dye, the outer portion being well nigh black, and the interior a dark dirty brown. The action of this fen water upon them not only imparts a colour, but also a hardness, which makes them for all building purposes, where not exposed to the changes of the atmosphere, almost as enduring as time itself. I have in my hall two chairs made from oaks dug up on my own property; the blackest portions were selected, and being polished, they are now as black and as hard as ebony, which they much resemble. A few years ago, when a steam engine was about to be erected for draining certain lands, in which I was then interested, it became necessary to dig a large deep pit in which to construct the trough for the water-wheel to work in. I was present at frequent intervals during the excavations. After passing through the ordinary surface soil and peaty subsoil, and a bed of soft buttery clay about 3 feet in depth, we came upon another soil and subsoil, some 3 or 4 feet in thickness, and beneath this a second bed of clay. The whole of this second stratum was much harder and stronger than the one above it; partly, perhaps, but not altogether, the result of compression. The clay especially was very stubborn, utterly unlike that in the upper stratum, but rather resembling that found in the heavy upland districts. But what I wish more particularly to remark is, that on this lower clay-bed we came upon a large oak tree, equal in size and similar in appearance to what are found resting on the upper clay-bed. From these facts we may reasonably infer that these low-lying, oft-submerged fen lands were not *always* as they have been during the historic period, and as they still are, but time was when they occupied a much higher level, probably as high as the surrounding hills of Cambridgeshire and Huntingdonshire, and owe their depression and present position to one or more terrible convulsions of nature. For it is a well-ascertained fact that oaks like those I have described will not grow, and by no ordinary or extraordinary methods of culture can be made to flourish on low, marshy, water-logged soils like the Fens. The conclusion then seems inevitable that when they grew the land was not fen, but the Fens are an after-growth and formation consequent upon favourable and altered circumstances. But these great convulsive throes of nature, these grand upheavals and depressions, these changes from land to water, and from water to land, the evidences of earth's internal discord, have been experienced elsewhere than in the Fens. Ovid, in his *Metamorphoses*, says (I give it in English, as translated by G. Sandis):

"Where once was solid land seas have I seen,
And solid land where once deep seas have been;
Shells far from sea, like quarries in the ground,
And anchors have on mountain-tops been found.
Torrents have made a valley of a plain,
High hills by deluges borne to the main;
Deep-standing lakes sucked dry by thirsty land,
And on late thirsty earth now lakes do stand."

The quiet seclusion and comparative inaccessibility, except by sea, of the Fen country, rendered it a favourite resort for those who, professedly wearied and tired of the world's vanities and pleasures, desired to consecrate themselves to a higher and purer service. These devout aspirations led to the formation of religious houses all over the country. We find them at Ely, Peterborough, Thorney, Ramsey, Crowland, Spalding, Chatteris, and elsewhere. Each has its own history, and tells of its long roll of saints, its heaven-blessed miracles, and its many acts of devoted piety. Glastonbury may proudly boast of its "Holy Grail," which Tennyson has inspired with immortality, by his thrilling and inimitable verse; but Ely, too, fondly tells of the health-restoring, life-giving and life-destroying miracles wrought at the tombs of St. Etheldreda, her foundress and benefactress, the canonized of Rome, and of her chaste fellow saints, of which no Laureate has yet sung. We are told that sixteen years after St. Etheldreda's interment, her body was exhumed by her devout sister and successor for more appropriate burial, when the discovery was made that the linen which engirdled her was still incorrupt, and "cured many diseased people with the touch thereof," and that from the vacant tomb "issued a fountain of pure water, which remaineth." For nearly nine score years her ashes, after their more honourable interment, rested in peace. But the restless Danes, sources of sad trouble and disquiet to those godly people, once more invaded their island home, when one of these dreaded pagans, more inhuman than the rest, beholding

the tomb, and inspired with insatiable cupidity, supposing that not only the body of the saint, but also vast hidden treasures were there entombed, had the temerity to raise his pickaxe and strike a hole into its side, whereupon, says the historian, "through the divine vengeance his eyes presently fell out of his head, so that he died. With which judgment the rest were so terrified, that they durst not presume to meddle there any more." We read elsewhere that this religious house at Ely "had had many good penmen, and yet, it was said, that they had failed to record all the miracles that had been wrought at these tombs." I shall not attempt to repair that omission. The Isle of Ely has been not inaptly designated the "Camp of Refuge." William from Normandy had invaded the country; Harold, last of the Saxon kings, was slain; province after province had yielded to the claims or succumbed to the overwhelming forces of the Conqueror; on all sides was war, devastation, and death. Old Saxon abbots and heads of religious houses had one after another plighted their troth to William, vainly hoping to retain their dignities and emoluments, and to be able to afford protection to their Saxon brethren, and to preserve them from the dreaded Norman persecution. Amongst these was the Abbot of Crowland, but amongst these was not Thurstan, my Lord Abbot of Ely. He was not prepared, under any pretext, to ignore the many obligations he owed, and the fealty and friendship he had sworn to Harold. His island home he felt was alike secure from the iron hoofs of William's cavalry and from the incursions of his infantry. From his Abbey tower he saw all around him a country made defensible by nature, and round about him he looked upon a brave, courageous, and devoted people. One old writer says, "This little Isle of Ely is environed with fens and reed-plecks unpassable; so that they feared not the invasion of the enemy." That sense of security which encouraged and assured Thurstan exerted a like influence upon others far away, and the dispossessed from every quarter hastened with all good speed to the safe retreat and generous hospitality of the Camp of Refuge. Nobles, warriors, bishops, abbots, and others, to escape Norman persecution, and to retain their Saxon liberty, rushed in such overwhelming numbers, that the place became overstocked, and the new-comers were driven, many of them, to seek shelter in tents and huts placed on the dry hillocks around. This stream of guests, with empty purses and empty stomachs, struck the Chamberlain who kept the accounts, and the Cellarer who had charge of the wine-buts, with terror and dismay; but good, generous Thurstan gave them a cordial and hearty welcome, and fed them right nobly in his profusely and delicately supplied refectory. Among all the religious houses none could vie with Ely in the Lenten season. Its own waters teemed with fish, and being open to Lynn, supplies of salt-water fish and continental wines were easily procurable. It has been said their fish-fasts were feasts. And while the brethren of other houses grew thin, these fasting monks of Ely grew fat, for there was nothing in the land to compare with these fish dinners, these banquets in Lent. And they were not unmindful of the old proverb, which says, "Good eating demands good drinking." If history can be trusted, it seems pretty conclusive that these devoted saints were never so oppressed and overwhelmed with an all absorbing concern for the soul as to become in any sense forgetful of the claims and necessities of the body; but it may with great truthfulness be said they fared sumptuously every day. But these days of fasting festivity and joyous gratulations were the precursors of days of darkness and sore troubles. Trials, many and bitter, awaited them. William's rapid and brilliant successes were inspiring him with confidence, and urging him on to further and still more startling victories. Soon his eye turned wishfully to the Fens, and despite all their natural defences, he daringly determines to venture an assault and test their vaunted impregnability. Hereward, Lord of Brunne, the wayward and dissolute son of Leofric, Earl of Mercia, by Godiva of Coventry renown, who whilst in his teens had been exiled by Edward the Confessor, and who had now returned a wiser man, was appointed chief in command, and chosen to direct the defence. His great deeds of valour, and his many noble exploits, had won for him a well-merited reputation. His brain-power and his arm-power were alike the admiration of all. True envy, that withering social curse, excited by his manly and heroic deeds of daring, had once jeopardised his life. Skilful in tactics,

clever in strategy, wise in counsel, quick in perception, nothing in effort, and bold as a lion in fight, he was eminently fitted for the position assigned him. Hastening to Ely to work out his designs, and to make the Camp of Refuge that great fact which it afterwards became, his life was sought by Earl Warren, whose brother he had slain. Ambushes on the borders of the Fens were laid for him, and attempts cunningly made to entrap him; but he, conscious of the plot, frustrated the Earl's designs, and drew from him those words of bitter rage, but of unquestioned truth, "Oh that I had that devilish fellow here, I would certainly torment him to death!" Hereward, quick and ready, replies, "If we should happen to be so fortunate as to meet alone in any fit place, you would not wish me on your feeble hands, nor like well of my company;" and, gently stooping, lets fly an arrow which unhorses the Earl and alarms his servants. Meanwhile Hereward and his companions pursue their journey, and that same day enter Ely, being received with great honour and hearty greetings by the Abbot and his monks, as also by Edwin, Earl of Leicester and Morecar, Earl of Warwick, two of the noble fugitives who had found an asylum there. The tidings from Ely as they reached William aroused his anger, and he resolved upon an immediate assault. He gathered his forces together at Aldreth, and there collected stores of wood, stone, faggots, trees, large pieces of timber, fastening them together with cowhides; and further to facilitate the passage across these Fen bogs and swamps, caused beasts to be killed and their skins filled with air like bladders. Inspired with greed for the gold and the silver supposed to be treasured up in the Isle, his soldiers rushed madly forward; the bridge yielded beneath the pressure, and all, except a few of the hindmost, who by throwing away their weapons, managed to struggle through the mud and escape, were drowned or swallowed up in the depths of the Fens—one man only, Beda by name, getting into the Isle. Beda, having received the hospitalities and civilities of the place, was permitted to return to the King's camp, where he recites before William and his nobles a wondrous tale. He tells of the impregnability of the Isle, its huge waters and fens compassing it about like a strong wall; of the utter indifference of its inhabitants to the siege—the ploughman keeping to his plough, the hunter to his sport, and the fowler to his work; of its teeming supplies, consisting of domestic cattle, harts, does, goats, hares, eels, pike, perch, roach, royal fishes, geese, bitterns, sea-fowl, herons, ducks, and all in abundance. The fighting men, and especially Hereward, receive a rich meed of praise, much to the annoyance of Earl Warren, who insinuates that Beda has been bribed to make these representations. But William repels these insinuations, and with a noble generosity refuses to hear these valiant men evil spoken of, and commends their courage as above that of his own men, and feels inclined to make peace with them. From this his nobles dissuade him, urging that such a concession would be a precedent which might be fraught with great evil. The King angrily replies, expressing his inability to conquer the people, the place being naturally so defensible. Ivo-Taillebois, indignant at the King's timidity, reminds him of the old Norman witch, and suggests the desirableness of enlisting her services. For, says he, "by her art she would soon destroy their whole strength and places of defence, and drive them out as cowards from the island." This suggestion secures the cordial and hearty sympathy of his nobles; and at length, being strongly urged to it, William yields. Secrecy is enjoined lest mischief should result, and the old woman is privately sent for. Preparations on a gigantic scale are forthwith commenced; the new idea inspires new hopes. Forces numerous and powerful, and materials abundant and diversified, are once more collected at Aldreth. Towers are erected, earthworks thrown up, and engines of war arranged. The old witch mounts the highest eminence, and with vehemence pours forth that volume of words, and exhibits those mad frantic signs, the spells of witchery, which are to ensure the success of the assault on the morrow. But Hereward, wise and crafty, by skilful manoeuvres and at great personal risk, contrives to discover the intentions of his foes, and just as the old witch was beginning with her third spell, he causes a fire to break out in the reed beds, which, despite all opposition, rushes on madly and with irresistible fury towards the Norman camp. The crackling of the willows, the blaze of the reeds and other dry vegetable substances, as the fire goes leaping forward, strike the whole army with terror and dismay. Thus terrified and awe-stricken,

they beat a quick retreat, and in wild confusion grope their way amid dense clouds of smoke, not knowing whither they go, whilst to the windward from Saxon bows comes whizzing a volley of bristling arrows. The old witch is left to perish miserably alone. William narrowly escapes with his life, and the whole army, in modern parlance, becomes demoralised. For seven long years did these Fens successfully resist invasion, but at length treachery within and strategy without secured them to the Normans. Hereward made his peace with the Conqueror, and returned to his ancestral hall at Bourne. Hereward had an only daughter, who became the wife of Hugh de Evermere, Lord of Deeping, whose only child and daughter married Richard de Rulos, Chamberlain to William the Conqueror. The said Richard de Rulos not only attended to the ceremonies incident to Court life, but devoted himself with great zeal and energy to the pursuits of agriculture. On his uplands, the lands above the flood level, he was renowned for his good tillage and his successful breeding of cattle; and on his low lands he projected and carried out, at immense cost, great works of reclamation. By constructing strong and substantial banks to prevent inundations from the Welland, to which they were constantly subjected, he converted those low-lying grounds about Market Deeping (which signifies a deep meadow), and which before were deep lakes and impassable fens, into fruitful fields and pastures, and we are told "he reduced the most humid and moorish parts thereof to a garden of pleasure." We are likewise told that "by the like means of banking and draining he also made a village, in the very pan of Pullington, and by much labour and charge reduced it into fields, meadows, and pastures, which is now called Deeping St. James." All honour to Richard de Rulos! and, with Kingsley, we would write on his tomb, "Here lies the first of the new English, who, by the inspiration of God, began to drain the Fens." The Romans, bringing with them a higher civilization, performed various works of drainage, and made roads, and in other different ways sought to improve the fen country, and numerous traces of their skilful and intelligent labour are still discernible. The religious houses expended considerable energy, and not a little wealth, in their efforts to bank out the waters, to keep the outfalls well open, and in other practical works of drainage; for William of Malmesbury, writing in the eleventh century, represents Thorney as "a very paradise, for that in pleasure and delight it resembleth heaven itself." This Paradise was subsequently lost, but how far through neglect of outfalls and other works, and how far from uncontrollable causes, I shall not venture an opinion. Suffice it to say it was lost, and it has only been during the present century that it has been fully regained. In the reign of the 7th Henry, John Morton, Bishop of Ely, made a channel from Standground to Guyhirn, still called Morton's Leam, which Dugdale says was "a work certainly of singular consequence, not only for the quicker evacuation of the overflows of Nene, but for conveniency of carriage from Peterborough to Wisbeche." The drainage of the great watery waste appears never to have been lost sight of, and yet for centuries no great effective works were undertaken, and no specific legislative measures, relating exclusively to the Fens, were passed. To protect the country from the ravages of the sea, and to maintain water-courses for purposes of drainage, appear to have been considered duties devolving on the sovereign and his subjects; and when necessity arose, or occasion required it, the Crown granted a Commission to inquire into and remedy whatever faults were found to exist. These Commissions were sometimes, justly or unjustly, deemed oppressions. Hence we find in Magna Charta it is provided, "No town nor freemen shall be distrained to make bridges or banks, nor should any banks be defended, but such as were in defence in the time of King Henry, our grandfather, by the same places and bounds as they were wont to be in his time." In 1531, in the reign of Henry the 8th, the law known as "the Statute of Sewers" was passed. From that time Commissions of Sewers were occasionally granted, and some partial works were done under them in the "Great Level," as it was termed, but nothing of a permanent character. In 1570, in the thirteenth of Elizabeth, a more extended Commission was granted to Sir William Cecil, son of the first Lord Burleigh, and ten other influential persons, who on the 9th of June of the same year sat at Peterborough, but nothing in reality was accomplished by it. For thirty years no further progress was made, but in 1600, in the forty-third of Elizabeth, what was called "the General Drain-

age Act," was passed. This Act was intitled "An Act for the recovery of many hundred thousand acres of marishes, and other grounds, subject commonly to surrounding, within the Isle of Ely, and the counties of Cambridge, Huntingdon, Northampton, Lincoln, Norfolk, Suffolk, Sussex, Essex, Kent, and the county palatine of Duresme," the preamble whereof runs thus: "Whereas it is apparent to such as have travelled in the execution of Commissions of Sewers in the isle and counties aforesaid, that the wastes, commons, marishes, and fenny grounds there, subject to surrounding, may be recovered by skilful and able undertakers; whereby great and inestimable benefit would arise to her Majesty, her heirs and successors, disburthening her Highness of many chargeable banks and works of sewers, within those surrounded grounds, as the increase of many able subjects by habitations being there erected, and in like sort profitable to many of her Highness's subjects, both bodies politic and corporate, who have estates of inheritance and other interest within the same. And for that the draining and making dry and profitable of those surrounded grounds is chiefly hindered; for that the greater part of them are wastes and commons, subject yearly to surrounding, wherein divers have common by prescription by reason of their resiancy and inhabitation; which kind of commons, nor their interest therein, can by the common law be extinguished or granted to bind others which should inhabit there afterwards. And in that also it appeareth, that the Commoners, in respect of their poverty, are unable to pay the great charges to such as should undertake the recovery of the same." It then proceeded to give power to the owners of these lands to make contracts with such persons as would undertake the draining, such contracts, and conveyances thereupon, being "made good and available in law against the lords of the soil and all other the Commoners therein." This Act was passed so near the close of Elizabeth's reign that little was done; but her successor had scarcely ascended the throne ere he resolved to attempt the reclamation of the Great Level, and in the second year of his reign we find James I. appointed the first Commission for this purpose, but without any great practical results. Successive Commissions for seventeen years were equally fruitless. Schemes were projected, expensive views taken, plans decided upon, but the works did not proceed. Opposition was aroused, and disputes between the country and the Commissioners were bitter and constant, and the King was petitioned again and again to restrain acts of supposed injustice; law suits were commenced both against the Commissioners and those in their employ; everything to retard, and nothing to advance the work. So excited and infuriated did these Fen men become that they could find relief only in song. Here is a specimen, called "The Powtes Complaint":

Come, brethren of the water, and let us all assemble,
To treat upon this matter, which makes us quake and tremble;

For we shall rue it, if't be true, that Fens be undertaken,
And where we feed in Fen and Reed, they'll feed both Beef and Bacon.

They'll sow both Beans and Oats, where never man yet thought it,

Where men did row in boats, ere undertakers bought it;
But, Ceres, thou behold us now, let wild oats be their venture,

Oh let the frogs and miry bogs destroy where they do enter.

Behold the great design, which they do now determine,
Will make our bodies pine, a prey to crows and vermine;
For they do mean all Fens to drain, and waters overmaster,
All will be dry, and we must die, 'cause Essex calves want pasture.

Away with boasted rudder, farewell both boots and skatches,
No need of one, nor th' other, men now make better matches;
Salt-makers all and tanners shall complain of this disaster;
For they will make each muddy lake for Essex calves a pasture.

The feather'd fowls have wings, to fly to other nations,
But we have no such things to help our transportations;
We must give place (oh, grievous case!) to horned beasts and cattle,
Except that we can all agree to drive them out by battle.

Wherefore let us intreat our ancient water nurses,
To show their power so great as t' help to drain their purses;
And send us good old Captain Flood to lead us out to battle,
Then twopenny Jack, with scales on's back, will drive out all the cattle.

This noble Captain yet was never known to fail us,
But did the conquest get of all that did assail us,
His furious rage none could assuage; but to the world's great wonder,
He bears down banks, and breaks their cranks and whirligigs asunder.

Good Eolus, we do thee pray, that thou wilt not be wanting,
Thou never saidst us nay, now listen to our canting;
Do thou deride their hope and pride, that purpose our confusion,
And send a blast, that they in haste may work no good conclusion.

Great Neptune (God of Seas) this work must needs provoke thee;

They mean thee to disease, and with Fen water choak thee;
But with thy mace do thou deface, and quite confound this matter,
And send thy sands to make dry lands, when they shall want fresh water.

And eke we pray thee, Moon, that thou wilt be propitious,
To see that nought be done to prosper the malicious;
Though summer's heat hath wrought a feat, whereby themselves they flatter,
Yet, be so good as send a flood, lest Essex calves want water.

James, wearied and annoyed by these repeated failures, and incensed by the determined and resolute opposition everywhere met with, said "that for the honour of his kingdom, he would not any longer suffer these countries to be abandoned to the will of the waters, nor let them lie waste and unprofitable;" and to ensure success and promptitude of action, he at once declared himself the principal undertaker. How true it is "Man propheth and God disposeth;" for just at this important juncture, when success seemed so well assured, his attention is diverted from the Fens to the Continent, and his daughter's husband earnestly implores him to aid in the restoration of his forfeited dominions. These family and other troubles effectually stay his drainage schemes, and he bequeaths to his successor this gigantic undertaking. Until the fifth year of his reign Charles I. appears to have taken no decided action towards freeing these submerged lands from the waters which desolated them; but on the 6th January, 1629 a Session of Sewers was held at Huntingdon, which, in its wisdom decreed that a rate of 6s. per acre should be laid on all these "marsh, fenny, waste, and surrounded grounds," in order to their draining. But notwithstanding all this show of business, nothing was done. The tax was not collected, and the works were not proceeded with. In the month of September of the following year another Session of Sewers was held at Lynn, when something more definite and hopeful was accomplished. There were nearly fifty Commissioners present, and they entered into a contract with Sir Cornelius Vermuyden, a Dutch engineer of great skill and experience, to drain the Great Level, offering to give him as his recompense for the works undertaken 95,000 acres of the surrounded lands. I would here observe the word *surrounded*, so frequently used in these old documents, means simply *flooded* or *inundated*. Once more the prize so rarely gained tantalizingly eludes the grasp. Prejudice, deep-rooted and omnipotent, impels these Fen men to a course of determined hostility, and they resolutely refused to ratify the contract sanctioned by the Commissioners, not from any intelligent conviction of the insufficiency or unsuitableness of the scheme itself, but simply and solely because Vermuyden was an alien born. Having done this, and upset the contract, they then turn round and do a very wise thing. They become "humble sniters" to Francis, then Earl of Bedford, an owner of some 20,000 acres in the Level, and solicit him to undertake the work. This request is supported by the Commissioners, and the Earl assents. On the 13th of January, 1630, another Session of Sewers was held at Lynn, when the contract, commonly known as the "Lynn Law," was made. In this law the Earl engages to commence the work forthwith, "and to finish it, so as to make the grounds fit for meadow, arable or pasture, within the compass of six years from the 1st of October following." He is to receive 95,000 acres of the drained land, these whole 95,000 acres to be liable to the first finishing of the work, and 40,000 acres, part of the same, for its subsequent maintenance. Provision was also made that when 30,000 acres should be finished, the Earl should have his proportion of it. The Earl enjoyed the confidence of the country. His fortune was ample, and his character commanded universal esteem. The opposition which had so successfully

thwarted all previous efforts to drain the Level was no longer experienced. Unanimity prevails, and the whole country gathers around the Earl, and proffers its assistance. In the following year the Earl and thirteen other gentlemen of rank and wealth interested in the country, who had become associates with him in the adventure, entered into an agreement among themselves, commonly known as the "Indenture of 14 Parts," whereby the undertaking was divided into twenty shares, and the adventurers were for each share to sustain proportional shares of the charges. On the 13th of March, 1637, the Earl and certain other persons were by letters patent incorporated. This charter of incorporation gave them certain other powers, besides making them guardians of all the waters, rivers, and fens within the precincts of the Level, such as the building of churches and chapels and making churchyards, "in such fitting places of the said Fens as they shall judge meet, and to cause them to be consecrated by the bishop." This breath of royal favour inspired the Earl and his co-adventurers with spirit, and they vigorously pushed on the work; and on the 12th of October, 1637, the whole Level was adjudged drained, and the 95,000 acres of land were set out for the Earl's recompense. This ray of kingly sunshine unhappily was only the prelude to the approaching storm. The cloud was gathering thick and portentous, and was soon to burst on the noble band of adventurers. For on the 14th of April, 1638, at a Session of Sewers held at Huntingdon, the Earl of Bedford's undertaking was adjudged defective. The King, professing a great desire to make these 400,000 acres in the Great Level good winter as well as summer lands, which he considers the Earl has failed to do, consults Sir C. Vermuyden and others competent to advise him; and at a Session of Sewers held at Huntingdon on the 15th of July causes himself to be declared the undertaker, the bargain being that he shall have not only the 95,000 acres which had been formerly set out for the Earl of Bedford, but also 57,000 acres from the country additional. But in consideration of the great expenses incurred by the Earl and his participants in their efforts to perform the undertaking, he was to receive 40,000 out of the 95,000 acres. Charles, like his royal predecessor, when proclaimed undertaker, projects grand works, and pictures to himself great and speedy results. One of his pet schemes was to build an eminent town in the midst of the level at the village of Manea, which was to enjoy the euphonious name of Charlemont, he had himself drawn the designs, and intended making a navigable stream from this chosen spot to the Ouse. But, like James too, just as his plans were ripening, and he was preparing to take prompt and active measures to accomplish his purposes, his attention is diverted from the Fens to other more important and disastrous scenes, which finally result in the loss of his crown and of his head. National disquietude was inimical to Fen interests, and the works which the Earl of Bedford and his associates had at such immense cost constructed were allowed to go to decay, and the drains were rapidly growing up. Francis, Earl of Bedford, the old, and Charles I., the new undertaker, were both dead. William, son to Francis, succeeded to his father's earldom, and, inheriting much of the spirit and enterprise of his father, applied with others of the adventurers in 1649, during the Commonwealth, to the Parliament sitting at Westminster. Parliament listened to their application, carefully examined all former proceedings, declared the decisions of the Huntingdon meeting null and void, and entrusted the works to the new Earl on the general plan of the "Lynn Law." This Act of 1649 was called the "Pretended Act," it not having been re-enacted on the restoration of Charles II. The new undertakers began in real earnest, and made good speed. The old works were repaired, and new ones constructed, and on the 25th of March, 1653, the Level, by a decree of Sewers made at Ely, was adjudged to be fully drained, and the Earl and his co-adventurers had the 95,000 acres of land awarded to them. The Great Level henceforward took the name of the "Bedford Level." In 1663, in the 15th of Charles II., a Bill was brought into Parliament, to make the adventurers a corporation, and during that session became law. This Act made the adventurers a corporation in perpetuity. The manner of their continuance is prescribed; their powers are declared; the whole 95,000 acres, their recompense for the work of draining, are made subject to taxes to be annually laid and raised for the support and maintenance of the works of the Level; the public meetings of the Corporation are fixed;

and the business of those meetings directed. From that time to within the last few years an Earl or Duke of Bedford has been the Governor of the Corporation. But on the occasion of the North Level, in which the Duke's property is situated, being legally separated from the Corporation, he withdrew, and was succeeded by the Earl of Hardwicke, the present Governor. From what has been already stated, it will be seen that the work of reclaiming this vast area of inundated land was no easy task; but one fraught with immense and ever-recurring difficulties, and required men of strong nerve and intrepid courage to undertake it. And it affords an apt illustration of the fact that subjects rather than sovereigns can most safely be entrusted with the prosecution of great national enterprises. The name of Russell is one ever to be honoured in the Fen country. To that family every fen-man is largely indebted. I cannot resist the conviction that the draining of the Bedford Level is the real starting-point, and that all subsequent and more perfect works of drainage owe their existence to the successful issue of that great adventure. The two maps I have introduced are copies from Dugdale, and show the state of the Level before and after its drainage by the adventurers. In the one, as you will see, the villages stand on high ground above the flood level, and are mostly surrounded with water, and constitute the Isles around Ely, from which circumstance that division of the county of Cambridge, called the Isle of Ely, very probably took its name. On these high grounds (and to this day the distinctive names of *high* and *fen* lands are retained) the sparse resident population doubtless produced corn and meat sufficient for their requirements, whilst on the flooded lands they had an inexhaustible supply of fish and wildfowl. And it seems fair to suppose they realized no small measure of enjoyment, dividing their time between work and sport, and making both contribute to their family necessities. On the other map you have a view of the Level after it was adjudged fully drained, with the works of Sir C. Vermuyden, which show the design of his scheme, and to which I must briefly call your attention. Sir Cornelius Vermuyden, although rejected by the country, as already stated, in consequence of being "an alien born," was employed by the adventurers, and the drainage of the Level was carried out according to his plans, and under his direction. He divided the Level into three parts. The first from Welland River to Morton's Leam, the second from Morton's Leam to Bedford River, and the third from Bedford River southwards. The first, containing about 40,000 acres, was called the North Level; the second, containing about 140,000 acres, was called the Middle Level; and the third, containing about 120,000 acres, was called the South Level. The leading features of his scheme were to convey the upland waters through the Level, by means of straightened and embanked rivers, to sea, and to prevent the tide entering and overflowing either of the levels. He effected these objects by turning the course of the Nene along Morton's Leam, between the North and the Middle Level, and the Ouse from Earith by a new cut called the "100 feet" or New Bedford River, on the confines of the South Level, and so obtaining direct outfalls to sea at Wisbech and Lynn, which tended greatly to improve those outfalls. Another feature in his scheme was to cut large new straight drains within each level, to convey the downfall to the rivers. Each level was defended by high barrier banks, and between the North and Middle Levels, and also between the Middle and South Levels, within these high strong banks, are washes, which, when the floods from the upland districts are greater than the rivers can carry away to sea, receive these surplus waters, proper provisions being made for their reception and evacuation. The second map shows this very clearly, and gives at once a distinct idea of the plan; and in comparing these straight embanked rivers, keeping out the upland waters from the Fens altogether, with those old natural streams which, crooked and devious, went winding through the whole Level, the waters overflowing them without let or hindrance, one sees at once the wisdom of this part of Vermuyden's scheme. For it must be remembered that the waters, whose passage to sea he thus provides for, are not the waters falling in the immediate neighbourhood, but what flow down the Ouse and the Nene from Buckinghamshire, Bedfordshire, Huntingdonshire, and Northamptonshire—the water-shed of whole counties. The two great defects in Vermuyden's scheme were (1st) his omission to provide for the improvement of the natural outfalls to sea at Lynn and Wisbech. He satisfied

himself with getting the water out of the Fens into the drains and rivers running through the Level; but gave no attention to their discharge therefrom; whereas his first great business should have been to have scoured for these drains and rivers the best outfall possible to sea, for, without that, all internal works, however good, must sooner or later fail. His second error consisted in not making the new drains and cuts of sufficient depth. He either did not understand or did not properly consider the nature of the soil he had to excavate. This soil was a deep moor-bed, which had been growing and accumulating for centuries, probably for ages, and for these drains to be permanently efficient, it required that this bed should be cut quite through to the natural soil on which it rested; but this he failed to do, and the consequence was the peat bottoms of these drains, covered with fen water, began, imperceptibly it might be, but surely, to rise upwards towards the surface of the water, seriously impairing their utility as drainage channels. And whilst this process was going on in the drainage channels, a process of a directly opposite character was going on in the drained lands around. Whilst the one was rising, the other was subsiding. These errors were sources of great trouble and loss to the adventurers. The completion of the adventurers' works and their effects upon the drainage of the Level led, after a while, to the consideration of still further works. Leading drains or rivers had been provided to convey the waters into the larger streams, and thence to sea; but as the drained land subsided, the question very naturally arose how the waters could be got from the fen drains into the adventurers' drains. When they ceased to flow naturally or by their own gravitation, it became necessary to provide some lifting power. The consequence was the division of the Level into districts, not on any uniform plan; but as certain owners in any locality deemed it expedient to improve the drainage of a certain specified area, they applied to Parliament for the necessary powers, which very commonly included embanking as well as draining, as both were essential. The first of these district Acts was obtained "for the better draining and preservation of Haddenham Level," which is within the South Level. This Act was passed in 1726, and was followed by a number of similar Acts. These districts were provided with drains, which all converged to certain points, and these mills, driven by wind-power, were erected for lifting, by means of scoop wheels, the waters from these drains into the adventurers' drains, to be conveyed by them to sea. Both the adventurers' and the free lands (as they were designated) were taxed to carry out and continue these operations. These wind engines during the present century have very generally given place to steam. A few remain as the relics of a former dispensation. Unfortunately, when the floods came, it so frequently happened that the wind refused to blow, and until Eolus could be aroused, these fen lands, instead of their embanked rivers, became reservoirs for the waters, and these floodings oftentimes resulted in heavy pecuniary losses. Steam-power, exchanging a certainty for an uncertainty, has contributed very largely to the improved drainage, and consequently to the increased fertility and value of fen lands. The advent of steam was the occasion of poetic inspiration. Hence a poor man writes as a motto for a steam-drainage engine:

"These Fens oftentimes have been by water drown'd—
Science a remedy in water found;
'The power of steam,' she said, 'shall be employed,
And the Destroyer by himself destroyed.'"

Vermuyden's omission to provide adequately for the improvement of the natural outfalls, as already referred to, became towards the end of the last century a subject of vast and serious moment. To deepen and improve the internal drains, and heighten the banks in the Middle and South Levels, as proposed, could be of little avail, so long as the outfall remained unaltered. Indeed, so bad had things become, that the Corporation were induced to consult Mr. John Golborne, an eminent engineer, who reported upon the state of the Level, and discouraged the execution of any other works until the outfall from St. Germain's to Lynn was improved. His report is melancholy and sad. He says, "Look which way you will, you see nothing but misery and desolation. Go but half-a-mile from Ely, and you come to a track of 16,000 acres given up and abandoned. There you see the ruins of windmills, the last efforts of an industrious people." This is in the South Level, and the Middle Level is no better. If you go to Ramsey," he

says, "you find more than 10,000 acres occupied by the waters, and see houses without inhabitants, and lands incapable of either pasturage or tillage. We passed two farm-houses, now deserted, where one of the occupiers got but two crops in nine years, and there were thousands of acres in other parts covered with fine crops of wheat, barley, and oats, that would be lost if there happened to fall twenty-four hours of heavy rain; wretched people whose all depends on the clemency of the season." Once more referring to the South Level, he says: "We saw the whole Level surcharged with water." And to the Middle Level, "Look which way you will along the Level and it is brim full." Golborne's Fen picture is not a very cheering one, but amid all the dark pencillings there is one little shading of light, one little sun-beam tinged with brightness stealing from behind the cloud, for he says "the roof of the evil lay in the outfall," and that if "a new channel is made for the Ouse from Eau Brink, and through the marshes to Lynn," cutting off a long circuitous bend, which so calamitously impeded the free flow of the waters from the discharge sluices of the two levels in their passage to sea, "the Level would again flourish and become fruitful land at a moderate expense." This Eau Brink Cut, so wisely recommended by Golborne, was made, but between twenty and thirty years elapsed between the passing of the first Eau Brink Act and the opening of the cut. But when it was opened in 1821 all the beneficial effects predicted by Golborne, Rennie, and other engineers, were fully realised. The low-water level of the Ouse, especially at its seaward end, was considerably lowered, and hence the discharge from the Fens was in like manner facilitated. A few feet additional fall to such low lying lands is of the utmost value. Between the passing of the first Eau Brink Act and the opening of the Eau Brink Cut, the Middle Level, anxious to improve its own internal works, obtained in 1810 an Act for that purpose, under which they expended some £80,000. But these improvements, added to the benefits resulting from the opening of the Eau Brink Cut, did not afford the country an efficient drainage. And I am not surprised at it; for when I stood the other day and looked at the two little openings from Well Creek into the Tongs' Drain, through which nearly the whole of the Middle Level waters had to pass, I felt amazed that the owners of Middle Level land could, even for a short time, have rested contented with such a miserable apology for drainage. In 1841 general discontent began to prevail, and schemes for improved drainage were projected, which resulted in the adoption of a plan submitted by Mr. Walker, which in 1844 received the sanction of Parliament. Mr. Walker avoided the error of Vermuyden, and gave his first consideration to the outfall. Previously to this time the waters, as just intimated, had been discharged by the Tongs' Drain into the Ouse. Mr. Walker decided to cut a new drain to a point nine miles nearer Lynn, just at the top of the Eau Brink Cut, thereby giving a greatly improved fall for the waters. Probably in times of pressure the difference would be as much as ten feet, or even more. Having secured this immensely improved outfall, Mr. Walker then sought to adapt the internal works to it, increasing the dimensions and depths of the drains accordingly, and where practicable giving a natural drainage, and where otherwise reducing the requirements for mill power to a minimum. The advantages resulting from Mr. Walker's scheme cannot well be over estimated. Formerly the waters were held up in shallow streams, between two high banks, which banks, in early Fen history, were sources of perpetual disquietude to Fenmen, as during every flood there were apprehensions of a breach, and these breaches were not infrequent. Since the Eau Brink Cut was opened these breaches have been less frequent, but where water is carried between banks several feet above the level of the surrounding lands there is always danger; besides danger there is leakage, and unless the banks have good puddle walls of clay in them, this is oftentimes a source of considerable difficulty and expense, and in addition to these evils there is the increased pumping power required. It is a self-evident fact that the higher the head of water against which you have to lift, the greater will be the lifting power required, and the less will be the discharge. Since Mr. Walker's plans were carried out these things have ceased to exist in the Middle Level; but half a million of money was expended in securing the advantages it enjoys. Since these works were erected the Two Miles Estuary Cut below Lynn has contributed to improve the outfall, by increasing

the depression at low water-mark in the Ouse at Lynn three to four feet, and at St. German's, where the Middle Level waters are discharged, two to three feet. But the increased scour of the Ouse is a source of danger as well as of drainage benefit. Already two sluices have succumbed, and twice has the country been excited and alarmed by reported failures of the Ouse banks; and did I possess the spirit of prophecy which some people seem to enjoy I should venture to predict that we have as yet not heard the last of these reports, but that sooner or later those banks will be occasions of disaster to the country. Since the failure of the Middle Level Outfall sluice in 1862 the country has been drained by syphons; this plan was suggested by Mr. Hawkslow, and has thus far been successful. There are sixteen of these syphons, each $3\frac{1}{2}$ feet in diameter, and about 150 feet in length, placed over the bank which was put across the main drain to stop the inflow of the tide after the sluice failed. There is every appliance which science can devise for keeping them in efficient working order. Probably in any new drainage schemes a sluice would be preferred to syphons, but the Middle Level has occasion to speak well of the syphons, and although their present number may possess less discharging power than their old sluice, and there may be some slight loss of fall, yet upon the whole they have worked satisfactorily, and have kept the Level well drained. The large sum of money expended by the Middle Level under its Act of 1844 on works properly belonging to the Bedford Level Corporation, and which it had failed to adapt to the requirements of the Level, occasioned dissatisfaction amongst the proprietors of the Middle Level lands, and led them to seek a separation from it, having their own works and share of funds placed exclusively under their own management. Parliament sanctioned this separation in 1862. The North Level as far back as 1753 had been practically and virtually separated from the Corporation, its share of the Corporation funds being secured to its own uses, but it was not legally and technically separated from it until 1858. The North Level took the lead in securing a good and efficient drainage. By making a new river eight or nine miles in length, and by cutting off a long bend by another straight cut of about the same length, they gained an additional outfall of some ten feet, which enabled them to do away with all pumping power, and for forty years they have now enjoyed a good natural drainage, their waters falling by their own gravitation to the sea. The South Level, having lost both the North and the Middle Levels, now enjoys the honour of being itself the Bedford Level Corporation. By an Act passed in 1827 some part of this level was benefited, but no great and comprehensive scheme for giving the whole Level a more perfect and efficient drainage has yet been submitted to Parliament. Considerable benefit has been necessarily derived from the Eau Brink and Estuary Cuts, but to reap the full advantage of these a new outfall much nearer to Lynn is required. The old outfall at Denver Sluice is still retained. This being some ten miles higher up the Ouse than the Middle Level point of discharge there is a consequent loss of fall of several feet; and this necessitates the keeping of the waters piled up in the rivers between high banks, the level of the water being some few feet above the level of the land, whereby they are exposed to all the evils incident to this primitive, but imperfect system of drainage, and to which I have already adverted. Last Whitsuntide the Bedford Level Corporation received a memorial from the Commissioners of the Haddenham Level Drainage, which stated that at their last half-yearly meeting "it was unanimously agreed to incur great and necessary expense in puddling the north bank of the old west river, as there are reasons to apprehend that in the event of a flush of water in the river the leakage through the banks would be greater than the memorialists engine could keep down. The memorialists are of opinion that the work is absolutely necessary for the preservation of their Level, though the bank is not within the limits of their jurisdiction." From what I have already stated respecting the draining of this "great Level" (and I have confined my observations mainly to this, and it sufficiently illustrates the drainage of all fen lands) the inference is easily deducible, that if fen lands are to be perfectly and successfully drained the true principle is first of all to secure the best possible outfall for the discharge of the waters, and then to construct the internal works of corresponding dimensions and depths, giving where practicable a natural drainage, and where not, reducing the pumping power

to a minimum; and sooner or later I conceive this will be the principle adopted by all the drainage levels in the kingdom. One important and somewhat startling fact in connection with the review of the drainage history of the great level during the last two or three centuries strikes one, and that is, that all the great works which have contributed to drain the land effectually, rescuing it from all risk of winter floods, and making it really valuable, have been made during the present century. At the beginning of the century the lands were little more than summer lands, and men were considered demented who ventured to sow a whole field with wheat. But now the Fens are the great corn-producing lands of the kingdom, and have been not inaptly termed "the granary of England." In 1774 the Fen Country had excited so much interest that Lord Orford and a party of friends resolved to take a cruise "in the narrow seas" in the Great Level, and accordingly had a fleet fitted out at Deptford and Ely, and in July commenced their twenty-one days' cruise. They passed through Denver Sluice into the Ouse, and thence through Sallers' Lode Sluice to Well Creek, and so through the Level. At Whittlesea Mere the great reservoir for fen waters, they amused themselves with fishing, and got up a regatta; they also received a visit while there from Lord Sandwich, the first Lord of the Admiralty, and some of his naval friends. In cruising down the rivers they took some very lordly liberties, which I fancy would be speedily avenged in these days. Where bridges were found to obstruct the passage of their ships they simply knocked them down, and passed on. They were not very complimentary to our Fen mothers; they say "many very old women in Upwell, Outwell, and March; the sex in general extremely ugly; the towns, population, crops of all kinds, plentiful." At Ramsey his Lordship says they found "the sex much handsomer . . . The girls had many of them guido faces, with fair hair, good shapes, with expression and life in their countenances." I don't learn that amongst those inhabitants whom they describe as having "disagreeable sallow complexions, broad flat noses, and wide mouths," were any "yellow-bellied" or "web-footed." Perhaps this reputed race had become extinct. Lord Orford's race-course and fishing-ground is now the home of flocks and herds, and teems with rich abundance. The eel, the perch, and the pike, have yielded to the bullock, the sheep, and the horse, and the lake-billow, which when tempest-tossed brought sickness to the cruisers, has given place to the golden wave of plenty. The Mere was drained under the Middle Level Act of 1844, and for all details and particulars relative to its subsequent cultivation I refer you to a very excellent paper on the subject, written by one of its chief proprietors, Mr. Wells, M.P. for Peterborough, and which appeared in a late number of the Royal Agricultural Society's Journal. The subsidence of Fen lands after they become drained is a subject deserving attention. The more we drain the lower our lands become, and we are beginning to inquire what is to be the end of all this. I am informed by Mr. Laurance, the agent to Mr. Wells, that when Whittlesea Mere was drained, to ascertain accurately what the subsidence was, a Doric column was placed in the ground, on which feet and inches were marked downward from the capitol, which was the original surface of the land. That surface is now seven feet below what it was when they began to drain the Mere eighteen years ago; and in the Middle Level on all our old drained lands we find the subsidence is still going on at the rate of an inch per year. We learn this from our drainage engines, which are continually requiring the centres of their water-wheels to be lowered, or the ladders to be lengthened, or they would soon lose their dip altogether. The increased facilities of discharge through the improved outfalls must continue to be felt until the peaty subsoil shall well nigh disappear. One of Lord Orford's companions on referring to their passage through Salter's Lode Sluice, tells us that the tide at that place rises five or six feet. On the 21st of February of the present year it rose to twenty-two feet three inches at 11.15 P.M. The effect upon drainage of this altered state of things, and consequently upon subsidence, must be obvious to every one. The Fen rivers and drains so useful and essential for the discharge of the flood waters of winter are scarcely less valuable for the supply of fresh water in the summer. It is not easy to overestimate the immense value of a good and liberal supply of fresh water for the whole Fen country during the dry summer months, and I need hardly say every effort is made to obtain this. The practice of irrigation

has not found much favour in the Fens, and it is questionable whether it would be of any great good where the waters possess so few fertilising elements. Irrigation appears to depend for its success very much upon the chemical properties contained in the waters. An analysis of the water will pretty correctly indicate what will be the effects of its overflow. Cultivation and drainage have gone on hand in hand, each successive improvement in the one leading to a corresponding improvement in the other. During the early drainage history most of the low-lying Fen lands were kept in grass, as they could not be profitably brought under cultivation in consequence of their liability to inundations during every recurring flood. Some farmers ventured to sow a few oats on the higher lands, but it was not until May was well in and the winter rainfalls had passed away to sea. By and by oats were grown more largely, and wheat was cultivated to some extent. Then came the system which prevailed very generally in the Fens for a good number of years, and which was to let the land keep in grass for two or three years, then pare and burn, and sow with coleseed to feed with sheep during the winter months, to be followed by oats, and then wheat; and again sown down with seeds, to remain two or three years—often three. This virgin soil, under such management, produced cole-seed of most extraordinary fattening qualities, and perhaps there has never been any natural food that would compare with it, or that would in so short a time produce so much weight of mutton. It was otherwise with the seeds, for after the first year they contained comparatively little nutritive properties, and their long continuance on the land made a fine refuge and breeding-ground for the wire-worms, to which the succeeding crops oftentimes bore indubitable testimony; and to this day they remain the greatest foe to successful cultivation the Fen-farmer has, and it is a very occasional year when his oat crop is not more or less ravaged by them. Probably the greatest improvement next to drainage, and consequent upon it, is the practice of claying fen lands. The value of clay, I believe, was first accidentally discovered by some of it which had been thrown from the ditches having been spread round the outsides of the field, and which produced most marvellous effects upon the growing corn crops. Our fathers were not slow to learn, and were very soon led to adopt a system of claying which still continues, some lands having been gone over three or four times. The plan is this: pits or trenches are made down the field, from $2\frac{1}{2}$ to 3 feet wide, and from 12 to 16 yards apart; two spits of clay are taken therefrom, and spread upon the intervening land, the peat or clunch subsoil being thrown to the bottom of the trench, and when all is finished, the pits are ploughed in, and the land being loose, and easily moved, is soon levelled again. The cost of claying is governed by the depth at which the clay is found from the surface of the land; but improved drainage occasioning a continual subsidence, as I have already observed, is bringing it within easy reach, and thousands of acres can now be done at a cost of 30s. per acre, and under; and no money expended upon a Fen farm yields so quick and so bountiful a return. The application of clay to these light soils not only gives solidity, but being possessed of considerable fertilising properties, greatly enriches them. Happily, the Fen lands very largely rest upon a clay bed; but the clay is not of a uniform quality. That which is blue, and of a soft buttery nature, contains the most lime, and is the best fertiliser. Some is silty, and some stony and hard, and these do little more than solidify. Perhaps the next great improvement consequent upon the drainage of Fen lands is their deep cultivation, to which reference has already been made. To talk of turning over a furrow slice 30 inches in thickness must sound to a clay-land farmer something like a piece of exaggerated nonsense; and may put his credulity to the test as surely as some of the wonderful statements he occasionally meets with now-a-days in agricultural newspapers; but you, sir, know it is no exaggeration. Deep cultivation on Fen land is generally accomplished by horse-power, as the great underground forest offers considerable obstacles to the application of steam. A pair of horses in a common plough go first, and take a furrow 4 or 5 inches thick, and are followed by a huge implement made expressly for the purpose, and which is pulled by six, eight, or ten horses, as the case and required depth may be. This plough buries the furrow turned over by the small plough, and brings the subsoil well on to the top, that its vegetable properties, by exposure to the atmosphere, may become speedily

decomposed, and made available as food for plants. One object in putting the top furrow down is to get it as far as possible beyond the reach of atmospheric influences, with the idea that under these circumstances the twitch or couch and weed roots will die and decay. It certainly is a very clever and ingenious way of cleaning land, if it can only be done; but my experience and observation lead me to the conclusion that it far oftener fails than succeeds. I think land should be quite clean ere it is deep ploughed. There can be no doubt but deep cultivation tends to preserve moisture in the soil in dry seasons, and to facilitate drainage in wet ones. It also unlocks those hidden treasures in which are so many elements of fertility, and consequently increases the producing-power of the land. Drainage, clay, and deep tillage, to which should be added superphosphate of lime and the water-drill, have completely metamorphosed the country, and altogether changed its modes of husbandry; and perhaps at the present day there is no country which is so utterly defiant of system. Every one sows what he thinks he will, and by proportionately liberal management labours under no apprehension that his soil will become exhausted; nor will it, if he treats it generously, and cultivates it wisely. Although there is no uniformity of system in the cultivation of fen lands, there is, however, a five-course shift which has found favour, and which prevails more largely than any other, and to which several farmers pretty strictly adhere. This is the order of it: Mangolds, kohlrabi, coleseed, or cabbages, which are gradually growing into favour; oats, wheat, seeds, wheat. The green crops and the oats are sown with artificial manure, the farmyard manure being reserved for the wheat crops. This rotation appears well suited to the Fens, and has been pursued with considerable success; but, as I have intimated, Fen farmers are impatient of the restraints of system, and break away from them to follow their own inclinations. A ride through the Fen country at the proper season will afford ample evidence of the truthfulness of this. In addition to the crops ordinarily found on a farm will be seen coleseed, turnip seed, linseed, mustard and cress growing as seed crops, and potatoes and carrots extensively cultivated for the London and other large markets. Turnips are not at all suited to fen soils. They grow of a woody fibrous quality, coarse, and long in the neck, and possessing scarcely any nutriment; they are, indeed, almost valueless as food for stock, and are consequently not cultivated. Kohlrabi and mangolds are much better; but these, like the hay, straw, and other products of Fen lands (coleseed excepted) are very deficient in fattening properties. I have already referred to the water-drill and superphosphate of lime, and their value in the successful cultivation of Fen lands. Our Fen soils appear to yield much larger supplies of ammonia than of phosphates, hence the free application of phosphatic manures is accompanied by much greater and more palpable results than is the case where ammoniacal manures are used. Probably there is no part of the kingdom where the application of phosphates to the soil has produced such startling results, and especially where they have been applied with the water-drill. The Fens have not been specially famed for the breeding of either cattle or sheep, but from very early times they have been noted for their good breed of cart-horses. The decreased acreage of grass seeds, consequent upon the increased acreage of corn and other crops, has largely tended to diminish the number of animals bred; but the show of cart colts, both as regards number and quality, on the 1st of July of every year at Thorney, is pretty good evidence that Fen farmers have not altogether lost their long-enjoyed and well-merited reputation. The Great Level generally, even now, under its more perfect drainage and improved cultivation, offers very few tempting residential inducements, and formerly, under other and more unfavourable circumstances, it repelled rather than invited residence. Hence it is no uncommon occurrence in many parts of the Fens to find both farmer and labourer residing in the town or village, rather than upon the farm. Another cause has largely contributed to this. Throughout the Fens there are a comparatively large number of small freeholders, and where these are found the farms generally are small, and a person's occupation is not uncommonly made up of three or four or more of these small holdings, which he finds can be more satisfactorily managed by residing in the town away from all, than by living upon any one of them. To an assembly of practical agriculturists I need scarcely say that these occupations are altogether bad; they

fearfully multiply the difficulties of management, and tend to increase the cost and diminish the profits of cultivation. These small ownerships, too, operate prejudicially to the labourer. Were the lauds, as in some other districts of the country we find them, chiefly in the hands of a few large proprietors, these might then be held responsible for the provision of proper and adequate cottage accommodation for the labourer; but as it is, such responsibility appears to rest on no one, and the poor man is driven to seek such a home as the village can offer, and instead of being on the farm ready for his work, has, morning and evening, to walk to and fro, thereby increasing his own toil, and with no corresponding gain, but an actual loss to his employer. This is an unmitigated evil; but where to find and how to apply the remedy is a problem difficult of solution; but time may eventually solve it, and it is earnestly to be hoped it will, for the cottage accommodation which these villages afford is painfully insufficient. Families are oftentimes crowded into miserable wretched hovels, totally unfit for human habitations, where, huddled together, regardless of age or sex, they grow up insensible to those moral instincts and refined susceptibilities to which modesty and virtue give birth, and lamentably exhibit that boldness and unblushing effrontery which are the natural outgrowths of sensuality and lust; and so long as their homes, if homes they can be called, remain unimproved, they must tend to foster every social evil, and continue hot-beds of immorality, bringing forth abundant fruit in the future, as they have done in the past, and to a great extent neutralising the efforts which religion and education so zealously put forth, and which are designed and calculated to improve the condition of the labouring-classes. Some fearful facts confirming the correctness of these statements might be adduced, but I forbear. Another feature peculiar to the cultivation of Fen lands is the large employment of children. Perhaps nowhere else do weeds grow so thickly and luxuriantly as in the Fens, and it is a constant labour to eradicate them; and to accomplish this, resort has been had to what are popularly known as agricultural gangs. Already the gang system has been reported upon by Government commissions, and has formed the subject of legislative enactment. Much that has been said has been more caricature than the representation of facts. The very worst cases have been hunted out, and when well-dressed and garished, have been presented as truthful pictures of the whole, and have elicited an amount of sympathy which might well have been reserved for more needy objects. That evils did exist, and required to be remedied, I readily admit. The licensing of gang-masters and the separation of the sexes are steps in the right direction; but I cannot resist the conviction that much of the immorality ascribed to the gang system, might, with far greater truthfulness, be attributed to the home influences I have just attempted to describe. Here lies the root of the evil, and here philanthropy and legislation should seek to apply the remedy. The sensational pictures of cruelty and slave-driving, and the like, might, with equal propriety, be presented as representations of the schoolmaster as of the gang-master. Whether children are receiving school or technical education, they alike require to be under control and management; and it would be as unwise to send them into the fields to labour, as it would be to send them to school to study, without the superintendence and direction of a master. The duty of the gang-master is simply to teach them how to do their work, and to see that they do it; and I presume the duty of the schoolmaster is very similar. This does not necessarily imply cruelty or immorality. Under right and judicious management, I conceive it is to the advantage of the children that they should be employed in suitable field-labour during the summer months. They are there learning that which will be a practical benefit to them in subsequent years; and the labour, whatever may be said to the contrary, is not excessive, and tends to promote, and not to impair, health and vigour of body; and the earnings of these young people form a most important item in the family income, and can ill be spared. After a good deal of reflection, I have arrived at the conclusion that children of a suitable age should be permitted to engage in field work, which is always plentiful during the summer months; and should be kept at school during the winter months, when their services are not required on the farm. Where farms are sufficiently large, I prefer a private gang. I have not employed the public gangs; but my plan has been to take my own labourers' children, with a few others occa-

sionally, and to place them under the supervision of the best man for the purpose I have in my employ, and I have reason to be well satisfied with this arrangement. One essential to successful farming is a good road. Hitherto the subject of good roads has received comparatively little attention in the Fens; Fen farmers are now awaking to their importance. In a recent Act of Parliament some powers were given and some provisions made for the gravelling and improving roads within the confines of the Middle Level, from which considerable good has resulted; and a more wide and comprehensive scheme has been projected and advocated by Mr. Wm. Marshall, of Ely, to whom be all praise for his able and untiring efforts. His scheme formed the subject of discussion some few months ago at the Cambridge Chamber of Agriculture, and will, I trust, ere long receive the practical attention of the Legislature. Bad roads add greatly to the cost of cultivation, and are a constant nuisance to all who have to use them. The value of Fen lands has increased or decreased, just as the drainage has been efficient or otherwise. In 1651 Lord Arundel, one of the Earl of Bedford's associates, in draining the Great Level, became so discouraged by the reverses and losses sustained by the adventurers that he sold his 5,900 acres for 3s. 9d. per acre, the same land now being worth probably from £30 to £50 per acre. Many farms in later times have been sold at very little over their present annual rentals, and some at even less. Through the kindness of Mr. Richards, of Wimbington, I am able to present the assessments to the poor rates of certain lands in the parish of Doddington, made at different periods, showing the influence which improved drainage has had upon the value of Fen lands:

	Acres.	Rateable Value.
1736	200	£40 0 0
1784	200	60 0 0
1822	200	100 0 0
1869	200	238 0 3
1784	60	15 0 0
1833	60	21 0 0
1869	60	68 1 4
1757	20	2 0 0
1784	20	5 0 0
1869	20	26 0 0

Mr. Richards has also placed another document in my hands, bearing date the 14th of May, 1626, and which refers to the payment of tithes by the inhabitants of March to the Rector of Doddington, and which I give *in extenso*:

MARCH, PART OF THE PARRISHE OF DODDINGTON, MAY 14, 1626.

A TREWE RECORD for the Payments of all Tythe by the Inhabitants of March to the Parson of Doddington, the Time when they are to be paid, and the custom how they are and have been paid of Ancient Time, and now agreed upon to be recorded by Samuel Wright, Doctor of Divinity and Parson of Doddington, and the Inhabitants of March part of the Parishioners of Doddington, as followeth:

Offerings with Garden Penny and Hearth Penny to be paid at Easter.—*IMPRIMIS*: Every Householder is to pay to the Parson of Doddington at Easter for his offerings *Twopence*, for his Wife *Twopence*, for every Child that he hath that doth take the Communion *One Penny*, for every servant *Twopence*, for his Garden in lewe of Hearbs *One Penny*, and for his Hearth in lewe of Firewood and Fireinge *One Penny*.

Tythe Eggs.—*ITEM*: Every one that keepeth Hens or Ducks is to paye upon Good Friday for every Henne or Ducke that then they have *Two Eggs*, and for every Cocke and Drake *Three Eggs*.

Tythe for Foals.—*ITEM*: Every man is to paye at Easter for every Foale he hath had foaled alive the year before *One Penny*.

Tythe for Cows and Calves payable at Easter.—*ITEM*: Every Parishioner not having a Tythe Calf then fallen, nor likely to have betwixt Easter and St. Mark's following, is to pay at Easter for the milk of every cowe that he hath milked the year past, and then is Owner of, *Three Halfpence*; and for every Calfe, not having a Tythe Calfe, that he hath had calved alive, *One Halfpenny*; and for every Heiforth that doth or hath given milk, *One Penny*; and every Heiforth's Calfe calved alive, *One Halfpenny*.

Tythe Milke to be paid at Whitsontide.—ITEM: Every man is to paye more in lewe of his Tythe Milke, the milke of all his Cows that doth give milke upon Whitsunday Morninge, the Parishioner causinge it to be milked, and brought to March Church Porch, where the Parson of Doddington or his assignees is to receive it.

Tythe Calves to be paid at Saint Marke.—ITEM: Every Parishioner is to paye upon St. Marke's Daye, in lewe of his Tythe Calfe, if he have Tenne, *Six Shillings Eightpence*, if he have under Tenne to Seaven to pay a Tythe Calfe, for the which the Parson is to abate of Six Shillings Eightpence for every Cowe and Calfe wanting of Tenne, *Twopence*, and for all above a Tythe to paye for every Cowe *Three Halfpenny*, and every Calfe a *Halfpenny*.

Tythe Lambe to be paid at May-daye.—ITEM: Every Man having Tenne Lambs fallen at May-daye and then livinge, shall for every Tenne Lambs he hath, paye a Tythe Lambe upon May-daye, and what he hath more than a Tythe, for every Lambe one *Halfpenny*, and if he hath but Seaven, he is to paye a Tythe Lambe, and the Parson is to pay him for every Lambe wanting of Ten One *Halfpenny*.

Tythe Wool and Tythe for Sheep bought or sold, to be paid at Shear-daye.—ITEM: Every Man keepinge Sheepe is to paye for all such Sheepe as he sheareth at Shear-daye, and was Owner of, or in his Possession at Candlemas before the full Tythe Wools in kinde, and for all such Sheepe that any Man doth buy after Candlemas, and soe to Shear-day, "for every Sheepe" One *Halfpenny*, and for every Sheepe by him sold, betwixt Candlemas and Shear-day, One *Halfpenny*, but for such Sheepe as shall be sold from Shear-day unto Candlemas no Tythe to be paid, because the Parson hath a full Tythe off all such Sheepe as any Man doth Buy before Candlemas and sheareth them.

Tythe Hay.—ITEM: Every man is to paye the Tythe Haye in kinde, by the Cocke, every Tenth Cocke or Tenth part when it is Cocked, and no Herbidge to be paid for Hedgronthe of after-grass, because the Owner doth now and make the Parson's Tithe as his own.

Tythe Fodder.—ITEM: Every man is to paye his Tythe Fodder by the Tenth Sheafe, puckled and shocked as his own, if a man puckle and shocke his own.

Tythe Hemp.—ITEM: Every Man is to paye Tythe Hemp in kinde, bound up in Sheafe as his own is bound, and not in Boulds, and no Hempseed to be paid, because every Man is to pull and make up the Parson's Tythe as he does his owne.

Tythe Corne.—ITEM: Every Man is to paye Tythe Corne shocked or bound up in Sheafe as he maketh up his own.

Tythe Freinte and Roots.—Every Man is to paye Tythe Freinte and Roots when he plucketh and inneth them, in kind.

Tythe Geese to be paid at Whitsontide.—ITEM: Every Man is to paye for every Tenne Younge Geese he hath at Whitsontide, a Tithe Goose at Whitsontide, and for all odd Geese above Tenne, not having Seavene, One *Halfpenny*, and if he have Seavene, he is to paye a Tythe, and the Parson is to allow him for every Goose wanting of Tenne, One *Halfpenny*.

Per me, SAMUELAM WRIGIIT, *Rectorem ibidem.*

PARRISHIONERS.

The perusal of this curious and interesting document, associated with the recollection that, under the Commutation Act, the tithes of the Doddington Rectory were commuted at a very few pounds short of £10,000 per annum, furnishes still more conclusive evidence of the immensely altered value of Fen lands through drainage. These works of drainage have re-

quired men of indomitable will, unflinching courage, resolute determination, and unremitting perseverance to bring them to such a successful issue as we now find them. Kingsley, after a poetic and elaborate description of the Fens of other days, says, "Such was the Fen-land—hard, yet cheerful, rearing a race of hard and cheerful men; showing their power in old times in valiant fighting, and for many a century since in that valiant industry which has drained and embanked the land of the Girvii, till it has become a very 'garden of the Lord.' And the Scotsman who may look from the promontory of Peterborough, the 'golden borough' of old time, or from the Tower of Crowland, while Hereward and Torfrida sleep in the ruined nave beneath; or from the heights of that Isle of Ely, which was so long the 'Camp of Refuge' for English freedom—over the labyrinth of dykes and lodes, the squares of rich corn and verdure—will confess that the lowland as well as the highland can at times breed gallant men."

Mr. J. BROWNE (Elham, Wisbeach) said there could be no doubt that drainage of the fens was a most interesting subject to Fen men, whatever might be the case as regarded the majority of those assembled, and the anticipation of the chairman as to the manner in which it would be treated by Mr. Ruston had been fully realized. Although the Fen districts might not usually be inviting in their aspect, yet there were periods of the year when no class of English farmers could go though them without being thoroughly convinced of the great importance of the Fen district to the productions for the English agricultural market (Hear, hear). In some portions of the Fens you might see the sheep distributed about pretty nearly almost as thickly as they could walk. In the grass land districts, where some of the better kinds of grass prevailed, they would carry from ten to fifteen half-bred sheep per acre; while on passing from the grass land districts to the corn fields they would see almost every fourth piece of land in corn. These great results had been brought about in the manner which Mr. Ruston had so well described. It had always been a very difficult matter to drain Fen land, and he was very much struck with an observation in Mr. Ruston's paper to the effect that the thing began with opposition. The opposition had continued up to the present day. There had not been the slightest improvement ventured upon or suggested which had not aroused opposition (Hear, hear). Any application which was made to Parliament was sure to raise opposition, and the interference of a host of lawyers on one side or another for a time almost neutralised any efforts at improvement. He had hoped that they would have some representatives of the South Fens present on that occasion, because in his opinion the South Level was a century behind either the North Level or the Middle Level (laughter). He did not know whether or not there was a South Level farmer present, but if there were he trusted that he would rise up and defend himself (renewed laughter). He knew that such a person might tell them that he could drain his land at a cheaper rate and with as good results as they of the Middle or the North Level; but he fancied that a day would come when they would materially suffer for it; and he drained and cultivated his land under a fear of inundation. They could not boast very much on that point, even in the Middle Level; for although when that "heavy blow and great discouragement" came about eight years ago not a single acre of the Middle Level was inundated, they had to pay very dearly for what occurred. He thanked Mr. Ruston for his interesting paper, and he felt sure that many Fen men on reading it would be startled to find how much there was in the history of their district which they had known nothing about (Hear, hear).

Mr. W. C. LITTLE (Stag's Holt March) said he had expected to have a great treat in listening to Mr. Ruston's paper on the Fen country, and he had not been disappointed. It appeared to him that one subject which was mentioned was passed over rather lightly; he alluded to the subject of fresh water. They in the Fens had been in the habit of treating water as if it were always an enemy, a thing to be got rid of at any price, instead of treating it as a friend or a servant. They had sent it out to sea as fast as they could, and the consequence was that in a dry season like the present one they had suffered immensely. He knew something of the Bedford Level, and there were hundreds of acres which in his opinion would be much better employed as reservoirs for water than in growing corn. Another point which he should like to

notice was connected with the subject of local taxation. In speaking of the immense improvement which had taken place in the value of land in the Fens, Mr. Ruston had brought forward on instance of a farm formerly assessed to the poor-rate at £40, and now assessed at £238, that is to say, it had turned itself over six times through the application of capital. It had often been said that the increase in the value of land was occasioned by the increased population and other similar causes; but here at least was a case in which improvement was due mainly to the expenditure of capital, and that was an argument which he hoped would not be lost sight of by their friends who were contending for the relief of the land from some of the burdens of local taxation. Another fact of some importance was the great amount of law expenses which attended these improvements. The Middle Level had already spent £590,000, and there was a debt of £500,000 resting upon 120,000 acres. It would be interesting to inquire how much of that sum had been absorbed in parliamentary expenses. But the Middle Level expenditure did not include the whole expenditure for drainage in the district which was so designated; there were thirty or forty districts lying inside of it, and which required separate Acts of Parliament, and immense sums had to be expended before executing any work. Probably a hundred Acts of Parliament had been required on the old Bedford Level. He did not grudge lawyers and others their fair fees, but he must say that the cost of Acts of Parliament had formed a serious obstruction to improvement. He was aware that general land-drainage Acts had been passed to secure objects of that kind; but they were not based on sound principles, or they would be more generally adopted, and he knew one case in which serious difficulties had arisen from the defects of the general Act.

Mr. G. MARTIN (Hubert's Bridge, Boston), having risen in response to a call from the chair, said he was formerly a Cambridgeshire Fen man, but he had not resided there for 20 years, and the remarks of Mr. Ruston seemed to apply entirely to that district.

The CHAIRMAN: No.

Mr. G. MARTIN continued: He did not say a word about the Lincolnshire Fens.

The CHAIRMAN thought that Mr. Ruston's remarks embraced the whole country.

Mr. G. MARTIN said as he happened to be in another locality he was not in the position of those who were referred to by Mr. Ruston. In his district they were not so dissatisfied with the top soil as to bury it to the extent of 2 feet 6 inches. He should like to see the fen plough come into his district: whether it would answer as it did elsewhere he could not say. He lived on a strong fen, the subsoil being of extremely tenacious quality, and therefore Mr. Ruston's remarks on cultivation were scarcely applicable to his own case. He was not a black land farmer. He could not agree with Mr. Ruston that the breed of cart-horses had been kept up. If he went to Thorney fair he could not obtain such horses as he did formerly.

Mr. J. J. MECHE said he should not have said a word on this subject, but that it had an indirect bearing on another important question. Every man in England who was a bit of a florist if he had a garden-pot took care to have a hole in the bottom, well knowing that without that plants could not thrive; but with regard to drainage the same notion did not appear to prevail. He had felt exceedingly interested in Mr. Ruston's able and exhaustive paper, and as he listened to it he could not help feeling that the common-sense principle of the flower-pot involved in land drainage had had an immense start during the last few years. That brought him to another important question, the application of sewage to the soil—a question which like that of drainage seemed to be beset with difficulties. Probably ten millions of the people of this country resided in towns, and the manurial products of a man were more than equal to those of a sheep (Cries of "Question").

The CHAIRMAN intimated that in his opinion, although the paper opened up a broad question, Mr. Mechi was going beyond it in introducing the sewage of towns (Hear, hear).

Mr. MECHE wished to know if he were to understand that the feeling was that capital employed in conveying to Fen lands what they required to fertilize them would be wasted? At all events he thought he should be excused for alluding to that subject; and he hoped that the same intelligence which had been brought to bear on the cultivation of the Fen districts

would be applied to the fertilization of all the soils of England. The great outcry of the present day was that they did not produce enough. That was because they had not manure or drainage enough (Renewed cries of "Question"). He would not enter into that question at length, but he hoped that the intelligence of Englishmen of the present day would so facilitate the operations of agriculture that, while they had drainage to carry off surplus water, they would also have steam appliances to convey to the land by way of irrigation the valuable substances contained in the sewage of towns.

Mr. PELL, M.P., said he wished, as an owner in the South Level, before the discussion closed, to answer the challenge given to the South by a Middle Level man. He would observe that, although they might now be five hundred years behind the men of other districts, there was a time when they were five hundred years before them, the men of the Haddenham district having been the first to move in the right direction and apply steam power (Hear, hear). Perhaps their drainage was not quite so complete as that of the North and the Middle Level. But they had great natural advantages. They were beginning to think less of wheat, and were taking to the cultivation of fruit and other luxuries (laughter). As regarded the small occupiers between Ely and St. Ives, he must say that they were remarkable for their great industry, and for their intelligent application of capital to the cultivation of the soil. They carried on drainage works in a very superior manner, and he believed they were among the most cunning agriculturists on the face of the earth (laughter). That was a quality which extended over the whole district (Renewed laughter).

Mr. E. MAXSELL said he should like to hear from Mr. Ruston what was the cost of reclaiming land from the foreshore.

Mr. C. SEWELL READ, M.P., was quite sure they would all agree with him that they had had a most able and interesting paper. But he must observe that drainage in the Fen district did not always pay. They had in the county of Norfolk a considerable extent of Fen land, and some of it had been drained in the best and most efficient manner. Large and good steam-engines had been erected for the purpose of drainage, and yet—they might hardly believe this, but it was nevertheless a fact—the dykes were now dammed up, and engines were never used, except when there was a flood. He might be asked how that came to pass. When they cultivated this poor Fen, it became so light and frothy that it actually blew away. There was no clay at all until they perforated through from 17 to 20 feet of peat. The result was that all the money expended was wasted, and land which everyone thought was going to be a garden for arable, relapsed into a state in which it grew only a rough coarse grass. It might be interesting to some present to know that that curious erection the windmill, which was supposed to belong to a former generation, was in some cases, in his county, superseding steam. They had a large tract of land which all lay below high water mark; but it being all in grass, of an oozy nature, you could cut large drains in it without difficulty, and a windmill had sufficient power to keep them going. In his district they had had much more cause to complain of a lack of water than of a superabundance. He was particularly struck with the sensible remarks of Mr. Ruston, in reference to the gang system. The great cause of that evil was the lack of cottages; but on the other hand, some years ago, when landlords had built cottages in the Fens, they could not get anyone to live in them. Now, he believed, the Fens were as healthy as any other portion of England. There were some proprietors who had nobly done their duty, as regarded the erection of cottages, among whom the Duke of Bedford was remarkable in that respect.

Mr. NEILD (Lancashire) said: Having listened to the paper with the view of learning some practical lessons from it, he should have been glad to hear something more with regard to the application of clay to the soil. He had a few hundred acres of somewhat similar soil, on which he had been continually making experiments, and had been strongly urged to get clay; but as this would require carting a few miles, to what extent clay or marl could be applied in such a case seemed to him a very important problem. When he heard that it was done for 30s. per acre he was puzzled to understand how that result was arrived at. He had noticed in the case of the banks of a canal that puddling was essential. He had for 15 years farmed near a canal some land which, in the knowledge of persons now living, had sunk 7 feet at least, and he had had great trouble in consequence of the tendency

of the land to revert to its natural product of dry poor grass. In fact, if they took a spit 10 feet deep and put it on the surface, in a very short time it was covered over with vegetation (Hear).

The CHAIRMAN, in summing up, observed that Mr. Ruston had treated the subject in a manner which had left very little room for discussion. One very important question which had been raised that evening concerned not merely the Fen district, but the country at large; he meant the water supply (Hear, hear). It was not the Fen district only that had got rid of "the destroyer," as water had been termed, but he was sorry to say that on some of the heavy lands there was a great deficiency of water. If they went into a heavy or clay district in the winter months they would see an abundance of water rushing headlong into the brooks and rivers, but if they repeated their visit in June or July they would probably find a great scarcity of that indispensable article. That was a question, he repeated, which affected not only the Fen district but the whole country. Mr. Martin gave them a very favourable view of the Fen country when he told them that it would carry from 10 to 15 half-bred sheep per acre. He certainly rather envied that gentleman such grazing land as that (Hear, hear).

Mr. G. MARTIN: It was in the Cambridgeshire fen.

Mr. RUSTON, in replying, observed in reference to some of the remarks which had been made that it was impossible for

him to embrace everything in one paper, and that he had therefore applied his observations mainly to the Great Level which had created so much interest. The cost of reclaiming land from the fore-shore was not included in his subject. As regarded the bad Fen lands of Norfolk, mentioned by Mr. Read, it appeared to him that it would be well if some of them were used as reservoirs for water (laughter). Cultivation must be in a very bad state where windmills were used for the purpose which that gentleman mentioned. As respected what Mr. Neild said respecting clay, what he (Mr. Ruston) stated was that clay could be applied at a cost of 30s. an acre.

On the motion of Mr. Mechi, seconded by Mr. Little, a vote of thanks was given to Mr. Ruston for his paper; and on the motion of Mr. C. S. Read, M.P., thanks were also accorded to the Chairman.

FOREIGN CATTLE DISEASES.—At a meeting of the Committee of the Farmers' Club, on Monday, November 7th, Mr. James Howard, M.P., in the chair, it was resolved: That the thanks of this Committee be offered to the Right Hon. W. E. Forster for the energetic measures which have been recently taken by the Privy Council to prevent any importation of foreign cattle diseases. At the same time, the Committee begs to express a hope that separate markets for the sale and slaughter of all foreign stock will be enforced at the ports of landing throughout this kingdom.

THE CENTRAL CHAMBER OF AGRICULTURE.

A council meeting was held on November 8th, at the Salisbury Hotel. In the absence of Col. Tomline, M.P., president for the year, the Chair was taken by Sir Massey Lopes, M.P.

After some preliminary business had been despatched,

The CHAIRMAN presented the Report of the Local Taxation Committee, which was as follows:

The Local Taxation Committee, in presenting a report of their proceedings during the past month, have much pleasure in stating that they have been able to increase the number of their local agencies, but regret that many counties in England and Wales still remain unrepresented. Amongst others, the important counties of Lancashire, Northumberland, Oxford, Nottingham, Berkshire, Derbyshire, Dorsetshire, Kent, Shropshire, and Staffordshire, may be particularised. The Committee feel themselves entitled to congratulate the Central and Provincial Chambers of Agriculture, and all who take an interest in the efforts they are making to obtain a reform in the present system of levying local taxation, on the success that has attended the suggestion of the Chairman that the attention of magistrates assembled in quarter-sessions should be drawn to the very large and increasing charges of recent years upon the ratepayers for county-rate purposes, more particularly for police, prisons, lunatic-asylums, militia, &c., which your Committee contend are not for the benefit of any one particular class of the community, but for the general good, and ought therefore to be wholly defrayed, or much more largely supplemented from the national exchequer. The Committee are happy to say that this suggestion has been generally very favourably responded to, more particularly in the counties of Devon, Leicester, Somerset, Suffolk, Lincoln, Anglesea, Durham, Wilts, Derby, Radnor, Isle of Ely, Cambridge, Gloucester, Worcester, and Cornwall. A full and very interesting report of the proceedings of the magistrates in the Devon quarter sessions has been reprinted and very widely circulated. Copies of this report have been sent to every clerk of the peace in England and Wales, with a request that they would lay them before the chairman, the finance committee, and other magistrates in their respective counties. Copies of a memorial addressed by the East Suffolk Chamber of Agriculture, and signed by Mr. F. S. Corrance, M.P., to the justices of quarter sessions, assembled for the eastern division of the county of Suffolk, have also been sent to most of the clerks of the peace with a similar request. In one or two counties objections were at first raised with regard to the propriety of discussing this subject at quarter sessions, but, on the presentation of a memorial from the ratepayers, the difficulty was overcome. The committee call attention to this fact,

inasmuch as it shows the good effect of any expression of feeling on the part of the ratepayers on this vexed question. The committee cannot help feeling that if the magistrates of other counties assembled in quarter sessions would follow the example of those enumerated, and present petitions to the Legislature, a great step would be gained, and that such influential support must greatly tend to further the objects which your committee are striving for. Your committee are of opinion that a petition to the House of Commons would be preferable to memorialising any individual member of the Government, the counties of Devon and Salop having already adopted the latter course some few years ago without any good result, a petition to the Legislature being a more public expression of opinion as well as a more direct appeal to those who have the power of imposing and readjusting both local and imperial burdens. The vastly increasing burdens which will be thrown upon the ratepayers by the operation of the Elementary Education Act are demanding serious attention and augmenting the general dissatisfaction. Very cogent evidence as to the large sums which will soon be required for building purposes, &c., especially in the metropolis, will be found in the addresses of the candidates for the London School Board, and the consequent inadequacy of a 3d. rate to satisfy these requirements.

Some contributions were acknowledged.

Mr. NEILD moved that the Report be received and adopted. The motion was seconded by Mr. G. E. MUNTZ, and agreed to.

Mr. A. PELL, M.P., then moved: "That this Council recommends Provincial Chambers to memorialise their respective Courts of Quarter Sessions on the subject of the increased taxation arising from rates levied under the authority of those Courts." They were all aware how small was the power vested in the county magistrates with regard to the limitation of county expenses. Those magistrates assembled in Quarter Sessions were, however, the ruling authority to whom the ratepayers must in the first instance appeal; and if there were a general expression of dissatisfaction on the part of the ratepayers with regard to the incidence of the rates, the question would, no doubt, be discussed at the approaching Epiphany Sessions, and many petitions to Parliament be presented from counties which had not yet taken any part in the matter.

Capt. CRAIGIE, in seconding the resolution, said he was quite sure that the Chambers of Agriculture throughout the kingdom would cordially respond to the appeal thus made to them. In various quarters he had observed that the question of local taxation was assuming increased importance, and if

was now being discussed in many places where it had not engaged attention hitherto.

Mr. WHITTAKER thought the resolution before the meeting would tend to strengthen the hands of the magistrates in dealing with the question, by bringing out the fact that the present excessive expenditure was not occasioned by any imprudence or lavishness on their part. Over a large proportion of the expenditure the magistrates had, in fact, no control, and what they should do was to appeal to the Legislature to supplement the rates in other cases as was done in the case of prison expenses. He hoped the Local Taxation Committee would call the attention of the Chambers to the grievous want of funds for the agitation of that question. The circulation of printed matter throughout the kingdom was very expensive, and it was necessary that the local chambers should contribute liberally to enable the Committee to carry on their work with vigour. Further, it appeared to him to be the duty of the landed proprietors to protect their struggling tenantry, and not to stand in the back-ground on an occasion like that, thus leaving it to farmers to provide the requisite funds. He thought the large landowners should come forward, not with their five and ten pounds, but with their twenties and fifties, so that the public might be well instructed on the subject. When any portion of the manufacturing interest wanted to show that they had a grievance, they did not spare their money, and if agriculturists wished to succeed in the present case they must not spare it. In some counties the press had rendered great assistance, and he trusted that the powerful press of London would aid them in promoting so just and desirable an object. The Council did not speak merely for the landed interest; householders, the citizens of the metropolis, the manufacturers, and the small mechanics were all deeply interested in that question. Under the present system all rates were lumped together, and not one man in a dozen could tell how much the poor cost him, or how much he paid for the police, lunatics, or any other department of expense.

The resolution was put and carried, with the following rider, suggested by the Chairman: "That the secretary of the Central Chamber be instructed to write to secretaries of provincial Chambers in those counties where as yet no action has been taken by the magistrates in Quarter Sessions with reference to the county-rate expenditure, and urge upon the members of those Chambers the great importance of memorializing the magistrates to discuss this subject at the January Sessions, and present a petition to the House of Commons."

The next subject on the agenda was the new regulations of the fire insurance companies for the insurance of farming stock.

The Secretary read the following letters, which had been received from the Sun and the Phoenix Fire Offices:

"Sun Fire Office, Threadneedle-street,
London, E.C., Nov. 7, 1870.

"Sir,—I have to acknowledge the receipt of your letter of the 5th inst., containing an invitation to attend a Meeting of your Society to-morrow, at eleven o'clock, at the Salisbury-Hotel, Fleet-street. I am very desirous to meet your wishes in this respect; but owing to the shortness of the notice, I regret that it is impossible to make arrangements for a suitable representative of this Society to attend on this occasion.

"I am, sir, your obedient servant,
"S. J. FLETCHER, Secretary."

"Phoenix Fire Office, 19, Lombard-street,
London, Nov. 7, 1870.

"Sir,—I regret that I cannot accept your invitation to confer on the subject of the new conditions for farming-stock insurances. In the reports of other meetings of Agricultural Chambers, I have, however, found so much misapprehension on the point of *live* stock, that I enclose you one of our own circulars, in which it is distinctly stated that the proportionate condition does *not* apply to *live* stock if insured in a distinct amount, and not in one gross sum with the produce, and the same with respect to implements. With regard to root crops, not in buildings, these can be excluded from the insurance on produce, in which case, of course, they would not be taken into the calculation of proportionate value.

"I am, sir, your obedient servant,
"GEO. W. LOVELL, Secretary."

"Phoenix Fire Office, Lombard-street,
London, E.C., June, 1870.

"SPECIAL.—The result of Farming Stock Insurances has

been so unsatisfactory to the offices, that they have resolved to make it a condition henceforth, that premium shall be paid on a sum equal to at least three-fourths of the actual value of the agricultural produce at the time of a fire; and that if less than that proportion shall be found to have been insured, the office will then pay, not the whole of the loss, but only such a *proportion* of it as the sum insured bears to the actual value. Thus, if agricultural produce is insured for £500, and at the time of a fire is worth £1,000, the office will pay only half the loss sustained, or if it is worth £1,500, and the insurance only £500, then only a third of the loss will be payable, and so in proportion whenever the insurance is for less than three-fourths of the value. This will be the condition of all insurances effected on and after the 24th instant, and the policies will contain the following declaration: 'If the sum insured on agricultural produce, either separately or in one amount with other property, shall at the breaking out of a fire be less than three-fourths of the value of all the property insured in that amount, then this company shall be liable only for such a proportion of the loss sustained as the sum so insured shall bear to the total value of all the property to which such sum applies.' The same condition will be on all renewal receipts for Farming Stock Policies expiring at or after Michaelmas next. The agent will please to call the particular attention of his friends to this condition when granting or renewing Farming Stock Insurances. It will be seen, however, *that it does not apply to live stock, nor to implements, except when these are included in one sum with agricultural produce.*

"GEO. W. LOVELL, Secretary."

Mr. C. S. READ, M.P., said: I have been requested by the Business Committee, to move the following resolution: "That the 'Average Clause,' as insisted upon by the new regulations of the principal Fire Insurance Offices, is inapplicable to a property so variable in amount and in value as agricultural produce." I believe that I have been asked to move this in consequence of the Norfolk Chamber having been the first to stir in the matter. Let me say, in commencing, that I am fully aware that farming stock, as a rule, does not pay the insurance companies; and I think the companies are perfectly justified—justified in relation, both to their proprietors and to their other customers—in altering their rates and endeavouring to improve their system. But I contend that they should not, in order to cure one evil inflict upon us another (Hear, hear). No doubt the course they have adopted is the easiest one, and the one that will cost them and their agents least trouble; but I believe, that if they had had only one practical farmer upon their Committee they would never have insisted upon this average clause being applied to agricultural produce (Hear, hear). Probably you are nearly all aware that the principal insurance companies are associated in what they call tariffs but in what I shall call a trades union (Hear, hear). There was such a fierce, and I may say unscrupulous, competition among offices to secure business that they at last found it necessary to unite, and each of them appoint a member of a committee, and to that committee a great number of the business regulations of the leading insurance societies are delegated. To show you the way in which this committee acts, and how little power the directors have, I may mention that I am a director of a large insurance company, having a capital of £1,000,000 sterling, and that I actually knew nothing whatever of this new regulation until I received the notice about the renewal of the insurance of my own farming stock (laughter). I am supposed to be one of the persons who not only agreed to but proposed this new restriction and order. If I am rightly informed the committee met in the first week of June, and agreed to these new terms of insurance; and it was not until the middle of September that the principal offices thought fit to issue the notices to their agricultural insurers with regard to policies expiring on the 29th of September, while some offices have to this day not informed their customers of the changes which have taken place in their system. I am told that one great office, instead of giving formal notice to its customers, has simply put on the back of the receipt a clause, which is almost sure to have escaped attention when the document was placed on the file (Hear, hear). Now we say that this average clause is not applicable to farming stock. It is, I believe, applicable to any property that has a fixed value. In the case, for example, of a house, if you know its value now you probably know its value a year hence. But agricultural produce is subject to a great decrease,

In September it is at its highest, and in June it is probably at its lowest. But it is not a regular or gradual decrease. In a year like this, when we are particularly short of cash, as soon as we have got our ricks into our yards, we may soon begin to see what the steam engine can do to fill our pockets; so that three months after harvest, there would not be half, or at any rate a quarter, of the corn in stock (Hear, hear). Again, the yield has a great deal to do with the value of agricultural produce. In the light-lands of the county of Norfolk the average value of the corn crop this year may be set down at only £5 an acre; we hope that through the blessing of God it will next year be £10. The farmers and occupiers of the soil in the clay lands of the Fen district have grown this year five or six quarters of wheat per acre, and perhaps next year they will not grow four. Supposing wheat when at 40s. to jump up to 50s., see what a difference that must make in value. The great majority of the offices complain of the insufficiency of the sum insured for by farmers (Hear, hear). I believe this complaint to be in a great many instances well founded. The offices say that in consequence of farmers stacking their corn separately, and all over the farm, they have diminished the amount of their insurance. They put the case in this way. Supposing you have insured for £1,000, and by no possibility can have a fire that will consume more than £100, if you only insure for one-fourth of the value, your position is like that of a man who has 10 separate houses and only insures one of them. I admit that there is a great deal of truth in that statement of the matter; but I say that they have done worse; they have put all of us who stack in the fields, and who have comparatively little risk, under the same rates as a man who, for his own convenience or necessity, stacks the whole of his produce in the rickyard (Hear, hear). We of the light-land districts, who stack the whole of our crops in the fields, are certainly not exposed to as much risk from fire and candle as others, though a wayfarer's pipe may now and then cause destruction. There are, I believe, very few counties in England which pay a sufficient amount for the insurance of farming stock. The one that pays the most is the county of Norfolk. Why? Not because we are insurers to a larger extent than the farmers of other districts, but simply because we stack in the field and there is not as much risk of a destructive fire. I may observe that when I was one of the deputation who waited upon the Norwich Union Office, I put my finger on six counties and said, "I know very well that you lose a considerable sum of money by them." I was right: those six counties were the worst customers the office had. Any one who is at all acquainted with the general agricultural features of different counties, must know that the risks of agricultural produce are extremely variable. The Norwich Union Office insures, I believe, a larger amount of farming stock than any other office, the total being over £11,000,000. They did not think proper to withdraw the circular which they issued, but they have recently sent forth another which considerably modifies it, and they say to their agents, "We shall not insist upon your taking particular notice of the operation of the average clause in case of a fire unless you have special instructions from the directors. Every one who knows the Board of Directors of that Office, as I do and its excellent secretary, Sir Samuel Bignold, must be aware that they are just, honourable, and fair-dealing men; and this being the case, if a farmer has a fire when his crops are unexceptionally heavy or prices are very high, they will not take advantage of this position, while, on the other hand, if he systematically under-insures his crops, they will. But I say to them "You have no business to take a man who habitually under-insures his crops; and, if the agents did their duty, you would not have such persons." Have any of you seen the list of questions which those unfortunate agents have to answer? In the case of every policy there are fourteen or fifteen questions, and, as they are compound questions, I dare say that before the matter is finished they amount to more than thirty. The agents ask all sorts of reasonable and unreasonable questions (Hear, hear). They ask how many acres of arable land a man is cultivating. That, of course, is quite right, and any practical man would at once know, from the answer, whether or not the farmer had insured for a sufficient amount. But they go on to ask, "Are there any incendiary fires in the neighbourhood?" "Is the insurer popular with this labourers?" and all such complex questions as those. If you are to put agricultural

produce in all parts of the country at one risk, you might as well insure all sorts of buildings, whether they are of slate and brick, or of wood and thatch, at exactly the same rate; and you should also take the life of every man who happens to be 50 years of age, irrespective of his habits and his state of health (Hear, hear). I believe that the majority of the offices have insisted upon the produce being divided under three or four heads. I am told that the Sun Office insists on the average clause being applied to live as well as dead farming stock. I cannot say whether this be the case or not, but generally speaking, I may say, the office insists upon a division under three or four heads. To my mind that seems a certain benefit to the farmer provided they do not insist upon the average clause being applied to all the divisions, and I am informed that they do not wish it to be applied except to agricultural produce, which means, of course, the hay and corn crops. Of course they could not be so barefaced as to ask us to pay 5s. for our live stock and insist on the average clause being applied to that. Why, take the case of the very farm buildings where the stock are sometimes kept. They are insured at from 1s. 6d. to 3s. per cent., and yet they want us to pay 5s. for stock that never go near a building at all, and which in time of danger could generally walk out. Then, with regard to implements. They insure household furniture at 1s. 6d. per cent., and surely they cannot ask us to pay 5s. for our implements, many of which I am sorry to say never go into a shed at all (Hear, hear). Some of them are composed entirely of iron, and none of them, I suppose, can be subject to great risk from either water or removal. Some gentlemen say we should have policies half-yearly. Well, I believe that generally speaking offices will not assent to such an arrangement; but even if they would I should not like it (Hear, hear). It would be an immense bother (Hear, hear). I don't like even a yearly policy. Ever since I commenced business I have had but one policy, and I hope that will go on at the same rate. If the offices would be so good as to take the average price of every crop I should have no objection to the average clause, but at the same time I do say that it is utterly inapplicable to agricultural produce; and as they had raised their rates from 1s. 6d. per cent.—an amount of which, though I may not recollect it myself, I have heard my father speak—to 5s., so I contend that they had better raise their rates again, or apply some more practical, business-like system to agricultural produce than persist in what they had begun. There is not, I am sure, the least desire on the part of farmers to do anything to injure the offices (Hear, hear); but on the other hand, it ought not to be the wish of the offices permanently to injure the farmers (cheers).

Mr. HEWITT, in seconding the resolution, said he believed the chief cause of the recent movement of the offices was the want of a proper amount of insurance on the part of farmers. He knew several instances in which the value being £5,000 the owner did not insure for more than £500. He should have no objection to insure his own dead stock for three-fourths of the value, but he should decidedly object to insure his live stock for anything like that amount. The two cases were altogether different (Hear, hear). Mr. Read alluded to the Sun Office. He was insured there. When the circular was first issued he certainly thought that he was required to insure his live and dead stock for three-fourths of the value; but since then he had received a letter from the agent which altered the complexion of the matter. That letter contained the following: "If a farmer is insured on his dead stock, say for £1,500 and he has £2,000 worth on his farm at the time of a fire, he will be paid in full for any loss up to £1,500, but if he is only insured for £1,000 and has £2,000 stock, he will only be paid half his loss up to £1,000. The live stock is separate altogether, and is not made the subject of average at all. Thus, if a farmer has £2,000 live stock and is insured for only £500, he will be paid for the loss of all animals (not exceeding £40 each) up to £500." If that statement were correct—and he repeated that it was sent to him by an agent of the Sun Office—he thought he should not object very much to the new regulation.

Mr. READ: Might I ask whether the term "dead stock" includes implements?

Mr. HEWITT said he believed it did. The agents in the country seemed to know very little about such matters. When a fire occurred they were seldom able to value the injury done, and a superior class of persons had to be called in for the purpose of

valuation. It seemed to him very desirable that a better class of persons should be employed as agents. In his own county they consisted perhaps of lawyer's clerks, bank clerks, grocers, drapers, and stationers, who really knew nothing about what they were called upon to deal with.

Mr. G. MARTIN (Lincolnshire Chamber) said that on the 24th of October the Chamber which he represented passed a resolution to the effect that the new regulations of the fire insurance companies for the insurance of farming stock were in his opinion reasonable. Before the meeting was held he went to the office of a large insurance company to obtain information, and his feeling was quite changed before he left. He quite agreed with Mr. Read that there had been unfairness on the part of some of the offices; but there were always hardships in such cases. Insurance had certainly not been a paying business, and farmers could not expect to have it all their own way. As regarded the amount of insurance, he had himself put agricultural produce and dead stock at a fair sum, leaving the live stock at a mere nominal sum, and he believed that his insurance would not cost him more than it had done. The change might cause some trouble, but these were troublesome times (laughter).

Mr. NELL thought that where the insurance was in a jump sum it would not answer to have the average clause introduced, and farmers would find it to their interest to specify. A system of insurance which was applicable in one district might not be so in another. Some farmers had a large amount of valuable stock tied up day and night for five or six months in the year, and it would not do to ignore that state of things in the case of insurance. They had before them the fact that farming insurance did not pay. Did the fault rest with the offices or with the insurers? He ventured to say that farmers as a body did not insure for such an amount as they might reasonably be expected to do; and he believed that if they were to insure adequately on their implements and dead stock there need be scarcely any increase on the live stock.

Mr. WALFORD said that he was not officially connected with any insurance office, but he had paid great attention to the subject of insurance, both on the continent of Europe and America, and had found it surrounded with difficulties. He had conversed with the managers of different offices on the question under consideration, and he thought he knew something about the object which they had in view. He would give a short illustration of the working of the average clause. He would suppose the case of a farm the gross value of the produce of which after harvest was £4,000. The farmer, wishing to adapt his insurance to the average value of his produce during the year, might say "I will insure my crops for £2,000." That amount might be the full value in June; but what would be the case after harvest? His crops would then be worth £4,000, and if a fire occurred he might hitherto have received the whole £2,000. The offices thought that such a state of things required some modification, and said, "If you will insure for £3,000 on the £4,000 value we will then pay you the actual loss incurred." That was the way in which he understood the statement of the offices, and he thought he perceived in it a desire to deal fairly with agricultural insurers (Hear, hear). It had been too much the practice of many agriculturists to insure only for half, or even one-third of the value of crops which were distributed over the whole of a farm, while others paid on a much larger proportion. On the other hand, as Mr. Read remarked, it would be most unfair to require a farmer to insure for the whole of the crops existing at the end of harvest (Hear, hear). There should clearly be some equitable adjustment in such a case, and he (Mr. Walford) thought that three-fourths was not an unfair amount for either side. There was, indeed, another method in which that matter might be adjusted. The offices had tried for some time to get a basis which would be fair as between farmers and themselves, but they had never succeeded in doing so; and he thought that if a committee of practical men were to meet together to consider the matter they would soon arrive at some satisfactory conclusion. He believed that a proposition of that kind emanating from that Council would receive due attention from the associated farmers, and that they would be disposed to view with favourable eyes any suggestion of a practical character. As the matter stood it might certainly appear as if because a large number of farmers had not dealt fairly with them they have dealt an unfair blow at farmers generally (Hear, hear). He knew at least one company who he thought would be disposed to nominate local

directors in each agricultural district, and would be prepared to take insurances on their recommendation; and he believed that some arrangement of that kind would meet the case.

Mr. READ, in replying, said he believed that Mr. Martin, who lived in the land of Goshen, had this year grown a most extraordinary crop of corn. Hence he had been willing to insure for three-fourths of the crop; but he (Mr. Read) did not suppose he would be willing next year to pay that amount on a crop which might be only half as productive.

Mr. MARTIN observed that he should continue to pay it.

Mr. READ: Well, then, Mr. Martin was not quite as sharp as he had taken him to be (laughter). He was, in fact, a great deal too generous. What he (Mr. Read) maintained was, that every man should be insured according to his risk, and that persons which had hitherto insured for the proper amount, and had taken every precaution against heavy losses accruing to offices, should not now be classed with others of an indifferent character, and made to pay for their shortcomings (Hear, hear).

The CHAIRMAN said: A valuable suggestion had just been made by Mr. Walford, to the effect that a committee should be formed to meet the representatives of various offices. It was for the meeting to determine whether any action should be taken in that respect.

The resolution was then put and carried.

Captain CATLIN moved the next resolution, viz., "That the secretary be instructed to invite from other offices a declaration of their terms for the insurance of farming stock." He agreed with those who thought that the object of the offices was not clearly defined. He himself in effecting an insurance took great pains to induce the agent to fix a price per acre for arable land with which the office would be satisfied, but the only result was that the agent asked him to fix his own price. That he found very difficult, because the produce varied so much from year to year. In order to guard against anything that might invalidate his insurance, he wished to fix a price founded on an average of years. He was asked to estimate the value of the produce in his district. In 1868 the produce of 600 acres of arable land was worth upwards of £2,000 more than in the preceding year, and, on the whole, he found it impossible to put in an estimate which might not have made him liable to be called upon to pay more than was fair and reasonable. He asked the agent to tell him what was the highest price at which corn had been put down elsewhere. The reply was, that £12 per acre was the maximum price put upon wheat. He (Capt. Catlin) had fixed his at £14, and he asked the agent how, under such circumstances, he could be treated fairly. He inquired whether in case of fire the agent would estimate the damage upon the price at which the party insuring estimated the value of his crop, or whether he would call in some competent person, and be guided by him; and the agent replied that that was a question he could not answer.

Mr. TURNER, in seconding the resolution, said there were two or three courses open to farmers generally in reference to that question. The first was to ignore the offices altogether and not insure at all; the second was to establish an office on their own account; and the third—and this appeared to him the best—was if possible to meet the representatives of the offices and come to a settlement of the dispute with them. He concurred in what had been said as to the great difficulty of arriving at a solution for all districts upon one hard and fast line. Mr. Martin had alluded to agricultural produce to the almost total exclusion of live stock. He knew a case in which a farmer who had a fire in the month of February, when his produce was of but little value, was almost totally ruined, having lost in consequence the whole of his breeding ewes. He was at a sale in North Lincolnshire where 40 animals were sold for about £3,000, and with all deference to Mr. Read he must say that those animals seemed to him to have been well worth insuring. There would have been great difficulty in getting them out in case of fire. As regarded the third course suggested, namely, the formation of a committee to meet the managers of the insurance offices, he did not know whether that could be incorporated in the resolution.

The CHAIRMAN observed that a rider had just been handed in for that purpose, and would now be proposed.

Mr. VARDEN said there could be no doubt that the object of the societies was on the whole a reasonable and proper one; the only difficulty was how to carry it out in such a manner as to do justice to both parties. Mr. Read had spoken of those

who insured fairly and those who did not. The question seemed to him to be rather one of detail than of principle, and he would, therefore, propose the following as a rider to the resolution of Captain Catlin: "That a committee be appointed to confer with the representatives of the various offices, in order to arrive at some equitable basis for effecting such insurances."

Mr. BUDD, in seconding this rider, concurred in the opinion that considering the varying circumstances of the country it was impossible for any one rule to be applicable to the whole. He thought the only way in which a fair settlement could be arrived at, was by taking into account various local interests, and in his opinion that object would be best attained as suggested by Mr. Walford, by means of a local committee for each county.

Mr. MORRISON (West Riding) observed that if the offices did not meet agriculturists fairly it would still be open to them to form a mutual insurance fund, which would be advantageous and lucrative because the farmers would join to a man.

Sir G. JENKINSON, M.P., said it appeared to him that the insurance offices had pursued a very arbitrary and unfair course towards agriculturists in declaring that they would not renew their policies unless they insured on certain terms which were now laid down for the first time. His idea was that the offices were endeavouring to obtain from them some portion of the revenue which had been recently given up by the Government, and in his opinion if they wished to do that they should first have invited the representatives of agriculture to meet them. He knew the difficulty of establishing mutual offices; but greater difficulties had been met, and he had no doubt that if agriculturists determined to form a co-operative insurance office, all difficulties would be surmounted. At the same time he did not believe they would go into that line of business unless they were driven to it by the arbitrary conduct of insurances offices (Hear, hear), and he thought that as a body they would be ready to accept fair and reasonable conditions. He did not undertake to propose his resolution in any hostile spirit towards the offices, but simply with the view of giving the agricultural class an opportunity of looking after their own interests and obtaining fair terms. Insurance companies had no doubt suffered great losses, but that was partly owing to the careless way in which they appointed irresponsible agents in the country towns. If one went into a grocer's or draper's shop in a small village, almost the first thing one saw was a placard showing that the owner was the agent of an insurance office. These were not the kind of persons who were acquainted with agricultural business; they knew nothing about rotations of crops or the value of stock from time to time; and if the offices had appointed agents who were conversant with farming operations, many of the difficulties which had arisen would have been avoided.

Col. WILSON (Suffolk) believed it would not be so easy to appoint agents who were conversant with the details of farming operations as Sir George Jenkinson appeared to suppose. As regarded the hon. baronet's supposition that the object of the companies was to benefit by the remission of duty, he might observe that for very many years there had been no duty on farm insurances. It seemed to him that too much fuss had been made on that subject. Mr. Read admitted that farming insurances had not paid, and the first duty of the managers of the different offices was to take care to do no business that would not pay. It was the trying to force business and the entering on business of an unprofitable nature, which had brought some offices into such an unenviable position. As to the idea that a new society should be established for farmers, that might be a very good suggestion, but all he could say was that he should be very sorry to join it. He did not believe there was any variance of interests as between the offices and farmers—they were in the same boat, and he felt sure that if the offices had made a mistake they would be quite willing to rectify it.

Mr. PELL, M.P., said he had that morning called at one of the largest Offices in London, as regarded farming insurance, and having been invited to see the manager, he must say that so far as he could judge from what he heard there would be no indisposition on the part of that office to meet a committee emanating from that Chamber (Hear, hear). His own insurance was, he might remark, based on favourable terms, and although he had been fortunate enough never to have a fire, he should be quite willing to submit to some change. He

thought it should be suggested for the consideration of the insurance offices whether it would not be simpler to insure with reference to the number of acres in cropping down with reference to what there was in the rick-yard. There were many persons who could tell what was the average yield of a certain description of land and what amount of produce a man might be expected to bring to his rick-yard. It was pretty well known what number of acres a farmer devoted to corn crops, and if there were any material change in that respect a statement of the fact might be made essential to the validity of the insurance. He thought that through the adoption of some such principle as that they might come to fair and equitable terms with the insurance offices, although it might involve a higher rate of premium.

Mr. NELLID objected to the word "other" before "offices" in the resolution. In his opinion all offices ought to be included (Hear, hear).

Mr. G. E. MUNTZ also thought that the word "other" had a hostile appearance, and suggested the substitution of the word "all."

Mr. READ, M.P., would prefer the words "non-associated" offices, especially as they had the terms of the large offices.

Mr. WALFORD observed that nine out of ten of the offices were associated, but there were 8 or 10 respectable young offices which had been excluded from what was called the tariff, and who were disposed to do justice to farmers, thinking that they had not been fairly treated.

Mr. READ, M.P., recommended that the resolution and the proposed rider, should be dealt with as separate resolutions, and Mr. G. E. Muntz, and Mr. Varden, took the same view.

After some discussion this course was followed, and in accordance with Mr. Read's proposal, the resolution of Capt. Catlin was agreed to with the substitution of "non-associated" for "other" before the word "offices."

On the motion of Mr. PELL, M.P., the following resolution was adopted, in place of that submitted by Mr. Varden, the latter gentleman having seconded it: "That a committee be appointed to confer with the various insurance offices as to the most equitable mode of insuring farming stock and produce, and that the committee report to this Council the result of their proceedings."

On the motion of Mr. READ, M.P., the following gentlemen were appointed to form the Committee: Col. Tomline, M.P. (Suffolk); Mr. Pell, M.P. (Leicestershire); Capt. Catlin (Cambridgeshire); Mr. Jabez Turner (Northamptonshire); Mr. G. E. Muntz (Warwickshire); Mr. Morrison (Yorkshire); Mr. C. S. Read, M.P. (Norfolk); Mr. Varden (Worcestershire); Mr. Walford, and the Secretary, *ex officio*.

The CHAIRMAN said that the next question fixed for consideration was, "What further regulations for the home and foreign cattle trade are required in the interest of producers and consumers?"

Mr. T. DUCKHAM moved the following resolution: "That the thanks of this Council are due to the Right Hon. W. E. Forster, M.P., for the prompt manner in which the powers of the Contagious Diseases (Animals) Act were put in force upon the outbreak of cattle-plague on the Continent; but that the interests of both producers and consumers demand that regulations for water-side slaughter should be permanently extended to all imported fat animals, with quarantine for store stock." With regard to the latter part of the resolution, he observed that there had been great laxity hitherto in carrying out the objects of the Act, and that it was absolutely necessary that farmers should be better protected.

Mr. G. MARTIN (of the Lincolnshire Chamber), who seconded the resolution, read the following paragraph, which had appeared in the *Times* about ten days ago: "Trade of the Port of Grimsby.—Thirteen large steamers have been running weekly to and fro to the ports of Hamburg, Dieppe, Rotterdam, and others to Antwerp, to Riga, and Cronstadt, and the Black Sea. There has been a large passenger traffic carried on, through from the Continent, *en route via* Grimsby and Liverpool, to New York. The importation of sheep and pigs, calves and beasts, from Hamburg has largely increased during the past year, and notwithstanding the orders issued by the Privy Council for their slaughter at the landing-place they are sent, the steamship 'Grimsby' bringing in on Friday 31 sheep and 60 cattle." Mr. Martin stated that the Lincolnshire Chamber had at once instituted an inquiry as to how far a dangerous importation was being carried on at Grimsby, in

contravention of the orders of the Privy Council. The secretary of the Central Chamber here read a communication which he had just received from Mr. S. Upton, the secretary of the Lincolnshire Chamber, as follows:—

“Lincolnshire Chamber of Agriculture,
“St. Benedict-square, Lincoln, Nov. 7, 1870.

“Dear Sir,—I send you on the third and fourth pages copies of letters received from the town clerk and superintendent of police at Grimsby. The paragraph brought under the notice of our Chamber has been misunderstood, but it appears to me that the removal of pigs (as coming over in the same vessel as cattle) into the county alive must be attended with considerable danger. Your note dated the 4th did not reach me until this morning. The envelope bears the Long Sutton and Wisbeach post-marks of the 5th, and Lincoln of the 7th.—Yours truly,

“S. UPTON, Secretary.”

[COPY.]

“Great Grimsby, Nov. 3, 1870.

“Dear Sir,—The Mayor has desired me to reply to your note of the 29th ult., containing paragraph from the *Times* newspaper. We have a large slaughter-house on the dock works, and all cattle from suspected countries are slaughtered there, and the skins disinfected. I think you have misunderstood the paragraph. It means that the trade has not decreased in Grimsby notwithstanding that all cattle are slaughtered on their arrival from foreign parts. Our inspector is very strict, and so are the customs authorities at this port.—Yours truly,

“W. GRANGE, Town Clerk.”

“S. Upton, Esq.”

[COPY.]

“Lincolnshire Constabulary, Nov. 3, 1870,
“Grimsby Station.

“Mr. Superintendent Martyn,

“Sir,—In answer to yours, respecting the importation of foreign cattle into Grimsby, I beg to state that the regulations in force at the docks are, that all cattle coming from foreign countries are slaughtered at the slaughter-house provided on the docks, none being allowed to be taken from the docks alive. The hides are branded and disinfected by the inspector, Mr. Wentworth, V.S. The same regulations apply to sheep, but pigs can be taken away alive, and a great many are sent to Manchester, Sheffield, &c. I cannot hear of any cattle or sheep leaving the docks alive during the last fortnight.—I am, sir, your most obedient servant,

“A. RICHDALE, Supt.”

Mr. GENGE ANDREWS, in supporting it, suggested the insertion of the word “effective” instead of “the present” before “regulations.” It was absurd to have a restriction in London and not make it equally applicable to all other ports. They all knew that cattle-plague was as readily conveyed by an individual who had come in contact with cattle affected as by the cattle themselves, and unless the regulations were made thoroughly effective they would still be subject to the evil. He would therefore propose to add to the resolution: “And that the regulations should be applied with the least possible delay at every port at which foreign animals are admitted.”

Mr. MUNTZ deprecated the addition as needless if the word “effective” were adopted.

The resolution was ultimately adopted with the alteration and addition suggested by Mr. Genge Andrews.

Mr. BENNETT moved the following: “This Council expresses a hope that her Majesty’s Government will not hesitate to adhere to and support the provisions of the Contagious Diseases (Animals) Act, with reference to the establishment of a permanent Metropolitan Foreign Cattle Market, and trusts that when such market has been opened the present restriction against the removal of cattle from the metropolitan area will be rescinded.”

Mr. DICKSON, in seconding the resolution, dwelt on the disadvantages to which farmers residing north of London are exposed by having their finest animals excluded from such places as Brighton, Hastings, Maidstone, and Canterbury.

Mr. READ, M.P., remarked that the Norfolk graziers complained not merely of their exclusion from southern markets, but also of the enormous charges made by railway companies for the conveyance of dead meat; and, in his opinion, the Chamber should express its opinion on that subject.

The resolution having been adopted,

Mr. T. WILLSON moved the following: “This Council would direct special attention to the exorbitant charges of the railway companies for the conveyance of dead meat, and trusts

that by a reasonable revision of their tariff they will facilitate the supply of meat to populous districts.” That was, he observed, a question which concerned consumers as well as producers, and the inhabitants of Yorkshire, Lancashire, and other large consuming districts, had great cause to complain. For the conveyance of dead meat from Leicester to London the London and North-Western and the Midland Companies charged four times as much as they charged for carrying live meat, although the risk was less.

Mr. READ, M.P., in seconding the resolution, said he thought that all who took an interest in the welfare of large towns must desire to see a large development of the dead meat trade. It was impossible to understand the varying rates charged by the railway companies. From Liverpool to London—a distance of 214 miles—the charge made for conveying dead meat was 2s. 6d. per cwt., while from Grantham—a distance of only 111 miles—the charge was exactly the same. Again, from Berwick to London, the distance being 337 miles, the charge was 3s. per cwt.; while from Sleaford, only 115 miles, it was 2s. 10d. He really thought that railway companies required to be associated in the same way as fire insurance offices—he meant, of course, not for the purpose of charging more, but if possible charging less and equalising their rates (Hear, hear). Everybody knew that there was a greater amount of risk and trouble in conveying dead meat than live animals, especially as the railway companies invariably delivered the dead meat in the metropolitan market; whereas live animals, generally speaking, delivered themselves. He felt quite sure there would be a much larger development of the dead-meat trade if railway companies were more reasonable in their charges (Hear, hear). One of the increasing tendencies of the present day was the sending of large quantities of dead meat to the great towns.

A MEMBER observed that for eight months of the year Aberdeenshire sent about 2,000 carcasses a-week to London, and only about 500 live animals. The former were delivered at 3s. 3d. per cwt.; while the charge for live animals was only 25s. per head. Thus, assuming the average weight to be 7 cwt., the charges for live and dead meat were about the same, the difference being rather in favour of live meat. Several carcasses might be placed in the space occupied by one live animal.

The CHAIRMAN remarked that some one else ought, perhaps, to have been placed in the chair before that resolution was submitted, as he himself happened to be a railway trector (laughter). He concurred, however, in its purport.

The resolution was then adopted.

The following resolution was afterwards proposed by Mr. T. Duckham, and seconded by Mr. Hewitt: “That, owing to the lax manner in which the Contagious Diseases Act is being carried out, great losses are accruing to the stock-owners of various parts of the kingdom; and that, therefore, the local authorities should be urged rigidly to enforce its provisions.”

After a short discussion, in which the resolution was objected to as needlessly implying a censure upon the authorities, and, also, because the meeting had become very thin, the resolution was withdrawn.

A vote of thanks was given to the Chairman, and the meeting separated.

THE CENTRAL AND THE LOCAL CHAMBERS OF AGRICULTURE.

At a meeting of the Shropshire Chamber of Agriculture on the same evening, Mr. Bowen Jones, vice-president, in the chair, the subjoined recommendations were unanimously agreed to: “That this committee, while fully recognizing the deserts of the Central Chamber, and admitting its part action to have entitled it to the support of agriculturists, considers that its organization lacks the amount of representative force that should belong to the central exponent of agricultural views, and without at the present time being prepared to recommend an entirely representative association to act as the mouthpiece of chambers, is of opinion that the Council of the Central Chamber of Agriculture in London should be appointed at an annual meeting, including deputed representatives from provincial chambers, and should consist of a limited number of members appointed from its own body, together with one representative from each of the affiliated chambers, with the addition of other deputies appointed on the basis of numerical

representation and an equivalent payment. That in order to carry out this view each chamber and association shall elect one permanent representative for the ensuing year for such purpose." "That in order to increase greater unanimity of action, and to diffuse information more widely, the various local chambers should without fail distribute all reports of discussions and other matter obtained through their organization to each of the provincial chambers established as well as to the Central Chamber." "That the Central Chamber should publish its reports in pamphlet form, so as to be added to annual reports of local chambers, and that all Parliamentary bills should be forwarded without being sent for, a charge being previously agreed upon."

The following letter has also been addressed to the secretary of the Central Chamber of Agriculture:

SIR,—Again the Central Chamber has met on the subject of "Securing greater unanimity of action between the Central and provincial chambers," and again it has adjourned the question. Your remarks implying that such postponement was a consequence caused by the absence of delegated members are not clear, as certainly those chambers that had sent resolutions on the subject were present by their resolutions. The subject is a delicate one, as although some chambers may deem an association of chambers indispensable, yet they cannot feel at liberty to urge the Central to dissolve and allow its position to be taken up by an association of chambers. The grounds on which the North of England Chamber founded their resolutions were fully stated in their discussion; you were the judge of whether your readers cared to know them, and they did not appear in your columns. The cost of attending at the Central meeting, to repeat them, would have been at least £4, and this would have been to again incur at the two adjournments that have taken place, and at every future adjournment. Nothing could more fully illustrate the necessity of an associated chamber which would not call a meeting on a subject until ready to discuss it, and then at one and the same time dispose of it. The present anomalous position of the Central Chamber may be no barrier to its independent acts; but some who do not know its exact position may be misled by supposing it to represent the opinions of the provincial chambers. Many of its most prominent acts have been totally at variance with the resolutions of the North of England Chamber. I may instance the deputation to the First Lord of the Treasury, and the suggestion of an "income-tax rate" for poor-rate purposes, instead of the present basis of "the ability of a parish," the delegation of a portion of its duties to a Local Taxation Committee, which committee sets up its independence, collecting separate funds, issuing pamphlets, and further diverging from chamber action by a letter to the courts of quarter sessions, and which act assumes either that the members of sessions are not members of chambers of agriculture, or that the question of local rates is fitter matter for a court of sessions than a chamber of agriculture. The ratepayers cannot be benefited by any mediators intervening between them and Parliament save their duly constituted representatives, and all the machinery necessary is the united action of the ratepayers themselves. The principal objects for which chambers were formed were to discuss and set forth by resolutions the present faulty manner in which local rates were assessed, and how they might and ought to be adjusted. An association of chambers is necessary on some questions to reconcile and combine the various resolutions of the provincial chambers in one general resolution, in order that the approach to Parliament be in a united and common-weal form. The present members of the Central Chamber may or may not be willing to alter its constitution so as to become an associated chamber. The question has been fairly and courteously put to them, and their reply is looked forward to with much interest.

Yours, &c.,

THOMAS LAWSON.

Loughurst Grange, Morpeth.

At a general meeting of the County of Devon Central Chamber of Agriculture, the president (Mr. C. J. Wade) said the most important business for discussion was, the want of combination existing between the local Chambers and the central Chamber in London. He did not think the questions discussed and the importance of the local resolutions passed at their meetings were fairly met, and taken sufficient notice of by the Central Chamber, he thought they were somewhat shut out in the cold; indeed, he himself had not

met with the courtesy he expected when presenting himself to offer opinion on the working of the local Chambers, and he wished the gentlemen now present would seriously entertain the question, and, by the aid of a resolution or some other method, endeavour to effect a most cordial operation between the parent institution and the branches. There were points of local discussion, such as police rates, turnpike tolls, and other matters which they were called upon to solve, which received no characteristic response, when those questions were sent up for discussion at the Central Board. He spoke of the necessity of having un-tolled roads for the transmission of forces and war material, and thought it should be provided either by contribution or otherwise, out of the national funds; he had some communication with the Secretary on these subjects, and he thought the Central Chamber should be in more direct connection with the local chambers.

Mr. STOOKE said there were 55 local chambers, and there was no unanimity of action, for it required a guinea a-year to be constituted a member of the Central Chamber, and even then his opinion was crippled in discussion. He thought the chamber should be a representative one, as yet only five or one-tenth had followed in the same opinion, and he deemed it necessary the local chamber should be one and all unanimous on this question.

Mr. CREED proposed the following resolution, which was seconded by Mr. Stooke, "That in the opinion of this chamber every local chamber should have power to send delegates to the central chamber meetings, and that they should have same position as those who are members of the central chamber in discussion and voting, both in the general meeting and also in council."

The SECRETARY called attention to the resignation of Mr. Wade, as president, circumstances calling him away.

HUNGERFORD CHAMBER OF AGRICULTURE.—

The fears entertained by some persons that the above association would soon cease to exist, are now entirely dissipated, the meeting held at the Bear Hotel on Wednesday evening being one of the most successful remembered in connection with the Club. The attendance proved larger than it has been on several occasions lately, while the able paper read was followed by a discussion of an animated and interesting character. The subject was Steam Cultivation, introduced in a very practical manner by Mr. Cottrell, steam plough proprietor, of Charnham-street, Hungerford, whose paper was listened to with much interest. Mr. T. Chandler congratulated the members upon the character of the present meeting, which gave hopes that the Chamber had been thoroughly resuscitated.—*Reading Mercury.*

DOUBLE-FURROW PLOUGH v. SINGLE-FURROW

PLOUGH.—A match took place at Tarporley, between a double-furrow plough, manufactured by Corbett of Shrewsbury, and a single-furrow plough, by Mr. Shean of Eddisbury, for £5 a-side. The two-furrow, according to agreement, was to plough more than double the quantity of land to the single-furrow plough, and this was done easily. When the ground was measured, it was shown that the two-furrow had ploughed 2a. 0r. 19p., and had 104 furrows to every 83 feet; while the single-furrow had done 1a. 1r. 17p., but only had 92 furrows to every 83 feet. The dynamometer was put to the two-furrow plough, and registered to be only 5c. 22lbs. in draught. The decision was, of course, in favour of the double-furrow plough

THE DOUBLE-FURROW PLOUGH TRIALS AT

ALFORD.—These trials took place on Friday, Nov. 12. Amongst the entries were—Ransome, Ipswich; Howard, Bedford; Ball, Rothwell; Cooke, Lincoln; and one of Fowler's Pirie Ploughs. The land, which was very heavy, was in a terribly sticky and wet state, owing to the heavy rains and the frost of the previous night. At the conclusion of the trials the first prize of £10 for the best general purpose double-furrow plough, due regard being had to lightness of draught, ease, and economy of management, strength and simplicity of construction, was awarded to Messrs. Ransome, and the second prize of £5 to Messrs. Howard. The judges were—Major Grantham, Spilsby; Mr. Helmsley, Nottingham; and Mr. James Martin, of Wainfleet. As at the Peterborough trials, the services of Mr. C. E. Amos, C.E., were engaged to carry out the dynamometrical tests,

THE DISEASES OF STOCK.

The following Circular has been issued :

Privy Council Office (Veterinary Department),
Princes-street, Westminster, S.W.,

November, 1870.

SIR,—I have the honour to enclose a copy of the Form of Return for *Foot-and-mouth disease* referred to in the Order of Council of 8th November, 1870, and am directed by the Lords of the Council to inform you that they anticipate that, under the new arrangements, the amount of expense hitherto incurred by the Local Authorities in furnishing the information required by their Lordships will be considerably reduced.

I am also directed to call the attention of your Local Authority to the circumstance that Cattle Plague or Rinderpest, the disease from which this country suffered so much in 1865-6, now prevails more or less extensively in France and North and South Germany.

Their Lordships have taken measures to guard against its introduction by imported animals; but as it is possible that the disease might be brought in by human beings, or by any means capable of transporting very minute particles of the contagious matter, it is especially necessary, at the present moment, that the Inspectors of the Local Authorities should be on the alert.

The detection of this disease requires special professional knowledge, and as it appears that some of the Local Authorities have appointed the Local Police and other non-professional persons as Inspectors under the Contagious Diseases (Animals) Act, 1869, the Lords of the Council trust that such Inspectors will not, in any district, be left without professional assistance, but that the Local Authorities will authorize them, in any case, where there is a doubt as to the nature of a disease, forthwith to call in a professional Inspector.

Their Lordships feel that they cannot too strongly impress upon the Local Authorities the urgent necessity for the most careful attention to the above-mentioned point, and they trust that, in consequence of the decrease in the duties of the professional Inspectors with regard to the Returns relating to Foot-and-mouth disease, they will be instructed to give increased attention to the other contagious and infectious diseases of animals, and more especially to those diseases which have any resemblance to Cattle Plague, or concerning the nature of which there appears to be any doubt.

I have the honour to be, Sir,

Your obedient servant,

ALEXANDER WILLIAMS,
Secretary.

THE NEW FOREST.—A Parliamentary notice has been issued by the Hon. J. K. Howard, Commissioner of Wood, Forest, and Land Revenues. It announces that application will be made to Parliament in the Session of 1871 for an Act having for its object—first the repeal or amending of certain Acts relating in whole or in part to the New Forest; second, the abolishing forestal offices in or over the same forest, and making compensation to the holders of such offices; the division of the forest, or some part or parts thereof, into parishes or ecclesiastical districts, the alteration of the boundaries of existing parishes and ecclesiastical districts, and the making of allotment for churches, schools, or other purposes; the ascertainment of the value of the rights of her Majesty in the forest or some parts thereof, and of certain rights of commoners; the making of allotments of part or parts of the forest, or of other compensation in satisfaction of such rights; certain alterations of rights of way; the confirmation and carrying out of the register of decision or award of the commissioners appointed to inquire into the rights of common in the New Forest under certain Acts which are named; the authorising of the application to the purposes of the Act of the balance of purchase money received by the Crown from the Southampton and Dorchester Railway Company for land taken by them in the Forest; the authorising the commission or commissions to be appointed under the Act to sell part or parts of the forest, and to apply the purchase-money to the purposes of the Act; third, the disafforestation of the forest in some part

or parts thereof; fourth, the appointment of a Commission or Commissions for effecting all or some of these contemplated objects, with all necessary powers; and fifth, the variation or extinguishment of all rights, powers, and privileges which would interfere with any of its objects, with power to confer others in lieu thereof.

SALE OF MR. COX'S SHORTHORN HERD,

AT BRAILSFORD HALL, DERBY,

ON WEDNESDAY, Nov. 9.

BY MR. JOHN THORNTON.

Any one who has seen the herd of yearling bulls at the spring fairs in Derby must have noticed the want of blood and character in the general stock of the county. Sir John Crewe and Mr. Chandos Pole Gell both introduced some pedigree cattle into the district, and Mr. Cox also brought a few to Brailsford, between Derby and Ashbourne, fully twenty years since. He took his cue from Mr. Parkinson, and Mr. Booth, of Cotham, and visited Kirklevington, in the Spencer period, when that "love of the Shorthorn was implanted in his bosom," while as he said it at the luncheon, "he should like to see implanted in others." Eight years ago his small holding became overstocked, and a local firm dispersed his Shorthorns and general stock, even to the dairy utensils. But he was in the next year again, and bought old Harmony, of pure Bates' blood, and Sir Chas. Knightley's Wheedle calf by Second Grand Duke of Oxford (17996) at Mr. Leeke's sale. These, with one or two private purchases, were the beginning of the present herd. A long absence from home left the stock in the bailiff's hands; and, with the county belief strong within him, the man used an unpedigreed bull, to the disgust of his master and injury of the stock. Mr. Clayden's sale in 1865 supplied a couple of good cows, Sunshine and Daphne, and with one or two other purchases the herd outgrew the place. We had understood that the sale was to have been in the spring, but was postponed until autumn; and when autumn came, the dry summer and foot-and-mouth had done such mischief, the sale was put off again until Lord Mayor's Day. Fortunately, the day, out of town at least, turned out very bright, although it was very misty in the morning, and by noon a good company had assembled. These Mr. H. Chandos Pole Gell and Mr. Cox entertained in the commodious coach-house with a capital lunch and champagne. After the customary toasts, of which Mr. Cox delivered himself with much humour, the company adjourned to the ring. Although the sale was, as the auctioneer said, "out of season," and the stock not in that condition they might under more favourable circumstances have been, yet the company seemed to bid well, and there was good local competition. Mr. Clayden's Daphne, a fine cow, newly calved, and with an enormous udder, was put in by a dairyman at 30 gs., and Mr. George Sauday bid for her, but she went to Captain Aveling at 35 gs. Sarah Ann, of the Osberton Scraphi tribe, and the property of Mr. Blackwell had been walked from a distance, and looked stale, so she went cheap to Mr. Arthur Garfit, who also bought Wedlock out of Wheedle, low in condition and cheap enough at 50 gs. Her daughter, by Mr. Torr's Grand Marshal, was one of the best animals in the sale; and brought out among an aristocratic company she would have fetched double the 53 gs. Mr. Curtler gave for her. Maria 11th (33 gs.) and Maria 14th (24 gs.), both bred at Cotham, went to the Rev. Mr. Wilson, in Shropshire; and Mr. John Norwood, of Newark, took Statera at 39 gs., and Harmony 4th, a good roan heifer, at 34 gs. Adeline made 45gs., to Mr. Williams; and the Harmony cows, badly crossed, went only at low prices, two making 24gs. each.

The bull calves, sold after their dams, went off remarkably well, Julius making 28gs., and Bismarck 21gs.; whilst the competition for the extra stock, with a cross or two of blood, drew great spirit out of the men of the district, and two of them fought over a fine roan in-calf heifer up to 41gs., and the others went up to 23gs. and 27gs. each. Altogether the sale was considered a success, with a sum total of about £1,356 3s. 6d., or an average of £26 2s. 7d. for the herd of forty head, the cows and heifers averaging within a few shillings of £30 each.

CALENDAR OF AGRICULTURE.

In fresh weather plough stubbles for wheat fallows in the first place, in order that the stiffest soils may have the benefit of exposure to the atmospheric changes, which, by alternately contracting and swelling the soil, crumble and dissever the particles into a minute adherence. The furrows must be deep and square cut, and the edge that is raised from the coulter and share placed thoroughly vertical, in order to expose both sides equally to the air. Being placed into this position by the shouldered width of the mould-board, it matters not what name the plough enjoys in the maker or in the design, in the iron or in the timber. Stiff clays require the power of 3 or 4 horses, as a deep ploughing raises earth for the summer workings preferably to a shallow winter-furrow, and a deep ploughing in the spring. Plough in succession the stiffest green crop lands, and also the stiffest leys for Lent crops.

Continue the cutting of drains to half depth, to be dug out and filled in dry weather; mend roads and cast up earths for composts; collect for manures all earthy and vegetable substances that can be got in any shape or quality.

Flood meadows, and lay dry occasionally.

Cut underwoods and fill up vacancies by planting and layering. Plant all kinds of forest trees, especially ash and oak, single. Standard trees in corners or in clumps, are treated as directed for gardening, with guano and dung. Keep plantation fences in good order to prevent trespass, a sure mark of slovenly management. Plantations of all kinds with the fences are best placed in the management of the landlord, who cuts the wood into periodical sales, which supply the wants of the country.

Raise turnips from the ground, and cut from the bulbs the tops and roots, and store the crop in a thatched longitudinal heap at the homestead on a dry bottom. Give fresh tops to young cattle in the yards or to store sheep in the fields.

Early lambs will be dropped this month—feed the ewes largely with juicy food under a good shelter.

During frosty weather thrash very frequently by machinery, and litter the yards very often and thinly. Machinery will cut the straw by knives into short lengths on the upper floor, on which the scutching is done, and hence conveyed on travelling carriers, supported by three-legged standards, to any part of the yard, for food as chaff, or for promiscuous litter. This provision is well adapted for large farms, and straw in short lengths are very conveniently managed in the yards, and covered in the drills of land.

Collect earths to the compost heaps, and carry lime for mixing with the earths. Cart stones to the places required for draining, and carry fuel, timber, and faggots for domestic and other purposes.

The systematic arrangement of farm labours for the mid-winter months consists in ploughing and planting in fresh weather and in carting operations in frosty weather. The thrashing of grain is done by machinery in all weathers, at regular intervals, to supply straw for common use, and thrashing with flail still goes on with daily labour, evincing a prejudice of slowness, wholly incompatible with the present speed of steam and telegraph. It continues the stolid character that has ever been attached to the cultivators of the soil in expending five times the cost in the flail over steam in a non-productive point, instead of increasing the produce, for if £5 were

paid for thrashing one quarter of wheat it would produce only eight bushels of grain.

The cattle in the yards, cribs, and fattening houses, must be supplied by daybreak with food in a fresh condition, as turnips and other roots, straw, hay, and chaff, in quantity for the day's consumption. The turnip troughs are carefully cleaned out by shovel from mud and filth before the fresh turnips are deposited—the straw racks are frequently shifted in position in order to prevent dry places underneath, and to maintain a uniform soaking of moisture over the yard, of which the surface must be kept level and frequently and thinly littered with short cut straw as has been mentioned. In this way, and in most situations, all the moisture of the yard will be absorbed by straw and litter; and after all that has been spoken and written on the subject of liquid manure, its warmest advocates have been compelled to acknowledge that it is most beneficially applied by being absorbed by earths and earthy matters. In very rainy localities the extra quantity of moisture from the heavens should be carried away by cave-spouts into a culvert, for if allowed to pass through the feces and straw of the yard, it will carry away with it the urinary liquid which forms a chief value of the fecal compost.

The sheep in the fields that are fattening on turnips sliced into troughs, or which are in store keeping in fields of grass or stubble, must have fresh food by daybreak for a day's consumption, in fresh sliced turnips, and in roots drawn from the field in the morning. Sheep confined on the grown crop by hurdles or other light fencing, get a fresh space of ground every three or four days, as the surface is cleared of roots. It is of great moment in the feeding of animals that the food passes into the stomach of the beast in the shortest possible time from being separated from the ground, in order to have the benefit of the vegetable freshness—a mighty element of nutrition. With this view the storing of roots is not eligible except in early climates, shooting into tops, and where snow lies long and deep. The last case is not very frequent, and the former is confined to the extreme southern counties.

Pigs fattening in sties in two animals together are supplied with a mashed food of steamed roots and meals in mixture of two meals daily, and in the last month of fattening with a meal of raw grain, as beans, oats, and barley, in order to whiten and consolidate the flesh. In the store yard the younger animals are supplied with roots, raw and steamed, and with abundance of litter.

Poultry are fed with light grain, and with steamed roots and meal, placed in troughs under a shed. A fresh supply of water is required.

Work-horses are treated with steamed potatoes in the evening meal, and benefit is thought to ensue. But the horse is a dry feeding animal, and is much exposed to weathers, and warm food will open the pores of the skin to the reception of cold. Hay, oats, and pea-straw suit the dry constitution of the horse—pigs are the only favourites of cooked food.

Early in this month, or rather in last month, the farm buildings should be insured by the landlord, with a small part by the farmer for such articles as he is bound to keep in repair. The crops of the year, with the animals, are insured at the farmer's cost, and now very cheaply in an office of the special designation, rendering a neglect doubly culpable.

CALENDAR OF GARDENING.

KITCHEN GARDEN.

Protect artichoke beds with three inches of half-decayed leaves strewed over the surface, or if the land be stiff and clayey, with as much coal and wood ashes.

Asparagus is easily forced upon deep beds of leaves, raked from woods and parks, avoiding those of laurels and of evergreens generally. The plants should be prepared in proper beds for the express purpose, and selected from the best two and three-year old stock. Brick pits are the best erections, but wooden frames set upon leaves, with warm linings will do well.

Earth up early for the last time very high in the ridge. Excite sea-kale, as directed for asparagus. Much litter is prevented by using pits and darkened frames, with good linings.

Trench deeply and manure richly lands intended to grow onions. Ridge ground in all vacant places. Cut the soil into long and narrow spadefuls, and place the slices in a half-vertical position, with a corner standing upright, with cavities open at the bottom, to allow the free permeation of air and moisture. In snowy countries these openings lodge the snow, which is dissolved into an ammoniacal liquor of much benefit to the land. The alternate thaws and freezings expand and contract the ground into a crumbling condition, of great benefit in cultivating all stiff lands, as clay and meagre loams.

Frost may set in early, and, therefore, every means of defence for plants in frames, under glasses, and in warm borders, such as matting, littery straw, and fern, ought to be at hand. In this way late-sown radishes are preserved under straw, which, however, should be raked off in open sunny weather. All is contingent, and if the weather is open, there is every probability that it will be wet, and then to trample and work ground saturated with water is only to do mischief. During this month all operations must be done in dry weather, for otherwise the temperature of the land will sustain much injury.

The relish and the rarity of getting green vegetables, as radishes in mid-winter, is well worth the small expense and trouble, as the late autumn sowings are rendered with some small attention into an edible condition. Glass gardening may not engage the farmer, but a small portion of it will be agreeable and useful, and managed by otherwise unemployed hands.

Collect and prepare manures in the liquid form, and in a dry compost. Lay the former on lands for the early spring crops, and dig the latter into the ground, or spread it over the surface as a thick top-dressing, to rot and dissolve during winter. This mode of applying manures protects the lands from waste, and increases the temperature, preserves the winter-grown plants, and promotes an early spring vegetation; it therefore merits a large amount of attention.

FRUIT DEPARTMENT.

Look over any stores of fruit, and remove decaying apples and pears. A dry cool air and a covering of dry straw, are the best preservers. Pears should be kept in a warmer situation than apples.

In open weather, plant fruit trees and fruit-bearing shrubs of all kinds in the garden and in the orchard. The shrubs will be inserted on cultivated ground, dug, and well manured. Prune the roots of the sets within a short distance of the stem by shortening the loose fibres; and beneath the insertion in the ground, place a quantity of

guano mixed with earth in proportion of 1 to 4 or 5, raised in the edges, so that the incised roots are in immediate contact with the mixture. A very quick and strong growth of the plant will ensue to last for several years. The distance between the sets of shrubs varies according to the bulk of its growth from 2 to 5 feet, a medium being about 4 feet for the larger kinds.

Fruit trees must have a width of 20 feet between the rows, and of 15 feet between the trees in a line, each tree occupying a diameter of 18 feet. The land may be deeply trenched in the whole surface, or a pit may be dug and manured in an extent of 3 to 4 feet across, to hold the tree; but no lasting advantage has been gained by any preparation of the land, and only for a few years. Prune the roots of the young tree that is about 5 or 6 feet high, shortening the long fibres closely in a length; raise by the spade the sods of the surface in an extent and depth to hold the roots, and place the tree on a thin layer of mixed guano; replace the turfs on the soil over some short dung, and place a thick mulch of rough farm-yard dung around the tree 4 feet in diameter. Protect the tree from rodent animals by a wire guard 2 feet high, and if the tree is single in open grounds, place a three cornered fence of light posts and cross bars 5 or 6 feet high above the reach of grazing animals, and widening at the top by the posts leaning outwards, for the greater defence against damage from the height of animals. In this position the trees may grow unmolested.

FLOWER GARDEN.

If snow falls, shake it from the evergreens before the sun shines. Remove the litter of all kinds, and also from lawns and gravels. Protect the glasses of any pits or greenhouses by mats or screens, or rollers; give air, but little water. Straw mats, skilfully made, with bands and strong packthreads or cord, afford the best protection to frames and low pits.

During this month every labour is contingent on frost-bound soils, or lands drenched with rains; but much use may be made of the open intervals of weather in digging and manuring the land for future crops, and in planting the larger vegetable growths, so that no time is lost.

THE RAILWAYS AND COUNTRY CORN DEALERS.

—An action of importance to railway travellers was tried in the Court of Exchequer before Mr. Baron Martin. Mr. Buckmaster, a miller, living at Framlingham, Suffolk, a season-ticketholder on the Great Eastern Railway, went on the morning of the 6th of September, 1869, to the company's station at Framlingham, with the intention of coming to London by the train advertised to start at 6.45, in order that he might attend the London corn market. Owing to the negligence of the fireman, the fire in the engine was not sufficient to get up the steam, and consequently the train was unable to start. The plaintiff complained to the station-master, who brusquely told him that if he desired to go on he must pay for a special train. The plaintiff thereupon ordered a special train, for which he was charged £39 14s., but not arriving in London in time for the market, he sustained a further pecuniary loss of £10. He then brought an action to recover the amount he had paid for a special train, and the money he had lost by the loss of his market. Mr. Baron Martin, in summing up, said that no action would have lain against the company for any alteration of trains or any delay in the

starting or arrival of trains arising from accident or causes of a similar character, but in this case the delay arose from a clear neglect of duty, from the fireman not rising early enough to get up the steam. The company said they would use every exertion to insure punctuality, but had they done so in this case? No exertion was used at all. Then they said the departure and arrival of trains at the times stated would not be guaranteed nor would they hold themselves responsible for any delay or any consequence arising from it. People guilty of negligence always said, "Mind, I won't be responsible for it."

That was nonsense. It was like a man striking another on the head, and then telling him he would not be responsible for the consequences. The real question was whether there was gross negligence or an absence of reasonable exertions to ensure punctuality. With regard to damages, his lordship expressed the opinion that plaintiff was entitled to the £39 14s., and said it was astonishing that the company had not returned the money. He also saw no objection to the jury giving the £10 for loss of market. The jury almost immediately returned a verdict for the plaintiff—damages £49 14s.

FOREIGN AGRICULTURAL GOSSIP.

The cattle plague is stated to have broken out with some virulence in the districts bordering on the River Plate, and an equally virulent disease is reported to have set in among sheep in the same part of South America. A few details as to Ohio breeding farms may not be unacceptable. The breeding farms of Messrs. Delano and Crouse lie some six miles north of Chillicothe, and are situated upon that beautiful and romantic little stream, the Kinnikinick. Mr. Delano has only recently associated himself with Mr. Crouse in the breeding of thoroughbred stock, his attention having hitherto been almost entirely directed to trotters, of which he has a fine collection. Messrs. Delano and Crouse have spared no expense in collecting a stable of thoroughbred colts and fillies. New stables have been erected, in which the facilities afforded for proper ventilation are of high excellence; the stalls, loose boxes, &c., are also large and roomy. Eight miles south of Chillicothe lies the estate of Mr. D. R. Harness, a gentleman long associated with the American turf, who, after a brief retirement, may be said to have returned to his first love, and is now in possession of a fine little stud of thoroughbreds. Mr. Harness recently purchased in Kentucky a colt and filly by Asteroid, considered one of the best horses ever bred in the United States. Mr. Harness, however, although placing a high value on his Asteroid colts, considers a chesnut colt by Boven, out of a dam of Luxembourg, the best animal now in his possession. The question is being discussed in American circles whether rearing thoroughbreds pays. It would seem that it does; at any rate, in some instances. Thus the late Mr. R. A. Alexander purchased, in 1856, of Mr. J. L. Bradley the brood mare Bay Leaf for 1,000 dollars. Since Bay Leaf became Mr. Alexander's property she has had the following produce: 1858, a bay colt, Rubicon, by Lexington (sent to England); 1859, bay filly, Bay Flower, by Lexington; 1860, barren; 1861, bay colt, Beacon, by Lexington; 1862, barren; 1863, bay colt, Bayswater, by Lexington; 1864, bay colt, Baywood, by Lexington; 1865, bay colt, Bayonet, by Lexington; 1866, bay filly, Niagara, by Lexington; 1867, bay colt, Preakness, by Lexington; 1868, bay colt, Bingaman, by Asteroid; 1869, bay filly by Asteroid. Rubicon won a stallion stake at Lexington, Kentucky, worth about 3,000 dollars, and was sold for 3,000 dollars, to go to England. Bay Flower won many races, her winnings amounting to something like 3,000 dollars. Beacon was sold for 6,000 dollars. Bayswater won many races, the Paterson St. Leger among them, winning something like 5,000 dollars; and he was sold at five years old for 3,000 dollars. Baywood never ran, but Mr. Alexander refused 10,000 dollars for him when a two-year-old. Bayonet was sold as a yearling for 2,700 dollars, won many races, and was sold for 6,000 dollars. 12,000 dollars was afterwards refused for him. Niagara has won several races, and was sold as a yearling for 2,500 dollars. Preakness realised 2,000 dollars as a yearling, and won the Dinner Party Stake, worth 19,500 dollars. Bingaman realised 4,000 dollars as a yearling, and the bay filly foaled in 1869 sold as a yearling for 1,120 dollars. The 1,000 dollars invested by Mr. Alexander, in 1856, in the purchase of the fruitful Bay Leaf may thus be said to have yielded a good annual income ever since.—A Chicago firm has patented a "palace stock car" for use upon American railways. The car is roomy, and is so arranged that it will contain from sixteen to eighteen head of horned cattle or horses, and afford at the same time each animal a separate stall. The construction of the stall is such that it

can be adjusted to the size of the animal. As the car is longer than the ordinary cars used for stock purposes, it can be made large enough to permit an animal to lay down and rise up at his convenience. A feed-box is placed at the head of each animal, and into this box feed is conveyed by a spout connected with a feed-bin at the top of the car. By this arrangement stock are enabled to eat and enjoy their meals regularly while being carried over a great extent of country. Animals *in transitu* in the new cars can also be furnished with ample supplies of water, since under the feeding-trough, on opposite sides of each half of the car, is an iron cylinder or water-tank, about a foot in diameter, with openings in the centre of each stall. An iron tube passes under the car, and connects the two water-tanks; and by means of a reservoir at the end of the car, the tanks are supplied with water from the railroad tanks. It requires but a few minutes to water the stock by this arrangement; in fact, water is constantly before them. The car can be loaded in from eight to ten minutes, and when loaded one-half the cattle *in transitu* stand facing opposite sides of the car. It is calculated that by the new cars three days will be saved in the conveyance of stock between Chicago and New York, as it will no longer be necessary to make long stoppages to give the stock rest, feed, and water. Stock will also not lose weight on the journey, while labour will be economized in every train.

RULES FOR MILKING.

Five per cent., and perhaps ten, can be added to the amount of milk obtained from the cows of this country, if the following rules are inexorably followed:

1. Never hurry cows in driving to and from the pasture.
2. Milk as nearly at equal intervals as possible. Half-past five in the morning and six at night are good hours.
3. Be especially tender of the cow at milking times.
4. When seated, draw the milk as rapidly as possible, being certain always to get it all.
5. Never talk or think of anything beside what you are doing when milking.
6. Offer some caress and always a soothing word when you approach a cow and when you leave her. The better she loves you, the more free and complete will be her *abandon* as you sit at her side.

We append the not uncommon practice:

1. Let some boy turn the cows away and get him who is fond of throwing stones and switching the hind ones every chance he gets.
2. Milk early in the morning and late at night, dividing the day into two portions, one of fifteen hours and the other nine.
3. Whack the cow over the back with the stool, or speak sharply to her if she does not "so" or "hoist."
4. Milk slowly and carelessly, and stop at the first slacking of the fluid.
5. Talk and laugh, and perhaps squirt milk at companion milkers, when seated at the cow.
6. Keep the animal in a tremble all the time you are milking her, and when done give her a vigorous kick.—*American Paper.*

AGRICULTURAL REPORTS.

BEDFORDSHIRE.

We are glad to see an upward tendency in the price of wheat, and hope it may be maintained. This grain has been drilled this year, as last, in many cases before the rains came, very dry, but it seems to be coming very nicely. Wheat, we think, yields well this year in most parts, and will be quite an average. Barley is of bad quality generally, but appears to yield well, and makes up in quantity, especially considering the dry season. Beans and peas also appear to yield well, and the straw being harvested well makes it very valuable, hay and clover being so dear and scarce. The root crop is good generally, especially the mangold and kohlrabi. The swede turnip for the most part suffered very much from the fly, which made it light. We wonder that kohlrabi is not more widely sown, as they are invaluable to a farmer, yet in many of the midland counties they are scarcely known. All kinds of stock fatten fast on them, and are very fond of them. The potato crop is very good, great weights per acre being recorded in many parts. Linseed cake still maintains its price, although corn is so low in the inferior quality for feeding purposes. Meat is fetching high prices, and is very scarce, especially beef. All kinds of beasts came off grass so low in condition that they must necessarily take some time to get meat. Water is very scarce in many places, although we have had some nice rains; the springs appear to be so low from the lengthened drought of the summer months.—Nov. 23.

NORTH NORTHUMBERLAND.

We have made brief reports at various periods during the late almost unprecedented dry season. Since our last notes, taken eight weeks ago, we have experienced a continuance of very changeable weather; taking data since the second week in October, up to which period very little autumn tillage could be effected, both surface and subsoil being as hard as brick earth. On the 10th sleet and rain fell, with a stormy N.E. wind; Border Hills all under snow. A few dry, cold days intervened, and farm labour was vigorously pursued—potato lifting, wheat sowing, &c.—a good breadth being planted during the week under most favourable circumstances. The turnip crop (at least, all the late resown) is improving rapidly in growth of top. Swedes, as reported in our last, were too far gone with disease and vermin ever to improve, many a broad acre being barely worth the lifting. Where early sown, on fine land, a moderate average crop has been saved, but generally not in a sufficiently healthy state to store for spring feeding. The weather during the past five weeks has been winterly: rain, snow, gales of wind, hail, and on two occasions heavy peals of thunder, with some casualties by lightning. The present week quiet, with light foggy rain. Land in good condition for autumn deep ploughing, but the wet has not penetrated through the hard dry subsoil, and the surface sponges up with the traffic. The young turnips, which promised favourably a month ago, have received a check by the late severe frosts and gales. Pastures, which assumed a green surface after the first rain, afford a very scanty bite for sheep. Cattle on all exposed situations, if not under hovel shelter, will lose in health and condition. As a summary, we anticipate an expensive and hard-feeding winter for all flockmasters who care for the well-doing of out-door stock generally. The late corn crops have now been fairly tested, and the grain generally is sound, dry, and of full average quality. Barley, as the crop of the season, has been freely thrashed, and comes quite up to valuation in weight; on strong land the colour is a little dark for the maltster, and the market value varies much. Wheat good in quality but light of straw; rather under average quantity per acre. Oats good and fine, but a very small acreage return. Potatoes a fair crop, and quality sound. Our labour market is not over-supplied, and every willing, able-bodied man finds full employment. Barn and field female helps in request at fully fifty per cent. over the rates of twenty years ago. As referred to above, deep tillage extends gradually over

our district, and the "steam-horse" is in rather extensive request. Machinery is making progress in every department of agriculture; the sturdy fallman, the immense boards of immigrant reapers and scythemmen, and last, though not least, the able-bodied whistling ploughman, are all dying out, to be superseded by educated mechanics. Still, as belonging to the old school of the early days of this century, we can recollect greater acreage crops of cereals and roots than we have yet seen produced by the new system, with all the extra expensive artificial auxiliaries. Have the seasons become less favourable, or our soils more exhausted?—Kov. 25.

REVIEW OF THE CATTLE TRADE DURING THE PAST MONTH.

The cattle trade has been free from any important feature during the month. The tone, generally, has been steady, owing principally to the prevalence of cooler weather, and the quotations have been fairly maintained. The stoppage of French and German beasts at the waterside continues, and naturally decreases the arrivals at the Metropolitan Market. It may not be out of place here to suggest that now that it is determined to detain stock at the waterside, the regulation may be extended to the receipts from all foreign ports, in which case the authorities could hardly refuse to rescind the order, so far as the arrivals from our own grazing districts are concerned, compelling the compulsory slaughter, within the four mile radius of Charing Cross, of all stock once exhibited in the market, an order which in many cases proves very irksome to butchers. A decided improvement has taken place in the condition of the Scotch and English arrivals. At one time the best Scots and crosses were making as much as 6s. 2d., but at the present moment the top quotation does not exceed 5s. 10d. per 8lbs. The supply of food in the pastures has increased, and as the root crops have yielded well, there is still a moderate quantity of hay untouched.

As regards sheep the show has been about an average. Fine breeds have been in request at full prices, the best downs and half-breds selling at 6s. 2d. per 8lbs., but for other qualities the demand has been inactive.

Calves have been in limited request, and the pig market has been in a quiet state.

The total imports of foreign stock into London during the past month have been as under:

	Head.
Beasts	14,906
Sheep	43,838
Calves	2,177
Pigs	2,463

COMPARISON OF IMPORTS.

Nov.	Beasts.	Sheep	Calves.	Pigs.
1869	9,964	32,091	1,713	2,208
1868	9,391	18,162	598	353
1867	10,761	33,203	618	2,069
1866	13,278	38,389	1,290	1,187
1865	16,254	52,517	2,526	7,770
1864	17,137	34,792	2,970	3,947
1863	11,020	30,347	1,770	2,202
1862	6,839	28,577	1,659	633
1861	5,295	27,833	946	1,241
1860	6,961	22,723	1,604	828
1859	5,927	21,907	997	159
1858	4,786	18,258	1,174	156
1857	4,409	17,830	2,687	136
1856	6,102	16,380	1,152	309

The arrivals of beasts from our own grazing districts, as well as from Scotland and Ireland, thus compare with the three previous years:

From—	Nov., 1867.	Nov., 1868.	Nov., 1869.	Nov., 1870.
Lincolnshire, Leicestershire, and Northamptonshire	8,760	9,500	9,550	5,250
Other parts of England.....	2,640	1,950	2,048	1,450
Scotland	43	635	158	1,020
Ireland	1,350	708	2,312	620

The total supplies of stock exhibited and disposed of at the Metropolitan Cattle Market during the month, have been as under:

Beasts	15,570
Sheep	96,920
Calves	2,232
Pigs	1,670

COMPARISON OF SUPPLIES.

Nov.	Beasts.	Sheep	Calves.	Pigs.
1869	21,390	77,990	1,604	615
1868	19,249	98,390	1,048	1,404
1867	24,080	109,960	1,016	2,350

1858	24,856	114,643	1,437	2,970
1857	25,383	103,120	3,002	3,037
1856	25,454	105,750	2,096	3,415

Beasts have sold at from 3s. 4d. to 6s., sheep 3s. 4d. to 6s. 2d., calves 3s. 6d. to 5s. 10d., and pigs 4s. 4d. to 6s. 2d. per 8lbs. to sink the offal.

COMPARISON OF PRICES.

	Nov., 1866.	Nov., 1867.
	s. d. s. d.	s. d. s. d.
Beef from	3 6 to 5 4	3 2 to 5 2
Mutton	3 8 to 6 4	3 2 to 5 0
Veal	4 2 to 5 10	4 4 to 5 8
Pork	3 10 to 5 2	3 4 to 4 2
	Nov., 1868.	Nov., 1869.
	s. d. s. d.	s. d. s. d.
Beef from	3 0 to 5 4	3 4 to 5 10
Mutton	2 10 to 5 4	2 6 to 5 10
Veal	3 6 to 5 6	4 0 to 6 2
Pork	3 4 to 4 6	4 4 to 6 0

The dead meat markets have been fairly supplied. The trade has been rather quiet at 3s. 4d. to 5s. 4d. for beef, 3s. 8d. to 5s. 4d. for mutton, 4s. 8d. to 5s. 4d. for veal, and 3s. 4d. to 5s. 4d. per 8lbs. by the carcase for pork.

AGRICULTURAL INTELLIGENCE,
FAIRS, &c.

BARNET FAIR.—There was but a limited supply of horned stock, most of which was of inferior class; young store cattle made good prices. The horse fair comprised a miscellaneous class of animals; sound horses for heavy draught work sold at prices varying from 15 to 25 gs., and nags and ponies 8 to 16 gs. There was but a small lot of sheep on sale, and the trade was dull. Grass feed in abundance in this district, and the pasture lands are studded with outlying cattle.

BLAIRGOWRIE MARTINMAS CATTLE.—The number of good cattle exposed was small, and prices were high. Best fat bullocks £20 to £23, others £14 to £18. Best beef ranged from 10s. 6d. to 11s. per Dutch stone, second class 9s.; best mutton was also dear, and sold from 8d. to 9d. per lb., and good demand.

BOSTON FAT SHEEP MARKET.—Only a small supply; prices (with anything but a brisk trade) ranged from 7½d. to 8½d. per lb.

CROWLE FAIR.—There was a large number of beasts for this season of the year, and a fair amount of business was

transacted. The horses were of an inferior kind, and very few changed hands. Pigs sold rather in favour of the seller.

DOUNE SECOND TRYST.—There were one or two good lots of Highland heifers, a lot of capital stirks which fetched the high price of £11, and a few good Ayrshires. Otherwise the lots shown were of an inferior class—the residue of recent markets. The best lots of the West Highland stock were sold on Tuesday. The prices of these were reported to be quite equal to those current at the tryst at Doune in the beginning of the month. On Wednesday morning, however, the demand opened quiet, owing to the high prices which were sought, and as the day progressed the stiffness increased. Those who sold in the morning at the value then offered did best; those who waited, thinking that the demand would improve, found themselves deceived, because in the afternoon they were glad to accept less money than what they were offered at the beginning. In one instance a lot of two-year-old West Highlanders were sold at 12s. 6d. a head less after midday than could have been obtained at an earlier stage of the proceedings. Highland heifers sold best, there being a fair demand for those from Lancashire. Stirks were very stiff, as indeed were all the other classes of Highlanders. With the exception of a few lots, this class of cattle were back from 10s. to 25s. a head as compared with last Doune tryst, and a clearance could not be effected. For Ayrshire stock and crosses the demand was equally stiff, and a considerable number remained unsold at the close. Altogether the result would seem to indicate that store stock have for the present reached their maximum value, and lower prices may now be anticipated. The show of sheep was small, and consisted chiefly of blackfaced ewes. There was also a couple of lots of wethers and a few whitefaced tups. Generally the demand was slow, but the prices obtained were much about the same as those current at the first market. So little business was done however in this department that the rates obtained can hardly be accepted as a criterion for future quotations.

DURHAM FAIR.—Cattle principally, of which there was a large supply, but the demand was not in proportion. Two-year-old heifers and steers £9 to £10, cows £14 to £23.

FROME CHEESE FAIR.—The morning was fine, and there was a large attendance. There was an average supply of cheese. Prices, 56s. to 72s.; Cheddar, 69s. to 75s.; skim, 25s. to 30s.

GARSTANG NOVEMBER GREAT CATTLE FAIR.—There was a very good show of cattle, which was well looked after. Lean stock sold at good prices, and soon cleared at from £15 to £20 per head. Tuesday's horse fair was not quite so good as in former years but of a better class. Anything useful was soon bought up, especially good cart colts; 25 to 35 guineas for two-year-olds.

GLOUCESTER FORTNIGHTLY MARKET.—There was a shorter supply of stock than at the two preceding markets. Trade in the best quality of beef and mutton was as at last market, but secondary sorts were dull. Beef, best quality, made 8d. to 8½d.; mutton, 8d. to 9d. per lb. Bacon pigs were in short supply, and met a dull sale; prices 9s. 6d. to 10s., and porkers from 11s. to 11s. 6d. per score.

GUILDFORD FAIR being the last autumn fair of this county, a large attendance of farmers and others was attracted. There was a large exhibition of horned cattle. The threatening and warlike aspect of the Continent has had great influence on the cattle trade, and the breeders anticipate that the importation of foreign cattle to this country will be materially checked, and the value of home-bred stock greatly enhanced, and dealers stood out firmly for an advance value of from 12 to 20 per cent. There was a good show of sheep huddled up on the hill, and among which an active demand ruled. The horse show was moderate; best class animals found buyers, but inferior horses were sold at discount prices. The following were the average selling figures: Cattle—Store steers and stock heifers £8 to £11, beasts for the fattening stalls £13 to £15, dairy cows in full profit £16 to £22, cows and heifers to calve down £9 to £14, beasts in full condition £16 to £24, and rough stock £6 to £10; many droves were not sold. Sheep, young Southdown bred ewes 33s. to 42s, aged ditto 27s. to 30s., tegs and wethers 45s. to 55s., and lambs 18s. to 27s., Cotswold and cross-bred lambs 30s. to 36s., choice lots of lambs 40s. to 42s., and ram lambs 2 to 4 guineas each. Horses—Sound cart horses of good class 25 to 35 guineas, aged ditto 14 to 20 guineas, horses of superior stamp for light

harness work 30 to 45 guineas, nags and roadsters 20 to 30 guineas, horses of good blood and hunters 50 to 70 guineas, ponies 6 to 12 guineas.

LINCOLN FAT STOCK MARKET.—Good show of beasts and sheep, many buyers, and both a good sale, at little under last week's prices. Beef 10s. per stone, ewe mutton 7d. to 7½d., wether 9d. per lb.

LOUTH FAIR.—There was a large show of beasts, including fat and lean, the latter very lean, the former very good. Good fat beasts sold well at from 9s. to 10s. per stone. Fresh steers and in-calfers were good to sell, whilst drapes and inferior kinds made much less money. Heifers and cows with calves at their sides sold at from £16 10s. to £21; ewes sold at—say, 7½d., and wethers 8½d. per lb.

MALTON FAIR.—The late exceptional droughty season, and the demand for good-conditioned cattle, caused all superior animals to be readily taken, but there was a slow sale for others. The show consisted chiefly of Irish cattle, the prices of which ranged from £6 to £14 each. English beasts were not numerous, but those ready for feeding and likely to come out at Christmas were eagerly purchased, at £10 to £18 per head. Scarcely any sheep. The pig market was heavily stocked: fat ones (live weight) fell to 6s. per stone, and small ones had dull sale. Beef 8s. 9d. to 9s. 3d., pork 8s. to 8s. 3d. per stone; veal 8d., mutton 8d. to 8½d. per lb. The horse fair was a poor one, but there was a strong demand for animals fit for the military. Artillery and army horses were sought for, but one dealer with a commission for fifty only purchased one. Prices were £28 to £33 each.

MARLBOROUGH FAIR.—There were fewer sheep penned than since 1864, not more than 4,000 being on the Common. Prices were 4s. a head in advance of Devizes October Fair, and in most cases 1s. to 2s. above Appleshaw and Andover; whilst they were at least from 10s. to 12s. a head dearer than Marlborough August Fair. Mr. Fall exhibited a fine pen of ewes which made 50s., and a pen of 100 very superior lambs at 36s. per head. Mr. Giddings, of Manton, made 45s. of his lambs at home the day previous to the fair; these were resold by the purchaser in the fair at 47s. Mr. Godding, of Brimslade, made 40s. for 200 very matching lambs. Mr. Hillier, Granham, 35s., &c. There were very few ewes penned. Mr. Moore, of Littlecot, made 50s. a head for the cull of everything, the usual run of other lots being from 35s. to 40s.

MARTINSTOWN (DORCHESTER) FAIR.—Judging from the scant supply of both stock and sheep, there was an indication that the fair is declining in importance. But the short supplies are fully accounted for by the prevalence of the foot-and-mouth disease around Dorchester. The prices for every class of animals were maintained. The best beef—the supply of which was exceedingly short—realized fully from 14s. to 15s. per score, the quotations for in-calf heifers ranged from £8 to £12 each, good barreners fetched from £12 to £15, inferior ditto from £7 to £12. Horn ewes sold at from 40s. to 44s., lambs at from 15s. to 23s. For several lots of chilver lambs 22s. 6d. per head was given.

MELROSE FAIR.—Compared with late years, the exhibition of stock was fair, both as to number and quality. There was a great number of stirks sold at good prices, varying from £5 to £10 per head; and one milch cow was sold for £17. There was a considerable show of horses, mostly very old, and of inferior quality, which were sold and resold at various prices; but the few young horses shown were readily sold at very high prices, but of this class of stock there was not a good animal on the ground. There were also a few sheep sold at current prices.

MONMOUTH FAIR.—Stock plentiful. Good animals, beasts in particular, sold well. A large business was done; three-year-old steers' average price, from £15 to £15 10s. Mutton, from 7½d. to 8d. per lb.; fat pigs—porkers, from 10s. to 11s.; bacon, 10s. per score. Store pigs lower than usual.

NEWARK FAT STOCK MARKET.—We had a small market, but a brisk demand for all sorts, and late rates were fully maintained. Prime beef 10s., second quality 9s. to 9s. 6d. per stone; wether sheep 9d., ewes 8d. per lb.; pigs 8s. to 8s. 3d. per stone.

RIPON FAIR.—A tolerable show of cattle. Calving cows scarce and dear. Bullocks and heifers £1 per head dearer. Lean stock plentiful, but bad to sell.

RUCBY HORSE FAIR.—The supply was not equal to the demand, and consequently prices had an upward tendency.

First-class hunters made various prices ranging from £80 to £200; good hacks fetched from £40 to £70; while the rough and inferior classes were quickly bought up at their full value, by French and German agents. The prices ranged from £18 to £30. There was a very short supply of all kinds of cart and town horses, and consequently they realised good prices, making from £40 to £70. Colts sold at from £20 to £44, and yearlings from £15 to £30.

SLEAFORD FAT STOCK MARKET.—A first-class show of fat sheep, which met with a brisk trade. Small show of fat beasts, which were readily disposed of. Good show of pigs, which realised late prices. Mutton realised from 8d. to 9d. per lb., beef from 9s. 6d. to 10s. 6d., and pork 8s. to 8s. 6d. per stone.

TRURO FAIR was a very small one, and business was dull to begin with in all but fat cattle and fat sheep, but at the close the greater part changed hands at about former prices, viz., 65s. to 68s., store beef 35s. to 45s., and cows and calves 56s. to 63s. per cwt.; mutton 7½d. to 8d. per lb. In the horse fair business was more animated than usual, owing to some dealers present buying on French account, and several of the horses were sold at good prices.

WHITCHURCH FAIR.—There was an unusually large supply of horned stock, most of which were in tolerably good condition. These realised fair average prices. Lean stock fared badly, and few sales were effected. The pig market was filled with pigs of all descriptions; there was, however, a notable preponderance of small ones. These did not command very high prices; they were, in fact, cheaper, if anything, than at the October fair. Fat ones met a ready sale, at from 10s. 9d. to 11s. per score.

WORCESTER FAIR.—The supply of stock was comparatively small, but the demand being brisk, a good clearance was effected. A good deal of the best went off as usual by auction, one firm selling nearly £1,000 worth of fat stock. Beef fetched 7½d. to 8½d., and mutton 7d. to 8½d. per lb.; fat pigs 11s. per score.

YEOVIL FAIR.—Beef 13s. per score, average, and mutton 8½d. to 8½d. per lb. The supply of pigs was small compared with former fairs, and trade in them was not over brisk. The supply of store stock was large, and were in good demand, barreners selling from £10 to £14. The horse fair was not extensive. Cart horses realised from £25 to £40 each.

YORK FAIR.—There was an average number of lean cattle. Business was slow during the day, and sales were principally confined to the better classes of stock. English beasts £12 to £17, Irish £6 to £12 per head. No sheep. The bulk of the horses were of only moderate quality, as the war now raging between France and Germany has helped to thin our markets of good animals. The better descriptions of horses went at remunerating prices, few of them remaining on hand. All the coachers, roadsters, and ponies were sold; but the better classes of cart horses only attracted customers. Roadsters and coachers £25 to £32, cab horses £15 to £20, cart and agricultural animals £18 to £30.

LONDON CHEESE MARKET.—We have only dulness to report this week. The demand for Cheshire Cheese is very limited at present, and unless it be for very choice lumps, at moderate prices, buyers can scarcely be secured on reasonable terms. We have, however, to refer to the season of the year as one reason for the present state of trade. The supply of English Cheese is not excessive, and when trade revives it will probably all be wanted at some price; in the mean time some of it is getting out of condition. American Cheese of the finest and mildest character sell pretty readily at 72s. to 74s., but all other descriptions are neglected; a considerable quantity is out of order. The arrivals since our last statement are 25,773 boxes.—CORDEROY and Co., Mill-lane, Tooley-street.

CHESTER CHEESE FAIR.—There was rather more than an average pitch of Cheese, all was sold. The bulk of it was of middling quality, and the prices realised ranged from 55s. to 70s., and some exceptionally fine lots commanded 50s., and perhaps a few shillings more.

CHESTERFIELD CHEESE FAIR.—The market was not so well attended as in former years, prices ruling from 70s. to 85s. per cwt., or from 7d. to 9d. per lb.

GLOUCESTER FORTNIGHTLY CHEESE MARKET was moderately supplied, about 30 tons having been pitched.

There was a ready sale at 70s. to 72s. for best, and 65s. to 68s. for second qualities.

GLASGOW, (Wednesday last.)—An excessively heavy stock of Cheese, which caused sellers to accept lower terms. This, however, had the effect of inducing purchasers to do more business.

POULTRY, &c., MARKETS.—Turkeys, 5s. to 8s.; ditto hens, 3s. 6d. to 5s. 6d.; Geese, 4s. to 6s.; ditto Irish, 2s. 6d. to 5s. 6d.; Ducks, 1s. 3d. to 2s. 6d.; Wild Ducks, 2s. to 2s. 6d.; Surrey Fowls, 3s. to 6s.; Sussex ditto, 2s. to 3s.; Boston and Essex, 1s. 9d. to 2s. 6d.; Irish, 1s. to 2s.; Rabbits, tame 1s. to 2s. 6d.; ditto wild, 6d. to 10d.; Pigeons, 6d. to 9d.; Pheasants, 2s. to 2s. 9d.; Partridges, 1s. 3d. to 2s.; Hares, 2s. to 3s. 3d.; white Scotch, 1s. to 1s. 9d.; Widgeon, 1s. to 1s. 3d.; Teal, 6d. to 1s.; Woodcocks, 2s. to 3s.; Snipes, 6d. to 1s.; Gold Plover, 10d.; Black ditto, 6d.; Larks, 1s. 3d. per dozen. Eggs, best 13s., seconds 10s. per 120.

HOP MARKET.

BOROUGH, MONDAY, Nov. 28.—A healthy demand still continues for all fine and choice Hops, and the low price at which medium and low are offered attracts the attention of buyers. Fine Bavarian and Belgian samples are still in request; low and medium of that class command little attention. Imports up to the present date amount to 10,612. A better inquiry prevails for 1868 and yearling Americans, which has resulted in some important sales. Latest advices from New York report trade as dull, with a great scarcity of choice hops.

Mid and East Kents	£1 15	£3 10	£7 0
Weald of Kent.....	1 15	3 0	3 15
Sussex	1 10	2 6	3 10
Farnham and Country ...	3 15	4 15	6 6
Olds	1 0	1 15	2 10

CANTERBURY HOP MARKET, (Saturday last.)—The trade has been quiet this week for all but the best sorts, which sell readily at former prices. East Kent's £3 to £7, Mid do. £3 10s. to £6, Wealds £2 10s. to £3 10s., Sussex £2 5s. to £3 10s., 1868 £1 to £2, 1869 £2 to £2 10s.

WOCESTER HOP MARKET, (Saturday last.)—Our market to-day is without any notable alteration in supply or demand, and prices are unaltered, the trade doing being entirely of a retail character; 40 pockets passed the scale to-day, and 24 previously in the week, making the total up to this evening 23,270 pockets. —

POTATO MARKETS.

SOUTHWARK WATERSIDE.

LONDON, MONDAY, Nov. 28.—During the past week the arrivals coastwise have been moderate, but a better supply by rail and road. Trade good for all best sorts at the following quotations:

Yorkshire Regents	70s. to 80s.
Lincolnshire do.	65s. to 75s.
Dunbar and East Lothian do.	75s. to 80s.
Perth, Forfar, and Fife do.	65s. to 75s.
Kent and Essex do.	55s. to 65s.
Do. do. do. Rocks	55s. to 60s.

BOROUGH AND SPITALFIELDS.

LONDON, MONDAY, Nov. 28.—These markets have been but moderately supplied with potatoes. The trade has been rather quiet, at our quotations. The import into London last week was confined to 30 packages from Amsterdam, and 8 from Rotterdam.

English Regents	60s. to 80s. per ton.
Scotch Regents	55s. to 80s. "
Rocks	45s. to 55s. "

COUNTRY POTATO MARKETS, (Saturday last.)—DONCASTER: Only a moderate supply of potatoes on offer, and

last Saturday's prices are fully maintained. Regents 8s. 6d. to 9s. 6d., rocks 7s. to 8s. per load.—MALTON: The prices for potatoes wholesale were flatter; business was done at 56s. per ton, rounds. Quotations: 55s. to 60s. per ton. Pig potatoes dear and scarce; wholesale buyers 40s. to 45s. per ton. Retail, table sorts 6d. to 8d. per stone. MANCHESTER: Potatoes, Yorkshire, 9s. 6d. to 10s. 6d., Scotch 7s. to 9s., Cheshire 6s. 6d. to 8s. 6d. per 252lbs.—YORK: The quantity of potatoes offering was only very moderate, and as there were more buyers for them than of late, the wholesale price rose to 7s. and 8s. per tub of 280lbs. In retail they were from 5d. to 6d. per stone of 14lb.

ENGLISH WOOL MARKETS.

CITY, MONDAY, Nov. 28.—The tone of the wool market is steady, but the transactions in English wool continue to be on a moderate scale. The demand is chiefly for good wether and half-bred wools, for which prices are well sustained, they being very scarce. Noils and brokes are in demand for the manufacture of army materials.

CURRENT PRICES OF ENGLISH WOOL.	s. d.	s. d.

BRADFORD WOOL MARKET, (Thursday last.)—The tone of the market is still quiet; but there is a healthy firmness that betokens no great alarm on the part of either buyers or sellers. The chances of peace being preserved are regarded as rather increased since last market day, and consequently there is rather less depression. There is still a certain consumptive demand for fashionable sorts of wool, although buyers are reluctant to commit themselves beyond the needs of their machinery. Wethers are still in favour, and bring fully late prices. The tone of prices at the colonial sales, and the great firmness still shown by farmers and country holders, make any serious giving way here almost impossible, and staplers hold by their stocks with confidence.—Bradford Observer.

LEEDS (ENGLISH AND FOREIGN) WOOL MARKET Friday.—There has been a diminished demand for English wool during the week, partly owing to the public sales in Scotland and partly to the untimely and outrageous proceedings of Russia endangering the peace of England and other nations not at present engaged in war. The sales in Scotland indicate a moderate range of prices, which no doubt suffered from the above cause. Considerable loss must have been experienced by the holders of wool from last clip. There seems to be a rather spirited demand for some sorts at the London sales for Colonial wool, though it is not participated in to any extent in this district. Prices are moderate, and are kept up by the withdrawal occasionally by importers, who seem to have confidence that better prices may be got next year.

THE TAUNTON FAT STOCK SHOW.—The annual show in connection with the Taunton Agricultural Association took place on Nov. 18. Some of the stock, notably the Devons and Shorthorns, were very fine specimens of their class. Mr. W. Farthing, of Stowey Court, Bridgwater, carried all before him with his Devons, taking no less than five first prizes. The other successful exhibitors of Devons were Mr. J. A. Smith, Bradford Peverell; Mr. T. H. Risdon, Washford; and Mr. R. Farthing, Farrington, North Petherton. Of Shorthorns the principal exhibitors was Mr. J. S. Bult, of Dodhill, who carried off the cup offered by Mr. H. James, M.P., with a beast of the Prince Frederick blood; Mr. O. Hoosegood, of Dillington, taking a prize with a cow of the same breed. Mr. J. W. Paul, Knott Oak, Ilminster, took first honours for the best bull of any breed. Horses were a very poor show, and the chief prizes were awarded to Mr. J. Dunning, Creech, and

Mr. R. Farthing, Farrington. Some of the sheep were unusually good, the principal prize-takers being Messrs. Bond and K. and H. Farthing. Pigs were also well represented: Mr. Taylor, Pool Farm, Taunton, and Mr. W. H. Hewett carrying off the leading prizes. The judges were—Messrs. J. Tyacke, Merthen, Penrlyn; Mr. J. Wippell, Barton Alplington, Exeter; and Mr. T. Bond, Perry Elm, Wellington. The annual dinner took place in the afternoon, Lord Bridport being elected president for the ensuing year.

IMPORTANT TO CATTLE AUCTIONEERS.—A case involving an interesting and important point was decided by the Sheriff at Nairn. An action was raised by Hamilton and Sons, cattle auctioneers, Inverness, against Mr. J. Simpson, for £7 17s. 6d., being the price of a cow sold and delivered by the complainers to defender in May last. Defender averred that the cow was sold when diseased and in an unsound state, and accordingly refused payment of the price. The defender's agent, at the first hearing, raised the preliminary objection that the pursuers had no title to sue; that the cow was not their property, but belonged to the man who put it into the pursuers' sale, and that he was the only party entitled to prosecute. The pursuers' agent replied as salesmen they were bound for the price of all bestial sold at their mart; that they had already paid the owner the price of the cow; and that they had no one to look to for the price but the defender. The Sheriff, after hearing proof, held the objection as good, dismissed the case with 10s. expenses to the defender, and stated in his opinion the proof showed that the pursuers were not the owners of the cow, and had therefore no title to sue, that it should have been the real owner who should have prosecuted.

SHORTHORN SALES AND LETTINGS.

BY PRIVATE CONTRACT.

W. Ashburner's Jessie Catherine sold to J. Crowdsen, and

Baron Blanche to J. Patterson. Capt. Aveling's Moreen, Cashmere, Honeysuckle's red b.c., and Dora's red c.c., sold to Capt. Barker; Young Oxford to Capt. Catling. C. Barnett's Blanche 6th sold to W. Ashburner; Phryne, Peplum, and Pride to T. H. Colman; and Albion to J. Beattie. T. C. Booth's King Richard (26523) let to W. Bolton. J. B. Booth's Banner Bearer sold to Sir W. S. Maxwell, Bart. Lord Braybrooke's Heydon Duke sold to Lord Feversham. J. Brown's Ursula 10th, Duchess of Rutland, Guelder Rose 2nd, Florentia 23rd, Guelder Rose 6th, Ursula 33rd, and Earl of Collingham, sold to J. P. Clark; Fairy Queen, Ursula 32nd, Beautiful Star, Marquis of Thorndale, and Earl of Thorndale to J. Turner; and Second Earl of Collingham to Mr. Thompson. Duke of Buccleuch's Passion Flower's roan b.c. sold to R. Bruce. T. Cloudsdale's Nancy 7th and Jessie Caroline sold to W. Ashburner. Duke of Devonshire's Duarobin sold to W. H. Wakefield. G. Drewry's roan b.c., by Eighteenth Duke of Oxford (25995), out of Elvira 6th, sold to T. Gibbons. J. W. Larking's Duke of Kirklevington let to R. P. Davies. F. Lenev's Grand Duke of Geneva sold to Sir C. M. Lampson, Bart., and J. W. Larking. D. McIntosh's Grand Duke of Havering sold to T. Brassey. A. Metcalfe's Grace sold to D. Webster, and Lady Cradock to W. Longstaff. T. Morris's Airdrie's Duke sold to J. V. Hornyold and R. Guilding. T. E. Pawlett's Rose of Hope's b.c. sold to J. C. Topping. Lady Pigot's Lord of Branches and La Belle Helene sold, and Sidus let, to W. I. N. Angerstein, and Victorious let to Capt. Barclay. J. Richardson's Wild Eyes 27th sold to W. Ashburner. T. Stamper's Cornelian and her heifer calf sold to T. Brown, and Charm and her twin heifer calf to J. R. Singleton. J. Thom's Amelia d'Eden, Maggie d'Eden, and Elsie d'Eden sold to T. Atherton. W. Torr's Warranter sold to H. F. Smith, and Bracelet to E. W. Meade Waldo. Col. Towneley's Royal Butterfly 24th sold to M. Whittington, and Towneley Oxford to Messrs. Hosken and Son. T. Willis's Sea Gull and Venus sold to M. Ford. Earl of Zetland's Musician sold to M. Yeoman.—*Thornton's Circular.*

REVIEW OF THE CORN TRADE DURING THE PAST MONTH.

The four weeks' business—which includes the last Monday in October, and excludes the 28th November—is the subject of the present review. The long-delayed rains had fallen plentifully, and with them came a mild growing temperature which some hoped might last to help them through the winter with their stock; but all this presently gave way to snow and tolerably sharp and frequent frosts, which soon cut off such hopes; and though with a return of rain it has once more become milder, it is not likely, at so late a period, that vegetation will again effectively revive. A fair amount of wheat, we hear, has been sown, and the early plants generally look well—and, maybe, the better for a timely check; but those who were late in sowing will have more difficulties to contend with. What has been done was mostly well done, and there we leave it, with the best hopes of a good gathering, and a remunerative price. It is a pity that the prosperity of British agriculturists should be so often identified with the existence of war, but this has been the case for some time past. This mighty evil has, indeed, been raging for some time close in our vicinity, and British sympathies have done much for the wounded of both nations, little dreaming that the curse might come upon themselves. But a cloud in the East, or rather the Black Sea, very portentous to England and to Europe, has suddenly risen, which, if not dissipated by peaceful diplomacy, may scatter ruin as widely as it is now seen in France. Till Russia avowed her intention to evade the treaty of 1856, the wheat trade, after some

fluctuations, seemed sinking into calm, from the overburdened state of the London granaries; but a change then came over the trade establishing an advance of 2s. to 3s.; and all depends on subsequent events whether this rise is to reach a higher importance, or whether we are to be left only to the effects of the waste already wrought in France. Against any material decline it is to be noted our English supplies have lessened in London, and the weekly sales have, in the course of the month, also fallen off 15,000 qrs., while our averages for the last five years have been 5s. above those at present noted; and, be it remembered, in the last Russian war we rose to 80s. 10d. Such rates, if war should come, we hope will not be reached, for they would oppress the poor; but farmers with bad crops of spring-corn certainly want better than present prices for wheat. Even with our recent advance, we are yet behind other countries. Low-quality wheat at Danzig has brought 60s., c. f. i., for Belgium. Hambro' is also higher. At New York they have advanced 5s. per qr. The scanty information now received in consequence of the war yet leaves these as the most recent prices at the several places named: Red wheat at Hambro' 54s. to 57s., f. o. b.; at Copenhagen, 55s. to 56s., c. f. i.; at Antwerp, 50s. to 63s., f. o. b.; at Rotterdam, white new Zealand 51s. to 58s., f. o. b., fine foreign red being worth 3s. to 4s. more. Saxonska wheat at Petersburg 45s. 6d., f. o. b. The best high-mixed at Danzig 67s., cost, freight, and insurance, included; inferior wheat at Alexandria 43s. 9d., f. o. b. Ghirka wheat has been selling off th

coast from 46s. to 50s.; at San Francisco 39s. per 500 lbs., f. o. b.; and the last telegram from New York quotes 49s. 6d., c. f. i., for old No. 2 Milwaukee, per 480lbs.

We open the present month with Monday, the 31st Oct. The London market then received moderate supplies of English wheat, and good arrivals of foreign. The weather for the previous week having been very rainy the condition of the Essex and Kentish wheat, then only showing moderately, was very much deteriorated, and town millers were averse to buy even at relatively less values, and the few fine dry lots on offer scarcely maintained their former value. There was, however, a good demand for American and Russian sorts for the purpose of mixing, at the full prices of the previous Monday. Floating cargoes were unaltered. The condition of the samples exhibited at the several country markets this week also continuing very bad, universal dullness was the rule. Some, to make way in sales, accepted a reduction of 1s. per qr. Among these were Brigg, Gainsborough, Gloucester, Leeds, Louth, Lynn, and Stockton; while several quoted a decline of 1s. to 2s. per qr., as Birmingham, Bristol, Market Rasen, and Melton Mowbray. Liverpool was 4d. per cental cheaper on Tuesday, and 1d. more on Friday. Glasgow reported a decline of 6d. per boll; but Leith was firm. The scarcity of native wheat at Dublin gave a firmness to Irish samples, but foreign was dull. The prices quoted at Cork were Ss. 6d. to 11s. 7d. per cwt.

On Monday, the 7th Nov., the English supply was lessened, and the foreign further increased. Though but a moderate show of fresh samples was exhibited on the Essex and Kentish stands, and the condition was somewhat improved, the best samples scarcely maintained their value, while inferior were decidedly 1s. per qr. lower. The foreign trade was much reduced by the unwelcome fact that the proposed armistice between Prussia and France was rejected, and prices were barely supported. The values of floating cargoes was, however, maintained. The country trade this week was again heavy and generally weaker, though with a large demand for Belgium on the East Coast. Some farmers would make no reduction, preferring to withdraw their samples; yet Bristol, Gloucester, Gainsborough, Ipswich, Newcastle, and some others, were 1s. down; and Market Rasen, with a few more places, noted a decline of 1s. to 2s. Liverpool, though dull on Tuesday, became firm on Friday. The trade at Glasgow was limited, at unaltered rates; but Edinburgh was rather in favour of buyers. Dublin was again firm for home and foreign produce.

On the third Monday there were but small supplies of English Wheat, and the foreign arrivals were much reduced. The show of fresh samples from the near counties during the morning was limited, and the condition much improved; nevertheless, business was very limited, though rates were without change. In foreign, also, there was but little doing; but holders were very careless about selling. With small arrivals off the coast, values were much as previously noted. Rumours unfavourable to the designs of Russia had on Monday been circulating on the London market, but nothing then took a decided form. As the week progressed, however, it was ascertained that the Northern Power designed partially to violate the Treaty of Paris, signed in 1856, neutralizing the Black Sea, against which our Foreign Secretary having protested, rumours of war became widely spread, and the latest markets noted a rise of 2s. to 3s. per qr. on the previous week's quotations; this was the case at Birmingham, Bristol, Wakefield, these rates being confirmed on the London market of Friday. Liverpool also advanced 2d. per cental on Tuesday, and 6d. more on Friday, making a rise of 8d. for

the week, equal to 3s. 4d. per qr.; and several of Saturday's markets were up 3s. to 4s. per qr. Glasgow's Wednesday's market was only up to 6d. per boll; but Dublin on Friday noted a rise 1s. per barrel on Irish samples, and 1s. to 2s. per barrel on fine foreign.

On the fourth Monday the supplies of home-growth were small, and there was only one cargo of foreign from Petersburg. The number of samples fresh from Essex and Kent was limited, and the condition not so good as in the previous week. Yet the rumours of a possible breach with Russia kept up the values of Friday, which were 2s. to 3s. higher than on the previous Monday, though there was less activity in the demand. The foreign trade was improved to an equal extent, but as buyers had pretty well stocked themselves on the previous market, and there were yet some hopes of peace, the business transacted was small. Floating cargoes were quite as much dearer.

The arrivals for four weeks into the port of London have been 23,701 qrs. English wheat and 68,474 qrs. foreign, against 22,048 qrs. English and 144,094 qrs. foreign for the same time last year. The imports into the kingdom for four weeks ending 12th of Nov. were 2,794,172 cwt. wheat and 357,308 cwt. flour, against 4,586,279 cwt. wheat and 626,143 cwt. flour for the same period in 1869. The general averages commenced at 47s. 3d., and closed at 50s. 5d.; those of London beginning at 51s. 9d., and ending at 52s. 7d. The exports from London in four weeks, were 11,381 qrs. wheat and 155 cwt. flour.

The flour trade, well supplied through the month, both in country and foreign qualities, for the most part ruled dull till the fourth Monday, when Norfolks rose 1s. to 2s., and barrels fully 1s. dearer, being worth 27s., while telegrams from New York on that day quoted 26s. 6d. c. f. and i., and no doubt since the increase of warlike rumours there will be a further rise. As to Paris, all we learn is, that the stock there will hold out for several months, some say till April, and that prices are forcibly kept down by the Provisional Government. The imports into London for four weeks were 85,324 sacks English and 6,894 sacks 34,136 barrels foreign, against 94,008 sacks English and 11,161 sacks 25,416 barrels foreign at the same time last year.

The arrival of maize having been moderate, and the demand steady, prices have advanced 2s. during the four weeks, the advance having occurred on the first and last Mondays at the rate of 1s. each market. As the supplies of oats are now likely to fall off from the closing of the Baltic, and fodder in the country is very scarce, we expect this grain will be dearer through the winter. The imports in four weeks were 21,536 qrs., against 48,596 qrs. for the same period in 1869. Though the United States have a large crop this year none of it can be available before the opening of the canals next May, and quotations now c. f. and i. are 36s. 6d. per qr., while here it is barely worth 32s. in granary.

Though the barley supply of home-growth has not materially exceeded that of last month, the malting trade has been exceedingly heavy, and none but the best samples bring full prices. As we descend, however, in quality, and come into competition with maize and oats, the value relatively increases, and grinding sorts readily have brought 27s. to 28s. per qr., and a large business has been done in floating cargoes. The imports into London for four weeks were 19,360 qrs. British and 27,209 qrs. foreign, against 14,366 qrs. British and 26,633 qrs. foreign for the same time in 1869.

The malt trade has ruled dull for the month, and prices have receded fully 1s., there being yet a large stock of old on hand, and brewers pretty full.

Though the supplies of English oats have been small, and those from Scotland and Ireland trifling, yet foreign arrivals have been free. On the first market there was a decline of 6d., and in the last a rise of 1s., leaving the gain in prices about 6d. to 1s. for the month; and as much more cannot now be expected from the Baltic, rates may yet improve, and the more so if any war should break out with Russia; 38lbs. Russians are worth fully 21s. 6d. per qr.; 40lbs., 23s., and others proportionately. There is, however, a heavy stock in the London granaries. The imports for four weeks were 2,696 qrs. English, 13 qrs. Scotch, 1,200 qrs. Irish, and 259,663 qrs. foreign, against 3,546 qrs. English, 860 qrs. Irish, and 206,167 qrs. foreign last year.

The trade in beans has been slow, with little change of value, excepting on the last Monday, when they rose fully 1s. per qr. With a poor English crop, and but scant expectations from Egypt, we seem likely to be yet dearer. Imports into London for four weeks were 3,056 qrs. English and 5,744 qrs. foreign, against 3,909 qrs. English and 8,888 qrs. foreign in 1869.

The market for peas, with much smaller supplies, has only improved lately to the same extent as beans, viz., 1s. per qr.; but if the navy should contract largely for boilers, there must be a good rise. They are now worth 38s. to 40s., while duns are worth 38s. to 39s., and maples 46s. The imports for four weeks into London were 1,693 qrs. English and 1,453 qrs. foreign, against 3,407 qrs. English, and 7,622 qrs. foreign last year.

The last Manday having brought a large arrival of linseed from India, prices gave way 1s. per qr., but no further decline was expected, and cakes were firm. The month's imports were 72,291 qrs., against 24,274 qrs. qrs. in 1869.

Though not much has been passing in cloverseed, or other agricultural seeds, the tendency of prices has been gradually upwards. America may, however, yet send some quantity of red cloverseed.

END OF VOLUME LXVIII.

DEATH OF MR. G. P. TUXFORD.

We regret to have to record the death of Mr. G. P. Tuxford, of the Strand, a gentleman well known in the agricultural world as one of the chief proprietors of the *Mark Lane Express* and the *Farmers' Magazine*. Mr. Tuxford was also one of the originators of the Farmers' Insurance Office, of which he had been for many years a director; one of the early members of the Farmers' Club, and a life governor of the Royal Agricultural Society of England. He was a man of much ability, sound judgment, and great integrity, and was consequently frequently called upon to act as arbitrator in disputed matters of business. He died on Monday, October 24, in the sixty-first year of his age.—*The Illustrated London News*, October 29.

Neither his long residence in London nor the busy occupations of an eminently successful career obliterated his attachment to his native town (Boston) or rendered him indifferent to its prosperity. To the last he took a lively interest in its welfare, and his purse was frequently opened in support of worthy objects.—*The Stamford Mercury*, October 28.

We feel inclined to let such testimony as this, and as borrowed from others, speak for itself. Into the sacred privacy of home we dare not intrude, nor more than glance here at George Tuxford's worth as a son, a husband, a father, or a brother, in which relations he was, so far as human nature can be, almost without reproach. In his more public life, as already intimated, he was ever careful, even jealously so, in the discharge of his duties—a steady friend, a considerate employer, with a fancy to see old faces about him, but still

ready to give the beginner an encouraging word and a helping hand. "Without your kind advice and solid aid," as the late Mr. H. H. Dixon (*The Druid*) wrote on the dedication of his last work, "I should never have faced all the weariness and anxiety of an author's life," and there are others who could speak still more strongly to such aid and advice. As identified more especially with the proprietorship of this Journal we may quote again from a contemporary, *The Gardeners' Chronicle*, which in an agricultural leader of a few months since said, "Everybody knows the perfect independence and straightforwardness of *The Mark Lane Express*. We say so with the most cordial admiration of it," and we venture to borrow these words as an act of justice to the dead. It was Mr. Tuxford's great pride that such a character for the Paper should be maintained without fear or favour, as, it is hoped, it still may be. He died at his house at Barnes after a sudden attack of only two days' duration, although he had never thoroughly recovered from a fall which he met with about twelve months since.

It will be noticed that we have preferred, in some degree at least, to let others speak to the worth of our departed friend rather than to suffer our own sympathies to colour the sketch. From an intimate knowledge of him for six-and-twenty years we could more than confirm all they have said, as we can only the more keenly lament his loss.

The funeral took place at Kirkby-on-the-Bain, near Horncastle, in Lincolnshire, where the late Mr. Tuxford's father and mother are buried.—*The Mark Lane Express*, October 31.

FARMERS' AND GRAZIERS' NEWSPAPER,

PUBLISHED EVERY MONDAY EVENING IN TIME FOR POST.

ROGERSON & TUXFORD, 265, STRAND, LONDON.

May be had of all Booksellers and Newsmen throughout the Kingdom, price Sevenpence, or £1 10s. 4d. per annum

DR. J. COLLIS BROWNE'S CHLORODYNE.

THE ORIGINAL AND ONLY GENUINE.

CHLORODYNE is admitted by the Profession to be the most wonderful and valuable remedy ever discovered.
CHLORODYNE is the best remedy known for Coughs, Consumption, Bronchitis, Asthma.
CHLORODYNE effectually checks and arrests those too often fatal diseases—Diphtheria, Fever, Croup, Ague.
CHLORODYNE acts like a charm in Diarrhoea, and is the only specific in Cholera and Dysentery.
CHLORODYNE effectually cuts short all attacks of Epilepsy, Hysteria, Palpitation and Spasms.
CHLORODYNE is the only palliative in Neuralgia, Rheumatism, Gout, Cancer, Toothache, Meningitis, &c.

From LORD FRANCIS CONYNTHAM, Mount Charles, Donegal, 11th December, 1868.

"Lord Francis Conyntham, who this time last year bought some of Dr. J. Collis Browne's Chlorodyne from Mr. Davenport, and has found it a most wonderful medicine, would be glad to have half-a-dozen bottles sent at once to the above address."

Earl Russell communicated to the College of Physicians that he received a dispatch from Her Majesty's Consul at Manilla to the effect that Cholera has been raging fearfully, and that the ONLY remedy of any service was CHLORODYNE."

—See *Lancet*, 1st December, 1864.

CAUTION.—BEWARE OF PIRACY and IMITATIONS.

CAUTION.—Vice-Chancellor Sir W. PAGE WOOD stated that Dr. J. COLLIS BROWNE was, undoubtedly, the Inventor of CHLORODYNE; that the story of the Defendant, FREEMAN, was deliberately untrue, which, he regretted to say, had been sworn to.—See *Tin.cs*, 13th July, 1864.

Sold in Bottles at 1s. 1½., 2s. 9d., 4s. 6d., and 11s. each. None is genuine without the words, "Dr. J. COLLIS BROWNE'S CHLORODYNE" on the Government Stamp. Overwhelming Medical Testimony accompanies each bottle.

SOLE MANUFACTURER:—J. T. DAVENPORT, 33, Great Russell Street, Bloomsbury, London.

POPULAR MEDICAL WORKS,

PUBLISHED BY MANN, 39, CORNHILL, LONDON.

Post Free, 12 Stamps; Sealed Ends, 16 Stamps.

DR. CURTIS'S MEDICAL GUIDE TO MARRIAGE: A PRACTICAL TREATISE ON ITS PHYSICAL AND PERSONAL OBLIGATIONS. With instructions to the Married and Unmarried of both Sexes, for removing the special disqualifications and impediments which destroy the happiness of wedded life, founded on the result of a successful practice of 30 years.—By DR. J. L. CURTIS, M.D., 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

And, by the same Author, for 12 stamps; sealed ends, 20.

MANHOOD: A MEDICAL ESSAY on the Causes and Cure of PREMATURE DECLINE IN MAN; the Treatment of Nervous Debility, Spermatorrhœa, Impotence, and those peculiar infirmities which result from youthful abuses, adult excesses, tropical climates, and other causes; with Instructions for the Cure of Infection without Mercury, and its Prevention by the Author's Prescription (his infallible Lotion).

REVIEWS OF THE WORK.

"Manhood.—This is truly a valuable work, and should be in the hands of young and old."—*Sunday Times*, 23rd March, 1858.

"The book under review is one calculated to warn and instruct the erring, without imparting one idea that can vitiate the mind not already tutored by the vices of which it treats."—*Naval and Military Gazette*, 1st February, 1856.

"We feel no hesitation in saying that there is no member of society by whom the book will not be found useful, whether such person hold the relation of a PARENT, PRECEPTOR, or CLERGYMAN."—*Sun*, Evening Paper.

Manhood.—"Dr. Curtis has conferred a great boon by publishing this little work, in which is described the source of those diseases which produce decline in youth, or more frequently premature old age."—*Daily Telegraph*, March 27, 1856.

Consultations daily, from 10 to 3 and 6 to 8. 15, ALBEMARLE STREET, PICCADILLY, LONDON, W.

HARDING'S FLEXIBLE ROOFING.

REDUCED TO ONE PENNY PER SQUARE FOOT.

The BEST and CHEAPEST COVERING for HOUSES, SHEDS, FARM and other BUILDINGS, &c.

Suitable for all Climates, and adopted by the English and Foreign Governments, Railway Companies, Metropolitan Board of Works, &c. Awarded the Silver Medal, Amsterdam Exhibition, 1869, for its Cheapness and Superiority to Felt, although the price was then 50 per cent. higher than at present, and is proved to be a much more Durable, Efficient, and Weather-tight Roofing than Corrugated Iron, at One-third the cost, and can be most easily fixed by any unpractised person. Please send for samples of present make.

PRICE ONE PENNY per Square Foot, or 23s. per Roll of 25 yards by 4 1/2 inches wide.
DRESSING, 2s. 6d. per gal.; ZINC NAILS, 5d. per lb.
SAMPLES AND TRADE TERMS FREE.

HARDING'S COMPOUND GLYCERINE DIP.

CONTAINS NO POISON, AND IS DESTRUCTIVE TO INSECT LIFE ONLY.

It is a certain cure for Scab in Sheep, who thrive and increase in weight after the use of this Dip. It also preserves the skin of all animals belonging to the homestead. It increases the growth of the wool, and cleanses it of all offensive accumulations which always cause functional derangement, it being a well known fact that acrid and corrupt humours allowed to remain on the surface are the cause of a great many diseases which afflict animal life. This preparation is most easily applied, perfectly harmless in use, and most deadly to Ticks, Lice, Maggots, and a sure cure for Foot Rot. It also prevents the Fly striking; avoiding the Animal being troubled with Maggots, and heals all Sores, &c.

old in Tins of 5lbs. and 10lbs., at 6d. per lb.; and in Drums of 25lbs., 50lbs. and upwards, at 5d. per lb.; by all Chemists, Seedsmen, Ironmongers, and others throughout the Kingdom.

A 5lb. TIN IS SUFFICIENT FOR TWENTY-FIVE SHEEP.

Dipping Apparatus necessary, common Tubs being all required. (See the simple Directions for Use on each Tin.)

THE LONDON AND COUNTY BANK opens—

DRAWING ACCOUNTS with Commercial Houses and Private Individuals, either upon the plan usually adopted by Bankers, or by charging a small Commission to those persons to whom it may not be convenient to sustain an agreed permanent Balance.

DEPOSIT ACCOUNTS.—Deposit Receipts are issued for sums of Money placed upon these Accounts, and Interest is allowed for such periods and at such rates as may be agreed upon, reference being had to the state of the Money Market.

CIRCULAR NOTES AND LETTERS OF CREDIT are issued, payable in the principal Cities and Towns of the Continent, in Australia, Canada, India, and China, the United States, and elsewhere.

The Agency for Foreign and Country Banks is undertaken.

The PURCHASE and SALE of Government and other Stocks, of English or Foreign Shares effected, and DIVIDENDS,

QUOTIES, &c., received for Customers of the Bank.

Great facilities are also afforded to the Customers of the Bank for the receipt of Money from the Towns where the Company has Branches.

The Officers of the Bank are bound not to disclose the transactions of any of its Customers.

By Order of the Directors, WM. McKEWAN, General Manager.

IMPORTANT TO FLOCKMASTERS.

THOMAS BIGG, Agricultural and Veterinary Chemist, by Appointment to His late Royal Highness the Prince Consort, K.G., Leicester House, Great Dover Street, Borough, London, begs to call the attention of Farmers and Graziers to his valuable SHEEP and LAMB DIPPING COMPOSITION, which requires no Boiling, and may be used with Warm or Cold Water, for effectually destroying the Tick, Lice, and all other insects injurious to the Flock, preventing the alarming attacks of Fly and Shab, and cleansing and purifying the Skin, thereby greatly improving the Wool, both in quantity and quality, and highly contributing to the general health of the animal.

Prepared only by Thomas Bigg, Chemist, &c., at his Manufactory as above, and sold as follows, although any other quantity may be had, if required:—

4 lb. for 20 sheep, price, jar included.....	£0	2	0
6 lb. 30 " " " "	0	3	0
8 lb. 40 " " " "	0	4	0
10 lb. 50 " " " "	0	5	0
20 lb. 100 " " " (cask and measure)	0	10	0
30 lb. 150 " " " included)	0	15	0
40 lb. 200 " " " "	1	0	0
50 lb. 250 " " " "	1	3	6
60 lb. 300 " " " "	1	7	6
80 lb. 400 " " " "	1	17	6
100 lb. 500 " " " "	2	5	0

Should any Flockmaster prefer boiling the Composition, it will be equally effective.

MOST IMPORTANT CERTIFICATE.

From Mr. HEREFATH, the celebrated Analytical Chemist:—
Bristol Laboratory, Old Park, January 18th, 1861.

Sir,—I have submitted your Sheep Dipping Composition to analysis, and find that the ingredients are well blended, and the mixture neutral. If it is used according to the directions given, I feel satisfied, that while it effectually destroys vermin, it will not injure the hair roots (or "yolk") in the skin, the fleece, or the carcass. I think it deserves the numerous testimonials published. I am, Sir, yours respectfully,

WILLIAM HEREFATH, Sen., F.C.S., &c., &c.,
To Mr. Thomas Bigg, Professor of Chemistry,
Leicester House, Great Dover-street, Borough, London.

He would also especially call attention to his SPECIFIC or LOTION, for the SCAB or SHAB, which will be found a certain remedy for eradicating that loathsome and ruinous disorder in Sheep, and which may be safely used in all climates, and at all seasons of the year, and to all descriptions of sheep, even ewes in lamb. Price FIVE SHILLINGS per gallon—sufficient on an average for thirty Sheep (according to the virulence of the disease); also in wine quart bottles, 1s. 3d. each.

IMPORTANT TESTIMONIAL.

"Scoulton, near Hingham, Norfolk. April 16th, 1855.
"Dear Sir,—In answer to yours of the 11th inst., which would have been replied to before this had I been at home, I have much pleasure in bearing testimony to the efficacy of your invaluable 'Specific for the cure of Scab in Sheep.' The 400 sheep were all dressed in August last with 84 gallons of the 'Non-poisonous Specific,' that was so highly recommended at the Lincoln Show, and by their own dresser, the best attention being paid to the flock by my shepherd after dressing according to instructions left; but notwithstanding the Scab continued getting worse. Being determined to have the Scab cured if possible, I wrote to you for a supply of your Specific, which I received the following day; and although the weather was most severe in February during your Specific proved itself an invaluable three weeks the Sheep were quite cured; and say the young lambs are doing remarkably well at present. In conclusion, I believe it to be the safest and best remedy now in use.
"I remain, dear Sir,
"For JOHN TINGEY, Esq.,
"R. RENNEY.

"To Mr. Thomas Bigg."
"Flockmasters would do well to beware of such preparations as "Non-poisonous Compositions;" it is necessary to appeal to their good common sense and judgment to be thoroughly convinced that no "Non-poisonous" article can poison or destroy insect vermin, particularly such as the Tick, Lice, and Scab Parasites—creatures so tenacious of life. Such advertised preparations must be wholly useless or they are not what they are represented to be.

DIPPING APPARATUS.....£14, £5, £4, & £3.

CHEAP SUNDAY AND WEEK-DAY READING FOR THE PEOPLE

Now Publishing,

The Church of England Magazine,

A VERY CHEAP RELIGIOUS PERIODICAL.

Containing original contributions by several of the Bishops and many other distinguished Divines; Narratives; Sketches of Natural History; Biography, Missionary Proceedings, Juvenile Reading, Poetry, &c., with a Register of Ecclesiastical Intelligence; the whole combining amusement with instruction, in a style suited for all classes of readers.

A series of Parish Churches, with Illustrations of a superior kind is in course of publication. This series, which will be of a very extended character, will be found of particular interest.

Vol. LXVI., Imperial Svo., Embossed Cloth, 480 pages, with highly-finished Illustrations of Parish Churches, price 5s. 6d. London: Published in weekly numbers, price 1½d., and in monthly parts, price 9d., by S. EWINS & SON, 9, Ave Marie Lane; ROGERSON & TUXFORD, 265, Strand, W.C.; and sold by all Booksellers.

Intending subscribers are requested to send their orders without delay, as the back volumes and parts are becoming VERY SCARCE.

As the Magazine enjoys a circulation far exceeding that of any other church periodical, and is read by all classes of society, it will be found a very eligible medium for Advertisements, which are conspicuously printed, and inserted at the most reasonable rate.
